ONE of the marked results of the war upon Americans is the inculcation of the principle of thrift. The wonderful response of all classes to the call of the nation to purchase Liberty Bonds and Thrift Stamps has popularized saving and investing. As a consequence those who never before saved any of their earnings have become bond-holders, bank-depositors and investors.

The same sort of education has been given for two years by President Rieder of the Canadian Consolidated Rubber Co., who introduced a plan whereby employes could leave part of their wages with the company and receive interest at the rate of six per cent per annum, compounded monthly. Naturally there were some over-cautious employes who at first feared that the company had some ulterior motive. When they learned, however, that they could withdraw any part or the whole of their deposits at any time, these suspicions departed and the plan has been proved a success. It has resulted not only in the pride of the employes in investment, but in their increased stability and faithfulness. Those who have thus invested earnings have also a greater interest in the company and its work, and are much better workmen.

The rubber company mentioned is but one of many in this country and Canada where similar plans have been tried and in no case has it proved other than advantageous to both employer and employee. Furthermore an I. W. W. or a Bolshevik is anathema to an investing employe, for is he not a capitalist?

No one can read the names of the dead and wounded soldiers which have been published in the daily papers without being impressed by the cosmopolitanism of our army. Truly every race and nation is represented, yet all these men, by their participation in the war, as units in the United States Army, have fully earned the title "American."

The pay roll of every large rubber concern presents a similar variety of racial surnames. The notices posted in the factories, printed in several languages, show the polyglot character of the rank and file of the work people.

The tendency of immigrants is to segregate into racial groups which, except for their work, remain as alien as though they were still in their native countries. In many cases there is slight endeavor on their part to learn the language of this country, no sympathy with things American nor appreciation of that thoroughness that makes for the highest efficiency.

That all workmen should understand English is of the first importance. And next to learning the language of their adopted country is to know its principles of equality, fair play and justice. Only by such means can the industries of this country be assured of progress and prosperity. The workman who understands that what is

for the common good of both employer and employe is ultimately best for each individual, himself included, is the only valuable one. As a means toward this end leading rubber manufacturers are maintaining schools where the English language is taught and at the same time the advantage of becoming American citizens is made plain.

Were every factory manned by English-speaking, self-respecting money-saving American citizens, native or naturalized, there would be little labor trouble, less fear of I. W. W.-ism and Bolshevism.

MEXICAN RUBBER LOOKING UP.

THE Intercontinental Rubber Co. and some forty other big oil, copper, and land companies, together with big banks such as the National City, the Guaranty Trust and J. P. Morgan, are out to reconstruct Mexico. As a beginning they have formed the National Association for the Protection of American Rights in Mexico. As our neighbor to the south is bankrupt, a receivership is planned, this to be brought about by the moral suasion of the civilized world. Armed intervention is not planned. Instead, wise and efficient support of a stable Mexican government is to be offered,—perhaps insisted upon.

It is high time and it is, moreover, the time. German propaganda is slumping more and more. Teutonic money that formerly was poured out by millions is becoming scarce. Hun promises and boasts are beginning to be understood for what they are worth. Arms and ammunition for insurgents are hard to get. Besides this, thousands of Mexicans on both sides of the border are enthusiastically in favor of the plan.

A wisely administered receivership means peace for the Mexicans, safety for foreigners, and renewed prosperity for the rubber plantations, and the guayule producers.

THE DAILY PAPERS ARE FEATURING A STORY TO THE effect that one man was killed and two women burned by the explosion of a hot-water bottle, and furthermore that the explosion was heard for blocks and several windows broken.

The inference is that the bottle contained hot water; that said hot water suddenly, energetically, and feloniously, turned itself into steam and did rend, wreck and scald, to the discomfort and damage of certain and sundry individuals. Without in any way impugning the veracity of the narrators, we venture to point out that hot water is not explosive. Even in a superheated bed its contents do not vaporize. The chances are that the bottle was filled with T.N.T., which conservative manufacturers do not advise for foot warming.

THE FOUR-MILLION-DOLLAR POTASH PLANT, NEAR SAN Diego, California, is to be shut down. As it made potash from kelp this is a rare opportunity for some manufacturer of "seaweed rubber."

The Production of Guayule Rubber.

From a special report by Henry C. Pearson, prepared for the Bureau of Foreign and Domestic Commerce.

EVEN before the Spanish occupation northern Mexico was a rubber-producing country, the source being a shrub or dwarf tree to-day known as guayule. The natives obtained the gum by chewing the bark and made toy balls of it. It is said that this fact was first chronicled by a Jesuit priest, Negrete, about the middle of the eighteenth century.

The plant was discovered by Dr. J. M. Bigelow, in 1852, when he was attached to the Mexican Boundary Survey. It was later described and named *Parthenium argentatum* by Professor Asa Gray, of Harvard University.

In 1876 a guayule product, known as Durango rubber, was exhibited at the Philadelphia Centennial Exposition. Attention was drawn again to it in 1886, when an English mining engineer, working in Mexico, reported to his principals that he had found "an enormous quantity of a plant that yielded 10 per cent of rubber."

It was not until 1888, however, that any attempt was made to extract the gum commercially. In that year John H. Cheever, the founder and at that time the treasurer of the New York Belting & Packing Co., New York, imported 100,000 pounds of the shrub, known as "hule." The bark when removed yielded about 18 per cent of rubber, which was considered equal to the best grade of "centrals." Because of the expense of transportation and treatment the experiment was not repeated.

In 1896 Guillermo Vogel, of Mexico City, sent samples of the shrub and rubber from it to manufacturers in the United States, but they attracted little attention.

Germans in Mexico endeavored to interest American capital in the extraction of the gum in the late nineties with little success. That some of the shrub or bark was sent to Germany was certain, but the trade heard nothing of it.

DEVELOPMENT OF EXTRACTION PROCESSES.

In 1899 William Prampolini, an Italian, took out a patent for extracting guayule by solvents. His apparatus was constructed at Monterey, Mexico, but was only experimental. Two years later the Bergner process was patented in Mexico, and this was followed by a large number of patents for extraction processes, some practical and some otherwise, and for several years afterwards applications for patents for this purpose were numerous.

In 1903 a small factory was established at Jimulco, Mexico, by Adolpho Marx.

In 1905 a factory in Germany, backed by large financial interests, did a successful business extracting the guayule from the shrub, which was gathered in Mexico, baled, and shipped to Germany. The Mexican Government, however, placed an export duty of 15 pesos per ton on the shrub, which, with the cost of gathering and transportation, rendered the industry

unprofitable.

Beginning in 1902, certain American capitalists financed a series of experiments that led to an invention by William A. Lawrence, by which, in 1904, rubber was extracted by a mechanical process, and 50 pounds were shipped to the United States. This was the real beginning of the extraction of guayule on a commercial basis in Mexico, and in 1906 it began to be used in quantity. Factories established in the States of Durango, Coahuila, San Luis Potosi, and in Texas soon produced large

quantities of rubber. Improvements in the processes of extraction tended to produce superior grades, and the guayule industry was fully established on a profitable basis. The rival companies, though strongly competing, were able to secure good prices and the question of a supply of the shrub became important. This led to the purchase of large tracts where the shrub was plentiful and the erection of extraction plants in many little-known sections of Mexico.

In 1907 the leading producers were companies briefly designated as the Continental, the Madero, and the Anglo-Mexicana. The Continental-Mexican Rubber Co. had its principal

plant at Torreon, its other factories being at Saltillo, Ocampo, Gomez Palacio, and La Grunidora. It had at that time acquired great tracts of guayule-producing land. The Madero family were the principal owners of the Compañia Exploradora Coahuilense, S. A., with headquarters at Parras, Coahuila, and other plants at Las Delicias, Cuartos Cienegas, and Vanegas. They also owned or controlled great tracts of shrub-producing land. The third largest interest was the Compañia Exploradora de Caucho Mexicana, with factories at Saltillo and Jimulco. There were also ten or a dozen other smaller concerns. From 1910 the production increased to a remarkable extent, though the revolutions of recent years in Mexico interfered seriously with the industry.

ORIGIN OF THE NAME.

The name guayule, guayhule, or huayule, comes from the Spanish *hay* and Indian *hule*, or "rubber yielder." In Durango, it is called *yerba de hule*; and in San Luis Potosi is called *yule*; also called *yiguhite* near Saltillo, and sometimes *copaline*.¹ Prampolini calls it *yerba del negro* or *mariola*, by which last name it is widely known, though *mariola* rightly means a kindred species (*Parthenium incanum* H. B. K.).

Dr. Seler, of Berlin, however, questions Endlich's idea that guayule=*hay* (has or there is) and *hule* (rubber); *hayhule*=rubber bearer. Seler says it is from two Indian words, *guauh* (wood, tree, or forest) and *olli* (rubber), thus *guauholl*==

TYPICAL GUAYULE COUNTRY.

¹"The Economic Importance of Guayule," by Dr. Rudolph Endlich, "Der Tropenpflanzer," May, 1905, p. 23.

wood rubber (Der Tropen-lanzer, Sept., 1905, p. 540.) This view has the support of Professor Francis E. Lloyd,² who believes in its Aztec origin.

DESCRIPTION OF THE GUAYULE SHRUB.

The *Parthenium argentatum* Gray, is the only present rubber

GATHERING THE PLANTS.

producer found among the composites. It is a woody shrub of spreading habit, naturally growing much branched. If the branches die away at the base, a distinctly treelike form is assumed. Large plants may acquire a spread or height of 3 feet or more, but such individuals are of advanced age, probably not less than 40 or 50 years old. The small leaves are greenish, silvery gray, as also are the younger twigs, which, as the age of the axis advances, change to light and then to dark ashy gray. The winter appearance of the plant is strikingly different from the summer appearance. In the winter the leaves, save those forming small clusters at the tips of the twigs, have fallen, leaving these bare. In summer the new growths are clothed with leaves of maximum size in which the green color is more apparent. At this time the flowers are borne in loose clusters on slender stems and crown the plant with a profusion of small yellow blossoms. These are arranged in heads, each head resembling a small daisy and capable of forming at most five seeds. Usually some of these do not develop. A curious manner of development results in the association with the seed of a large amount of chaff.

A plant that is not a rubber producer, the mariola (*Par-*

LOADING WAGON WITH GUAYULE.

thenium incanum H. B. K.), grows often side by side with the *argentatum* and is mistaken for it. To prevent confusion, Dr.

² "Guayule, a Rubber Plant of the Chihuahuan Desert," by Francis E. Lloyd, p. 5.

A. Stapf prepared the following comparison:

Parthenium argentatum.

A small shrub, with a short stem, much branched, much divided branches, from less than 1 foot to 2 feet high; woody, leafy branches, short, more or less curled, covered with a rather smooth, dark gray bark, young branches gray all over. Leaves laterally, or being entire, are often with 1 to 8 sessile, toothed lobes, $\frac{1}{2}$ inch long, 4 to 6 lines wide, densely covered with a fine silvery gray tomentum, gradually narrowed into an open tomentose slender petiole. Flower heads subsessile, single or in small clusters, 2 to 7 in diameter, the ends of the rays more slender branches, each into a very imperfectly lobed, white, tubular, slightly pubescent; outer bracts broadly herbaceous on the back.

Parthenium incanum.

A small shrub 1 to 2 feet high, much branched, woody persistent branches, elongate slender, covered with a somewhat rough bark, cracked longitudinally, young shoots whitish or grayish woody. Leaves obovate to obovate-oblong in outline, petiole (the smaller) hardly jointed, $\frac{1}{2}$ to 1 inch long, broadly more, $\frac{1}{3}$ to $\frac{1}{4}$ inch wide, lobes 1 to 2 on each side, entire at the terminal crenate, all very obtuse, the whole leaf densely covered with a white, woolly tomentum when young, then grayish; petiole very short. Flower heads shortly peduncled, or subsessile, 2 lines in diameter in terminal, often much branched corymbs 1 to 2 inches in diameter, branches slender. Involucre finely villous; outer bracts slightly herbaceous on the back, above the middle.

Quite recently another species, discovered by Professor F. E. Lloyd, has been named *Parthenium Lloydii*. Professor H. H. Bartlett thus describes the new species, emphasizing the differences between it and the *Parthenium argentatum* as follows:

In the *Parthenium argentatum* the monopodial growth of the seedling is continued by the development of the first inflorescences. Extension of the root system takes place at the base of the well-differentiated peduncle, by growth at that point of two or three branches, whose growth is in turn continued by inflorescences. As a result of this sharp delimitation of leafy stem and peduncle, the remaining of old plants is closely and repeatedly

A GUAYULE BALING PRESS.

divaricate. Grown plants are often finely symmetrical. In *Parthenium Lloydii* the branching is like that of the mariola (*P. incanum*). The stem is more slender than *P. argentatum*, and the leafy peduncle is not sharply delimited.

Well up toward the inflorescence it bears short, leafy spurs which elongate after the closing of the flowering season. A grown plant of the *P. Lloydii* is therefore characterized by its intricate interweaving of branches. In herbarium specimens the striking difference between the two specimens lies in the form of the leaves, which in *P. argentatum* are relatively only half as wide as in *P. Lloydii*, and rather deeply laciniate, whereas in *P. Lloydii* they are typically sparsely dentate or denticulate.

In the type material of *P. Lloydii* the pappus awns are slightly incurved toward the base, but diverge at the apex. In most material of *P. argentatum* the awns curve away from one another at the base and are somewhat incurved at the apex. This distinction pointed out by Professor Lloyd does not seem to hold throughout the large series of specimens of *P. argentatum* in the Gray and the National Herbaria, but in view of McCallum's recent report that the guayule consists of as many as 125 segregable elementary species, the occasional inapplicability of this character is not to be wondered at. The curvature of the pappus may serve to distinguish *P. Lloydii* from certain aggregates, but not from others.

RUBBER CONTENT.

Guayule is distinct from most other rubber-producing plants in that its bark contains no latex, rubber being in the cellular tissue of the epidermis and to a small extent in the branches and leaves, the blossoms being without traces of rubber. The amount of rubber in the topmost branches is very slight, but increases toward the roots. The bark also contains resins and essential oils, which decrease the value of the rubber. Fairly dry plants subdivide into the following weights:

	Per cent.
Wood	47.0
Bark	44.5
Leaves	8.5

BALE OF GUAYULE SHRUB.

According to Whittlesey (1905, p. 5), guayule plants contain rubber as follows:

	Per cent.
Trunk bark	21.4
Root bark	19.5
Branches and leaves	9.7
Trunk wood	Nil.
Root wood	1.7

The yield of marketable rubber from the wild plants varies according to the condition of the plants and the process of extraction employed. The extraction runs from 6 per cent for ex-

GUAYULE BALES IN FACTORY YARD.

periments with average Texas guayule to 15 per cent for some of the highest grade of Mexican, a fair average yield equaling 12 per cent of the weight of the moderately dry plant.

(To be continued.)

PROSPECTS OF RUBBER PRODUCTION IN QUEENSLAND.

UNDER the title "Neglected Industries," the "Queensland Agricultural Journal" for August, 1918, announces that Pará, Ceara, and other rubber-producing trees thrive luxuriantly in tropical Queensland, but that capitalists, when they are asked why they invest no money in rubber plantations in that country, inquire: "How can Queensland, where wages are high and where strikes threaten at critical moments, try to compete with countries where there is an abundance of colored native workers, where wages are low and where land can be leased at low rent, such as British New Guinea?"

At first glance that settles the whole matter, but on closer examination we find that rubber planting is just as profitable in Queensland under labor conditions suitable to white people as it is in a country where colored workers are used. Without going into details, the estimated cost of a rubber plantation in Queensland, comprising 500 acres bearing 75,000 trees, including wages, buildings and equipment, is £34,000. These trees should be ready for tapping after six years, and in the first year of tapping would bring in £15,000; the debit of £19,000 should be changed in the seventh year by a £30,000 crop into a profit of £11,000 above the cost of the plantation; the profit for the eighth year and every year after that should be £45,000 a year.

But even on a smaller scale the business pays. In New Queensland on the east and west coast of the peninsula, land is chiefly planted with sugar, as the climate and rainfall leave nothing to be wished for. The profit and loss account of 20 acres of rubber is as follows: the price of cleared land is £20 an acre; the total cost of exploitation for the first five years is £432. After six years the tapping can begin, each tree giving one pound of dry rubber, the seventh year two pounds, the third year three pounds, and so on, so that in the first three years of tapping, 18,000 pounds of rubber will be obtained, which, at three shillings a pound, means £2,700, from which the cost of collecting the rubber—one shilling per pound or £900 for the crops, including cases and freight—must be deducted.

Many plantations in Queensland are surrounded by forests and shrubs which offer a danger of fire. These could be removed and replaced by rubber trees, so that the profits may be continually increased.

RUBBER PRODUCTION ON HAINAN ISLAND.

The report of the commissioner of customs of the port of Kiangchow, Hainan—an island belonging to China, between latitude 18° and 20° N., deals with the increased production of rubber in that territory. It sums up the situation as follows:

At present the industry is chiefly undertaken by returned emigrants from the Malay States. Since 1910 the Kiung An Co. has planted 6,000 rubber trees in the Kachek district, and the Ch'iao Hsing Co. 45,000 trees in the Nodoo district. The latter company has not yet begun tapping its trees. Two years ago the Kiung An Co. tapped 2,000 trees and this year the number was 3,000, from which 14 pounds was produced daily.

Rubber to the amount of 3,066 pounds was exported to Singapore during the year, either direct or through Hongkong and Bangkok. Export is made in sheets averaging 16 inches long, 10 inches wide and ¼-inch thick. Prices on the last shipment reached only \$48 per picul (133-1/3 pounds as against \$100 per picul on the first consignment sent to Singapore, said to be first-quality.

Some months ago Lin I-shun, a Cantonese merchant in Singapore, obtained from the Ministry of Agriculture and Commerce a grant of 100,000 acres of land on which to grow 5,000,000 rubber trees, in return for which he guarantees to pay a royalty of \$5,000,000 to the Government when the trees have reached a flourishing condition. In December Mr. Lin sent three men to the island to look for suitable areas for planting rubber. A large part of the entire island is said to be suitable for rubber growing.

Gas Defense Equipment and the Rubber Industry.

J. Major C. R. Johnson, Chemical Warfare Service, United States Army

FIG. 1.—TYPES OF GAS MASKS USED BY AMERICAN, ALLIED, AND GERMAN ARMIES.

Sitting, left to right—1. German gas mask. 2. Russian gas mask. 3. Italian gas mask. 4. British mask for motor truck drivers. 5. British airplane respirator. 6. Experimental mask with metal facepiece. Designed by Major Connel, of Medical Corps, American Army.

Middle Row. 7. First emergency method put into practice after initial gas attack in April, 1915. Colonel Goodwin, of Medical Department, British Army, devised this mask. 8. British "P. H." helmet-emergency type first used in summer of 1915. 9. British "box respirator," standard type used by British Army. 10. French M-2 mask, original French type used until spring of 1918. 11. Original French artillery mask designed by Tissot. 12. French "A. R. S." mask, last type used by French Army.

Top Row. 13. Original American Navy mask. 14. American Navy mask, final type. 15. American "box respirator," a type used by U. S. Army throughout the war. 16. The improved design developed at Gas Defense plant to simplify manufacture. 17. American A. T. mask, all rubber mask in limited production at end of war. 18. American K. T. mask sewed fabric mask in limited production at end of war. 19. American "Model 1919" mask, improved type ready for production when armistice was signed. This mask embodied the good features of 17 and 18 and was extremely simple to manufacture.

THE WAR DEPARTMENT made heroic demands upon the rubber industry for rubber materials required in gas defense equipment and it is gratifying to be able to state that this industry heroically met those requirements. During the period of our participation in the war the rubber industry furnished products to the Gas Defense Division to the value of \$12,671,461, comprising the following commodities and quantities:

Commodity.	Quantity.
Face fabric.....	1,060,000 yards
Band fabric.....	282,500 yards
Lining fabric.....	21,370 yards
Impermeable fabric.....	296,500 yards
Strapings.....	43,100 yards
Rubberized stockinet.....	159,600 yards
Nose pads.....	9,210,000 pieces
Deflectors.....	645,000 pieces
C. E. hoods.....	2,317,000 pieces
A. T. hoods.....	2,448 pieces
K. T. hoods.....	264,400 pieces
Flexible hoses.....	7,070,000 pieces
Mouth-pieces.....	7,550,000 pieces
Flutter valves.....	8,500,000 pieces
Flutter valves (English type).....	850,000 pieces

Commodity.	Quantity.
Diaphragms.....	12,800,000 pieces
Clayton tubes.....	1,120,000 pieces
Clayton rings.....	1,378,000 pieces
Rubber bands.....	2,500 pounds
The casting washers.....	4,000,000 pieces
Flat washers.....	18,700,000 pieces
Hard rubber castings.....	700,000 pieces
Rubberized felt.....	103,700 yards
Flats.....	14,660,550 yards
Adhesive tape.....	4,106,300 yards

The purpose of this article is to point out the great importance of rubber in the gas mask, to show the intimate connection of the rubber industry with the development and production of this most necessary equipment, and to furnish some technical information acquired in gas-mask production, which may be of future value to the industry.

It can be stated that rubber was universally used in all types of masks. This is illustrated most effectively in Figure 1 in which every respirator, except the very earliest English emergency type, used rubber in various ways. The Germans

EDITOR'S NOTE.—Before the war, Major Johnson was chief chemist of The Goodyear Tire & Rubber Co., Akron, Ohio. He was commissioned in the Sanitary Corps, National Army, in January, 1918, with rank of captain, and was assigned to the Gas Defense Service where he was given the following assignments: rubber part procurement; development of Akron Tissot mask; officer in charge Long Island laboratories; technical director Gas Defense Division, Chemical Warfare Service. In October, 1918, he attended the Interallied Conference on Gas Warfare in Paris.

used less than any other nation (thanks to allied sea power) but were not able to eliminate it entirely. Their earliest masks were made of rubber fabric which was abandoned in favor of oiled leather as soon as the rubber shortage became acute. They substituted cloth-

covered spiral springs for elastic webbing and the only rubber used in the greater part of their production was a washer containing very little new rubber, to make a gas-tight joint between the canister and the mask. It is interesting to note in connection with this group that the Russian mask contained more rubber than any of the others, as it had a complete hood covering. The final English, all French, and all American masks

made gas-tight by use of wire, adhesive tape, and rubber cement.

THE FIRST 25,000 MASKS.

When the United States went into the war practically nothing was known of gas warfare. In fact, very soon after the first use of gas in April, 1915, by the Germans, the Allies adopted a policy of strict secrecy in order that their offensive and defensive plans might be more effective.

It can be easily appreciated that the Bureau of Mines faced a difficult task when it was requested by the War Department on May 16, 1917, to furnish 25,000 respirators in three weeks. The Director of the Bureau, Van H. Manning, had realized the ugly possibilities of gas warfare and had organized a bureau under the direction of G. A. Burrell for the purpose of gas investigations. Mr. Burrell called upon Bradley Dewey, a Pittsburgh chemical engineer, to take charge of the production of the first 25,000 masks.

It was recognized that a delivery could not possibly be made in three weeks' time, an impossibility, even if a settled design had existed. Contracts were placed with The B. F. Goodrich Co., Akron, Ohio, for furnishing complete face-pieces and with the American Can Co., New York, for the canister and final assembly. Only those actually connected with the enterprise at the time would appreciate the intense effort required of all to make this delivery by the end of June, which was done. While the masks resulting from this early effort were not adequate when they reached the front, because of new gases introduced in the interim, nevertheless they were adequate to meet conditions in 1918 when they were made and a credit to all concerned.

RUBBER MANUFACTURERS COOPERATE.

The memorandum of May 16, 1917, from the Chief of Staff called for completion of

FIG. 2.—AMERICAN BOX RESPIRATOR, C. E. TYPE, SHOWING RUBBER PARTS.

used rubberized fabric of some form, either unreinforced or united to close-woven cloth or stockinet.

OPERATION OF THE AMERICAN RESPIRATOR.

An outline drawing of the American box respirator furnished to our troops is shown in Figure 2 and in order that the reader may understand more clearly the various matters discussed later it will not be out of place to describe briefly the manner in which the respirator functions. Upon inhalation, the air passes into the bottom of the canister 18, through rubber diaphragm check valve 31, up through absorbent chemicals and mechanical filters into flexible rubber hose 17, through the face-piece by way of an aluminum die casting and into the mouth of the wearer through a rubber mouth-piece 16, which is worn between the lips and the teeth. At the same time any passage of air through the nose is stopped by a spring and rubber nose clip 8, and 9. Upon exhalation the air passes out through the same mouth-piece through another passage in the die casting and finally to the outside air through the rubber exhalation or flutter valve 14.

It is evident that in a device of this kind the lungs are protected by the closure of the nose and the direct connection of the mouth-piece. However, since the Germans used gases which immediately closed the eyes and even led to temporary blindness it was essential that the face-piece should provide a tight fit with the face and that the rubberized cloth in the face-piece prevent the entrance of gas by permeation. Gas-tightness of the eye-piece was insured by a rubber gasket and the various points were

FIG. 3.—AMERICAN BOX RESPIRATOR, C. E. TYPE.

FIG. 4.—ELECTRICAL RUBBER FABRIC TESTING MACHINES.

¹Mr. Dewey was commissioned in July, 1917, a major in the Sanitary Corps of the Medical Department and made responsible for the production of gas defense equipment. In July, 1918, this activity with all others involved in the gas warfare was consolidated by an order of the President into the Chemical Warfare Service, United States Army, and Major-General William S. Sober placed in charge. Gas defense production was a division of this service under Colonel Bradley Dewey and grew in its schedules and activities until, on November 11, 1918, it had throughout the country, 80 organized detachments and a personnel of 274 officers, 2,353 enlisted men and 13,000 civilians.

1,100,000 respirators by June 30, 1918. In July arrangements were made with The B. F. Goodrich Co., The Goodyear Tire & Rubber Co., and the United States Rubber Co. to supply 320,000 complete face-pieces ready for assembly, and the same quantity of other rubber parts including flexible hose, flutter valves.

FIG. 5.—TUBE ASSEMBLY SHOWING RUBBER MOUTH-PIECE, FLUTTER VALVE AND FLEXIBLE HOSE.

mouth-pieces, rubber diaphragm check valves and rubber washers for the die-casting assembly. The B. F. Goodrich Co. showed a very fine cooperative spirit in assisting the other two companies to bid intelligently by giving them the benefit of its previous mask-making experience which included not only the Army order for 25,000 but also a Navy order. Without this assistance the other two companies would have been reluctant to bid on a proposition which was not worked out in complete design and specification. This marked the beginning of the cooperation which continued between these companies on all matters pertaining to gas masks. This spirit of cooperation was universally evident among the various rubber companies who later supplied material. It is not going too far to say, based on gas-mask experience, that such cooperation carried into all lines would not only benefit all participating but would advance the industry. After all, no company has a monopoly on good ideas.

The months of July, August, September, and October, 1917, were consumed in getting various mold equipment and in devising methods of manufacturing. During this period, and in fact until the end of the year, questions of design and specifications were in a state of flux, partly because the Gas Defense Service required time to determine various important details of design and partly because one company after another would find an improvement in method or design which would be of such advantage that its adoption by all was desirable. Again, the Gas Defense Service had realized the importance of the highest perfection necessary in a respirator and consequently insisted on high standards of deliveries. The manufacturers, on the other hand, without detailed and sufficient specifications, with frequent changes coming through, with a vivid impression of the need of rapid action, and not as clear a vision of the need of extreme perfection, made deliveries of masks and parts which necessitated high rejections at the assembly plant. It was a most trying period and only the real desire on the part of all involved to see that our soldiers had good gas masks, kept the various elements together through this time.

RUBBER MANUFACTURING COMMITTEE FORMED.

In November, Colonel Dewey, at the suggestion of the rubber manufacturers, organized a rubber manufacturing committee, composed of Dr. W. C. Geer, of The B. F. Goodrich Co., chairman, Dr. T. H. Whittelsey, of the United States Rubber Co., and C. R. Johnson, of The Goodyear Tire & Rubber Co. This was done with the realization that the rubber companies should be in necessary touch with gas defense problems and that they could render considerable aid in the preparation of specifications. A quotation of the minutes of the first meeting indicates the spirit with which the committee worked.

(a) It is decided that the committee itself should help the Gas Defense Service in so far as research, development and specification problems are concerned. The problems of production volume, production distribution, relationships of personnel, etc., are to be divorced from the work of this committee.

(b) It is agreed that where new ideas are developed which may have value to other parts of the rubber industry, preliminary tests of both the raw and fabricated product shall be conducted without a full disclosure of the exact nature of the process by which the articles are made. It is, however, definitely agreed that whenever the Gas Defense Service feels that the tests in themselves show that the product is needed and should be given on soldiers in the field, the whole committee shall then be used every single detail of design, composition, and methods of manufacture in so far as it is possible to describe such details without the use of detailed dimension drawings or photographs.

(c) It is agreed that no member of the committee commit himself to the policy of inviting other rubber interests into his factory.

(d) The Gas Defense Service agrees that in the future, it will wherever possible before making any changes in specification or in methods of inspection, submit an outline of the changes to this committee for its comment. Furthermore, it agrees that in so far as possible it will see that the committee is kept informed regarding the less confidential features of gas warfare.

This committee prepared in frequent conference the complete specifications of the rubber materials used in gas masks and carried on by means of the available laboratory facilities many development and research problems the solution of which was urgently needed by the Gas Defense Service.

Early in January the writer entered the Gas Defense Service and was replaced on the committee by William Stephens, of The Goodyear Tire and Rubber Co. This committee was at that time officially recognized by The Rubber Association of America as its representative on gas defense matters. It continued to give

FIG. 6.—FLUTTER VALVE INSPECTION.

valuable service during the period of the war. It was enlarged in personnel in September, 1918, as follows: Dr. W. C. Geer, chairman, The B. F. Goodrich Co.; Dr. Theodore Whittelsey, United States Rubber Co.; William Stephens, The Goodyear Tire & Rubber Co.; T. W. Miller, The Faultless Rubber Co.; L. C.

Himebaugh, British-American Manufacturing Co.; George A. Luddington, The Fisk Rubber Co.; George A. Daum, Pennsylvania Rubber Co.

The closer contact resulting from the Rubber Committee was

FIG. 7.—FLUTTER VALVE LEAKAGE-TESTING APPARATUS.

evidenced by a better appreciation on the part of the manufacturers of gas defense needs and this was reflected in better deliveries of rubber parts. By February, production had reached a firm basis and in the three succeeding months the quality of production was improved to such an extent that rejections at the assembly plant were reduced to a very low percentage.

RUBBERIZED FABRIC EXTENSIVELY USED.

Rubberized fabrics were extensively used in mask manufacture and upwards of 1,500,000 yards were made. In the early days many difficulties were encountered and specifications were changed several times before a satisfactory gas-proof fabric was obtained.

At first a No. 4 sail-cloth coated on one side with rubber was used. The amount of rubber was insufficient and many masks were unsuitable on account of light spots and even pinholes. To overcome this, more rubber was used and both sides of the fabric were coated. With one ounce per square yard of rubber on the outside, 3.6-ounce sail-cloth and 4-ounce rubber on the inside, there was a total weight of 8.6-ounces per square yard. This, however, still resulted in light spots which were a cause of concern to the Service. At the same time it was reported from abroad that the Germans were using a new tear-producing gas, chloropicrin, which had great power in penetrating rubber and consequently with thinly coated fabrics might soon put soldiers out of action. Steps were therefore taken to increase the rubber coating and by compounding research to find a combination, if possible, which would better resist the gas. Hundreds of compounds were produced and tested and it was found that paraffine in small quantities incorporated in the rubber was most useful in increasing resistance.

FABRIC TESTING METHODS AND APPARATUS.

The method of testing employed at first consisted of putting a

thin glass-sealed capsule of the poison liquid (chloropicrin, boiling point, 122 degrees C.), in a wide-mouthed 250-cc. bottle, covering the mouth of the bottle with one layer of the fabric to be tested, breaking the capsule and noting the time for the gas to make itself evident to the eye or nose. This method was unsatisfactory for two reasons—difference in sensibility of the observers, and marked effect of temperature on the rate of permeability. This method was replaced by one worked out by the Bureau of Mines which gave much more consistent results.

The apparatus consisted of a silvered, two-part drum in the lower half of which was placed the liquid chloropicrin, the fabric to be tested acting as a diaphragm between the upper and lower halves, the upper half being provided with an arrangement for sweeping air over the upper surface of the fabric. The air was swept out through hot tubes which served to break down any chloropicrin to chlorine as soon as it came through. This end point was made evident by the use of starch iodide solution. While this apparatus provided an accurate end point and temperature control of the chloropicrin, it did not provide for temperature control of the incoming air and, therefore, the temperature of the fabric. The importance of this was not realized until summer when the permeability number of given fabric specifications went down markedly. The apparatus was finally modified by the Gas Defense Division to provide ample thermostatic control of liquid and fabric and thoroughly consistent results were then obtained.

The early requirements for fabric to test 8 minutes against chloropicrin were soon raised to 17 minutes. At this period it seemed likely that fabric with resistance of one hour might be demanded at any moment by the use on the part of the Germans of even more penetrating gas. It was recognized that this requirement could be met by increasing the amount of rubber coat, but this plan suffered two drawbacks—one, a too great increase in thickness and stiffness of the cloth, and the other, the requirement of too long a time for aeration. This latter term may be explained by the fact that permeation of rubber by these gases was a solubility phenomenon, layer by layer, through the rubber film. A thicker rubber which required one hour for the gas to penetrate required a correspondingly long time for the gas absorbed in the rubber to dissipate by evaporation. As a practical result, the soldier might be protected against a gas attack, put his mask away in his knapsack and later, when

FIG. 8.—FINAL ASSEMBLY OF R. F. K. TYPE MASKS.

wearing his mask, actually suffer a gas attack from the mask itself as the gas evaporated from it.

THE DEVELOPMENT OF FABRIC SPECIFICATIONS.

It was at this time, therefore, that the greatest amount of research work on fabric was performed by the three rubber companies who were making masks. As an outgrowth of this

work several specifications were developed providing protection up to 48 hours against the standard test which was in itself much more severe than field conditions. None of these fabrics was ever used, as the development of gas warfare did not demand it. They did, however, represent a reserve for any future developments, thus giving rise to an increase in confidence. These fabrics were, as a rule, made up of rubber but depended for their impermeability upon a film of different material.

The final specification used comprised of a No. 4 sail dyed olive drab and coated on one side with rubber to a total weight of 17 ounces. A lighter 11-ounce fabric was used for facing the band of the mask on account of its greater adaptability for yielding a mask with no wrinkles in contact with the face.

There were two types of compounds used and authorized by the Service, for the reason that various producing companies found them more adaptable. One based upon formulas obtained from the English carried approximately 60 per cent rubber and the balance inorganic fillers chiefly composed of China clay and litharge. A small amount of mineral rubber and brown substitute was used. The latter was eliminated later. This compound lent itself very satisfactorily to the use of dry-heat cure.

The other compound, higher in rubber (84 per cent), and the balance inorganic filler, gave better resistance to gas penetra-

FIG. 9.—FLEXIBLE HOSE AND FLEXIBILITY TEST. NEW DESIGN AT RIGHT.

tion. It was not found as suitable for the dry-heat cure, however, as the rubber lost much of its life, but to the steam cure this type responded very satisfactorily.

RIGID FABRIC INSPECTION REQUIRED.

The early days of fabric manufacture were troublesome times for both the manufacturers and the Gas Defense Service. In the first place only the highest standards prevailed in the minds of the Army representatives and yet in the early days it was not possible to reduce this high ideal to an inspection basis which really eliminated vital defects while allowing those of no consequence to pass. This resulted in the rejection of much material which might have been used, as shown by later experience. Many meetings were held to discuss when a defect was not a defect, etc., without bringing the two interests any closer together. The question of rough spots, the importance of foreign material at the surface and embedded in the fabric, the border lines of pits or depressions, the tremendous effect upon the rubber film of knots and slugs in the cloth itself, all constituted a basis of real difference of opinion which was a matter of great concern.

Type samples of all kinds of defects representing rejects, border cases, and accepts were finally agreed upon and the basis of inspection reached was a visual inspection of each roll, yard by yard, and a tally of defects. If the number of defects did not permit the plant to get 85 per cent perfect blanks when

the roll was cut, the roll was rejected. The manufacturer then had the choice of taking the roll back or having it cut at his risk with payment arranged upon a pro rata of acceptable blanks to the whole.

ELECTRICAL RUBBER FABRIC TESTING MACHINE.

While this method did smooth out the problem, the Gas Defense plant (a government-operated assembly plant located at

FIG. 10.—PRESSURE LEAKAGE TESTING MACHINE FOR FLEXIBLE HOSE.

Long Island City) recognized that many hidden defects might get by even the most rigid visual inspection and in turn visual inspection involved the never-constant human element. The plant therefore set about to eliminate this type of inspection and evolved the high-voltage electrical testing machine shown in Figure 4, which was entirely satisfactory. In this machine the fabric was passed between steel rolls which had an electrical potential difference of 4,000 volts. Any hidden hole, thin spots, pit, or embedded metal was broken down; the current arced through and burned a little circle which was its own rejection mark.

FABRIC MANUFACTURERS COOPERATE.

Mention has been made of the fact that knots and slugs in the cloth itself were a cause of trouble. This was true because

FIG. 11.—AUTOMATIC MACHINE FOR CUTTING ELASTIC HARNESS TAPE.

they became embedded in the rubber and made a thin spot in the film. The early days witnessed strenuous effort to improve the cloth used in gas masks. While a very fine cloth had been produced in this country for balloon work, no great

capacity was available and balloons and airplanes themselves were demanding enormous yardage to meet the wartime program. It was therefore necessary to work cooperatively with various cloth manufacturers in order that they might produce cloth to Gas Defense standards.

FIG. 12.—AMERICAN A. T. RESPIRATOR.

The problem involved more careful methods of yarn preparation, spinning, and the equipment of many hundreds of looms with automatic stop motions in connection with warp breakage. One manufacturer went so far as to start a spinning frame full-spooled and running through to the end, shutting down as the first spool ran out, and replacing throughout with new full spools. Thus the tied ends were eliminated. The less expensive method usually employed is to replace the spool and tie in a new end as each one runs out. This made by far the best fabric.

The No. 4 sail-cloth had a count of 110 in the warp and 116 in the fill, and a breaking strength of 50 pounds warp and fill in a one-inch strip.

EXHALATION OR FLUTTER VALVE.

This valve, see Figure 5, had to fulfil one of the most important requirements of all the parts of the respirator. It was necessary that it should allow the escape of exhaled air without too much resistance, and yet close instantly upon inspiration. It was required to show not over one inch of resistance at 120 liters per minute exhalation and a leakage of not over 10 cc. per minute when dry and at a pressure difference of one inch of water. In use, the valve became immediately wet with saliva which reduced its leakage to zero.

As originally made, the valve was wider and had a neck formed to fit the metal connection. Extensive experimentation revealed the fact that it was better to make the valve flat and narrower. When the flat neck was fitted to the oval connection, slight stresses were set up which tended to close the ports more tightly. The flutter valve was a source of great trouble for the manufacturers. The requirements were severe. Aside from the leakage test the valve was examined very carefully for holes, foreign material, gaping ports and dimensions. A part of this examination consisted in placing a rounded brass knob inside the valve, sliding and stretching the valve over the knob to bring to light any breaks, pits, or foreign material. This examination also showed any weak seams and edges. Seam construction gave a great amount

of early trouble, which was finally overcome by careful handling and adjustment of stocks. This valve had one weakness inherent in the design, which was not overcome during the whole experience. This was a weak edge where the two halves were joined at the sides. The weak edge resulted from the fold at this point and pressure during cure with a consequent loss in grain. It was undesirable because, when the valve was mounted, the solvent in the cement attacked the weakened tissue and often broke through.

The method of manufacture usually employed was to die out of sheet stock in single or double piece and then by making one or two seams and a fold, the make-up was ready for cure. Curing was done in soapstone or with slight pressure from plates. After cure, the valves were trimmed at neck and ports to dimensions. Specifications required not less than 85 per cent upriver fine Pará rubber, the remainder being sulphur and dry inorganic fillers. The use of organic accelerators was permitted upon application of manufacturers and upon evidence of satisfactory delivery. Large rejections took place at the manufacturing and assembly plants, and while constant effort was made to reduce rejections and much progress was made, yet the manufacturer was always obliged to reject many valves. To illustrate, there was an accepted delivery from all sources of 8,500,000 valves and it is estimated that 15,000,000 were made to yield this delivery.

Numerous attempts were made to replace this valve and many unique and interesting samples were submitted. All of them lacked some property which the standard valve possessed.

One of the most promising was submitted by Dr. Geer of The B. F. Goodrich Co. and was made up of two molded rubber parts and a cylindrical metal housing. One was a bell-shaped rubber piece joined to the housing and leading to the mask; the other, a nearly flat flange which rested against the bell-shaped part. This flange was mounted upon the base of the housing and contracted and expanded into a bellows, thus furnishing a delicate spring action to provide closure. The frame served to mount the two rubber parts, to protect them from damage, and to provide adjustment. The especially

FIG. 13.—INTERIOR OF A. T. FACE-PIECE, SHOWING CLARIFYING TUBE AND CHIN REST.

FIG. 14.—GAS CHAMBER FOR TESTING MASKS.

desirable features of this valve were its compactness and very low resistance to exhalation, about one-quarter of that of the standard valve. There was not time after the valve had been perfected in design, to determine its durability and dependability

in the field before the signing of the armistice was announced.

FLEXIBLE HOSE.

The flexible hose, shown in figure 9, was used to connect the canister to the facepiece. It was originally made of 3/32-gage

FIG. 15.—ALUMINUM A. T. MASK FORMS. TWO CURING FORMS AT LEFT. BUILDING FORM AT RIGHT.

rubber with spiral corrugations and covered with 5-ounce stockinet. It was made by placing tubed stock on a spiral corrugated mandrel, covering with stockinet, and wrapping with a cord. The make-ups were mounted upon racks and cured in open steam. This method yielded a product that was unsatisfactory from several standpoints. Rejections were high on account of interior folds or buckles and poor adhesion. The hose was not flexible enough. The English had used circular instead of spiral corrugations, and had secured greater flexibility. The early manufacturers tried several methods to make this hose and finally a molded method worked out by E. L. Stimson of the Mechanical Rubber Co., Cleveland, Ohio, was adopted. It consisted of a semi-cured rubber part which was covered with rubber-coated or cemented stockinet and then given a final cure to produce the necessary adhesion. First-cure and second-cure molds were therefore required and mandrels had to remain with their cavity. This process with the later use of stockinet knitted in a tube of proper size, was standard throughout the manufacture of the hose. Individual manufacturers worked out many clever labor-saving methods of applying stockinet, trimming ends, etc.

Many early troubles were encountered in the manufacture of hose involving correct corrugation design to produce flexibility, proper registration of molds and mandrels, pinching in final cure, and adhesion of stockinet. The hose was tested under water with five pounds' air pressure (Figure 10) and had to pass a flexibility test (Figure 9). The fabric adhesion on a two-corrugation section had to be at least four pounds at one inch per minute separation. It was necessary that the hose should not kink when bent double on thumb and forefinger.

MOUTH-PIECE.

The rubber mouth-piece (Figure 5) had to be designed to be as comfortable as possible in the mouth, to cause the minimum amount of salivation and to be tough enough to resist biting and chewing. Several improvements were made in the earlier design, involving a decrease in the flange which went between the lips and gums and the introduction of two corrugations in the neck to make greater flexibility and consequently less irritation to the mouth when running or walking.

The compound was similar to tread compound and called for 35 per cent plantation rubber and the balance sulphur and inorganic filler. The gravity was placed so high that it was necessary to make most of the balance of zinc oxide. No organic accelerator was permitted on account of the use of the mouthpiece.

Little difficulty was encountered in manufacture, once requirements were appreciated and mold equipment lined up and watched. It was necessary to use the same mandrel in the same cavity each

time to insure even wall thickness. Greater smoothness was obtained by tumbling.

NOSE PAD.

This was a small molded button provided with corrugations for fastening to the wire nose clip, and with concentric rings molded into the surface to come in contact with the nose in order to make the clip stay in place. The part contracted at the middle to a small diameter neck. This provided easy motion of the face of the pad to accommodate noses of different shapes. Two were furnished for each mask. The manufacture of this article was no different from that of any simple molded article.

DIAPHRAGM VALVE.

The diaphragm valve is a thin rubber disk designed to rest on a metal fitting in the bottom of the canister. Its use was to prevent exhaled air from passing out through the canister. This part was molded and little trouble was encountered in its manufacture. Some rejections were necessary on account of warpage and poor packing.

Eye-piece washers were made by the usual jar-ring processes, but a better composition was required. Thirty-five per cent plantation rubber was used, the remainder consisting of sulphur and dry inorganic fillers.

ELASTIC TAPE.

Elastic tape was used in enormous quantities for the head harness. Little trouble was encountered in the manufacture, but numerous changes in specifications were made necessary by changing conditions of gas warfare. At first it was necessary to wear the masks only a few minutes at a time. As soon as it became necessary to wear them for a longer period, it was found that the elastic was too strong in tension. This elastic had been made up in one-inch widths and each strand of rubber

FIG. 16.—OXYGEN INHALATOR FOR TREATMENT OF GASED SOLDIERS.

was protected against aging by a double thread winding. The tension was first reduced by using narrower tape and looser weaving and finally by omitting the winding of the original strands. A great many experiments on many heads revealed the fact that there was a very narrow limit in the stress strain properties of an elastic between comfort on one hand and safety on the other.

The purpose of the winding of the strand to protect from aging, caused an investigation of the properties of so-called black elastic thread as against the usual pure gum. All tests served to confirm that the black was more satisfactory, but none was used up to the time of the armistice.

The specifications provided for twelve strands of No. 26 thread with a tension of 18 ounces at 5 per cent stretch and 36 ounces at 40 per cent stretch.

Elastic tape to the amount of 14,666,500 yards was delivered to the Gas Defense Division.

In the quantity handling of elastic tape for harness, an ingenious machine shown in Figure 11 was developed at the Gas

Defense plant which made it possible to cut to any predetermined length 100 lengths at one time. The machine once adjusted was practically automatic in its operation, and only required replacement of the rolls of tape.

THE A. T. RESPIRATOR.

The A. T. respirator mask (Figure 12) was one of the two in the process of manufacture at the time of the armistice. It was suitable for manufacture in rubber factories. The other one, known as the K. T. respirator, was a sewed and cemented face-piece and suitable for manufacture in the Gas Defense plant. They were the same from the standpoint of the user, and both were manufactured to obtain maximum production.

The letters "A. T." are an abbreviation of the name "Akron Tissot." This name was used because the mask made use of a principle first used by a Frenchman named Tissot and the development largely took place at Akron. This mask was designed to meet the rapidly developing requirements of gas warfare. The use of mustard gas by the Germans (this gas often persisted in the ground from one to two weeks and continued to give off toxic concentrations) made necessary long wearing of masks—often ten to twelve hours. This was impossible with the standard mask; at least with many individuals, the discomfort of the nose clip and mouth-piece and the pressure of the face-piece became unbearable.

Mustard gas is most insidious. A man can be exposed to the vapors for twelve hours and hardly be conscious of its presence, with no apparent ill effects, and then, a day or two later, conjunctivitis of the eyes, lung tissue destruction and body burns will develop. As a result of these conditions, many soldiers would not wear their masks a long time in mustard gas or would use only the mouth-piece, and eye trouble developed later.

In addition to the above considerations, the vision obtained from the regular mask was not altogether satisfactory. The moisture from the face condensed upon the eye-piece and in spite of anti-dimming compounds (not always used) it was necessary when wearing the mask repeatedly to wipe the inside of the glass, by making use of a pocket in each side of the face-piece. Therefore, the problem of design involved was to achieve much greater face-piece comfort, to eliminate the nose clip and mouth-piece and make better vision possible.

Much preliminary work had been done by the Bureau of Mines along these lines and in April, 1918, a model was turned over to the Gas Defense Service. It was hand-made of sheet rubber, reinforced and protected by stockinet on the outside, provided with harness of pure gum straps and arranged to lead all incoming air against the inside of the eye-pieces before it was breathed by the soldier. This arrangement (the Tissot principle) kept the eye-pieces comparatively free from moisture and with the use of anti-dimming compound, practically perfect vision resulted.

While this model embodied the desirable elements, much development work was necessary before all requirements could be satisfied. Accordingly, arrangements were made in April to carry on this work at the plants of The B. F. Goodrich Co. and The Goodyear Tire & Rubber Co. in Akron.

By July 1, 1918, a model had been developed which eliminated some of the defects of the early designs. These improvements

included better vision, better stretch of the stockinet in each direction, less pressure on the forehead, elimination of pressure upon the nose, improvement in harness, and reinforcement of the lower face-piece to prevent collapse when breathing. These improvements were made as a result of tests upon soldiers in gas and upon advice of the American Expeditionary Force, which had been supplied with samples as they were developed. The two rubber companies built splendid gas chambers at their plants and thus afforded immediate facilities for testing. As an indication that this mask more nearly met requirements, a quotation from an American Expeditionary Force cabled report is given: "Six men wore these masks continuously for 29½ hours and took them off only because ordered."

During May and June a production of the earlier model was started in order to have production facilities available when the final design was adopted. The early method of manufacture was to cut the sheet stock to a flat pattern, apply the stockinet, build in semi-cured lens frames, form the seam under the chin, reinforce the edges with gum strips, and cure on an aluminum form in open steam with or without wrapping. This method yielded fairly satisfactory results on the earlier models, but in

the final design the amount of contact with the face had been sacrificed to obtain comfort and therefore dimension requirements had to be fulfilled within close limits. The method described did not yield a good product within these limits.

The period of July to October was employed in overcoming manufacturing difficulties which included the following:

1. The procurement of standard dimension curing forms in the necessary sizes. (See Figure 5.)

2. The procurement of lens frame molds which would yield the proper design of semi-cured rubber lens and

hold the register and gage.

3. The development of manufacturing methods which would yield a product satisfactory in dimensions.

In connection with No. 1 the pattern makers found it difficult to make proper allowances for shrinkage in making the aluminum curing form. It was necessary to change the source of supply several times.

With respect to No. 3, the rubber industry showed remarkable fertility of ideas and ingenuity of method with regard to methods of manufacture. It would require the space of a whole article in itself to describe the methods involved. Contracts were let to different companies and as many methods were employed. The wrapped cure was adopted in one way or another throughout. Some obtained results with one cure and by use of templates and guides attached to the curing form, which confined the flow of stock and located harness tabs. Others used variations of the two-cure process in which trimming was done after semi-cure and correct dimensions thus secured. Ingenious diaphragm and air-bag curing methods were employed and at the time of the armistice the mold mask began to show promise. The Aluminum Company of America worked out aluminum molds by successive casting of wax, plaster of Paris, cast iron, and aluminum. This method, in the opinion of the writer, will have a more general use for various irregular shapes which may be needed by the industry.

FIG. 17.—ANALYTICAL RUBBER LABORATORY, LONG ISLAND CITY, NEW YORK.

Other rubber parts used in the A. T. mask included a clarifying tube, a Y-shaped tube leading from the die casting and delivering air from the canister through its two branches to the eye-pieces.

The chin rest shown in Figure 13 was a molded rubber part composed of a sponge rubber face and a soft rubber back slotted for fastening to the die casting. The surface of the sponge rubber was made smooth in the molding. The soft rubber and sponge were molded separately and cemented together. Production of these two parts was obtained in large quantities with little trouble. Altogether, complete parts were furnished for 364,000 A. T. masks up to the time of the armistice.

THE K. T. TYPE RESPIRATOR.

This mask was developed at the Gas Defense plant to meet the same requirements as outlined in describing the A. T. respirator. It was made up by sewing and cementing stiff fabric and rubberized stockinet to a frame similar to the frame in the old-type masks. It contained many improvements in harness and fit which led to comfort. Air was deflected upon the eye-pieces by a molded rubber shield. Altogether, 338,000 of these were manufactured in the plant up to the armistice, over half of which were suitable for overseas use and the balance for soldiers in the training camps.

A stiff and gas-resisting fabric was needed to give body to the mask which would otherwise collapse against the face with each individual. Experiments were made to develop a stiff and impermeable fabric which was demanded by this type. Several constructions were developed. One involved the use of one ply of enameling duck impregnated with semi-hard rubber joined by cement to a ply of the regular gas-mask fabric. Another used a preliminary stiffening treatment of the duck followed by rubberizing and doubling with the regular fabric. The last named method produced the most satisfactory fabric, giving great elasticity, yet sufficient stiffness for the purpose, for which it was intended.

HARD RUBBER ANGLE TUBES.

The angle tube (see Figure 5) was ordinarily made of aluminum by the pressure-die-casting method. This process required complicated dies and cores, and in the spring of 1918 it became evident that the capacity available was not going to be sufficient for the needs, and attention was directed to the possibility of hard rubber as a material.

The various hard rubber companies cooperated in the development of this article and, working with the Rubber Committee, developed specifications. The great question to be determined was the degree of hardness desirable and whether or not the threads would stand temperature changes. Tests were made in great numbers in cold storage and in warm weather to decide points in the specification. The merits of various methods of manufacture were discussed in meetings. The consensus of opinion of the Rubber Committee in conference with manufacturers and Gas Defense representatives was that hard rubber as a material was satisfactory for use but not as satisfactory as metal. The 700,000 deliveries of this product justified this conclusion, as much trouble was encountered due to variation in hardness and in dimensions. Some were so soft as not to permit assembly to masks.

Other materials furnished by the rubber industry included zinc-oxide adhesive tape, rubberized felt for the bands of the R. F. K. type mask, strapping for covering sewed seams on the K. T. mask, rubberized stockinet for the K. T. mask, and molded rubber air deflectors for the K. T. type mask. Several thousand oxygen inhalers (Fig. 16), were shipped overseas for use in treatment of gassed soldiers. The rubber parts involved in this equipment included a face mask of metal filled with a pneumatic rubber cushion, a flexible armored rubber hose, and a rubberized fabric breathing bag to regulate pressure.

REGARDING SPECIFICATIONS.

The policy followed by the Gas Defense Division in harmony with the advice of the Rubber Committee was to use only the best materials throughout. Organic accelerators were barred from general use for two reasons: (1) certain parts were in contact with the mouth or face and (2) the use of these accelerators by the trade was new and not fully developed. In the case of the A. T. mask and parts in contact with the face, lead compounds were not permitted. This was due not to the knowledge that lead poisoning could be transmitted in this manner, but to the knowledge that skin irritations were liable to develop in

some cases from heat and contact, and it was not considered advisable to have a discussion as to the effect of lead in such cases. This requirement made a difficult compounding problem for the manufacturer, especially since a non-blooming product was desired.

Reclaimed rubber was not permitted in any product. This was not because of failure to realize that reclaims could be used successfully, but because it was considered difficult to write specifications which would amply protect the Government on products which had to be put into use immediately for a vitally important purpose. That the policy followed in writing the specifications was justified, is proved by the results shown

by the product. There are no reports which indicate that the rubber goods furnished in our gas masks were unsatisfactory at the start or after use. The writer personally inspected a salvage dump of masks in France, and with one exception, found no evidence of rubber failure from aging. There was, in the case of the flutter valve, which when mounted on the metal fitting was stretched by the bead, a tendency to surface check, but this serves merely to support a well-known fact that rubber, when placed under continued tension, does not age well.

SPECIAL RUBBER LABORATORIES.

Laboratories were established at Akron and at each assembly plant for the purpose of determining the fact of compliance with specifications. In all these laboratories physical tests were made on cured slabs and upon the articles themselves. The Akron laboratory was in charge of an experienced rubber man and cures were checked on all deliveries. The institution not only was of value to the Government but often saved contractors losses on off-cure articles which had not been caught by regular inspection.

At Long Island City a chemical laboratory was equipped to perform chemical analysis of the rubber products. One sample of each article from each manufacturer was analyzed every month. It is gratifying to state that this check revealed no attempt on

FIG. 18.—RUBBER WORKSHOP, LONG ISLAND LABORATORY, LONG ISLAND CITY, NEW YORK.

the part of the manufacturer to deliver products that were not within the specifications. At the Long Island laboratory there was established an experimental rubber workshop, which furnished immediate service on rubber needs of the Gas Defense Division. It was equipped with a combination mill, calender, presses, and dry-heat, steam, and vacuum vulcanizers.

THE ACCOMPLISHMENT OF UNSELFISH COOPERATION.

The problem of supplying our soldiers with satisfactory gas defense equipment was a start from nothing, so far as knowledge in this country at our entrance into the war was concerned. Time and production were the key-notes. It called for much designing and many kinds of materials, and the rubber industry can be proud of the way in which it responded to the call. Fullest cooperation in development and production was given by every manufacturer involved. The proportion of development effort to production was so great and changes were necessarily so frequent that it can be said that the industry made no great war profits from gas-mask materials. In the matter of development cooperation it is desired to mention especially the work of Dr. W. C. Geer of The B. F. Goodrich Co. He became interested early in the great problem of gas defense and its tremendous possibilities; and gave unstintingly of his time in the solution of these problems. His ideas were a constant source of inspiration to the Service. Among the things which he produced was a better gas-mask fabric, a lower resistance exhalation valve, a telephone mask and a fighting mask which embodied the Akron Tissot principle, combined low resistance, and provided a carrying position of canister on shoulder away from chest, thus permitting the soldier to carry on offensive operations more successfully.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(697.) A correspondent in Argentina requests catalogs and price-lists of druggists' and surgical sundries, with the object of securing the agency for these goods.

(698.) A subscriber requests the addresses of manufacturers of molds for rubber toys.

(699.) A subscriber desires information concerning Ruberine as a compounding ingredient.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce or its district or cooperative offices. Request for each should be on a separate sheet, and state number.

(28,206.) An Englishman desires to import from America material and machine tools for manufacturing automobile tires and other rubber accessories.

(28,209.) A firm of brokers and agents in Ireland desires to communicate with exporters desiring direct representation in that country.

(28,210.) A Cuban desires to represent manufacturers of cotton goods, including ducks and drills.

(28,217.) An Italian desires an agency for traveling goods, imitation leather, etc. Correspondence should be in Italian. References.

(28,218.) A retail house in India desires to purchase sporting goods, motor tire tubes, motor cars, cycles, and accessories. Payment at Madras through bank. Will consider agency proposition. References.

(28,229.) An Italian concern desires an agency for boots and shoes, tools and machinery for their manufacture and repair,

rubber goods, waterproof clothing, etc. Cash or '30 days' credit against security. Correspondence may be in English. References.

(28,233.) A firm in India desires to purchase erasers and other stationery. Quotations to be f. o. b. An agency for such supplies is also desired. References.

(28,235.) A Swedish firm wishes to buy rubber handles for cutlery, etc. Correspondence may be in English. References.

(28,242.) A commercial agent in Denmark desires an agency for rubber goods and other articles. Cash against documents. Correspondence may be in English. References.

(28,289.) A Norwegian firm desires an agency for the sale of rubber goods. Correspondence may be in English.

(28,312.) A Mexican firm desires to purchase screw bottle stoppers made of caoutchouc or gutta percha like samples to be seen at the offices of the Bureau. (Refer to Miscellaneous, No. 205.) These were formerly made in a European country.

(28,319.) A man in India desires to communicate with exporters for the sale to merchants in India of rubber tires.

(28,320.) A firm in Denmark desires to purchase and also secure an agency for tires for motor cars and lorries. Quotations f. o. b. New York. Terms, cash. Correspondence may be in English.

(28,323.) A Swedish firm desires to purchase belting, packing, etc. Correspondence may be in English.

(28,338.) A business man in Denmark desires to secure an agency on commission for the sale of rubber goods. Correspondence may be in English.

(28,352.) A Canadian desires to secure an agency for the sale of druggists' sundries. Quotations f. o. b. destination.

(28,255.) An Englishman desires an agency for the sale in Belgium of rubber heels and soles and leather substitutes. Terms, cash payments.

(28,376.) A French firm desires an agency for the sale of sporting goods. Correspondence in French.

(28,393.) A commercial agent in Algeria desires to secure an agency for the sale of rubber articles. Correspondence in French.

(28,394.) A man in Switzerland desires an agency for the sale of insulating materials, belting, etc. Correspondence may be in English.

(28,408.) An Italian desires to secure an agency for the sale of rubber goods. Correspondence may be in English.

(28,244.) A Canadian concern desires an agency for the sale of rubber goods.

(28,247.) A Norwegian firm desires to purchase supplies for the manufacture of waterproof clothing, sporting goods, etc. Quotations f. o. b. New York. Payment against documents. Correspondence may be in English.

(28,280.) A man in England desires to communicate with manufacturers of rubber footwear.

(28,253.) A Norwegian firm desires to purchase 100 cravettes and 100 spring raincoats.

(28,260.) A Swedish importer desires to purchase rubber goods. Correspondence may be in English.

(28,287.) An Australian firm desires agencies for the sale of gums, resins, waxes, waterproofing compositions, rubber goods, etc. Catalogs, price lists, and particulars are requested.

POLISH COMMERCIAL AND INDUSTRIAL BUREAU.

Early in January the Commercial and Industrial Bureau of the Polish National Department was opened, with the object of assisting to establish commercial connections between the United States and Poland to collect and disseminate all necessary data and information for the success of this purpose.

The Bureau will be glad to furnish information concerning trade conditions and business possibilities in Poland to those interested. The offices of the organization are at 1032-1035 Aeolian Building, 33 West 42nd street, New York City.

Echoes of the Great War.

ADELBERT H. ALDEN IN WAR WORK.

FOR nearly four years Adelbert H. Alden has been engaged in war work in Europe, and when the United States entered the war he became interested in providing entertainment and caring for the American soldiers passing through London. When the American hospitals were established there both Mr. and Mrs. Alden devoted much of their time to the care of wounded Americans.

ADELBERT H. ALDEN.

In response to an invitation from a friend to spend Christmas in the States, Mr. Alden wrote:

We would desire to eat our Christmas dinner with you in the States, but there are some things which make it impossible. I feel I am of service here in the hospitals—at least for a time longer, as some of the wounded men seem to depend on me and I don't like to desert them, for when I have spoken of leaving them for home their words and manner have touched me deeply and I simply cannot do it. However, this condition of affairs

will probably not continue very long, for the wounded are being evacuated back to the United States very rapidly and soon there should be none left here. They are the very finest lot of young men I ever saw.

In a later letter Mr. Alden writes:

Our hospital work is finished. All our wounded friends have departed and we plan to sail for home March 15th.

WHAT THE WESTINGHOUSE COMPANY DID TO HELP WIN THE WAR.

In a recent interview General Guy E. Tripp, who during the war was assistant to the Chief of Ordnance at Washington, D. C., but has now returned to his duties as chairman of the board of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, spoke enthusiastically of the aid the Government received during the war from the men and women who make up our great commercial organizations. As an example, General Tripp pointed out the valuable contributions to the winning of the war which have been made by the Westinghouse organization and employees.

Not only did an army of 7,468 men, or about 20 per cent of the company's employees, go forth to fight, but a loyal industrial army of nearly 40,000 remained to operate the company's several great plants day and night, turning out vast quantities of war munitions of many sorts. Works, machinery, and workmen were turned over to the Government, including the services of inventors, engineers, chemists, and innumerable specialists. And when greater factory capacity was required, a plowed field at South Philadelphia, Pennsylvania, was, in less than a year, converted into a fully equipped industrial plant embracing seven large buildings and employing over 2,000 persons.

The Westinghouse organization also did much to assist financially in the campaign for Liberty Loans, Red Cross and United

War Work Funds. The company and employees joined hands and the results are most gratifying. The employees alone subscribed for a total of \$10,500,000 of Liberty Bonds, the company subscribing for \$8,000,000, making a total of \$18,500,000, or 1.08 per cent of the four Liberty Loans.

In the civilian personnel furnished the Government were a number of prominent men who performed invaluable services along their chosen lines. Among these might be mentioned, Benjamin G. Lamme, chief engineer, who was appointed by the Secretary of the Navy as a member of the Naval Consulting Board; vice-president L. A. Osborne, a member of the War Labor Board; Frederick Darlington, consulting engineer, head of Power Section of War Industrial Board—and many others doing equally important work.

THRIFT IN 1919.

The Government has taken steps to provide for a new issue of War Savings Stamps for 1919, similar to those put out during 1918. The new ones, however, are to be kept on special cards or folders and not combined with those of 1918. Similar rates are also announced, a War Savings Stamp in March, 1919, costing \$4.14, and one cent additional during each subsequent month. The same kind of Thrift Stamps are being issued as were put out in 1918. Thrift Stamps purchased during 1918 may therefore be applied on War Savings Stamps of the current issue.

HOLD YOUR LIBERTY BONDS LOYALLY.

In connection with the buying of War Savings and Thrift Stamps and Liberty Bonds, the new Secretary of the Treasury, Carter Glass, deprecates the tendency in some directions to sell Liberty Bonds already acquired. He especially censures the exchange of these bonds, the best security in the world from the point of view of investment, for other securities of doubtful and sometimes worthless value, or for unnecessary purchases. He makes the point that as long as the Government needs to sell bonds, those who hold the present issue will show their unimpaired loyalty by retaining them except under the spur of the most urgent necessity. In such a circumstance, with the bonds as security, the best method of procedure is to negotiate a loan from some reputable bank, to be repaid later. The bond owner who disposes of his bond for cash outright does not help the Government, and perhaps the best test of his real loyalty and thrift lies in his ability to continue to practice self-denial and not purchase the small luxuries which the money to be obtained from the sale of a Liberty Bond would make possible.

EXPORTATION OF AUTOMOBILES AND BICYCLES TO DENMARK, NORWAY, SWEDEN AND HOLLAND.

In a new ruling (W. T. B. R. 588), the War Trade Board announces that in shipping automobiles and bicycles to the above countries, it will no longer be necessary to furnish with the application for export license an import certificate number covering the tires on such vehicles. The import certificate and export license issued for automobiles and bicycles will be deemed to include the necessary tires.

RESUMPTION OF TRADE WITH SERBIA AND ROUMANIA.

Trade with Serbia and Roumania has been resumed, subject to the rules and regulations of the War Trade Board, and applications for import or export licenses for all commodities will now be considered. Applications for export licenses should be filed on Form X or X-a. No supplemental sheets are required for rubber goods. As the import regulations of these countries are unknown, prospective exporters should communicate with their customers before making shipments, in order that the importer may comply with the requirements governing imports to Serbia and Roumania.

SON OF GEORGE B. HODGMAN HONORED IN FRANCE.

Corporal Alfred P. Hodgman, of the United States Army Ambulance Service Attached to the French Army, has recently been decorated with the Croix de Guerre for bravery during one of the German offensives last summer when he advanced beyond the front lines and rescued several wounded French soldiers. He is the second son of George B. Hodgman, president of the Hodgman Rubber Co., Tuckahoe, New York.

MR. KIRK, BOXING INSTRUCTOR.

More and more it is becoming evident that the men who toiled "behind the lines" did as much to win the war as those who went over the top. A case in point is that of the manager of the New York office of the Thermoid Rubber Co., J. N.

Kirk, Jr. Always interested in athletics, and a splendid boxer, he was called upon early in the game to train recruits in the manly art. So successful was he that all of his spare time and much that was not to spare was given up in showing the embryo soldiers how to account for themselves with credit when brought face to face with opponents of any caliber.

Although the armistice is signed, Mr. Kirk finds that when he is not selling rubber goods he is still called upon to continue his training work.

Incidentally he has learned that this extra work has been of great advantage to him. A 260-pounder at the beginning he now weighs 185 pounds and, as he explains it, instead of feeling fatly good-natured he is all of the new fitly good natured.

MARTYRS TO THE CAUSE OF LIBERTY.

THE total number for former employees of the United States Rubber Co. and associated companies in military service was 4,298. In all, 49 casualties have been reported, as follows: killed in action, H. Bartlett, Stanley Dubinski, Stanley Rikeski, George Lawson, T. F. Deady, Eopim Vorasoks, Salvatore Missri, Henry Pappagallo, G. A. Waldo, L. E. Richardson, J. F. Potter, Antoney Spino, F. Charles, James Mosher, R. Dulmage, T. F. Ryan, S. H. Young, M. D. Bacon, M. F. Cassidy; died of wounds, A. N. Allyn and Olaf Flink; died of pneumonia, influenza, accident and other causes: M. Bickerdike, Loren Smart, S. A. Charles, J. H. Johnson, John Wasnick, George Shetler, M. Esikovich, R. MacDonald, J. Kerber, E. Whynott, H. Klein, Fred Cummings, Ira Valentine, Joseph Green, O. P. Friend, H. B. Bragdon, W. P. MacDonald; missing in action: N. Carabillo, F. G. Swan, C. H. Drechsel, T. McDonough; wounded, J. Marinitis, F. N. Champoux, J. W. Townsen, T. Farrell, O. Schaeffer, F. E. Topping, H. Fahrenholz.

Private C. Puerto, of the 316th Infantry, who was formerly employed in the carton department of the L. Candee Co., New Haven, Connecticut, has been killed in action.

RUBBER TIRES AND CLOTHING FOR NORWAY, SWEDEN, HOLLAND AND DENMARK.

The Allied Governments have materially increased the quantities of commodities allowed to be imported by Norway, Sweden, Holland and Denmark. All quantity limits have been removed from rubber tires, clothing and machinery. These commodities may now be licensed freely, subject only to the condition that appropriate import certificates have been issued. Exporters should request their customers in these countries to apply for such certificates.

INTERESTING LETTERS FROM OUR SOLDIERS.
SOLDIERS TO CARE FOR STILL.

THAT there are soldiers who still need and appreciate gifts from the home folks is vividly shown by the letter that follows. It was written to a member of the staff of THE INDIA RUBBER WORLD who, through a friendly colonel, discovered a private without kith or kin and "adopted" him as far as sending cheering letters, tobacco, books, magazines, etc. There are others and they "sure appreciate" attention.

ON THE MEXICAN BORDER.

DEAR FRIEND:—Received your package of soap, tobacco and papers. I don't understand how you happen to understand my needs, but you come to the rescue every time. We happen to be so far from civilization that there's hardly an essential within fifty miles of this place. Last Saturday when your package arrived there were only about six smokers left in our crowd and those went after breakfast, and just think of it, we didn't have a smoke until three o'clock that afternoon when the mail arrived and I received the package. I don't believe a soldier ever received a package that was more appreciated than that one and also the magazines—the boys just went loco over them. I guess you know how much I thank you.

I asked the Captain if I could do a little trapping during my spare time and he said I could. As there are grey fox and coyote in these parts you see I will have something to do to relieve the monotony.

It may be six months before we get a discharge from this district and so I am still in hopes of another good scrap with the "Spicks." We feel a little bit as if we had done our "bit" and knowing that our regiment has guarded almost 2,000 miles of the Mexican border line, perhaps you will realize our task is no small one. I'd do ten years more in service just to be able to show those "Spicks" a good cleaning up.

This place is sure some place. It is 105 miles from the railroad, right on the edge of the desert, a town of about 300 people, most of them miners, and a sort of a supply base for the troops on the river. The mails go out but once a week by motor stage. When we first arrived my old job of "skinning mules" was mine again and I had some great trips across the desert for supplies, usually all-night trips, and it sure was some cold.

When I get my discharge I hope to join the Government Ranger Forces on the border, and have already sent in my application.

I've got to close as I have to get about my duties. Thanking you again for your many kindnesses,

Respectfully yours,

MORE ABOUT THE THIRD BORDEAUX SAMPLE FAIR.

Literature concerning the Third Bordeaux Fair, to be held in Bordeaux, France, from May 31 to June 15, 1919, which has been received by the Bureau of Foreign and Domestic Commerce and its district or cooperative offices (refer to File No. 110760a), includes (a) application blanks for participation in the fair; (b) sample contracts for advertising space in the official catalog; and (c) pamphlets describing the plan of the buildings and their location on the Place des Quincones, together with data relative to accommodations, etc.

John M. Chapman, 101 Park avenue, New York City, is the official representative of the fair in this country, and further information may be obtained from him.

JOHN N. KIRK, JR.

What the Rubber Chemists Are Doing.

COMPARATIVE METHODS FOR DETERMINING THE STATE OF CURE OF RUBBER.

A VALUABLE paper by Henry P. Stevens on comparative methods for determining the state of cure of rubber, appeared in the "Journal of the Society of Chemical Industry," August 31, 1918, page 280r. Tabulated data of physical tests and curves are given, showing the relationship of the coefficient of vulcanization to breaking load and time of cure for ordinary crepe and smoked sheet.

The state of cure or degree of vulcanization of rubber may be formulated in reference to (1) the percentage of combined sulphur calculated on the rubber present, which is the coefficient of vulcanization; (2) the physical properties of the vulcanizate, particularly the load supported per unit cross-sectional area at a given elongation or *rice evra*. The former method is independent of the age and external conditions of the vulcanizate, while the latter is dependent on these conditions. It is therefore necessary to make a careful comparative study of the coefficients and the corresponding physical properties under varying conditions before the latter can be taken as a measure of the condition or state of cure. I have already shown that the physical properties are dependent on the age of the vulcanized specimen,¹ so that comparable results are only obtainable when the specimens are tested at a fixed period subsequent to vulcanization. The present results show that the temperature also has a considerable influence on the physical properties, and uniform conditions must be observed in order to obtain comparable figures.

SUMMARY.

The position of the stress-strain curves is appreciably influenced by the period elapsing between vulcanizing and testing the rubber and by the temperature. Hence, the results are only comparable when these conditions are kept constant. Results obtained in summer are not comparable with those obtained in winter, nor those obtained in the tropics with those obtained in Europe.

The position of the stress-strain curves is influenced by the type of rubber, that is, whether crepe or sheet, probably owing to a variation in the proportion of non-caoutchouc ingredients.

The coefficient of vulcanization is independent of the above and other conditions and is therefore a more reliable index of the rate of cure. In any case, if the stress-strain curves are to be taken as an index of the state of cure, it is essential that these curves be obtained under standard conditions.

Of particular interest is the greater curvature of the graphs for crepe from matured coagulum than of those for ordinary crepe and sheet. This may be attributed to the larger proportion of accelerating base contained in the former.

To insure as great a degree of uniformity as possible, all specimens should be tested as soon as possible after vulcanization, for instance, the next day; and between vulcanizing and testing, the specimens should be kept as nearly as possible at 30 degrees C.

VULCANIZATION RESEARCHES.

B. J. Eaton summarizes the vulcanization researches of the chemical laboratory of the Agricultural Department of the Federated Malay States for the first half of 1918, as follows:

The principal investigation has been on the effect of different alum salts used as coagulants. The writer has previously shown that common potash alum, when used as a coagulant, has a very deleterious effect on rubber, especially in regard to its effect on the rate of cure. The subject is of considerable importance since, owing to the rise in price of acetic acid, the use of alum by Asiatic small holders has increased considerably, and the result with the comparatively large amount of rubber from such holding now being manufactured, may give a bad name to plantation Pará rubber. American manufacturers, who have been large buyers of rubber from such sources on the Singapore market, have previously drawn attention to the subject.

The present investigation was carried out to ascertain whether

the different alum salts had a similar effect and the result of the investigation has shown that such is the case. The effect of the following alum salts was investigated: potash alum (pure), commercial potash alum, soda alum, ammonia alum and aluminium sulphate. The use of alum salts generally as coagulants should therefore be discouraged.

The effect of alum as a retarding agent in vulcanization, and of some other substances, namely, mineral acids, has not yet been investigated on a scientific basis with a view to ascertaining whether the effect is due to the bactericidal or anti-enzyme action of these substances or their effect as direct negative catalysts in vulcanization. Experiments with certain other reagents, described below, indicate that these substances behave directly as negative catalysts or retarding agents in vulcanization.

EFFECT OF CERTAIN CHEMICALS WHEN ADDED TO FINISHED DRY RUBBER.

When used as coagulants the various salts or acids may retard vulcanization by virtue of their bactericidal action on the organisms or enzymes which bring about the changes in raw rubber during the maturation period of six to seven days. By adding these chemicals, however, to the finished rubber, any effect must be due to a neutralization of the effect of the natural accelerator or to a direct negative effect of the chemical added.

The following substances have so far been tested in this manner: starch (as a neutral organic adjunct), boric acid, tannic acid, molybdic acid and phosphotungstic acid used as precipitants of proteins, amines and basic nitrogenous compounds.

All of these substances, with the exception of starch, when added to the extent of one to two per cent of the rubber-sulphur mixing, had a very marked effect in retarding vulcanization, both in the case of "slab" crepe and crepe samples. Generally the larger amount had a greater effect than the smaller, and the effect appears to be specific, that is to say, the vulcanization of the "slab" crepe is retarded to a certain extent, but is not as slow as the slow-curing crepe which had been treated similarly. Rubbers having different rates of cure due to different amounts of the natural accelerators present, are not all brought to the same degree of slowness in the vulcanization.

DETERMINATION OF UNCOMBINED RUBBER IN RECLAIMED VULCANIZED RUBBER.

The following method is that of André Dubosc in "Le Caoutchouc et la Gutta-Percha," November 15, 1918, page 9646.

The value of a reclaimed rubber depends on the amount of caoutchouc it contains in free or uncombined condition. The following method of analysis requires certain precautions and considerable care, but gives very exact results.

APPARATUS FOR CHLORHYDRATION.

The sample for analysis reduced to 120-mesh fineness which may be done easily after swelling it in a mixture of the tetrachloride and sulphide of carbon and drying at 60 degrees C. before sifting. Ten grams of the powdered sample is weighed for chlorhydration. This is placed in a flask provided with two tubulures, one of which is connected to a source of cold, dry, hydrochloric-acid gas, and the other to an absorption flask containing a solution of caustic soda or milk of lime and connected to a vacuum pump to facilitate the passage of the gas through the sample. Cork stoppers boiled in paraffine are used to close the tubulures and the inlet and outlet gas tubes pass loosely through them to permit rotating the flask for the purpose of exposing fresh surfaces of the powdered rubber to the action of the gas. The lower part of the gas flask is cooled in water or a freezing mixture to prevent overheating the mass. A double-walled container or any water-sprinkling arrangement may be used for cooling. The temperature of the powder is not allowed to exceed 30 to 35 degrees C.

¹"Journal of the Society of Chemical Industry," 1916, page 872.

The apparatus for generating the hydrochloric gas consists of a double tubular flask containing hydrochloric acid at 22 degrees Beaumé. To one of the tubulures is attached a funnel with an S-bend for safety against back pressure of the gas forcing out the supply of sulphuric acid contained in the funnel.

The length of the branches of the S-bend may be 15 to 20 centimeters. For drying the gas the second tubulure of the apparatus connects with two tubes containing broken pumice wet with sulphuric acid, and with a gas washer filled with fuming sulphuric acid. The gas generator is stoppered with paraffine-boiled, tinfoil-covered cork stoppers and sealed with paraffine. Sulphuric acid (66 degrees Beaumé) is delivered from the funnel, drop by drop, into the dilute hydrochloric acid in the flask. The hydrochloric gas disengaged carries along a little hydrochloric acid and moisture. The latter is retained by the pumice, which serves as a gas filter and dehydrator. The gas produced should not react blue on powdered copper sulphate. The passage of gas through the powdered rubber is easily controlled by regulation of the vacuum connection with the flask and absorption train. The application of vacuum is made cautiously so that the sulphuric acid will not be drawn into the generator abruptly. The difference in level should not exceed two to three centimeters of mercury in order that the contact of the gas with the powdered rubber may be as prolonged as possible.

CHLORHYDRATING EFFECT.

The action of the gas on the rubber liberates some heat. This temperature is not allowed to exceed 35 degrees C. The chlorhydration reaction proceeds slowly, and if the temperature rises, the mass tends to become sticky at 35 degrees C., the powder becomes a little tacky but does not unite enough to prevent passage of the gas.

Complete chlorhydration requires 24 hours. The product obtained is nearly white and retains its elasticity. It is removed from the flask, washed with warm water, then with cold, until the wash water is free of acid. Next follows washing with warm alcohol, then with cold alcohol, drying at 60 degrees C., and cooling in a desiccator. The rubber is then in the form of an easily pulverizable white powder, insoluble in alcohol, ether, acetone, benzene and sulphide of carbon. It consists of a mixture of three chlorhydrates of caoutchouc: (1) chlorhydrate of polypréne sulphide, (2) chlorhydrate of stable (vulcanized) caoutchouc, (3) chlorhydrate of metastable (unvulcanized) caoutchouc, or caoutchouc in its natural state. The first two forms are completely insoluble in chloroform, while the third is completely soluble.

SEPARATION OF CHLORHYDRATED PRODUCT.

There are three different methods by which the amount of unvulcanized caoutchouc in the sample may be determined.

1. A known weight of the dry chlorhydrated material is treated with chloroform and the insoluble residue dried at 60 degrees C., cooled in a desiccator, and weighed. The difference between the two weights gives that of the chloroform soluble chlorhydrate or unvulcanized caoutchouc. The formula for this chlorhydrate is $C_{10}H_{16}Cl_2$, therefore 1.99 grams of the chlorhydrate correspond to 1.36 grams of caoutchouc.

2. The unvulcanized caoutchouc may be similarly calculated from the weight of dry residue obtained by evaporation of the chloroform extract.

3. The dry chlorhydrate, if treated on a water-bath with pyridine or pyridine bases, gives up its hydrochloric acid and assumes the gummy state of unvulcanized caoutchouc. Aniline has the same reaction, but the unvulcanized caoutchouc is partly soluble in it, necessitating precipitation. The use of pyridine is the more practical, as follows: the chlorhydrate of unvulcanized caoutchouc is extracted for six hours with 100 cc. of pyridine, using a reflux condenser. The caoutchouc,

which floats as white threads in the liquid, is received on a tared filter; to the filtrate is added twice its volume of acetone to precipitate the dissolved caoutchouc. The residue is washed with hot and with cold acetone, then with 95 per cent alcohol, dried at 60 degrees C. in vacuum, cooled in a desiccator, and weighed.

The caoutchouc thus separated has all the characteristics of the natural gum. It is elastic, slightly sticky, easily erases pencil marks, and dissolves completely in all the usual caoutchouc solvents forming viscous solutions.

Before making this determination it is well to eliminate from the vulcanized rubber the different organic additions which it may contain and which may render the results faulty, by making preliminary extractions with acetone, chloroform and alcoholic-potash.

This process is not only suitable as an analytic method, but can be utilized industrially for the separation of unvulcanized caoutchouc present in waste rubber.

CHEMICAL PATENTS.

THE UNITED STATES.

COMPOSITION FOR SOLES.—Composition and soles of vulcanizable material consisting of a mixture of comminuted waste felt roofing saturated and treated with asphaltum and boiled linseed oil; reclaimed rubber, litharge, sulphur, and zinc oxide. (George R. Wyman and Andrew E. Currier, assignors to Charles S. Bird, all of Walpole, Massachusetts. United States patent No. 1,284,023.)

ARTIFICIAL RUBBER AND PROCESS OF MAKING.—A composition of matter for use in the manufacture of artificial rubber, including vulcanizable vegetable oils, resinous hydrocarbon bodies, camphor, powdered shale and sulphur. (Edwin R. Talley, Grinnell, Iowa. United States patent No. 1,285,463.)

RUBBER DERIVATIVES AND PROCESS.—A plastic oxidation product of rubber produced by treating a natural rubber with an oxidizing agent (ozone) in the presence of water and copper oleate. (Walter O. Snelling, Pittsburgh, Pennsylvania. United States Patent No. 1,288,723.)

SYNTHETIC RUBBER PROCESS.—A process of making a rubber-like substance by synthesis which comprises heating a mixture of pinene and an acid until the pinene is changed into limonene raising the temperature of the mixed vapors until the limonene is partly changed into a rubber-like substance, condensing the vapors, and removing the acid. (Louis Gottschalk, Metuchen, New Jersey; Esther J. Gottschalk, administratrix of said Louis Gottschalk, deceased. United States patent No. 1,289,444.)

MATERIAL COMPRISING METAL AND VULCANIZED RUBBER.—Rubber vulcanized by an agent containing oxygen and a metallic material attached thereto. (Albert A. Somerville, Flushing, New York, and Mahlon J. Rentschler, Willoughby, Ohio, assignors to Rubber Regenerating Company, Naugatuck, Connecticut. United States patent No. 1,289,566.)

PROCESS OF PREPARING TIRE-TREADS.—On a tire-tread a band of vegetable fiber is formed, impregnated with hot tar and rosin. After cooling, grit is applied to the prepared surface. (Delaska A. Kendall, San Diego, California. United States patent No. 1,290,576.)

THE DOMINION OF CANADA.

VULCANIZABLE COMPOSITION AND PRODUCT.—A vulcanized, composition rubber product comprising natural and reclaimed rubber, coumarone resin, sulphur, and extending materials. (Alfred Alonzo Wells, Montclair, N. J., U. S. A. Canadian patent No. 186,812.)

TREATMENT OF FABRIC.—The treatment of fabric by impregnation and the product of the process patented. The process:

consists of treating the fabric with an emulsified lubricant produced by a basic emulsifying agent adapted to produce a capillary impregnation of the fabric, evaporating the volatile carrying liquid and subsequently applying a vulcanizable compound. (The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada, assignee of Erwin E. A. G. Meyer, Detroit, Michigan. Canadian patent No. 186,407.)

THE UNITED KINGDOM.

SUBSTITUTES FOR INDIA RUBBER.—Substitutes for india rubber are made by mixing together a fatty oil, sulphur or compound of sulphur, and stearine or other hard fat, with or without other ingredients, and then heating them. The following is one example of ingredients and proportions: linseed oil, 1 part; sulphur, 1 part; stearine, 1 part; oxide of iron, $\frac{1}{2}$ part. A small proportion of tar, or resin or other pitch-like substances may be added. Also, lime may be added. The material may be strengthened by adding sawdust, cellulose in the form of cotton, jute, and paper. The material forms a varnish with most of the well-known rubber solvents. (F. J. Bennett, Gordon Cross House, Dronfield, Derbyshire, and F. W. Mellowes, Corporation Works, Corporation street, Sheffield, England. British patent No. 119,878.)

LEATHER SUBSTITUTE.—Relates to rubber substitutes of the kind containing scrap and new rubber, scrap leather, and cotton or other vegetable fiber. It may include a coloring agent and slate or cement for increasing the weight. (J. L. Watkins, 1 Jeffrey's road, Clapham road, London. British patent No. 119,902.)

COLORS RUBBER.—A sheet of rubber or fabric is provided with pigment, as aluminum powder, in its outer layer only, the pigment being embedded by vulcanization so as to produce a smooth glossy surface. (W. J. Mellersh-Jackson, 28 Southampton Buildings, London, England. [India Rubber Co., 1790 Broadway, New York.] British patent No. 120,824.)

HALOGENATING RUBBER.—Alkyl, alkylene, alkenyl, and aryl halides, such as trichlorethylene and tetrachlorethane, are used as solvents in the making of halogenated india rubber, gutta percha or balata. (S. J. Peachey, 5 Yew Tree Road, Davenport, Stockport, England. British patent No. 121,091.)

AUSTRALIA.

TIRE SEALING COMPOSITION.—This is identical with U. S. patent No. 1,271,015 (THE INDIA RUBBER WORLD September 1, 1918, page 723.) (Puncture Cure, Limited, assignee of Ernest Campbell and T. F. Cushman, Calgary, Alberta, Canada. Australian patent No. 5,872.)

BOX-TOE STIFFENER.—A self-hardening compound consisting of asphaltum, paraffine wax, carnauba wax and gutta percha for use in molding under heat and pressure to form desired. (J. H. Ordway, Massachusetts, U. S. A. Australian patent No. 5,933.)

THE FRENCH REPUBLIC.

COLORS RUBBER.—Process of making colored rubber and products obtained by the aid of rubber. Same as British patent No. 102,824. (India Rubber Co., 1790 Broadway, New York City, U. S. A. French patent No. 488,372.)

ESTIMATION OF UNSAPONIFIABLE RESINS IN RUBBER.

The following abstract from the "Journal of the Society of Chemical Industry," volume 37, 341A, outlines the method of P. Dekker on the estimation of the content of unsaponifiable resins in various kinds of rubber mixings:

When the mineral oil in a rubber mixing is estimated by the measurement of the unsaponifiable portion of the acetone extract which is soluble in petroleum ether, the accuracy of the result is affected by the fact that a part of the rubber resins resists saponification and is included with the mineral oil. The oxidation products of rubber are completely saponifiable, and the ordinary method of analysis includes them with the saponifiable resins.

LABORATORY APPARATUS.

LABORATORY GRINDING AND KNEADING MACHINES.

THERE is daily occasion in the rubber laboratory, as in many others, for grinding and mixing machines in the preparation of samples where the ordinary roller mixer is not suitable. This requirement is met most effectively by the new series of grinding and kneading or mixing machines here illustrated. They are built in three laboratory sizes. Both grinder and mixer are electrically driven. The former has a very unique feature in its interchangeable grinding units. These units can be furnished for either wet or dry grinding and are easily joined with or separated from the power unit. This permits a number of these interchangeable grinding units to be kept on hand,

LABORATORY MIXER.

LABORATORY GRINDER.

each unit being used for a separate purpose. (Werner & Pfeleiderer Co., Inc., Saginaw, Michigan.)

ABBE REFRACTOMETER.

The Abbé refractometer is shown in the illustration as manufactured by Adam Hilger, Limited, 75a Camden Road, London, N. W. In addition to its well-known general use as a laboratory instrument for the identification of oils, resins, etc., the

Abbé refractometer here referred to is coming into use for the control of solutions of rubber and the solvents used in their manufacture. These instruments are standardized and the parts are interchangeable, a matter of great convenience in repair replacement. It is suggested that this refractometer might form a valuable aid in dealing with such problems as the following:

Ascertaining degree of vulcanization of lightly cured goods.

The determining of resin in rubber.

ABBÉ REFRACTOMETER.

The establishing of some relation between the quality of different rubbers, and such an easily measured physical property as the refractive index. (Eimer & Amend, 211 Third avenue, New York City.)

New Machines and Appliances.

"CONDITIONING"—A NEW RUBBER-DRYING SYSTEM.

SINCE rubber first became an article of industrial importance the drying of the crude, after washing and preparatory to compounding, has constituted a problem of great interest to rubber manufacturers everywhere.

The so-called "natural drying method," adopted at first because it seemed the most obvious expedient, consisted in hanging the washed sheets over horizontal racks and subjecting them to the chance effects of atmospheric conditions. This method required from two to five weeks, in some cases even longer, and though the quality of the rubber so dried was good, the impossibility of establishing a routine, and the amount of money rendered non-productive for long periods, led to the abandonment of this process, in favor of more advanced methods.

Recently there has been perfected a system which is called "conditioning" as distinguished from "drying," because the results obtained are due to the use of conditioned air, applied somewhat differently from the manner previously employed. In this system the sheets are placed on trays, racked in tiers on trucks, and the trucks placed within a dry-room constructed of dressed and matched lumber over a 2 by 4 framework. The

THE CARRIER DRYER.

dry-room is provided with conditioned air through a set of ejector nozzles in such manner that an absolutely positive and uniform circulation is maintained throughout every cubic foot of space enclosed by the kiln. Before the air is admitted through the nozzles it is conducted through a humidifier, wherein it is washed free of impurities (ammonia gas, if present) and automatically brought to an exact, predetermined degree of humidity. Leaving the humidifier, the air is drawn through a ventoy or steam-coil heater, brought to the required temperature, and admitted to the kiln through the ejector nozzles.

Not only is circulation within the kiln insured by means of the nozzles, but re-circulation is provided so that all of the air within the kiln is periodically removed and replaced with clean air. Constant humidity is thereby maintained, and maximum efficiency secured by automatically recirculating as much of the heated kiln air as possible. The system is entirely automatic in its operation, thus avoiding expense and obviating carelessness. (Carrier Engineering Corp., 39 Cortlandt street, New York City.)

FRENCH HORIZONTAL SPREADING MACHINE.

This type of spreader is commonly used in France, although the vertical machine is sometimes preferred for special work. While the horizontal type is built along the general lines of spreader construction, certain details, however, are different, and therefore of interest.

The rubber-covered feeding roller is 7 1/2 inches in diameter,

78.7 inches long, and is provided with an adjustable spreading knife and adjustable, compound guides. The cast-iron hot-plates are eight in number, each section measuring 78.7 inches

FRENCH SPREADER.

long by 19 11/16 inches wide and being provided with steam inlet and outlet connections.

The machine is belt-driven by a 3-step cone pulley and equipped with friction clutches, controlled by a bar extending over the front of the machine within reach of the operator, for starting and stopping the machine.

The rear fabric roller is driven from the front shaft by bevel gearing and a shaft connected by bevel gearing to the back roller and operated at the front by a hand-lever. The wind-up roller at the front is provided with a speed accelerator for rewinding the proofed fabric. (F. Soyer, 80-84 rue des Pyrénées, Paris, France.)

ADJUSTABLE ANCHORAGE FOR MOTORS.

In setting up electric motors of 50-horse-power and over, considerable skill is required to obtain perfect alinement, and for that purpose clearance is usually allowed in the bolt holes for final adjustment. With the adjustable anchorage device, this is not necessary, as the motors can be moved accurately in any direction in a horizontal plane. Installations, therefore, may be

ANCHORAGE FOR MOTORS

made without close measurements, as the final alinement is easily accomplished by adjustable wedges.

Where very fine adjustments are required, as on magnetic clutches, it is important that no eccentric movement shall occur.

This often happens through wear of one or the other of the bearing boxes on either the motor or shaft, throwing them out of alignment, which in a short time destroys the journal boxes. It is then necessary to rehabilitate the journal boxes and realine the motor. This expensive procedure can be obviated by the use of the adjustable anchorage.

In case the journal boxes wear unevenly the motor can be rotated and easily brought up into position again, whereas without the adjustable anchorage the grooves in the base of the motor must be planed out to allow this movement. (Adjustable Anchorage Co., 1502 Ford Building, Detroit, Michigan.)

MACHINERY PATENTS.

CALENDER FOR FORMING AND JOINING RUBBER SHEETS.

A PLURALITY of rubber sheets are calendered sufficiently thin to avoid blisters, and superposed by this machine, forming a multiple-sheet of desired thickness for making tire-building strips.

In the operation, rubber stock is fed between rolls *A* and *B*, and also between *B* and *C*, forming banks shown in the illustration. As the rolls rotate in the direction indicated by the arrows, the rubber is formed into relatively thin sheets, *D* and *E*.

The upper sheet *D* passes over idler roller *F* and under pressure roller *G*, where it is united with sheet *E* and then delivered from the machine by the conveyor *H*. A multiple sheet is thus

formed that will be free from blisters and devoid of the usual imperfections encountered in calendering thick sheets. Three or more plies may be formed by providing rolls for each additional ply. (John Hanna, assignor to The Fisk Rubber Co., both of Chicopee Falls, Massachusetts. United States patent No. 1,289,744.)

MULTI-PLY SHEET CALENDER.

OTHER MACHINERY PATENTS.

THE UNITED STATES.

- N**O. 1,287,071. Vulcanizing apparatus. W. C. Merrill, assignor by mesne assignments to The Merrill Process Co.—both of Boston, Mass.
- 1,287,253. Machine for knapping rubber, etc. S. C. Davidson, Belfast, Ireland.
- 1,287,256. Vulcanizing press. P. and B. De Mattia, Clifton, N. J.
- 1,288,181. Vulcanizing press. J. Pollak, Dorchester, Mass.
- 1,288,601. Apparatus for making elastic body-holding web. J. L. Lee, assignor to The Live Leather Belt Co., both of New York City. (Original application divided.)
- 1,288,641. Fabric-coating machine. C. W. Mayer, Rochester, N. Y.
- 1,288,642. Webspinning machine. C. W. Mayer, Rochester, N. Y.
- 1,288,643. Stretching device for vulcanizing rubbers. C. W. Mayer, Rochester, N. Y.
- 1,288,733. Tire-coupling machine. W. C. Stevens, assignor to Firestone Tire & Rubber Co., both of Akron, O.
- 1,288,746. Fabric-testing machine. S. P. Thacher, Weehawken, N. J., assignor to Revere Rubber Co., Providence, R. I.
- 1,288,862. Tire-building machine. G. F. Fisher, Roselle, N. J., assignor to Morgan & Wright, Detroit, Mich.
- 1,289,033. Rubber tubing machine. W. P. Bradley, assignor to Revere Rubber Co., both of Providence, R. I.
- 1,289,043. Apparatus and process for vulcanizing rubber goods. A. I. Comstock, assignor to American Rubber Co.—both of Boston, Mass.
- 1,289,233. Core-handling apparatus for tire-building machines. De C. Neal and A. O. Abbott, Jr., assignors to Morgan & Wright—all of Detroit, Mich.
- 1,289,324. Device for manipulating rubber stock. H. C. Wagner, assignor to Woonsocket Rubber Co.—both of Woonsocket, R. I.
- 1,289,746. Tire mill. A. Hargrave, assignor to Firestone Tire & Rubber Co.—both of Akron, O.
- 1,289,768. Apparatus for manufacturing pneumatic tires. E. Hopkinson, New York City.

- 1,289,769. Mold for pneumatic tires. E. Hopkinson, New York City.
- 1,289,770. Mold for pneumatic tires. E. Hopkinson, New York City.
- 1,289,773. Vulcanizing apparatus for pneumatic tires. E. Hopkinson, New York City.
- 1,289,774. Apparatus for manufacturing pneumatic tires. E. Hopkinson, New York City.
- 1,289,775. Pneumatic tire-building machine. E. Hopkinson, New York City.
- 1,289,849. Apparatus for manufacturing automobile tires. W. C. Stevens, assignor to Firestone Tire & Rubber Co.—both of Akron, O.
- 1,289,853. Mold for plastic materials. H. Weida, Highland Park, assignor to India Rubber Co., New Brunswick—both in N. J.
- 1,289,855. Rubber-working machine. G. W. Bulley, St. Joseph, Mo.
- 1,289,775. Apparatus for vulcanizing rubber articles. J. R. Gammeter, Akron, O., assignor to The B. F. Goodrich Co., New York City.

THE UNITED KINGDOM.

AUTOMATIC LAMP-CORD REEL.

A very practical device and one that suggests a variety of uses in every rubber mill, is the automatic extension reel for electric lamps. Designed primarily for garages, this reel has been installed in factories, machine shops, warehouses, and storerooms with satisfactory results.

The reel is 9 inches in diameter by 2 inches wide and carries 25 feet of reinforced lamp cord. The head is provided with a swivel joint, so that the lamp may be carried in any direction from the reel, and an automatic lock checks the cord at any point. A slow, backward motion of the cord causes the lock to hold the cord and the release is effected by a slight pull, the cord being automatically rewound on the reel. (W. S. Broadhurst, 37-41 Cortland street, New York City.)

LAMP-CORD REEL.

"RUBBER MACHINERY," by HENRY C. PEARSON, is filled with valuable information for rubber manufacturers. Price \$6.

The New York Automobile Show.

THE New York Automobile Show for 1919 was held under the auspices of the Automobile Dealers' Association, Inc., of New York, in Madison Square Garden and the 69th Regiment Armory, February 3-15.

The first week was devoted to the exhibition of passenger cars and the second to commercial vehicles, with accessories on exhibition in the gallery and a portion of the basement at the Garden, during both weeks. The attendance, interest, and sales at each section of the show were phenomenal.

THE PASSENGER CAR SECTION.

The outstanding feature of the passenger car exhibition was the fact that closed cars greatly predominated. This seems to be a very sensible development as the fixed top of the closed car body obviates delay and labor incident to erecting the removable top of the ordinary touring car, often necessary under trying circumstances.

By its permanent structure the closed body affords better protection against dust and weather conditions, without appreciably diminishing the advantages of light and air. This development in car bodies will be more appreciated by car users than by manufacturers of rubber and artificial leather automobile topping materials, as it promises to eliminate much of the former demand for such goods.

Another noticeable feature is the steady increase in appreciation of the cord tire, especially on the more expensive and heavier cars.

Certain of the accessories exhibits were of special rubber interest although there was a marked scarcity of new fixtures in this department of the show.

RUBBER ACCESSORY EXHIBITORS.

THE BULL'S EYE RUBBER CO., Long Island City, New York. A self-curing patch for inner tubes.

A. SHRAEDER'S SON, INC., Brooklyn, New York. Maker of tire valves and tire-pressure gages, exhibited the well-known specialties of this company.

THE STORY RUBBER CORP., New York City. Bonner self-heating inner tubes, closing punctures by compression of the specially constructed tread.

DURAL RUBBER CORP., Flemington, New Jersey. Antimony-red hand-made inner tubes.

PARA-BELL RUBBER CO., Columbiana, Ohio. Tires and tubes.

EASTERN RUBBER CO., Philadelphia, Pennsylvania. Magic Mend for repairing inner tubes.

GEO. H. RIVES MANUFACTURING CO., INC., New York City. Auto pedal pads.

THE COFFIELD TIRE PROTECTOR CO., Dayton, Ohio. A thick tread protector of firm elastic rubber without fabric which functions by turning and clinching nails that may pierce the tread of the tire casing.

J. & D. TIRE CO., Charlotte, North Carolina. Pneumatic tires guaranteed for 5,000 miles.

GATES RUBBER CO., Denver, Colorado. Gates Half-Sole tires and Gates tested tubes.

THE NORWALK TIRE AND RUBBER CO., Norwalk, Connecticut. High-Pressure casings and tubes.

DUPLEX TIRE CO., INC., New York City. DuPlex non-skid tires.

CARLISLE CORD TIRE CO., New York City. Carlisle cord tires, specially constructed with two plies of single unbroken strands of rugged, large-diameter cotton cord.

THE SHAW TIRE CO., Boston, Mass. A leak-proof molded endless inner tube secure against loss of air when punctured, by compression imparted to the entire tube by reason of the

scientific principle involved in its formation and inflation.

RUBBER PRESERVING CO., Chicago, Illinois. A patented liquid preparation known as "Kept-rubber," for preserving rubber goods of all kinds. It overcomes the tendency of rubber goods to deteriorate by oxidation, thus maintaining elasticity, flexibility, resilience and usefulness indefinitely.

THE COMMERCIAL CAR SECTION.

From the point of view of rubber interest, the exhibits at the commercial car section of the show presented few novelties. For the tire manufacturer, however, there were certain exhibits which were notable because they signalize recognition of the factors of economy involved in adapting wheels and tires to conditions of roads, loads, and speeds. From this point of view, injury to the truck and mechanism depends on the selection of tires and how they function. In line with this purpose the increasing use of pneumatic tires, particularly the larger sizes of cord tires, was noticeable, some of these tires being 42 by 9 and 44 by 10 cords of Firestone and Goodyear make, fitted to steel wheels.

THE BRUNSWICK-BALKE-COLENDER CO., Chicago, Illinois, made an interesting display of their line of solid tires, cord and fabric pneumatics, and inner tubes, all recent developments from the company's extensive model plant at Muskegon, Michigan.

Substitutes for air for filling tire casings, such as the preparation manufactured by the ESSENEY PRODUCTS CO. and that by the STANDARD FILLER CO. were demonstrated very effectively.

An interesting tire was that exhibited by the EAGLE PNEUMATIC PROOF TIRE AND WHEEL CO., of New York City, comprising two side pneumatic cylinders supporting a solid tire tread backed by a shock-absorbing device.

THE SMALL CUSHION WHEEL CO., Detroit, Michigan, exhibited a wood wheel of composite structure, comprising a spoked center with a zig-zag molded soft-rubber cushion filling the annular space between two wood felloes, the outer one of which carries a standard solid tire.

Other lines of accessories shown were: rubber patches for inner tubes, by the Bull's Eye Rubber Co., Long Island City, New York; Magic Mend for inner tube puncture repairs, by the Eastern Rubber Co., Philadelphia, Pennsylvania.

New Goods and Specialties.

A SWIMMING WEB FOR THE HAND.

THE approach of spring and summer calls out novelties and specialties suitable for use during those seasons. Sports always come in for their share of attention, and now that the restrictions on the manufacture of rubber goods have been removed, no doubt the coming months will show many sports accessories of rubber and rubberized fabrics.

The swimming device shown here is of sheet rubber such as used for bathing caps, and has a flat web between each of the tubular finger casings, the open ends of which permit the fingertips to come through. The edges of the web form a reinforcing band between the finger casings. The web is said to aid materially in increasing a swimmer's power and speed, as well as in keeping him afloat. A patent has recently been granted to the inventor. (Justin A. Clarke, Vincennes, Indiana.)

RUBBER SWIMMING WEB.

A NEW GOLF BALL.

Dealers in sporting goods will be glad to know about this new golf ball, called the "Super-Chick." It is made in two styles, floating and non-floating, in recess and mesh marking. A number stamped on the pole of the ball indicates which kind it is.

The particular features of this ball are its extraordinary powers of flight, its steadiness, and its reliability on the putting green. It is so constructed as to remain spherical and is painted with a special paint so applied that the ball will retain its whiteness, even after many rounds. (The North British Rubber Co., Limited, 43 Colborne street, Toronto, Ontario.)

"SUPER-CHICK" GOLF BALL.

TO FIT HIGH-HEELED FOOTWEAR.

The continued vogue of Louis Quinze heels of extreme type, 12/8 to 18/8 high, has increased the demand for rubbers to fit over such up-to-date footwear. The illustration shows the graceful lines of a rubber designed to fill this demand. It follows the shape of the leather shoe with the narrow recede toe, and is so constructed as to fit snugly the instep and the breast of the heel. The back of the quarter is so modeled as to cling tightly when properly fitted.

"BELL"-SHAPE RUBBER.

This rubber is made in black, seal-brown, and taupe colors, and the manufacturers report a large sale throughout the Dominion of Canada. (Columbus Rubber Co. of Montreal, Limited, Montreal, Quebec, Canada.)

A NUTLESS HOSE CLAMP.

While hose clamps look much alike, occasionally one is met with that has some distinguishing feature to recommend it by contrast with other similar devices.

"LOCK-ROLL" CLAMP.

The one shown here, called the "Lock-Roll" hose clamp, eliminates the nut so generally used and depends on its special construction for efficiency. It is made of nickel-plated steel in stock sizes from $\frac{3}{8}$ -inch to $\frac{3}{4}$ -inch by $\frac{1}{8}$ -inch variations, and requires nothing but an ordinary screw-driver for its adjustment. It is guaranteed by its manufacturers to be non-strippable and vibration-proof, and

adaptable in every case where it is absolutely necessary to have a tight connection. (Federal Tin Co., Charles and Barre streets, Baltimore, Maryland.)

A NOVEL INNER TUBE.

One of the novelties of the recent New York Automobile Show was an inner tube of the leak-proof variety, of which an illustration is given

herewith. The tube is molded seamless with thick walls, and presents a series of cup-like depressions in staggered arrangement over the entire surface. By this formation thirty per cent more material is contained

THE "AUTO-SEAL" INNER TUBE.

in the tube walls than would be the case were it molded perfectly circular in cross-section. Under inflation this excess material is effectively compressed by flattening outwardly the inwardly-curved depressions, thus supplying the anti-leak feature. (Shaw Tire Co., Inc., 2 Old South Bldg., Boston, Massachusetts.)

A NAIL-BRUSH WITH SUCTION CUPS.

The demand for a nail-brush that can be used with only one hand has produced the one shown in the accompanying illustration. It is provided with two good-sized rubber suction cups attached to the back of the brush, by means of which it can be temporarily held in place on the top or side of a wash-basin or set-bowl.

"LIMPET" ONE-HAND NAIL-BRUSH.

The problem of properly cleaning the nails and hand when only one hand can be used has to be experienced to be appreciated. There are many men to-day, as the result of the recent war, who are temporarily or permanently so handicapped. A brush of the kind shown here would be warmly welcomed by such individuals. (S. Maw, Son & Sons, Limited, 7 to 12 Aldersgate street, London, E. C., England.)

AN ADJUSTABLE PEDAL COVER.

A new rubber cover for automobile pedals is made in such a way that it is adjustable to all makes of square and oblong pedals and can be adjusted with the fingers. There are no holes to drill and no bolts to come loose. A lock spring and sliding clip are the means by which the cover is attached. It can also be fitted to concave and convex pedals by bending as required. (Rich Manufacturing Co., 1777 Broadway, New York City.)

Patent applied for
"RICO" PEDAL COVER.

from the heel, and one containing an invisible rubber cushion and air space which create a pneumatic effect when the fiber plug presses against the rubber cushion. To the top surface of the heel is applied a special cement which softens in a lamp flame, permitting the ordinary shoemaker to apply the heel by

NEW TYPE OF RUBBER HEEL.

A rubber heel of new design is composed of two separate sections; one of rubber compound, containing a friction fiber plug, modeled and vulcanized separately

THE BULL'S EYE TWO-SECTION RUBBER HEEL.

driving six nails. This method of construction makes it possible to use a better grade of rubber in the heel proper, increasing the wearing quality. (Bull's Eye Rubber Co., Long Island City, New York.)

A GROUP OF INTERESTING NEW CORD TIRES.

Among the new cord tires that are coming into more general use every day, the one that combines with its cord construction the already well-known features of other kinds of tires made by the same manufacturer has a distinct advantage, especially from the standpoint of advertising.

The first tire of the group shown here embodies the uniform mileage feature and the "geared-to-the-road" tread which its manufacturer patented for use in its pneumatic tires. The tread has caterpillar teeth, and there are vacuum cups in the running band, both of which combine to give this tire its positive traction, even on wet asphalt. (The Miller Rubber Co., Akron, Ohio.)

MILLER.

MIDGELIN.

GENERAL.

The middle tire of the group on this page represents the latest product of its manufacturer. It is called the "Improved

"Universal" cord tire, and is built by a special process by which each separate cord is impregnated with rubber and not merely coated. The finished tire is therefore more resilient and offers greater resistance to shock and to the action of moisture and air. This tire combines the effective non-skid tread and the broad flat traction surface which are features of the tires of this manufacturer. (Michelin Tire Co., Milltown, New Jersey.)

An 8-ply cord tire is third in this group, of 2-cure construction, expanded on a specially constructed air bag instead of the usual steel core. Each

SPECIALTIES IN RUBBER FOOTWEAR.

The prevalence of high heels of the Louis and Cuban types in women's leather footwear has raised some problems which rubber-shoe manufacturers have been forced to solve. That they have been successful in overcoming the difficulties of

perfect fit, ease of putting on and off, and proper wear of heels equal to the soles, is acknowledged by retailers and wearers.

The "Hiheel" rubber shown here is intended

THE "TOP NOTCH HIHEEL" RUBBER.

to fit the present-day shoe styles. It is made in this "croquet" height and also in the "storm" style, higher in cut over the vamp. Its special advantage over other rubbers is the construction of the heel, which has a heavy duck interluff under the regular lining. The stock of the tread is of specially tough compound, while that part most likely to wrinkle and break just above the tread has an extra piping of heavy rubber. This rubber is made in the fashionable shapes of ladies' leather shoes.

The "Top Notch" auto boot is intended to wear over ladies' evening slippers. It is of fine black -erge, rubber interlined, with warm, fleecy, wool fabric lining. It has ten buttons with reinforced button-holes, and durable sole and heel tread for walking when that is preferred. (Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut.)

"TOP NOTCH" AUTO BOOT.

individual cord is expanded equally and the tire is cured while the cords are stretched to the degree that inflation on the wheel would have stretched them. The tire on the wheel afterward is therefore in the same condition when inflated as it was when cured. (The General Tire & Rubber Co., Akron, Ohio.)

JUDICIAL DECISIONS.

L. P. LARSON, JR., CO. VS. WM. WRIGLEY, JR., C. WM. WRIGLEY, JR., CO. VS. L. P. LARSON, JR., CO.—Circuit Court of Appeals, Seventh Circuit. July 30, 1918.

The Wrigley company appealed from a final dismissal of its bill against the Larson company in which it alleged unfair competition and the infringement of its trade name "Spearmint."

The Larson company had on the market a chewing gum called Peptomint. The Court decided that Spearmint, being a proper noun, was not susceptible of appropriation as a trade-mark and that even if it were, the Larson trade-mark was not an infringement.

The two brands are put on the market in bundles of 5 sticks each, done up in pink waxed paper bound together so that the ends stick out of a white outer wrapper printed in red and green. However, when the two are placed side by side they are strikingly different. Wrigley secured an injunction against this brand, pending decision by the court.

While under this injunction Larson put on the market his "Wintermint" brand and about seven months afterward Wrigley put his "Doublemint" on the market in a package similar to that used by Larson. After the Wrigley product appeared on the market the sales of "Wintermint" decreased.

The Court of Appeals dismissed the bill against Larson and reversed the dismissal of the counterclaim, ordering an injunction and an accounting. (Federal Reporter, Volume 253, page 914.)

WILLIAM WRIGLEY, JR., CO. VS. J. P. LARSON, JR., CO.—Supreme Court of the United States, November 23, 1918.

Petition for a writ of certiorari to the United States Circuit Court of Appeals for the Seventh Circuit denied. (Supreme Court Reporter, Volume 39, page 22.)

CUSTOMS APPRAISER'S DECISIONS.

GUTTA SIAK.—The appeal of Charles H. Demarest (New York) to have gutta siak, which had been classified at 15 per cent. ad valorem under paragraph 385 of the Tariff Act of 1913, admitted free of duty as gutta percha under paragraph 502, was upheld. (Treasury Decisions, Volume 36, No. 3, January 16, 1919.)

CHICLE.—Protests of Wm. Wrigley, Jr., Co., et al., Chicago and New York; of American Chicle Co., Cleveland, Ohio; of American Chicle Co., Detroit, Michigan. The question was whether certain chicle was refined, or advanced, or dutiable as crude under the provisions of paragraph 36 of the Tariff Act of 1913. It was held properly classified as refined, at 20 cents per pound under paragraph 36. (Treasury Decisions, Volume 36, No. 3, January 16, 1919.)

JELTONGE—GUTTA SIAK.—Protests of William F. Mullen et al., and of The Rubber Association of America. Gutta siak and jeltong, which had been classified under paragraph 385 of the Tariff Act of 1913, were claimed to be entitled to free entry under paragraphs 502 and 513, respectively. The claims of the protestants were upheld. (Treasury Decisions, Volume 36, No. 4, January 23, 1919.)

RUBBER BROOCHES.—Protest was made by William H. Stiner & Son, New York City, against the classification as jewelry at 60 per cent ad valorem under paragraph 356, Tariff Act of 1913, of brooches of vulcanized or hard rubber in imitation of jet.

The merchandise was held dutiable as manufactures of rubber at 25 per cent under paragraph 369. (Treasury Decisions, Volume 36, No. 5, January 30, 1919.)

GUTTA SIAK—GUTTA PERCHA—CRUDE RUBBER.—Protest was made by George S. Bush & Co., Inc., et al., Seattle, Washington, against the invoicing as non-enumerated articles under paragraph 385, Tariff Act of 1913, of gutta mieuau, gutta habock, gutta hand kang, kampar gutta percha, and bankok gutta percha. The merchandise was held entitled to free entry under paragraphs 502 and 513. (Treasury Decisions, Volume 36, No. 5, January 30, 1919.)

ADJUDICATED PATENTS. THE UNITED KINGDOM.

IN THE MATTER OF A TRADE-MARK OF THE NEW ATLAS RUBBER CO., LIMITED.—In the High Court of Justice, Chancery Division, October 17-18, 1918.

The New Atlas Rubber Co., Limited, which had registered in Class 40 a trade-mark, No. 357,844, consisting of the word "Talisman," brought action for infringement of the mark against the Rubber Heel Manufacturing Co. The plaintiffs had sold to and the defendants had manufactured for the Maison Talbot, Milan, Italy, rubber heels bearing this trade-mark combined with the Italian firm's initials. The Maison Talbot owned this trade-mark in Italy and the applicants sought to obtain a monopoly in the United Kingdom of business with this foreign firm by registering its trade-mark in The United Kingdom as their own when they had acted only as agent for the owner. The testimony brought out that this effort was part of a systematic plan to "jump" customers' trade-marks and that the applicants had registered or attempted to register four other marks under similar circumstances.

Held, that the respondents (the applicants) had been merely the agents for the foreign firm to stamp goods being made for it with its trade-mark and initials; that there had been a limited use of the mark in The United Kingdom sufficient to disentitle the respondents to register it; that the intention of the respondents had been to prevent anyone else in The United Kingdom competing with them for business for the foreign firm; and that they were not entitled to do that. The trade-mark was ordered to be removed from the register.

PHILLIPS VS. HARBRO RUBBER CO.—In the High Court of Justice, Chancery Division, October 23-24, 1918.

Registration in Class 3 was obtained for a design of rubber pads or plates for heels of boots and shoes, consisting of a pad in the shape of a heel and having a plain central depression that might be filled in with leather or other material, and ornamented on the surrounding portion with cross lines. The proprietor brought an action for infringement. The defendants had sold rubber heels of the same form as the registered design, except that the ornamentation was different. It was proved, that, from a date prior to that of the registration, the defendants had sold two forms of rubber heels similar in form to the registered design, but having the surrounding portion plain, and, in the one case, a central depression that was plain, and, in the other case, a central portion with a pattern at a slightly lower level than that of the surrounding portion. The defendants contended that, if the parts of the designs were important elements of novelty, the defendants' rubber heels had not those details, and there was no infringement; or, if the parts were not important, the design differed so little from the prior forms of heels that it was not new or original.

Held, that the importance of the parts of a design is dependent on the character of the design; and that there was no substantial novelty or originality in the plaintiffs' combination of old parts. The action was dismissed with costs, and a certificate as to certain of the particulars of objections was given. (The Illustrated Official Journal Supplement, Volume XXV, No. 14.)

Interesting Letters from Our Readers.

HOW BIG IS THE RUBBER BUSINESS?

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—The present size of the American rubber trade comes up for discussion often and opinions seem to differ. One estimate in 1917 was \$900,000,000. About the same time Colonel Colt spoke of the gross business in the United States as being about \$800,000,000. Using crude rubber imports as a base and drawing on much manufacturing data, I get the following:

Automobile tires	\$250,000,000
Automobile tubes	70,000,000
Solid tires	175,000,000
Boots and shoes	100,000,000
Clothing, auto tippings and similar goods	75,000,000
Hard rubber	15,000,000
Rubber cements	5,000,000
Mechanical goods	200,000,000
Druggists' sundries	30,000,000
Rubber insulated wire and insulation	65,000,000
Motor cycle, bicycle tires, etc.	10,000,000
Miscellaneous	30,000,000
Total annual value	\$1,025,000,000

Faithfully yours,

New York City.

N. W.

SPECIFIC GRAVITY TABLES.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—Being in the employ of Messrs Lamprecht & Co. at Oerlikon near Zurich and having been brought up in the rubber trade, it is always with much pleasure that I read your paper, THE INDIA RUBBER WORLD, and follow any discussion about trade matters with much interest.

The tables on the basis of specific gravity 1.00 prompted me to write a few lines about my experience in this matter and the perfection which these tables can be brought up to by using volume prices on the said basis.

Perhaps you may find them also interesting to the readers of THE INDIA RUBBER WORLD.

Yours faithfully,

HERMAN GRIMELMANN.

Wallisellen, Switzerland.

The account of Mr. Grimmelmann's experience follows:

VOLUME PRICES AT SPECIFIC GRAVITY 1.00.

With reference to the specific gravity tables in the March and July issues of THE INDIA RUBBER WORLD I beg to say, that in my experience, both as cost clerk and salesman of an india rubber factory for mechanical goods, similar tables have been of the greatest use, both to the man in the office and to the traveler on the road, enabling them to quote the piece price of a certain article, of certain measurements, in a certain quality, at a few minutes' notice. While competing firms made their offers at so many francs per kilogram, the client mostly did not know the specific gravity of the quality offered him and was in consequence not properly fixed as to the cost of the article he had asked for and appreciated my offer when I quoted the price per piece or one hundred pieces. Though the specific gravity was stated, he had no time to reckon out the cost himself and would give the preference to the man who did it for him.

But also, from another point of view, such tables are of great value to the salesman, as he will get to know in this way the real value of his goods compared with other makes. Many times I quoted, for instance, the price for ordinary sheets and was told that a competitor offered at a much lower price and that an order could not be given. Of course no specific weight had been stated and even if it had been mentioned, it had not been taken into consideration by the client. After going fully into the matter and having taken the specific gravity into consideration, my quality was almost always preferred, in spite of its so-called "high" price.

In order to facilitate the use of such tables, they must be kept as plain as possible and the less operations you have to do to get at the result, the fewer mistakes will occur; also the handier the table is in size, the more it will be used.

In this respect the fixing of volume prices for the different qualities, also, on the basis of the specific gravity 1.00 will give much advantage to anyone using weight tables of specific gravity 1.00, as by this means the weight and the price basis are on the same foundation, the specific gravity 1.00, and one simple multiplication will bring you straight to the result.

For instance, instead of multiplying the weight given by the table for a certain dimension, by the specific gravity of the quality chosen, and multiplying the result again with the price of the said quality, I had fixed for each quality the volume price on the basis of the specific gravity 1.00 in my price-book and could therefore save one operation when quoting, for instance:

Quality Number.	Price Per Kilogram for Effective Weight.	Specific Gravity.	Volume Price on the Basis of Specific Gravity 1.00.
1	francs 20.00	1.20	francs 24.00
2	francs 16.00	1.50	francs 24.00
3	francs 16.00	1.25	francs 20.00
4	francs 12.00	1.67	francs 20.00
5	francs 8.00	1.30	francs 10.40
6	francs 8.00	2.00	francs 16.00

To get the most out of your tables, the prices of the different qualities should be fixed in the salesman's price-book on the basis of the one-ounce volume price, as the tables read in ounces. These one-ounce-volume prices would avoid the trouble of a third operation: viz., converting the ounces into pounds for which the prices are commonly fixed.

To give you an example: let us presume the price of quality X with specific gravity 1.50 is 1.60 per pound, effective weight, which is equal to 0.10 per ounce effective weight. The volume price of quality X on the basis of specific gravity 1.00 will then be 2.40 per pound. The one-ounce-volume price will be 0.15 per ounce.

If you wish to know the price of one square yard of sheets $\frac{1}{8}$ -inch in thickness, in the above stated quality X of specific gravity 1.50 the following operation will be necessary:

Your table shows: $\frac{1}{8}$ -inch thickness=93.60 ounces per square yard. Volume price for quality X is fixed at 0.15 the ounce. Result, 93.60 by 0.15=14.04 per square yard. While in the ordinary way three operations could not have been avoided, the fixed-volume price reduces same to one single operation and thus saves much time, besides helping to prevent errors.

I had different weight tables at hand, using them daily while quoting to the clients. For instance: Table No. 1, showing the weight at gravity 1.00 of cords, cylinders, etc.; Table No. 2, for tubes; Table No. 3, for balls; Table No. 4, for rings of round profiles; Table No. 5, for round joints of square profiles in all sizes which could possibly occur in the trade.

Tables for square sheets and square strips I had not in use, the reason why I did not miss them lying in the fact that such tables would not have given any advantage at all, the decimal system of weights and measurements enabling a quick result in a simple manner, giving the result not by one foot or one yard, but straight for the length desired.

I must confess that comparing your table with those I had in use, the balance lies much in favor of the latter, the superiority being caused by the great practical use of the French decimal system of weights and measurements, a fact for which, of course, you cannot be held responsible.

For instance the one-ounce volume price would be unnecessary and the one-pound volume price sufficient, if you could fix the

specific gravity tables 1.00 very exactly in pounds instead of ounces, as we can do, for example, with the decimal system of grams and kilograms. For the long and diametrical measurements we have also the advantage in fixing easily if necessary 1-tenth of a millimeter or one-250th part of an inch. Also in writing, how much shorter it is to write 70 mm. than 2=15/32 inches.

I feel sure, that anyone having used the two systems of weights and measurements, will ask himself, how it is possible that this French decimal system of weights and measurements has not yet been accepted universally as standard weights and measurements.

Why can chemists of the whole world have the same formulas for definite quantities, volumes, compositions, while engineers and business men worry themselves with inches, feet, yards and ounces, pounds, quarters and hundredweights instead of adopting the decimal system, based, as its name implies, on the figure 10.

There are, I am sure, many who must feel the same and I quite understand "Effero," author of a series of articles on molds for hard-rubber insulators in the "India Rubber Journal," who simply states: "All dimensions are in millimeters." Is there no remedy possible in the near future?

A QUESTION CONCERNING WASH SALES.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—May we ask you as a special favor for information as to a custom in the crude rubber business.

We purchased from an importer ten tons of rubber, to be shipped five tons in January and five tons in March, 1919. We later decided to sell this quantity and resold it to the same importer at a profit, and they sent us what you call a "wash sale."

It was our impression that without exception the custom of the trade on a "wash sale" is that at the date of the wash sale an invoice is rendered for the difference, and this difference is payable net 10 days from date of invoice, as specified in the wash sale. This rubber was an originally contracted shipment from the Far East, five tons each January and March.

The importer now takes the position that he will make his first wash sale or pay us the difference in about two months from January, 1919, contending it will take approximately that time for rubber to come from the Far East and he will make another "wash sale" two months from March.

We will very much appreciate any information you will let us have as to the custom of the trade in such matters.

Yours very truly, EASTERN MANUFACTURER.

AN IMPORTER'S OPINION.

The importer is quite within his rights. The sale was made for January shipment and March shipment. It requires at the least three months to receive the rubber via the coast, and it often takes much longer. It requires at least 60 days to get the rubber from the Far East via the canal. The importer has evidently given the manufacturer the benefit of the quicker trip, when he could easily have claimed that it would come via the Pacific, and which in all probability will.

A resale is the same as making a sale; therefore the time when the rubber would be billed would be the starting point when the account would begin to run for the ten days term of credit. If the rubber was shipped on January 31 it could not be ready for delivery (taking 60 days as a basis) until early April, and the same time would be true of the March shipment. Thus you will see that the importer is treating his friend very fairly.

A "wash" sale is the same, to all intent and purpose, as a regular sale, and the terms would be the same. The importer has got to make an actual delivery to someone, and what he will do is to make a delivery to another buyer and settle with your correspondent as if he had made the sale for the account of the manufacturer.

By figuring this "wash" on the basis of two months the importer is going to lose interest, and his loss of interest will be 30 to 60 days' interest, which in all fairness he could save by not paying the manufacturer until he had waited 10 days from date of the actual delivery.

IMPORTER.

REPLITE WITH INFORMATION FOR RUBBER MANUFACTURERS—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

NEW TRADE PUBLICATIONS.

MECHANICAL SUPERINTENDENTS WILL APPRECIATE THE SELECTOR meter, a handy device, in the form of a circular slide-rule for determining the correct size of Francke flexible couplings for any given drive. It is supplied on request to the trade by Smith-Serrrell Co., Inc., 90 West street, New York City.

* * *

THE FIRESTONE TIRE & RUBBER CO., AKRON, OHIO, HAS SENT out a handsome catalog of its rubber footwear, which is unique in its illustrations. In addition to showing the various models in the usual half-tone style, many of these models have combined with them a phantom background of some process used in the manufacture, these being grayed, or subdued, so as to embellish, rather than detract from the excellent cuts showing the footwear samples. The book is pocket size, long and narrow, and shows a large variety of goods made by the latest, newest concern to engage in the manufacture of rubber footwear. A fine portrait of President Firestone and a graphic view of the big Akron plant are also included among the illustrations.

* * *

THE CUTLER-HAMMER MANUFACTURING CO., MILWAUKEE, Wisconsin, is distributing a handsome Spanish edition of its 1919 catalog of C.H. wiring devices for the Central and South American trade. It illustrates and describes most of the devices shown in the 1919 English catalog, notably feed-through, pendant, and surface snap switches. The Spanish catalog comprises 24 pages, 8 by 10½ inches, and is bound in a striking orange-buff cover. It is uniform in style and arrangement with the 64-page English edition.

* * *

"VOCATIONAL EDUCATION FOR FOREIGN TRADE AND SHIPPING," Bulletin No. 24, issued by the Federal Board for Vocational Education, Washington, D. C., suggests courses of study on the practical aspects of the fundamentals of overseas commerce to be completed within a comparatively short time. It was written by Dr. R. S. MacElwee, Federal agent for commercial education on the above-named board, and a member of the faculty of Columbia University, New York City. This bulletin appeals particularly to business people employed during the day high-school seniors to be trained for junior clerks in the export business, engineers whose technical training must be supplemented by training in the essentials of the routine of foreign commerce, and colleges on a part-time or regular schedule. Business men are especially urged to investigate the courses for the benefit of their employees.

CALENDARS AND SOUVENIRS.

Tyson Bros., Woodbridge, New Jersey, manufacturers of chemicals, rubber substitutes, etc., are sending to the trade an art calendar reproducing C. D. Williams' painting, "The Angel of the Battlefields." The central figure is of a woman in white, representing the composite of women in all walks of life who have helped in winning the war. Around are grouped soldiers of each of the Allied countries, with a United States soldier and sailor, all paying her tribute. The color scheme is blue and white.

E. I. duPont de Nemours & Co., Wilmington, Delaware, have issued a large panel calendar advertising their different products, including chemicals. The calendar itself is printed in clear dark-blue figures of good size on white paper.

The Somerset Rubber Reclaiming Co., New Brunswick, New Jersey, is sending the trade an attractive brass desk combination including in one piece compartments for pens, stamps, etc., with a hinged cover on the outside of which the company's name is embossed, while inside is a 1919 calendar. Part of the base is a pen-tray, and the whole makes a happy combination and useful souvenir.

News of the American Rubber Industry.

ANNUAL REPORT OF THE B. F. GOODRICH CO.

THE B. F. GOODRICH CO., New York City, has recently issued its annual report for the year ended December 31, 1918, which shows the following figures:

PROFIT AND LOSS ACCOUNT.

Net sales	\$123,470,187.67
Manufacturing, selling, and general administration expenses	102,156,330.59
	\$21,610,322.21
Miscellaneous income	296,465.43
	\$21,610,322.21
Provision for depreciation	\$2,428,225.61
Interest on bills payable, etc.	1,993,031.54
Reserve to reduce plant additions during war	1,447,540.22
Reduction of United States Liberty Bonds from cost to market value	104,410.72
	\$5,973,208.09
Net profit before providing for final income and war excess profits taxes, carried to surplus account	\$15,637,114.62

SURPLUS ACCOUNT.

Balance, January 1, 1918	\$20,177,379.01
Net profit for year ended December 1, 1918	15,637,114.62
	\$35,814,493.63

9,000 shares 7 per cent cumulative preferred stock at par, redeemed and cancelled during year	\$900,000.00
Additional appropriation for pension fund	100,000.00
Reduction of treasury stock purchased, cost	9,506.25
7 per cent dividend on preferred stock for year	1,785,000.00
4 per cent dividend on common stock, paid during 1918	3,400,000.00
	\$5,194,506.25
	\$30,619,987.38
Applied in redemption of preferred stock	\$35,119,987.38

The increase in the net sales for the year amounted to 41 per cent over the amount for 1917.

DIVIDENDS.

Ajax Rubber Co., Inc., New York City, has declared its quarterly dividend of \$1.50 per share, payable March 15 on stock of record February 28, 1919.

The Amazon Rubber Co., Akron, Ohio, at its annual meeting, declared an extra dividend of twelve and one-half per cent, payable in common stock.

The Brunswick-Balke-Collender Co., Chicago, Illinois, declared a quarterly dividend of one and three-quarters per cent

on its common stock, payable February 15 to stock of record February 4, 1919. The last previous dividend was paid on May 15, 1918, at the rate of one and one-half per cent, none having been paid since until the present one because of war conditions.

The B. F. Goodrich Co., Akron, Ohio, has declared quarterly dividends of one per cent on its common stock, payable May 15 on stock of record May 5, and of one and three-quarters per cent on its preferred stock, payable April and July 1 to stock of record March 21 and June 20, 1919, respectively.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, at its recent annual meeting declared a quarterly dividend of one and three-quarters and one and one-half per cent, respectively, on its preferred and common stock.

The Plymouth Rubber Co., Canton, Massachusetts, has declared its regular quarterly dividend of one and three-quarters per cent on its preferred stock, payable March 1 to stock of record February 21, 1919.

The Swinchart Tire & Rubber Co., Akron, Ohio, has declared a dividend of two per cent in cash, payable April 15 on common stock of record March 31, and an extra dividend of ten per cent in preferred stock, payable March 5 to stock of record February 20, the latter dividend being in lieu of those not paid between October 1, 1917, and December 31, 1918.

NATIONAL ASSOCIATION OF WASTE MATERIAL DEALERS.

David Feinburg, Lionel D. Waixel and George B. Smitheman, the Nominating Committee of the National Association of Waste Material Dealers, have made the following nominations, to be acted on at the annual meeting March 19:

Officers: F. W. Reidenbach, president; James Rosenberg, first vice-president; Edward A. Stone, second vice-president; Henry Lissberger, third vice-president; Ivan Reitler, fourth vice-president; Paul H. Loewenthal, fifth vice-president; M. B. Speer, sixth vice-president; David Feinburg, treasurer.

Directors for two years: George B. Smitheman, Julius Rosenberg, Herman Muehlstein and Herman Goldstein.

Independent nominations can be made on petition of 25 members, such petitions to be filed with the secretary not later than 20 days preceding the annual meeting.

RUBBER COMPANY SHARE QUOTATIONS.

International Rubber Co., high 15 1/2, low 8. Keystone Tire & Rubber Co., common, par \$10, high 46 1/2, low 11 1/2; preferred, high 17 1/2, low 17. Pacific Tire & Rubber Co., high 48, low 47. Perfection Tire & Rubber Co., high \$100, low 32 cents.
(Compiled for THE INDIA RUBBER WORLD by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle street, Chicago.)

ONE OF THE REVERE PIONEERS.

A STEADY and unbroken service of nearly half a century with one concern is something of which one may well be proud. Such is the record of William H. Gleason, whose resignation from the offices of secretary and treasurer of the Revere Rubber Co., Chelsea, Massachusetts, was recently announced, after a continuous service of over 45 years.

William Henry Gleason was born and educated in Boston, and at the age of 15 entered a law office in that city. Later he was employed successively in the dry goods and the woolen goods businesses. On December 1, 1873, he entered the employ of the Boston Elastic Fabric Co., Chelsea, Massachusetts.

The company added mechanical rubber goods to its output, and the veteran Charles McBurney became president. In 1883 the company was re-organized and Henry C. Morse was elected treasurer and general manager and the name of the company was changed to Revere Rubber Co.

Beginning as bookkeeper Mr. Gleason soon became assistant treasurer, then treasurer, and later both secretary and treasurer of the company. Connected with the company were E. S. Converse, Franklin L. Pitcher, George H. Hood, and George A. Alden, all pioneers in the New England rubber business.

Thus it happened that Mr. Gleason, intimately associated with the then leaders of the trade, was a factor in the history making of that period. He was also one of the founders of the New England Rubber Club, now The Rubber Association of America, held various offices and did much to make the club a success. Mr. Gleason has two characteristics that were of extreme value in the positions that he held, unusual financial ability and a faculty for turning off work that is phenomenal. He is never behind, in fact it is said of him that he usually does things "the day before."

Mr. Gleason remains as treasurer of the Associated Industries of Massachusetts, an organization of business men having 1,100 members, in which he has long been active. An alert, shrewd, capable Yankee, his many friends wish for him a long, happy continuation of his very useful career.

H. W. JOHNS-MANVILLE CO. TO BUILD IN ILLINOIS.

The H. W. Johns-Manville Co., Madison avenue and 41st street, New York City, manufacturer of asbestos goods and machinery packing, has purchased from several different owners a tract of land containing approximately 225 acres north of and adjoining Waukegan, Illinois, between the Chicago and Northwestern railroad tracks and Lake Michigan. As soon as conditions allow, a \$3,000,000 plant to duplicate the one already located at Manville, New Jersey, will be built. It will cover 1,250,000 square feet of floor space and employ between 2,500 and 3,000 persons. Eight parcels of land were included.

BOSTON BANK TO ESTABLISH FAR EASTERN CONNECTIONS.

C. F. Weed, vice-president of The First National Bank, and D. A. de Menocal, vice-president of The First National Corp., Boston, Massachusetts, have been sent by the bank to establish further foreign banking connections in Australia, China and Japan. They expect to be away about four months. Boston merchants have shown keen interest in the trip and have submitted numerous matters for inquiry.

WILLIAM H. GLEASON.

TRADE NOTES.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, at its annual meeting elected the following directors and officers: directors—H. Wilfred DuPuy, president-treasurer; Charles M. DuPuy, vice-president; George W. Shiveley, secretary; Herbert DuPuy, chairman; Seneca G. Lewis, vice-president-general manager; other officers—George W. Daum, second vice-president in charge of production; A. H. Price, second vice-president in charge of sales development; C. G. Morrill, assistant treasurer; H. H. Salmon, purchasing agent; James Q. Goudie, general sales director; executive committee—Messrs. H. Wilfred and Charles M. DuPuy, Lewis Shiveley, Morrill, Salmon, and Price.

The Kelly-Springfield Tire Co., New York City, has announced the following elections and appointments: vice-presidents—F. A. Seaman, secretary: C. A. Brown; Otis R. Cook, formerly general sales manager, and a director; Maurice Switzer, advertising manager; other appointments—W. H. Bell, former Chicago district manager, appointed manager of motor truck tire division of general sales department, succeeded by H. H. Grobe, former manager of Baltimore branch; Capt. S. P. Landers, recently discharged from service, manager of branch, Baltimore, Maryland; Capt. John Baldwin, former Washington representative, now with motor tire division of general sales office; H. B. Joseph, former assistant advertising manager, now manager of outdoor display.

The Globe Tire Manufacturing Co., New York City, held its annual stockholders' meeting at the office of the company, 1851 Broadway, on February 4, 1919.

The Traveler Tire and Rubber Co., 819 North Broad street, Philadelphia, Pennsylvania, has purchased a factory site at Bethlehem, in that state, where it expects to begin building early in the summer. Specifications for the building are now being prepared. The company has an authorized capital of \$1,000,000 common stock and \$350,000 preferred stock. The officers are as follows: Guy de la Rigaudiere, president; Victor Durand, Jr., first vice-president; G. J. P. Raub, second vice-president; and E. E. Pollard, secretary and treasurer. The company will manufacture Traveler tires.

The United States Rubber Co., New York City, will exhibit at the Lyons fair to be held in Lyons, France, March 1-15, its full line of rubber tires, rubber and canvas footwear, belting, hose, insulated wire, gloves, sporting goods, druggists' sundries, and other rubber goods.

The Thermoid Rubber Co., New York City, at a meeting of its salesmen from the Boston, Philadelphia, and New York offices on January 29, discussed general trade conditions. The meeting was followed by a dinner at the New York Athletic Club, at which the bill of fare was printed on a salesman's expense report blank. The menu included "6,000-mile chicken," "Thermoid-Hardy peas," "Outlet ice cream," etc., to say nothing about "New York Branch cocktail" and "Boston Branch oysters." The company money on hand was "plenty" and directions regarding expense check read: "Hold! Do not need it."

The American Tire Filler Industry, Inc., was recently organized in the West, with offices at 220 West Superior street, Chicago, Illinois, and the following officers who are also directors: president, Franc D. Mayer, The Essenkay Products Co., Chicago, Illinois; first vice-president, Frank A. Hager, Universal Tire Filler Co., Portland, Oregon; second vice-president, Lee W. Lockwood, Dahl Punctureless Filler & Rim Co., Minneapolis, Minnesota; third vice-president, W. W. Major, National Rubber Filler Co., Midlothian, Texas; secretary, C. P. Umstot, Peerless Tire Filler Co., Chicago, Illinois; treasurer, L. G. Harris, Wolverine Tire Cushion & Accessory Co., Detroit, Michigan; J. Wolf, National Synthetic Tire & Rubber Co., New York City; and C. G. Schwarz, Panama Rubber & Equip-

ment Co., St. Louis, Missouri. The object of the organization is to standardize and perfect tire fillers, and it is incorporated without capital and not for profit.

E. I. du Pont de Nemours & Co., Inc., Wilmington, Delaware, will hold the annual meeting of its stockholders at the office of the company, 1007 Market street, on March 10, at noon, for the purpose of electing directors, receiving and acting on reports, etc.

Cameron Machine Co., 57 Poplar street, Brooklyn, New York, has increased its capital from 500 shares common and 150 preferred to 3,000 of each, making a total capitalization of \$600,000. Both classes of stock have been exchanged, share for share, for the new issue, of which 2,500 common and 850 preferred remain in the treasury and 2,000 of the new preferred are offered for sale.

The business conducted by William H. Stiles, crude rubber importer, at 79-85 Wall street, New York City, will hereafter be known as William H. Stiles & Co., Messrs. Lynn D. Stiles and Gordon Milne having been admitted to partnership.

H. Muehlstein & Co., dealers in scrap rubber, are now located at 147 East 125th street, New York City, their offices and one of five warehouse buildings having been destroyed by fire early in February. The new premises were formerly occupied by the Chatham & Phenix National Bank and provide facilities for the present lessee.

The Cotton Duck Association held its annual meeting at the Hotel Astor, New York City, early in February, and elected the following officers: William H. Wellington, president; Spencer Turner, vice-president; Summerfield Baldwin, Jr., treasurer; and C. S. Green, secretary. The executive committee includes the above officers and in addition S. Parker Bremer, F. Coit Johnson, William L. Barrell, and Robert P. Hooper.

Innis & Co., importers of crude rubber, etc., announce the removal of their general offices from 10 Herbert street to 132-4 Front street, New York City.

W. E. Byles, crude rubber and eastern produce broker, has moved to 140-142 Pearl street, New York City.

SCHAEFFER & BUDENBERG SALES AGENCIES.

The steady growth of the sales organization of Schaeffer & Budenberg, Brooklyn, New York, is indicated by the addition of Tulsa, Oklahoma, to their list of selling offices. This branch will carry a full stock of the firm's well known instruments, particularly those widely used in the refining industry. T. C. Eales has been appointed local manager.

Schaeffer & Budenberg now have direct branches in Chicago, Pittsburgh, Detroit, Philadelphia and San Francisco, and the following sales agencies: Toronto, Ontario, Milton & Prentiss; Greenville, South Carolina, L. W. Cuddy; Salt Lake City, Utah, F. C. Richmond Machinery Co.; Los Angeles, California, Adolf Frese Optical Co.; Seattle, Washington, Steam Supply & Rubber Co.

RUBBER SECTION OF THE AMERICAN CHEMICAL SOCIETY.

The plan to make the Rubber Section of the American Chemical Society a division of that society is beginning to take shape. By-laws similar to those of the other divisions have been drawn up for consideration by the executive committee, and the whole matter will be presented to the council of the American Chemical Society at the meeting in Buffalo in April.

It seems inadvisable to hold a meeting of the Rubber Section at that time, but preparations for the annual fall meeting are already in the making. The executive committee realizes fully that the success of this and every meeting depends upon the work of the rubber chemists of the country; that it is conditional upon their opportunities for original work in their special lines; and that it is sustained by the freedom with which the various problems confronting all are discussed. Secretary

Arnold H. Smith is therefore getting in touch with the rubber chemists of the country in an effort to have every laboratory head at the next meeting, which it is desired to make an especially active and interesting one.

The members of the executive committee are: John B. Tuttle, chairman; Dr. David Spence, George Oenslager, L. E. Weber, H. E. Simmons, L. H. Plumb and A. H. Smith, secretary, Bureau of Standards, Washington, D. C.

The jar-ring committee of the Rubber Section is working in active cooperation with the Department of Agriculture and it is expected that some announcement concerning its activities will be made in the near future.

NEW HOME OF AJAX RUBBER CO., INC.

For some months the building at 218-222 West 57th street, New York City, has been undergoing remodeling to adapt it for the use of its new tenant, Ajax Rubber Co., Inc. The build-

AJAX RUBBER CO.'S NEW QUARTERS.

ing is four stories high and offers approximately twice the area the company had in its former quarters.

The first floor of the new premises is devoted to the New York selling branch, while on the eastern and western ends, respectively, are a vestibuled entrance to the executive offices and a wide driveway. The offices of H. L. McClaren, president, Horace De Lisser, chairman of the board of directors, and of Stuart Webster, treasurer, are on the second floor, as well as the meeting-room of the board of directors and the credit, collection, and accounting departments. The third floor is occupied by the advertising department and the officers of the export, sundries, and traffic departments, branch house managers and sales correspondents. The sales conference room is also on this floor and the office of Fred E. Dayton, secretary and general sales manager of the company.

The exterior of the building has been refaced and the interior remodeled to meet the requirements of the company.

ALLEN MACHINE CO. OCCUPIES NEW PLANT.

The Allen Machine Co., Erie, Pennsylvania, is now installed in its recently acquired plant, which is one of the most modern in the country. Its facilities include a foundry, with two cupolas, machine tools for handling work up to 16 feet in diameter, 30-ton traveling cranes and motor-driven roll-lathes and grinders.

NEW INCORPORATIONS.

Acoustic Controls Corp., January 27, 1919 (Delaware), \$2,500.00. M. L. Harty, M. C. Kelly, S. L. Mackey—all of Wilmington, Delaware. Principal office with Charter Guarantee & Trust Co. Du Pont Building, Wilmington, Delaware. To deal in produce and manufacture goods, merchandise, and clothing, of which rubber is a component part.

Aconite Tire & Rubber Co., January 9, 1919 (New Jersey), \$125,000. E. J. Adams, president; J. E. Adams, vice-president; J. E. Adams, secretary and treasurer. Principal office, 115 South Warren street, Trenton, New Jersey. Agent in charge, J. M. Weaver. To manufacture, purchase, sell, import, export, and distribute all kinds of rubber goods.

Arentox Co., October 8, 1918 (Delaware), authorized capital, 1,000 shares of stock without nominal or par value. C. L. Rimplinger, M. M. Clancy, F. A. Armstrong—all of Wilmington, Delaware. Principal office with Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture and deal in gutta percha, etc.

Associated Rubber Interests, Inc., January 31, 1919 (New York), \$10,000. C. Byrd, 31 Delap street, Queens, N. Y.; C. Schleicher, 76 Pearl street, T. M. Healy, 32 Liberty street, both of New York City—all in New York. To deal in rubber products.

Automatic Safety Tire Valve Corp., The, January 28, 1919 (New York), \$5,000. S. N. Newman, 10 Stone street, Yonkers, G. H. Crossen, Hotel Prince George, New York City, C. R. Tock, 487 Sanford avenue, Flushing—all in New York. To manufacture auto tire valves, etc.

Bayonne Tire & Rubber Co., Inc., February 6, 1919 (New York), \$2,000. S. Bernheim, C. A. Weldon, A. Hirsch—all of 35 Nassau street, New York City. To manufacture tires.

Bridgeport Tire & Rubber Co., Inc., February 1, 1919 (New York), \$25,000. H. S. Hartstein, C. A. Weldon—all of 35 Nassau street, New York City. To manufacture tires.

Central New York Tire & Tube Co., Inc., February 1, 1919 (New York), \$20,000. H. S. Hartstein, C. A. Weldon—all of 35 Nassau street, New York City. To manufacture tires.

City Rubber Co., January 18, 1919 (Massachusetts), \$25,000. C. B. Delano, 52 Ivy street, G. F. Duhamel, 5 Boynton street—both of Boston; D. Bradley, 24 Market street, all in Massachusetts. Principal office, Boston, Massachusetts. To manufacture and deal in automobiles and motors of all kinds and all parts and appliances used in connection therewith.

Columbus Tire & Rubber Co., Inc., February 1, 1919 (New York), \$5,000. H. S. Hartstein, S. Bernheim, C. A. Weldon—all of 35 Nassau street, New York City. To manufacture tires.

Du Pont de Nemours Export Co., E. I., December 12, 1918 (Delaware), \$100,000. W. S. Gavan, C. R. Mudge, A. M. Gorman—all of Wilmington, Delaware. Delaware agent, A. I. Du Pont, 100 Market street, Wilmington, Delaware. To do a general export business, and, among other things, handle products of Du Pont Fabrickoid Co., Fairfield, Connecticut.

Eckrode Rubber Co., February 6, 1919 (New Jersey), \$100,000. C. E. Eckrode, Highgate Park, B. H. Eckrode, 132 South 11th street, C. E. Hensler, 815 South 11th street—both of Newark—all in New Jersey. Principal office, 118-122 Adams street, Newark, New Jersey. Agent in charge, C. E. Eckrode. To make, purchase, and sell rubber boots, shoes, tires and tubes.

Eric Tire & Rubber Co., Inc., February 17, 1919 (New York), \$5,000. C. S. Hartstein, C. A. Weldon, A. Hirsch—all of 35 Nassau street, New York City. To manufacture tires.

Essex Tire & Rubber Co., Inc., February 11, 1919 (New York), \$4,000. C. A. Weldon, H. S. Hartstein, A. Hirsch—all of 35 Nassau street, New York City. To manufacture tires.

Excello Rubber Heel Mfg. Co., January 9, 1919 (Delaware), \$300,000. F. L. M. E. and L. F. Mettler—all of Wilmington, Delaware. Principal office, 812 Market street, Wilmington, Delaware. To manufacture and sell rubber heels, soles, shoes, etc.

Fair Tire & Rubber Co., Inc., February 17, 1919 (New York), \$5,000. C. S. Hartstein, H. S. Hartstein, A. Hirsch—all of 35 Nassau street, New York City. To manufacture tires.

Fresno Tire Sales Co., Inc., February 10, 1919 (New York), \$5,000. C. A. Weldon, H. S. Hartstein, A. Hirsch—all of 35 Nassau street, New York City. To manufacture tires.

Hague Co., F. B., February 14, 1919 (New Jersey), \$125,000. F. B. and S. E. Hague, W. E. Turton—all of Newark, New Jersey. Principal office, 810 Broad street, Newark, New Jersey. Agent in charge, W. E. Turton. To manufacture, buy, sell, import, export, and generally deal in automobile tires, etc.

Harasheeb Rubber Co., January 8, 1919 (Illinois), \$25,000. T. H. Spencer, C. Wright, J. B. Drueger. Principal office, 2700 South Michigan avenue, Chicago, Illinois. To manufacture and deal in automobile tires and tire accessories.

Henry Tire & Rubber Co., January 7, 1919 (Delaware), \$1,000,000. E. J. Kelley, C. H. Bortell, Jr., both of New Haven, Connecticut; H. F. Gilg, Wilmington, Delaware. Principal office with Delaware Registration Trust Co., 900 Market street, Wilmington, Delaware. To manufacture and deal in tires for automobiles, bicycles, etc.

Laticia Tire Co., December 31, 1918 (New Hampshire), \$2,000. S. and A. Melanowski, O. L. and J. J. Melanowski, M. C. Gurnea, all of New Hampshire. To buy, sell, and deal in automobile supplies.

Missouri Tire & Rubber Co., Inc., February 4, 1919 (New York), \$5,000. C. A. Weldon, A. Hirsch, S. Bernheim—all of 35 Nassau street, New York City. To manufacture tires.

Modern Tire Co., Inc., January 27, 1919 (New York), \$2,500. N. Chaitowitz, 309 West 50th street, H. Glusack, 646 East 13th street, H. Epstein, 56 East 101st street—all of New York City.

Newark Tire & Rubber Co., Inc., February 6, 1919 (New York), \$4,000. S. Bernheim, C. A. Weldon, A. Hirsch—all of 35 Nassau street, New York City. To manufacture tires.

New Tread Tire Co., The, January 8, 1919 (Ohio), \$100,000. F. H. Groves, president; S. W. Tidd, vice-president; C. U. Calvin, secretary and treasurer; E. F. Altenburg, general manager—all of Columbus, Ohio. Principal office, Columbus, Ohio. To rebuild and retread automobile tires.

Rourke Tire & Battery Corp., February 17, 1919 (New York), \$500. John and John J., and C. O'Rourke—all of 348 91st street, Brooklyn, New York. Tire and battery service station.

Palace Tire & Rubber Co., Inc., February 17, 1919 (New York), \$3,000. C. A. Weldon, H. S. Hartstein, A. Hirsch—all of 35 Nassau street, New York City. To manufacture tires.

Paterson Tire & Rubber Co., Inc., January 28, 1919 (New York), \$2,000. C. A. Weldon, H. S. Hartstein, A. Hirsch—all of 35 Nassau street, New York City. To manufacture tires.

Peoples Auto Tire & Supply Co., February 10, 1919 (New Jersey), \$50,000. C. H. Reed, 40 Seymour avenue, G. S. Staib, 175 Chadwick avenue, L. G. Miller, 616 Bergen street—all of Newark, New Jersey. Principal office, 435 Clinton avenue, Newark, New Jersey. Agent in charge, L. G. Miller. To conduct a general automobile supply store.

Plaza Tire & Rubber Co., Inc., January 24, 1919 (New York), \$3,000. A. L. Diamond, president; W. L. Lissberger, vice-president; J. Jacobs, secretary and treasurer. Address, 382 Jackson avenue, Long Island City, New York. To manufacture tires.

Roadway Tire & Rubber Co., Inc., February 4, 1919 (New York), \$4,000. C. A. Weldon, A. Hirsch, S. Bernheim—all of 35 Nassau street, New York City. To manufacture tires.

Super Tire & Rubber Co., Inc., February 10, 1919 (New York), \$10,000. A. Paul, 415 Clinton avenue, Newark, New Jersey. Agent in charge, 51st street, New York City—all in New York. To manufacture tires.

Timothy Rubber Co., Inc., January 8, 1919 (Connecticut), \$20,000. W. A. Timothy, president; O. W. Olsen, secretary and treasurer; M. C. Timpany—all of 504 Bank street (principal office), New London, Connecticut. To buy and sell tires and automobile accessories.

Traveler Rubber Co. of Bethlehem, U. S. A., January 24, 1919 (Delaware), \$1,000. J. E. Pollard, J. E. Green—all of Philadelphia, Pennsylvania; S. D. Townsend, Jr., Wilmington, Delaware. Principal office with S. D. Townsend, Jr., 927 Market street, Wilmington, Delaware. To manufacture and deal in tires for automobiles, bicycles, etc.

Triangle Rubber Co., February 12, 1919 (Delaware), \$100,000. J. Whan, H. R. Shaffer, C. K. Delmore—all of Sebring, Ohio. Principal office with Capital Trust Co. of Delaware. To manufacture inner tubes, tires, and other rubber accessories.

Union Raincoat Co., Inc., January 31, 1919 (New York), \$20,000. M. Volansky, 1876 Marmon avenue, S. Volansky, 1539 Minford place—both of Bronx, N. Y.; M. Knick, 1735 Benson avenue, Brooklyn—all in New York. To manufacture rubber apparel.

Williamburg Tire & Rubber Co., Inc., February 17, 1919 (New York), \$3,000. H. S. Hartstein, F. H. S. Hartstein, A. Hirsch—all of 35 Nassau street, New York City. To manufacture tires.

World Rubber Products Co., Inc., February 10, 1919 (New York), \$1,000. L. Spieberger, 1237 Lee avenue, C. H. Herbst, 1071 West Farms road—both of Bronx, N. Y.; E. Cohen, 155 Rose street, Brooklyn—all of New York. To manufacture rubber products.

Yonkers Tire & Rubber Co., Inc., February 3, 1919 (New York), \$3,000. H. S. Hartstein, C. A. Weldon, S. Bernheim—all of 35 Nassau street, New York City. To manufacture tires.

TWO NEW DU PONT SUBSIDIARIES.

Two new companies have been recently incorporated to take over the chemical and export business of the Du Pont organization. These are: Du Pont Chemical Co., Inc., Wilmington, Delaware, which will manufacture and deal in chemicals, oils, paints, etc., and the E. I. du Pont de Nemours Export Co., Wilmington, Delaware, which will take over foreign business. The officers of the export organization are: F. W. Pickard, president, in charge of sales; Walter S. Gaven, vice-president and director of sales; F. D. Brown, treasurer; and Alexis I. du Pont, secretary. The directors, in addition to the officers, include F. C. Peters, C. L. Petze, J. A. Burckel and J. E. Hatt.

DOMINION RUBBER SYSTEM INCORPORATES.

The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada, in order to separate its sales and distribution from its manufacturing department, has incorporated seven provincial companies to handle sales and distribution in Canada, the name in each case being "Dominion Rubber System, Limited," with the name of the province in parenthesis inserted before the word "Limited."

Each company takes over the leases, property, fixtures, stock on hand, etc., at actual valuation, while its policy will be determined by a board of directors made up of members of the head office executive force and the manager of the provincial company.

The officers and directors of the parent company are: T. H. Rieder, president; R. E. Jamieson, vice-president; H. Wellein, A. E. Massie, H. R. Nixon, J. A. Martin, J. M. S. Carroll and W. A. Eden.

The offices, managers, and secretary-treasurers of the provincial companies are as follows, respectively:

Maritime—St. John, New Brunswick; W. R. Stewart, A. R. Hannah.

Quebec—Montreal; George Bergeron, J. Myles.

Ontario—Toronto; J. A. Connor, H. E. Dane.

Manitoba—Winnipeg; Charles Holden, R. W. Pollock.

Saskatchewan—Regina; G. E. Wight, H. A. Wells.

Alberta—Calgary; A. C. McGivern, G. E. Healey.

Pacific—Vancouver, British Columbia; W. A. Allan, J. M. Doyle.

PERSONAL MENTION.

Samuel P. Colt, chairman of the board of directors of the United States Rubber Co., New York City, spent the month of February in California.

Guy E. Tripp, chairman of the board of directors of the Westinghouse Electric & Manufacturing Co., New York City, sailed for Europe early in February.

R. Y. Cooke, who has been connected with the Racine Rubber Co., since 1912, has been promoted to the position of secretary and general manager of the company at Racine, Wisconsin, succeeding the late Mr. Severance. He has also been elected a director of the Ajax Rubber Co., Inc., New York City, of which the Racine company is a subsidiary.

Louis Rosenberg has been appointed director of advertising and sales for the Keystone Tire & Rubber Co., Inc., New York City.

A. P. Gormully has been placed in charge of the export business of the Ajax Rubber Co., Inc., New York City.

F. E. Kaeppl is now representing the mechanical department of the Federal Rubber Co., Cudahy, Wisconsin, among the jobbers of Chicago and the Middle West. He was formerly with the United States Rubber Co. and for seven years was connected with the Chicago plant of the Mechanical Rubber Co., serving the jobbing trade.

A. C. Eggers, manager of the crude rubber department of the Mercantile Bank of the Americas, Inc., 38 Pine street, New York City, was formerly connected with Eggers Bros. & Co., crude rubber dealers, and more recently was production expert in the Signal Corps of the Army.

Mark L. Smith has identified himself as a salesman with Stresen-Reuter & Hancock, Inc., manufacturer of and dealer in colors, minerals, and chemicals for the rubber and allied trades, Chicago, Illinois. He was formerly with the Commercial Chemical Co. and is well acquainted with the chemical trade.

R. J. CALDWELL HONORED BY LUNCHEON.

R. J. Caldwell of R. J. Caldwell Co., Inc., manufacturer of cotton duck and tire fabrics, New York City, was recently appointed a member of the United States Industrial and Economic Commission and is now in Europe making surveys of the industrial situation. On January 24, the day preceding the sailing of the commission, Mr. Caldwell was the guest of honor at a luncheon at the Lawyers' Club, attended by many men prominent in public life. The opening address was made by Mr. Caldwell, who dealt with industrial conditions, especially with reference to the more equitable treatment of labor. He was particularly emphatic in urging that adequate provision be made to retain workers in their employment in times of stress.

Among the other speakers, all of whom alluded in complimentary vein to the philanthropic and useful work accomplished by Mr. Caldwell in the promotion of better working and living conditions for industrial employees, were W. Bourke Cochran, John B. Stanchfield, George Gordon Battle and Simeon D. Fess, Congressman from Ohio. John Morgan, vice-president and treasurer of the McGraw Tire & Rubber Co., East Palestine, Ohio, and a recently appointed director of The Rubber Association of America, represented the rubber trade.

R. J. CALDWELL.

WEBSTER NORRIS, S. B.

DURING the early eighties, immediately following his graduation from the Massachusetts Institute of Technology, Webster Norris was an analyst in steel and sugar-refining industries. A few years later, as chief chemist of the Chicago, Milwaukee, and St. Paul Railway Co., his attention was directed to the technology of rubber. Personal investigation revealed the need of chemical standardization of the materials, processes and products of rubber manufacture. As result, he became chemist of the Boston Rubber Shoe Co. in July, 1887, and equipped a laboratory at their Malden plant. Thus, if not actually the first, Mr. Norris is one of the early chemists to be regularly employed on the factory staff of an American rubber manufacturing company.

WEBSTER NORRIS.

He was identified with the Boston Rubber Shoe Co. as chemist and assistant superintendent for a combined period of eight years. In 1895, he entered the mechanical goods division of the trade as chemist of the Revere Rubber Co. Subsequently he has been identified in a superintending capacity with several important companies, among them the Gutta Percha & Rubber Manufacturing Co., New York City; the Canadian Rubber Co., Limited, Montreal, Quebec, Canada; the Republic Rubber Co., Youngstown, Ohio, and the New York Rubber Co., New York City.

Mr. Norris has lectured on the technology of rubber at his Alma Mater, and several patents have been granted on his improvements in rubber-working machinery and factory equipment.

When THE INDIA RUBBER WORLD was founded, Mr. Norris promptly recognized it as a factor in advancing the development of the industry, and especially its value to the rubber chemist and superintendent. For many years he has contributed technical articles to its pages and in 1915 became identified with its staff in connection with the chemical department.

Mr. Norris is an expert in rubber factory equipment, processes, and operation. Throughout his career as a rubber technologist he has specialized in scientific compounding, the development of specification goods, and related problems in rubber goods manufacture.

He is engaged in developing long-cherished plans for serving as a consulting rubber technologist for American and foreign rubber manufacturers.

AERONAUTICAL EXPOSITION.

The Annual Aeronautical Exposition of the Manufacturers' Aircraft Association, Inc., will be held March 1-15 in the Madison Square Garden and the 69th Regiment armory, New York City. This exhibit will show the remarkable development of the flying machine from the first Langley and the original Wright machines to the Navy's newest flying boat, with the record carrying capacity of fifty passengers.

The United States Army and Navy Departments, together with the manufacturers, will display every type of airplane built in America during the war, including a complete exhibition illustrating the progress made in aerial ordnance, photography, the use of wireless and other developments. A collection of war trophies and captured German airplanes exactly as they were brought down behind the Allied lines will be exhibited.

The Obituary Record.

INVENTOR OF RUBBER PROCESSES.

CHARLES A. BeSaw of the BeSaw Tire & Rubber Co., Hartsville, Ohio, and Ardmore, Oklahoma, died at Guthrie, Oklahoma, February 6, aged 43 years. The burial was at Canton, Ohio.

Mr. BeSaw was born at Pleasant Grove, near Akron, Ohio. He entered the rubber business in 1900, being employed by the Diamond Rubber Co. in the technical department. In fact, it was in the technical departments almost exclusively in which he associated himself with the Milwaukee Rubber Works Co., Milwaukee, Wisconsin; the Firestone Tire & Rubber Co., Akron, Ohio; Swinehart Tire & Rubber Co., Akron, Ohio, and the Canton Rubber Co., Canton, Ohio. He was general superintendent of the Knight Tire & Rubber Co., Canton, Ohio, when, in 1916, he acquired control of the Quality Rubber Co., Hartsville, Ohio, which name he changed to BeSaw Tire & Rubber Co. and became president and general manager of the organization.

In 1917 the capital of the company was increased to \$1,000,000 and an additional factory was built at Ardmore, Oklahoma, and Mr. BeSaw made his residence in Guthrie, thus taking personal supervision of the business at the Ardmore plant, which, because of his business experience and technical knowledge, rapidly gained prestige and patronage. Mr. BeSaw was the inventor of the BeSaw process for reclaiming rubber, and was instrumental in perfecting several processes for the manipulation of rubber.

MANUFACTURER AND FINANCIER.

Daniel Neil Mason, vice-president and director of The Mason Tire & Rubber Co., Kent, Ohio, died at his residence in Cleveland, Ohio, of pneumonia, February 6, 1919, aged 31 years.

Mr. Mason was one of three brothers, all associated together in several business enterprises, one of which was the Mason Tire & Rubber Co., that was organized in the fall of 1915, and since that time he devoted the major portion of his time to the financial end of the business. He was a partner in Mason Brothers Investment Securities Co., and vice-president in the newly organized Mason Cotton Fabrics Co. Indeed, it is claimed that his extreme enthusiasm in starting this new enterprise caused his last illness.

Mr. Mason was an intense worker. Whatever he did was done with all his might. He was known in financial circles as a wonderfully successful salesman. Young, sympathetic, naturally a leader, he was popular with the workers in the plant, attending the outdoor sports and field days, on which occasions, because of his splendid physique, he participated in athletic sports.

Mr. Mason is survived by his widow and a five-year-old daughter.

A POPULAR AND CAPABLE MAN.

A. C. Redman, industrial manager of The McGraw Tire & Rubber Co., East Palestine, Ohio, died of pneumonia on January 27, 1919. His demise constitutes a lamented loss, not only to the McGraw organization but to the community in which he made his home and took so prominent a part in business life and civic affairs.

Previous to 1914, when he entered the employ of the McGraw company as traffic manager, Mr. Redman spent a number of years in the service of the Adams Express Co.

He was distinguished for his moral courage, energy, devotion to duty, and fair dealing—qualities which endeared him to his associates and won for him popularity and success as an executive of rare ability. As industrial manager, Mr. Redman came in constant daily touch with the employees, winning their confidence and respect in marked degree. It is the purpose of the McGraw company to execute his plans for the betterment, socially, physically and industrially, of its workmen.

Mr. Redman was a native of Circleville, Ohio, born June 15, 1885, and is survived by his father, widow, and two children.

A DIRECTOR OF THE CANADIAN CONSOLIDATED RUBBER CO., LIMITED.

Andrew A. Allan, a director of the Canadian Consolidated Rubber Co., Limited, of Montreal, Quebec, Canada, died at the Royal Victoria Hospital in that city Tuesday, February 11, 1919, following an operation performed the previous week.

He was the son of Andrew Allan, one of the founders of the Allan Line of steamships plying between Montreal and England. He was born in Montreal on June 16, 1860, educated at Rugby, England, and later by private tutors in France. He began business in the office of the Allan Line in 1877, admitted a partner in 1881 and later, with his brother, succeeded his father's interests. In 1910 he was elected president of the Shipping Federation of Canada and was for a time a member of the Montreal Board of Harbor Commissioners. He became a director of the Canadian Consolidated Rubber Co., Limited, in 1917, and was interested in a number of important industrial and financial corporations in Canada.

A SELF-MADE MAN.

Frederick R. Gillespie, of Hamill & Gillespie, dealers in compounding ingredients, etc., New York City, died at his residence in that city January 28, aged 74 years. He was born in Ireland, coming to New York when a boy, and entered the employ of the concern of which he was the head at the time of his death. He is survived by his widow and two daughters. Mr. Gillespie

CHARLES A. BESAW.

A. C. REDMAN.

DANIEL N. MASON.

ANDREW A. ALLAN.

was a man of large charities, was active in church work, and was highly respected by the trade.

FORMER TRENTON RUBBER MAN.

James D. Brady, formerly an official of the Standard Rubber Co., Trenton, New Jersey, died on January 2 at his home in Philadelphia, Pennsylvania, following an illness from typhoid fever. His body was interred in Riverview Cemetery, Trenton, New Jersey. Mr. Brady was 40 years old and is survived by his widow. He was a member of the Masonic fraternity and was active in Republican politics. After disposing of his interests in the Standard Rubber Co., he engaged in the coal business in Philadelphia.

A JAPANESE RUBBER IMPORTER.

Shunzo Takaki, a member of the firm of Mitsui & Co., Limited, crude rubber importers of Tokio, Japan and New York City, died in the latter place on January 29, aged 36 years.

The son of Baron Kanhiro Takaki, he was born in Tokio in 1883, and received his early education in that city. Coming to America he attended the University of Pennsylvania where he distinguished himself in athletic sports, especially tennis and baseball.

After his graduation he returned to Japan, married Miss Tatsuo Mitsui and allied himself with the great firm of Mitsui & Co., later returning to this country and settling in New York City. He was a member of the Nippon Club, the Japan Society, the Railroad Club, Aldine Club, and University of Pennsylvania Club, all of New York City. He leaves his widow and four children.

A REAL RUBBER BANK.

TIME was when rubber manufacturers approached banks with trepidation, or at least with a feeling of respectful gratitude, for they were big borrowers. It is also a matter of history that one large bank in New York said flatly and almost

THE FIRESTONE PARK TRUST & SAVINGS BANK.

profanely that it would never again touch anything in rubber.

The notable change that has come to the trade is shown not only in the bank directorships held by rubber men, by the eagerness of the banks for rubber accounts, but in a more spectacular way by the big rubber bank founded by Harvey S. Firestone, president of the Firestone Tire & Rubber Co., Akron, Ohio.

This institution is known as the Firestone Park Trust & Savings Bank. It was first established as the Rubber City Savings Bank in September, 1916, in temporary quarters on South Main street, but now occupies a large, new and handsome two-story fireproof building with every modern banking facility. At the end of that first month total deposits were only \$32,140.60

HARVEY S. FIRESTONE, BANK PRESIDENT.

as compared with \$2,307,686.61 at the end of 1918. These figures speak eloquently of the place this institution is taking in the remarkable development of southern Akron and the neighboring towns of Kenmore and Barberton. Founded on broad, sound banking principles and ably by the treasurer, L. B. Waters, a banker of wide experience, it is rendering an important service to the individuals and business houses of the community.

The officers of the bank are: president, Harvey S. Firestone; vice-president, J. G. Robertson; treasurer, L. B. Waters, secretary, E. A. Oberlin, Jr.; directors, Harvey S. Firestone, J. G. Robertson, F. W. Albrecht, John Hearty, L. B. Walters, Jacob Pfeiffer, J. M. Beck, J. W. Thomas, S. G. Carlshuff.

In common with most banking institutions it has well-organized commercial, foreign, savings, trust, safety deposit and legal departments managed by expert banking specialists. Also it maintains a steamship and foreign travel department for the benefit of foreigners, their families abroad and Americans planning extended business or pleasure trips; a real estate department which, under the style of the Coventry Land & Improvement Co., handles most of the real estate affairs of Firestone Park, and a payroll room for the use of industrial clients.

Excellent financial condition was indicated by the statement of December 31, 1918, which follows:

RESOURCES.

Cash on hand and in banks	\$324,455.87
Demand Loans	599,446.41
Bonds and other securities	353,900.00
	\$1,187,802.28
Loans secured by mortgages	\$311,941.60
All other loans and discounts	14,885.06
Overdrafts	352.02
Real estate	81,667.49
Furniture and fixtures	4,916.10
	\$2,664,473.63

LIABILITIES.

Capital stock	\$100,000.00
Surplus	50,000.00
Undivided profits (less reserve)	14,885.06
Deposits	2,307,686.61
U. S. Deposits	43,000.00
Payments on United States Liberty Bonds	119,204.96
	\$2,664,473.63

THE RUBBER TRADE IN OHIO.

By Our Special Correspondent.

LIEUTENANT-COLONEL A. B. JONES, of The B. F. Goodrich Co., Akron, has returned from overseas where he has been Deputy Commissioner of the Red Cross in France and in charge for the last three months of all Red Cross work in that country. He resumes his duties as director of plant administration for the Goodrich company, feeling that the Red Cross has done a man-sized job during the four years of the world war.

LIEUTENANT-COLONEL
A. B. JONES.

There were approximately 6,500 people in the Red Cross organization in France, about half of them women. The monthly expenditure was \$5,000,000, of which Mr. Jones had the supervision. The overhead administrative cost, including salaries, of which there were few among the executives, amounted to perhaps three per cent. of the total.

Mr. Jones says that the whole story of the Red Cross is one of innumerable instances of devotion, loyal service, and fine intelligence. It was the Red Cross that revived the morale of the French in 1916 when the soldiers returned home on leave to find their families starving. The Red Cross looked after the families and so put new heart into the men.

After the armistice was signed the first job was to get the American prisoners out of Germany. There were only 3,500 of them and the Red Cross got them all back in 10 days.

H. L. Zimmerman has been promoted to the position of traffic manager for The B. F. Goodrich Co., Akron.

The balloon room of The B. F. Goodrich Co., Akron, has been converted into a gymnasium and will be in charge of the Athletic Association, of which Edward Connelly is athletic director. Three basket-ball courts will be laid out as well as spaces for volley ball and hand ball. Noon-day dances are being held in the new gymnasium.

The Goodrich organization will play independent baseball this season, not having become identified with the newly formed league of industrial athletes.

The B. F. Goodrich Co. has added ten more names to the list of its pensioned employees. The terms of service of these men range from eight to 43 years.

* * *

Robert T. Griffith, general superintendent of the Miller Rubber Co., Akron, has been elected to membership on the Board of Education to succeed Dr. J. H. Seiler, resigned.

* * *

J. F. Barnett, manager of the crude rubber department of the Firestone Tire & Rubber Co., Akron, has gone to Singapore to investigate banking and financial conditions as well as to visit rubber plantations and study planting conditions in that locality. He will probably be absent six months.

W. W. Wright will represent the export department of the Firestone Tire & Rubber Co., Akron, in Singapore, to which he has recently gone.

William Tecuwen will represent the Firestone Tire & Rubber Co., Akron, in the Dutch East Indies as a salesman.

John B. Tuttle, head of the research department of the Firestone Tire & Rubber Co., Akron, has become abstractor of rubber literature in the department of rubber and allied substances for "Chemical Abstracts," published by the American Chemical Society. He succeeds Raxley F. Weber, recently deceased.

R. J. Firestone has resigned as vice-president and director of sales of the Firestone Tire & Rubber Co., Akron, but retains his interest in the company and membership on the board of directors.

* * *

The Faultless Rubber Co., Ashland, had a pleasing exhibit of its rubber toys and balloons on display at the toy show held at the Imperial Hotel, New York City, during February. The display was in charge of A. H. Otis, the former European representative of the company. One of the features of the exhibit was "Sweetie," one of the company's red rubber dolls, in half-size, three inches tall instead of six. Another interesting toy was a red balloon of extra quality rubber which an individual could inflate to a diameter of approximately 18 inches, but which it was said could be inflated by pressure to 27.

* * *

The United States Government has taken over Wingfoot Lake for a central training station for lighter-than-aircraft. The Goodyear Tire & Rubber Co.'s control of the property will terminate June 1, 1919. At this station there have recently been about 275 men in training, of whom half were enrolled in the Navy, being instructed in observation work and the operation of dirigible balloons. It is said that this will be the only training station of the kind in the United States. Early in February thirty men were graduated, on which occasion balloon races were held between pilots and Goodyear company officials made addresses. In future, only West Point and Annapolis graduates are to be eligible to train at Wingfoot Lake, under government ruling.

The Goodyear Tire & Rubber Co., Akron, has made the following appointments in its export department: C. L. Diers, former Indianapolis district manager, now manager of European division of export department, covering all activities of the company in Europe, Asiatic Russia, and the northern coast of Africa; C. H. Williams, former Chicago branch manager, now manager of Far Eastern division, covering the Philippines, China, Japan, Java, Siam, India, and Eastern Russia; A. G. Cameron, former St. Louis branch manager, now manager of Australasian division, covering Australia, New Zealand, and South Africa. Although this work will be carried on mainly from the Akron offices, these men will personally visit their respective fields at regular intervals to familiarize themselves with merchandising conditions and requirements.

The Silent Club, composed of mute employees of The Goodyear Tire & Rubber Co., recently opened club rooms in the building opposite the factory office of the company. This is perhaps the only club of the kind in the country. The facilities of the new quarters include reading and lounging rooms, pool tables, and the usual club-house features. On the opening night the club gave a smoker and open-house party at which the mute athletic organization furnished the entertainment. The Goodyear company employs about 300 mutes in various departments.

* * *

The Mohawk Rubber Co., Akron, recently elected the following officers: R. M. Pillmore, president; J. K. Williams, vice-president; M. E. Mason, secretary; C. W. McLaughlin, treasurer; and S. S. Miller, factory manager. These also constitute the board of directors, together with Messrs. H. L. Rose, Francis Seiberling and George A. Parkér, who were reelected.

* * *

O. L. Travis has been appointed sales manager for The Owen Tire & Rubber Co., Bedford, Ohio.

Casper Smith, sales director of the Katzenbach & Bullock Co., New York City, recently called on the trade in Akron and other points in Ohio. * * *

D. W. Brown has resigned his position as advertising manager of The Republic Rubber Corp., Youngstown, Ohio, to devote his entire attention to his weekly publication, the "Youngstown Citizen." He is succeeded by Honor Blocker, who for two years has been Mr. Brown's understudy and assistant. * * *

Charles E. Wood, dealer in crude rubber, 149 Broadway, New York City, announces that, owing to a change of name of the building where the Akron office is located, correspondence should be addressed to the Akron representative at 328 Central Savings & Trust Building instead of 328 Hamilton Building. * * *

The New Tread Tire Co., Columbiana, has been recently incorporated, as noted elsewhere in this issue. It is equipping with modern machinery a two-story brick building with about 20,000 square feet of floor space for a factory where it will rebuild and retread auto tires. The officers of the company are: F. H. Groves, president; S. W. Tidd, vice-president; C. U. Calvin, secretary and treasurer; and E. P. Altenburg, general manager. The capital stock is \$100,000. * * *

At a recent meeting of the stockholders of The Mansfield Tire & Rubber Co., Mansfield, Ohio, George W. Stevens was elected vice-president and general manager, succeeding George W. Henne who retires from the office to direct his attention to other interests, although he retains his place on the board of directors. Mr. Henne is president of the New Jersey Car Spring & Rubber Co., Inc., Jersey City, New Jersey, which he reorganized some months ago. Mr. Stevens was formerly with the Federal Tire & Rubber Co., Milwaukee, Wisconsin. * * *

The Mansfield Tire & Rubber Co., has elected the following officers: Judge C. R. Grant, president; George W. Stevens, vice-president and general manager; Jesse E. LaDow, secretary; Charles Hoffman, treasurer; and A. C. Moore, assistant treasurer. * * *

The Rotary Tire & Rubber Co., Columbus, with factory at Zanesville, has made Barton Griffith treasurer of the company and Charles W. Bryson and Mr. Griffith are two of its directors. * * *

The Sandusky Tire & Rubber Co., formerly at Sandusky, Ohio, has changed its name to The Ohio State Rubber Tire Co., and is now located at Port Clinton, Ohio. S. M. and W. O. Bruess are interested in the company. * * *

The National Tire & Rubber Co., East Palestine, Ohio, is building a large addition to its factory, in which it plans to manufacture two new brands of high-grade guaranteed tires for the jobbing trade. * * *

This company has just arranged for life insurance for its employees along the lines followed by other similar companies, the policy costing the employee nothing and increasing in value automatically with the employee's increased length of service. * * *

The Bucyrus Tire & Rubber Co., Inc., Bucyrus, Ohio, has changed its name to Henderson Tire & Rubber Co., Inc., but the officers and organization remain the same. * * *

Samuel L. McClune, Cleveland, Ohio, has been elected a director of The McGraw Tire & Rubber Co., East Palestine, Ohio. * * *

The Gordon Rubber Co., Canton, Ohio, at its annual meeting elected the following directors: Samuel Ake, E. A. Bowman, Judge Henry W. Harter, C. J., C. W. and W. E. Keplinger, H. B. McMaster, J. F. O'Dea, and H. S. Renkert. The directors

have elected the following officers: H. B. McMaster, president and general manager; C. K. Keplinger, vice-president; C. J. Keplinger, secretary and treasurer. The company is now manufacturing only automobile tires and tubes, having disposed of its druggists' sundries business. * * *

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

A SPECIAL meeting of the foremen and executives of the Stoughton Rubber Co., Stoughton, Massachusetts, was held at the office of the plant January 29, at which Ira F. Burnham, for more than 40 years at the head of that factory, introduced as his successor C. L. Wanamaker, a young man who had been specially fitted for such a position by intensive practical education. He is a graduate of Dartmouth College, and also of the Tuck School of Business Administration and Finance, and his practical education in the rubber business was acquired at Naugatuck and New Haven, Connecticut, Williamsport, Pennsylvania, and Cambridgeport, Massachusetts. He is thus well-trained in both technical and administrative duties. * * *

Mr. Burnham will still live in Stoughton, and will, to a certain extent, hold an advisory position in connection with the Stoughton Rubber Co., but being relieved of the detail, will be able to devote himself to the perfection of a new plan, and the installation of a new department of the United States Rubber Co. * * *

At the meeting, as special guests and representatives of the general management of the United States Rubber Co., were: Myron H. Clark, general factory manager; Arthur T. Hopkins, assistant general manager footwear division; Charles T. McCarthy, secretary to Mr. Hopkins; and W. D. Holden. * * *

Edwin H. Kidder, manager of the Boston branch of the United States Tire Co., who has been in military service for several months, has returned to civilian life, and resumed the duties of the above office. Mr. Kidder is one of the best known and most popular men connected with the tire industry in Boston, and he received a royal welcome on his return to business. * * *

EDWIN H. KIDDER.

Following the resignation of W. B. Gleason as secretary-treasurer of the Revere Rubber Co., Chelsea, Massachusetts, John D. Carberry was chosen secretary and W. H. Blackwell treasurer, with offices in New York City. F. L. Bunker as assistant treasurer has his headquarters at the plant in Chelsea. * * *

The United States Rubber Co. has sold a large plot of land in Chelsea to the Winnisimmet Land Co., which will improve and develop it for a ship-yard. Situated in the down-town section of the city and extending to the Harbor Commissioners' line, the property is admirably fitted for such use. Containing over 90,000 square feet, it is pronounced one of the finest pieces of wharf property in the city, and was assessed at \$109,700. It is said that the price paid was largely in excess of that figure. The plots (there were two of them), were not being industrially utilized by the United States Rubber Co. at the time of the sale. * * *

The C. & C. Raincoat Co., formerly at East Boston, but which has a factory on Washington street, Boston, has purchased a tract of land in Stoughton, Massachusetts, on which it proposes to erect a two-story factory, 200 feet long and 40 feet wide, mill construction, in which to manufacture raincoats and over-

alls. The contract for the erection of the factory has been signed, and it is stated that the work will be pushed forward so that the company can transfer its business within a few months, when 200 hands will be employed.

* * *

Revere Building, 60-66 High street, which houses the mechanical department of the United States Rubber Co. in Boston, was the scene of a rather lively fire on February 9. The blaze was confined to the fourth floor, occupied by the American Toilet Goods Co., and owing to the fireproof and waterproof construction of the building, the rubber concern's portion of the premises suffered but an inconsiderable inconvenience and little damage.

* * *

The Rubber Manufacturers' Mutual Insurance Co. held its annual meeting in this city on January 22, 1919, and re-elected the five directors whose terms expired on that date, thus continuing the board of directors and the officers as before. The officers are: Arthur H. Lowe, president; George B. Hodgman, vice-president; Benjamin Taft, secretary and treasurer. The directors include, besides the above, Marcus Beebe, C. C. Converse, E. H. Clapp, F. W. Pitcher, H. E. Converse, C. T. Plunkett, J. P. Stevens, C. A. Stone, B. F. Peach, E. Frank Lewis, and Lester Leland. The affiliated companies, namely the Industrial Mutual Insurance Co. and the Cotton and Woolen Manufacturers' Insurance Co. of New England, held annual meetings on the same date, and re-elected the same boards of managers and officers that had served the previous year.

* * *

Lieutenant Leon A. Field, who, before entering service was assistant to the master mechanic of the Boston Rubber Shoe Co., was given a complimentary dinner at the Aldine, Melrose, Massachusetts, late in January, by his immediate business associates of Factory No. 2. George L. Lawrence, Jr., factory manager, was toastmaster, and several short addresses were made. Lieutenant Field gave a very interesting account of his experiences overseas.

Lieutenant Field was born in New Hampshire July 11, 1891, and attended the public schools in Biddeford, Maine, graduating from the University of Maine, at Orono, that state, in 1914, and at once commenced work at the factory of the Boston Rubber Shoe Co. Entering the Third Officers' Training Camp in January, 1918, he was commissioned second lieutenant the following March, sailing for Brest March 21. He served at Southampton, the tank training center for all British tanks, also at Havre, Beauvais, and Tours, and was in action at Soissons. He celebrated Christmas, 1918, by sailing for the United States, and was recently mustered out at Camp Humphrey, Virginia.

* * *

The Hood Tire Sales Co. was organized in Watertown, Massachusetts, about a year ago, for the sale of Hood Tires. About the first of last month the concern opened a store at 1041 Commonwealth avenue, in the automobile section of Boston, where are carried in stock all sizes and treads of the Hood Rubber Company's tires. With a sales force and mechanical staff a lively season is expected.

D. Janion MacNichol, the new president and manager of the Hood Tire Sales Co., makes his headquarters at this Boston store. Mr. MacNichol was formerly New England manager of the Chicago advertising agency concern of Critchfield & Co., a position he relinquished to assume the management of the tire sales company.

* * *

Henry Chase Hopewell, son of the late John Hopewell, and connected with the carriage cloth firm of L. C. Chase & Co., Boston, was married last month to Miss Hilda Prince, daughter of James P. Prince, of Lexington, this state. Owing to the illness of his mother, the wedding was a quiet one.

Only a few days later his mother died at her residence in Newton. She was born in Springfield, Massachusetts, in 1844, and was married to John Hopewell October 20, 1870. The family resided in Cambridge for nearly 30 years, part of which time Mr. Hopewell was mayor of that city. She leaves three sons, Charles F., Frank B., and Henry C. Hopewell and two daughters, Mrs. Mabel G. Casselberry and Mrs. Nellie H. Colby.

* * *

The foremen and assistant foremen of The Fisk Rubber Co., Chicopee Falls, gave a banquet at the Worthy Hotel, Springfield, on the evening of February 1, 1919. About 150 employees of the company were present.

* * *

The Hewitt Rubber Co. of Massachusetts, recently incorporated, has opened a salesroom at 48 Gloucester street, to handle the New England sales of Hewitt tires, manufactured by Hewitt Rubber Co., Buffalo, New York. W. S. Carleton, formerly with the Republic Rubber Co., but who for the last nine months has been in the service of the United States Shipping Board in Philadelphia, is manager. Associated with him are F. M. Broadhead, for the last year or more with the 101st Engineers, in France, and T. H. Morgan, both of whom were formerly identified with the Republic Rubber Corp.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

THE Eckrode Rubber Co., of Newark, has been incorporated at Trenton with a capital stock of \$100,000 to engage in the manufacture of automobile tires, tubes and other rubber goods. The officers are Clement Eckrode, Highland Park, president; G. F. Hensler, Newark, vice-president; A. G. Hensler, Newark, secretary and treasurer. A large factory has been leased at 118-20-22 Adams street, Newark, where a large number of hands will be employed. Mr. Eckrode formerly was in charge of the Endurance tire plant at New Brunswick, New Jersey, which has been taken over by the Hardman Rubber Co.

* * *

Charles E. Stokes, vice-president of the Home Rubber Co., has been appointed chairman of the War Council of the Episcopal diocese of New Jersey. The diocese is seeking to raise \$250,000 for work among the army camps.

* * *

Herbert H. Coleman, of East Orange, New Jersey, president of the Delton Tire & Rubber Co., Trenton, sailed for France on February 18 on a business trip of about five weeks.

* * *

The Lambertville Rubber Co., Lambertville, New Jersey, has just completed an addition to its plant. The building is of concrete and will be used for storage purposes.

* * *

Clement Ehret, general auditor of The Empire Rubber & Tire Corp., who recently resigned to accept a position in New York City, was presented with a handsome diamond cluster scarf pin by the office force. The presentation was made by H. E. Berrien, the cashier of the concern. Mr. Ehret has been connected with the Empire company since 1917.

* * *

William J. B. Stokes, treasurer of the Thermoid Rubber Co., has been made chairman of the committee to solicit funds for the erection of a new \$1,000,000 hotel at Trenton. He has also been made president of the new hotel company. The following rubber companies have subscribed toward the project: United & Globe Rubber Manufacturing Co., Luzerne Rubber Co., DeLaski & Thropp, Circular Woven Tire Co., DeBlois Tire & Rubber Co., Woven Steel Hose & Rubber Co., Semple Rubber Co., Louis Destribats, manager Ajax Rubber Co., Inc., William H. Servis, vice-president of the Hamilton Rubber Manufacturing Co. William J. B. Stokes and his brother, J. Oliver Stokes,

treasurer of the Joseph Stokes Rubber Co. and the Home Rubber Co., head the rubber list.

* * *

Lionel Emdin, the founder of the Delton Tire & Rubber Co. plant at Trenton, announces that he will shortly break ground at Asbury Park for the erection of a rubber plant for the Victory Tire & Rubber Co. The factory will be located on Third and Fourth avenues and will have a siding running to the Central Railroad. The new plant will be of brick, two stories high and about 80 by 175 feet, with a daily capacity of 200 tires and tubes. Nothing but high-grade goods will be made, all having 6,000-mile guarantee. The necessary machinery has been ordered and it is expected that the new plant will be in operation in June.

* * *

Ensign George T. Oakley, naval aviator, son of Clifford H. Oakley, president of the Essex Rubber Co., has been assigned to inactive duty and has returned home from Pensacola, Florida. Ensign Oakley enlisted April 25, 1917, as a second-class seaman and was assigned to the U. S. S. *Niagara*. After being in the service for several months he went into the aviation section, United States Naval Reserve Force, and was trained at the Massachusetts Institute of Technology for a pilot. He was then sent to Pensacola for final flying work after training at Bay Shore, Long Island. He was making a flight at Key West when his airship fell into the ocean. He was rescued with another aviator.

* * *

William J. B. Stokes, president of the Thermoid Rubber Co., has been appointed chairman for Mercer County, this state, for the Fifth Liberty Loan, which begins Easter Monday. He was chairman of the last loan campaign and did splendid work.

WELLMAN-SEEVER-MORGAN CO. ELECTS OFFICERS.

The Wellman-Seever-Morgan Co., Cleveland, Ohio, at its annual meeting of stockholders on February 18, 1919, reelected the following directors: Edwin S. Church (president and general manager), F. E. Borton, W. H. Cowell (secretary and treasurer), F. B. Richards, S. T. Wellman, E. H. Whitlock, S. H. Pitkin (vice-president), Francis Seiberling, and F. A. Seiberling. George W. Burrell was elected second vice-president and will have charge of the company's works at both Cleveland and Akron.

CROSS COUNTRY TIRE CO., INC.

The Cross Country Tire Co., 343 Babcock street, Buffalo, New York, manufactures rebuilt auto tires from select carcasses that have been prematurely discarded. These are first repaired, then relined and a new cushion, breaker, tread and side wall applied. The line includes various non-skid tire designs. R. M. Loewenthal is president, and Jack Sider, secretary, of the company.

F. R. HENDERSON & CO. OPEN OFFICES IN SINGAPORE AND BATAVIA.

That fair business dealing and American enterprise are productive of commercial success is shown by recent developments in the firm of F. R. Henderson & Co., crude rubber importers, New York City and Akron, Ohio.

Francis R. Henderson, the head of the concern, has recently returned from a six months' business sojourn in the Far East, having visited the Federated Malay States, Straits Settlements, Java and Sumatra.

Mr. Henderson spent three months in Singapore where he acquired the property and business of the International Trading Co., Limited, that was merged in the new firm of Henderson Brothers Limited, Singapore, Straits Settlement. While in Batavia he established the firm of Henderson & Keulemans, Limited, (Handel Maatschappij Henderson & Keulemans.)

Batavia, Java. The associate, G. J. M. Keulemans, is a Hollander with broad experience in plantation rubber and well known by planters in the Far East.

THE RUBBER ASSOCIATION'S EFFICIENT SECRETARY.

IN the last five years many men have accomplished much for the good of the rubber trade. Of these successful workers a prominent place belongs to the secretary and treasurer of The Rubber Association, Harry Stephen Vorhis. At this time, therefore, a sketch of his career is of interest.

Mr. Vorhis was born in Spencer, New York, in 1873. After attending Spencer Academy and Franklin Academy at Prattsburgh, New York, he entered Yale University, graduating in 1895. During his college life he worked on the staff of the "Journal & Courier," a well-known New Haven paper. He later studied for a year at the New York Law School. Newspaper work was his ambition, however, and he served in various news and advertising positions previous to joining the staff of the New York "Sun" in 1900. Five years later he left to work on various New York and Boston financial and trade papers.

Two years before the great war The Rubber Association enlarged its scope and leaders in the rubber trade felt that a competent secretary was needed to carry out the plans they had formulated. The choice fell upon Mr.

H. S. VORHIS.

Vorhis and this selection has proved a wise one.

At the beginning of the European war complications regarding rubber imports resulted in the Association becoming advisory to the British Consul in New York City, to whom all crude rubber entering this country was consigned, and later the entire matter of receiving and allocating was turned over to the Association. How well this matter has been handled is too well known in the trade to need comment here. The work required the organization of a force of 50 or more employees, all under Mr. Vorhis' direct charge. Mr. Vorhis does not belong to the Secretaries' Union nor does he know anything about the eight-hour day. His office day over, he is usually to be found at the Union League, the Yale, or the Lotus, or wherever important rubber committees are to be found. There he answers questions, produces documents and makes a careful record of discussions, of suggestions, wise and otherwise, and of final decisions. Then, when the rest sleep, he puts the matter into shape against the demands of the morrow. He never rests, never complains, never "leaks." As an earnest, tireless worker he is without par, and has carried out the plans of the rubber committees, big and little, with unvarying intelligence and efficiency. With it all he is modest, likable and extremely popular.

RUBBER SUBSTITUTE FACTORY IN NORWAY.

Det Tekniske Finansindustri, Christiania, has acquired the sole right for Scandinavia to manufacture a rubber substitute from materials found in Norway. This is said to have been tried for many years, and is expected to be of great importance to Scandinavian rubber consumers, as it costs not more than a fraction of the price of real rubber. The company was started with a capital of \$134,000, and is now increasing it to \$576,000.

RUBBER IMPORTS INTO ST. PIERRE-MIQUELON.

Rubber footwear imports into St. Pierre-Miquelon, for 1917, amounted to \$16,076 from Canada, \$14,930 from the United States and \$183 from France.

Activities of The Rubber Association of America.

MANUFACTURERS ASKED TO SUPPORT ASSOCIATION
REVENUE PLAN.

January 28, 1919.

To the members:

ONLY a few years ago and just prior to the war the Rubber Association organization consisted of a secretary and one stenographer. The income of the Association in 1912 amounted to \$1,616.25, and was derived from initiation fees and dues. The expenses of the Association during that year amounted to \$829.90. For the year of 1918 the income was \$213,203.82 and the expenses \$199,614.75. In other words the Association has in a few short years grown from a social organization into a broad, active organization vitally representing the interests of the industry. The expenses due to war work have ceased. The revenue due to this same cause is about to cease. Much of the work started during the war can be continued for the benefit of the industry provided arrangements can be made to provide the necessary funds.

At the annual meeting it was unanimously voted to continue the work and provide funds by a tax upon crude rubber. The general feeling was that this assessment should be three (3) cents per hundred pounds. This will provide for an income somewhat in excess of present requirements and will enable the Association to increase its permanent investment fund. If at any time in the future this fund reaches such an amount that the income from it is sufficient to pay the running expenses then the assessment could be discontinued.

An assessment on crude rubber purchased by manufacturers is an eminently fair method of raising funds, inasmuch as it equitably distributes the burden among the large and small manufacturers and goes into the cost of all alike. Three cents per 100 pounds is only .0003-cent per pound, .0006 per cent on 50-cent rubber, and yet this small amount if paid by all will yield a revenue of approximately \$100,000 per year to the Association. It would obviously be unfair for some to pay and others not to pay and still derive the same benefits.

This assessment will take effect January 20, when the old charge was abolished, and it is therefore hoped that all manufacturers will agree to the revenue plan which is enclosed herewith. Please have it signed by an official of your company and returned to the secretary in the enclosed envelope.

The manufacturers are the important beneficiaries of the proposed work of the Association. The importers are also benefited but in a smaller degree and it was the sense of the meeting that in acting as a collection agency for the fund they would be doing their part.

It is proposed to have a published list of manufacturers signing the agreement and a copy of this will be given each manufacturer as well as each importer, dealer, and broker.

THE SECRETARY.

MANUFACTURERS' AGREEMENT.

From (name of manufacturer). (Address.)

To The Rubber Association of America:

We hereby agree to pay to The Rubber Association of America an amount equal to three (3) cents per hundred net pounds of crude rubber purchased by us.

If purchasing is made through an importer, dealer, or broker, we hereby authorize the charging of this amount on the invoice with the understanding that said importer, dealer, or broker will, upon receipt, remit the amount thus collected to The Rubber Association of America.

We further agree to make a confidential quarterly report to the secretary of the Association which will show the amounts collected from us for the account of the Association, by the various importers, dealers and brokers.

It is understood that the figures shall be available only to the secretary and auditor of the Association. It is further understood that any surplus remaining after paying the current expenses shall be invested and added to the permanent funds of the Association.

In the case of direct importations of crude rubber made by us we agree to remit to The Rubber Association of America an amount equal to three (3) cents per hundred pounds on all rubber so received.

It is further understood that funds so collected shall be held and used only for the common good of the members of The Rubber Association of America, and that the continuation of

this assessment shall be considered at the annual meeting of the Association.

THE RUBBER ASSOCIATION OF AMERICA.

By

(Signature of manufacturer.)

FIRM MEMBERS' BALLOT ON TRUST LEGISLATION.

February 15, 1919.

To the firm members:

By direction of the board of directors, we are enclosing you herewith a copy of Referendum No. 26 of the Chamber of Commerce of the United States of America on the report of the Federal Trade Commission of the Chamber regarding Trust Legislation.

This recommends (1) consideration by Congress of all anti-trust legislation, (2) formulation of standards of general business conduct to be administered by a supervisory body, (3) an enlarged Federal Trade Commission of nine instead of five members, (4) which should be made the supervisory body. It is, therefore, of immediate importance that an expression of the opinion of the best business minds of the country be obtained regarding this highly pertinent subject.

On the enclosed ballot, we would ask that you register your opinion with regard to the several questions asked, and return to the secretary not later than March 14, 1919.

THE SECRETARY.

BALLOT.

REFERENDUM No. 26 OF THE CHAMBER OF COMMERCE OF THE UNITED STATES OF AMERICA.

To The Secretary of the Rubber Association of America:

Dear Sir:

We desire to record our vote on the proposal of the Chamber of Commerce of the United States of America as noted below:

I. The committee recommends that Congress should at once consider the situation of all statutes constituting our anti-trust legislation.

In favor

Opposed

II. The committee recommends there should be formulated standards of general business conduct to be administered by a supervisory body.

In favor

Opposed

III. The committee recommends that an enlarged Federal Trade Commission should be made the supervisory body.

In favor

Opposed

IV. The committee recommends that the membership of the Federal Trade Commission should be increased from five to nine.

In favor

Opposed

Attest:

(Signature of Firm Representative.)

FREIGHT TRAFFIC PERMITS FOR DOMESTIC FREIGHT.

February 14, 1919.

To all firm members:

Your attention is directed to the following advices issued by the Allegheny and Eastern Regions of the United States Railroad Administration respecting the cancellation on February 15 of the permit system now applicable on domestic freight for New York.

Please cancel, effective February 15, 1919, the embargoes placed as a war emergency January 15, 1918, against carload domestic freight for Manhattan Island, the Bronx (New York City) and station deliveries on New York Harbor, including Brooklyn Terminal Companies, which freight is now being moved under F. T. C. permits issued by the Freight Traffic Committee, North Atlantic Ports.

Effective as above such freight may move without permits subject to embargoes of the delivering railroads.

No change will be made in the method of permitting export carload freight for the present; and carload domestic freight must not be accepted for other than regular station deliveries. Reconsignment for export or lighterage deliveries will not be allowed.

MANAGER, TRAFFIC DIVISION.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

RAW RUBBER.

SUPPLIES of Brazilian fine rubber are now coming to hand since shipping has become available. There is still, however, considerable delay at the ports, rubber which arrived in Liverpool in the first week of December not reaching the rubber works until the middle of January. This rubber was bought at a considerably higher price than to-day's quotations, but of course the future position could not be foreseen and supplies had to be assured. Now the premium on Brazilian is much lower than it was, the determining factor being shipping facilities. Rubber works generally seem to be pretty well supplied for their raw product and there is little buying at the satisfactory price of 2s. per pound. Indeed, there is a good deal on hand and more to come forward at 1s. 9d. per pound, and in some quarters there is a disposition to wish that the price would rise. There does not seem much chance of this, however, as long as the blockade of Germany continues and until the factories of Germany, Austria, and Russia get into full swing again. I hear of quite a large inquiry for raw rubber from Switzerland, which seems somewhat strange as this is not a manufacturing country.

TRADE CONDITIONS.

The past month has been characterized by much the same conditions as the preceding. There is a halting tone in the rubber trade as in most others, the fixation of contracts being deferred for the more favorable prices which buyers are always anticipating in the following week. With regard to the home rubber trade, the armistice came at the worst time of the year and general business has not progressed according to expectations. In fact, there is a good deal of pessimism to be met with because expenses and taxes show no signs of diminution with the cessation of so much government business. Government work naturally has not come to an end; even in peacetime there is always business doing and there will be for some time large armies to be equipped. One or two classes of rubber goods, particularly those where spreading is concerned, have had their production entirely stopped, leaving a good deal of plant capacity idle, but in a general way the proofoers by working ordinary hours and stopping all overtime have been able to dispense with any drastic dismissal of employees.

RUBBER CARD CLOTH.

In the November issue I referred to the rubber card cloth in which a large business has always been done between British manufacturers and Continental spinners. This trade was naturally much upset by the war and it does not look as if it would be resumed as quickly as was expected. This is entirely because of price. The material is wanted badly by the numerous mills which are now being rebuilt and put in order in Belgium and France and plenty of inquiries and orders have come to England. However, these have reference to pre-war prices which are quite out of the question on account of the rises in cotton, steel, and labor. Like many other rubber goods, the rubber in card clothing, though a most important component, does not form the whole or even the major part of the finished articles, so the fact that there has been no rise in the price of rubber has not a great bearing on the matter. Buyers no doubt will come to recognize that higher prices will have to be paid, but at the time of writing there is absolutely nothing doing in the Continental business referred to.

LABOR CONDITIONS.

The high rates of wages paid to munition workers and the numerous bonuses granted to workers of almost all kinds on

account of the increased cost of living have caused a general upset in the labor world and on all sides one reads of persistent demands for higher wages, in nearly all cases coupled with a request for shorter working hours. This hardly looks promising for a large increase of trade at competitive prices, though I think it may be taken for granted that the same sort of thing will be experienced to a greater or less extent all over Europe. The engineers' demand for a 47-hour week with no work before breakfast having been generally conceded, the cotton and other large industries are agitating in the same direction. It is stated by the men that there will be no diminution in the output, this being rather suggestive of slackness in the past. The employers say that they will not be able to check this statement until some months, possibly a year, has passed under the new conditions. The 48-hour week having been established, there is now talk of a 44-hour week. So far these movements have affected only the fringe of the rubber trade, i. e., the mechanical shops found in the larger works, but no doubt the whole trade will shortly be affected.

A good deal of resentment is shown by British workers at having to pay income tax and there is a strong disposition in some quarters to keep earnings below the taxable limit. In America I understand the case is different and the work people earn as much money as they can. This means that output is maintained and no doubt increased, while the action of our workers has the opposite effect. It is this rise in the cost of labor that must effectively prevent any return to pre-war prices in the case of almost every article of expenditure, whatever may be the fluctuation in the price of materials.

DUROPRENE.

This is a new varnish put upon the market by the United Alkali Co., Limited. Although its composition is not divulged in the trade circulars which extol its many desirable properties, it is understood to consist largely of the hydrochloride of caoutchouc, or whatever may be the correct designation of the white body produced by the action of chlorine upon rubber. The kaloid derivatives of rubber have now been known for many years in the chemical laboratories, but it is only in the last year or two that they have been put to commercial use, the pioneer in this movement having been S. Peachey, of Manchester. Duroprene is a thick viscous liquid which may be thinned by various diluents if the purchaser for special purposes so desires. A strong point is made of its noninflammability, and it has found favor as a fireproof dope as well as for varnishing wood and metal work of all kinds as a precaution against damp. It is claimed that its noninflammable character makes it superior to most agents as a waterproofing medium. I do not know whether this is capable of replacing rubber in this connection, but it is a quite new application of rubber. The price for single gallons is 14s., while for 100 gallons it is reduced to 12s. 6d. per gallon f. o. b. works, which are at Widner, Lancashire.

THE SOLVENT POSITION.

The contracts for solvent naphtha for 1919 rule about 2s. 9d. per gallon, a considerable reduction from the prices of the last two years, but still much higher than is liked in the now closely competitive spreading branch of the trade. The increased use of coal-tar products for mixing with petrol for motor purposes has had the effect of keeping up prices for the former. Thus benzol, which is now free from government control, is quoted at 2s. 6d. per gallon, though it may be taken for granted that this price will come down as further stocks of petrol become available. Benzol has never been at all popular with proofoers

and at the present price they are not inclined to look at it, though the case might be different if it were half the price of solvent naphtha. This question of the supply and price of solvents is closely connected with pleasure motoring, about the immediate revival of which quite diverse opinions are expressed. I am disposed to agree with those who say that it will be some time before we see anything like the pre-war rate of pleasure motoring because the prices all around, including hotel accommodations, are much higher and the increase in the income taxes is not to be ignored.

THOSE RUBBER TEATS.

A good deal of correspondence, of course politically flavored, has been going on with regard to the sending to Germany of a million rubber teats by the Women's International Association. I do not know the name of the British firm which filled the order, but it must be one of three or four which I have in mind, because these goods are not made in many of our works. I understand that the distribution is in the hands of the Red Cross. I have not made any calculation as to what weight of rubber is involved, but I think that those people who imagine that a large number of motor tires will promptly make their appearance in Berlin are alarming themselves needlessly. Anyway, the house to house collection and subsequent reclaiming will not be done in a day.

BARYTES.

The price of barytes has gone up very much during the war, owing to the imports from Germany and Belgium having ceased, and it is a matter of importance to British users to see what is going to happen under peace conditions. A rise from £2 to £8 is no trifle, as the principal users who are in the paint trade have found. The main facts as regards British production are that there is plenty of the raw material at home and that the output has increased by about 30,000 tons in the last three years. A large amount of this was used in the rough for lithopone manufacture, a material for which the large demand in the rubber trade has now declined. A large number of new mines have been started and several new grinding mills put up. Only a certain proportion of the British output is the best white quality and the makers are apprehensive that they will not be able to keep their present profitable business unless they are secured by tariff against foreign imports. The paint trade and possibly the rubber trade are not so keen against foreign competition and as far as I can judge the situation the authorities are inclined to conjure the British producers to see if they cannot manage to meet foreign competition better than they did before the war, especially if improved transport facilities become available. This barytes question, of course, is only one of many industries in which producers have for the first time formed themselves into an association for the furtherance or protection of their interests and which interests are not those of the consumer of these products.

TIRE IMPORTS IN BRITISH SOUTH AFRICA.

During 1917, tires were supplied to British South Africa by the United Kingdom of a value of \$1,374,227, Great Britain being the principal source of supply, with 53 per cent of the total imports to its credit. Imports from the United States increased from \$692,114, in 1916, to \$705,681, in 1917, and a material gain resulted to French and Italian manufacturers, imports of their goods increased by 71 per cent compared with the figures of 1916.

VENEZUELAN BALATA EXPORTS IN 1917.

During the second half of 1917, balata ranked fourth in value among the products exported from Venezuela, the total amounting to 3,719,633 bolivars, equivalent to \$717,889.17 in United States currency, a bolivar amounting to \$0.193.

LATEX-COLLECTING CUPS.

IN the development of the plantation rubber industry, quality of product is recognized as an important factor in the realization of profits. This has led to the utilization of carefully devised tools, machinery, and methods for every phase of the working processes, from the latex to the finished material packed for export to the rubber goods manufacturer.

In the scheme of development the simple latex cup employed at the tree for collecting the latex, has received considerable attention. Satisfactory latex cups are now obtainable, principally of English manufacture, in a variety of forms, dimensions, and materials.

VARIETIES OF CUPS.

The forms are commonly circular with tapered sides, to admit "nesting," and have inside rounded bottom.

Some are convex tapered and others are oval like the blossom end of a half lemon. Some forms show a flattened or inwardly

TYPES OF LATEX-COLLECTING CUPS.

curved surface on one side for close accommodation to the tree trunk, and others are provided with a hole for nailing to the tree.

The dimensions are variable from three to four inches in diameter. The porcelain cup used on certain large estates has the following measurements: diameter of top, four inches; diameter of bottom, 2½ inches; depth, three inches; thickness of wall, ¼-inch. The materials from which latex cups are made are tin, iron, aluminum, glass, porcelain, and earthenware.

In use the cups to receive the latex flow rest on the ground under the spout or are supported against the tree by a wire or cord encircling both cup and tree trunk. Many estates have the initials of the company on the outside surface of their cups. Prominent among many different styles and sizes of cups used in the Far East may be mentioned the half-round porcelain form. This cup is four inches across the top and two inches deep, with ⅝-inch walls and flat inside bottom to prevent its overturning when placed on the ground.

METHOD OF USE.

The method of using the latex cup varies on different estates. As received, cups come in boxes containing about 500. They are unpacked, inspected, and marked at the coagulating station. The cups, when distributed to the different trees, one for each, are hung on a piece of wire from the tree, or on top of a sharp-pointed stick stuck in the ground near by. After the tapping cut has been made the cup is placed underneath the sheet metal spout, either on the ground if the tapping is low or on wire formed into a loop encircling the tree.

The latex thus collected in the cup is emptied out and as much as possible removed with a squeegee. The cup is then washed in clean water and returned to the wire holder, or pointed stick, with the mouth down.

Several American concerns have recently given their attention to the manufacture of latex cups for which there is a large demand from rubber planters.

Russian Trade Possibilities.

AN eminent Russian authority on economics, Professor Joseph M. Goldstein, of the Moscow High Institute of Commerce and Industry, and of the University of Moscow, stated seventeen years ago in a report to Count Witte that if Russia did not radically change her foreign policy she would become, in effect, a German colony. Previous to the present war this result had actually taken place as shown by Germany's preponderating control of Russia's import trade in all classes of manufactures. Previous to 1914 Russian import trade amounted to \$600,000,000 annually and official statistics indicate that Germany was constantly gaining increasing control of this trade. Now with the country disorganized, Russia's imports will amount to \$1,500,000. Here is a magnificent opportunity for the Allies to free Russia from German economic domination on a purely business basis.

In the statistics presented by Professor Goldstein, those of interest to American rubber manufacturers include the following classifications, representing the total rubber and rubber goods importations by Russia for 1913 and the large proportion controlled by Germany.

RUBBER GOODS IMPORTED INTO RUSSIA

	Total Pounds Imported from All Countries	Imported From Germany	
		Per Cent.	Value.
Crude rubber and gutta percha....	24,960,200	27	\$5,000,000
Rubber cloth	347,800	83	179,000
Soft rubber sheets and slabs.....	177,600	79	189,000
Products of soft rubber.....	451,400	89	212,000
Soft rubber combined with other materials	410,700	75	169,000
Totals	26,347,700		\$5,749,000

In the case of machinery in which rubber is component or accessory the figures are as follows:

	Total Pounds Imported from All Countries	Imported From Germany	
		Per Cent.	Value.
Threshers, etc	284,000	32	\$252,000
Locomotives and motor wagons....	64,400	94	320,000
Typewriters	23,100	64	450,000
Cycles (2 wheel)	18,900	85	724,000
Motor cycles	1,500	80	175,000
Automobiles	3,300	79	4,740,000
Totals	395,200		\$6,661,000

In the matter of certain minerals and chemicals, Germany's trade with Russia averaged 71 per cent of the total in those lines in 1913 and aggregated a value of \$1,719,000. The materials referred to included tars, pitches, asphalt, mineral wax, paraffine, sulphur, sulphuric acid, bisulphide of carbon, benzol, aniline and caustic soda. These are all utilized to greater or lesser extent in rubber manufacture as well as in other lines.

Russia will have need to import manufactured goods for an indefinite long time, and it is imperatively necessary for the world's security that Germany be prevented from gaining economic control of Russia.

CEYLON RUBBER.

In 1908 the shipments of Ceylon rubber amounted to less than a million pounds; nine years later, in 1917, the figure increased to over 75,000,000 pounds, exceeding the previous record year of 1916 by nearly 30 per cent, compared with the increase in value of approximately 23 per cent.

Average rubber prices for the five years 1913 to 1917 were as follows: \$0.62 per pound in 1913, \$0.46 in 1914, \$0.54 in 1915, \$0.58 in 1916, and \$0.48 in 1917. Owing to the dislocation of exchange the first rubber auction in the chamber of commerce rooms was not held until February 23, and then payment was in London sterling drafts instead of Indian rupees. This condition of payment prevailed at all the sales throughout the year. There was, however, a fair amount of business done in private sales. First quality crepe opened at \$0.58, advancing steadily to \$0.68 per pound by April. Prices then declined until the beginning of August, when first-quality crepe auctioned at \$0.47 per pound. In November the price recovered to \$0.52, but in December it again fell, until the highest price paid was \$0.40 per pound. For the first three months of the year crepe had an advantage of about \$0.03; in April prices were about the same; in May smoked sheets were relatively a cent higher; in August they reached a point of about \$0.03 higher; but during the rest of the year crepe was level with or higher than sheets.

The United States and United Kingdom took approximately equal shares of Ceylon-grown rubber, the two countries consuming close to 95 per cent of the colony's entire rubber production. (Commerce Reports Supplement, December 17, 1918.)

"RUBBER MACHINERY" by HENRY C. PEARSON, IS FILLED WITH valuable information for rubber manufacturers. Price \$6.

Recent Patents Relating to Rubber.

THE UNITED STATES.
ISSUED DECEMBER 10, 1918.

- N**O. 2,780,898. Ball's hand with fingers actuated by rubber band threaded through interior passages. M. R. Harrison, New York City.
- 1,287,114. Respirator. J. Saracino, LaPorte, Ind.
- 1,287,149. Anesthetic mask. W. P. Walter and D. G. McCurdy, Evanston, assignors by mesne assignments to Safety Anaesthesia Apparatus Concern, Chicago—both in Ill.

REISSUES.

- 14,577. Rubber and fiber composition shoe sole. L. F. Montgomery, Fort Recovery, assignor of $\frac{1}{4}$ to J. E. Grosjean and $\frac{1}{4}$ to F. L. Maize, both of Lima—all in Ohio. Original No. 1,212,985, January 16, 1917.
- 14,579. Dust cap for valve stems. C. T. Shaffer, San Francisco, Calif., assignor by mesne assignments to A. Schrader's Son, Inc., Brooklyn, N. Y. Original No. 1,191,840, July 18, 1916.
- 1,289,106. Rubber-shoe sole with slip-resisting pockets and ribs. H. Buller, Andover, assignor to Converse Rubber Shoe Co., Malden, both in Mass.
- 1,289,231. Garter for knickerbockers. V. L. Munro, Highland Park, Ill.
- 1,289,269. Umbrella cover with elastic end. W. W. Rucker, Portland, Ore.
- 1,289,445. Shoe heel. V. B. Greco, Waterloo, Ia.
- 1,289,463. Puncture-proof pneumatic tire. D. F. Hervey, Logansport, Ind.
- 1,289,476. Life-preserver suit. L. V. Kevicky, New York City.
- 1,289,478. Automobile tire. J. Kozak, Milwaukee, Wis.
- 1,289,586. Cushion wheel. M. T. Weston, New York City.
- 1,289,630. Demountable tire rim. E. K. Bresler, Amanda, O.
- 1,289,647. Wind-shield wiper. J. W. Cain, Chicago, Ill.
- 1,289,662. Improved rubber-shoe sole. M. H. Clark, Hastings-on-Hudson, N. Y., assignor to Goodyear's Metallic Rubber Shoe Co., Naugatuck, Conn.
- 4,289,706. Nipple for nursing bottle. W. J. Eggers; Mary J. Eggers, administratrix of W. J. Eggers, deceased, Brooklyn, N. Y.
- 1,289,754. Clincher rim for tires. E. Hayes, Brooklyn, assignor of $\frac{1}{4}$ to Hayes-Buefleider Co., Inc., New York City, both in New York, and $\frac{1}{4}$ to G. F. Pickup, New Haven, Conn.
- 1,289,839. Life-saving garment. E. M. Lowy, assignor to Lowy Life Saving Suit Corp.—both of New York City.
- 1,289,921. Fountain pen. S. M. Rowe, assignor of $\frac{1}{4}$ to L. R. Shafer—both of Cincinnati, O.
- 1,289,929. Automobile tire. E. G. Schleicher, Stamford, Conn.
- 1,289,958. Rim for pneumatic tires. B. Tamburello, New York City.

ISSUED JANUARY 7, 1919.

- 1,290,695. Shoe heel. E. M. Cook, Oberlin, O.
- 1,290,113. Spring tire with rubber tread. V. Deisenhofer, Chicago, Ill.
- 1,290,128. Quick tire-patch for pneumatic tires. C. O. Duffy, Dallas, Tex.
- 1,290,159. Pad for typewriter feet, with rubber plug. S. Foster, Porto Bello, Jamaica, B. W. I.
- 1,290,211. Demountable rim for automobile tires. J. L. Jensen, Cowley, Wyo.
- 1,290,243. Valve for pneumatic tires. I. Kornetsky, Chelsea, and D. P. Sullivan, Boston—both in Mass.
- 1,290,365. Self-filling fountain pen. F. Scheibelecker, assignor to Sale Brothers—both of New York City.
- 1,290,426. Bicycle saddle with air cushions. A. P. van Leuven, The Hague, Netherlands.
- 1,290,453. Resilient cushioned tire. J. S. Williams, Philadelphia, Pa.
- 1,290,464. Wind-shield cleaner. S. C. Wolfe, Angola, Ind.
- 1,290,519. Resilient wheel with pneumatic tubes. J. T. Cowan, Pittsburgh, Pa.
- 1,290,534. Device for filling fountain pens. P. P. Flournoy, Bethesda, Md.
- 1,290,545. Fountain pen, with ink-tublet container. W. Graves, Alameda, Calif.
- 1,290,556. Demountable rim for tires. C. St. Hilaire, Gardner, Mass.
- 1,290,582. Tire valve. H. P. Kraft, Ridgewood, N. J. (Original application divided.)
- 1,290,608. Bicyclist with elastic inserts. E. H. Lowman, Los Angeles, Calif.
- 1,290,630. Sectional tire casing. C. V. Merling, Centralia, Wash.
- 1,290,672. Garment supporter. H. J. Stuart, Derby, assignor to Robert N. Bassett Co., Inc., Shelton—both in Conn.
- 1,290,678. Hose-supporter button. H. J. Stuart, Derby, assignor to Robert N. Bassett Co., Inc., Shelton—both in Conn.
- 1,290,693. Rubber heel. G. M. Anderson, Washington, D. C.
- 1,290,774. Shoe heel with elastic body. F. A. Nolan, St. Paul, Minn.

THE DOMINION OF CANADA.

PUBLISHED NOVEMBER 30, 1918.

- 187,333. Shock absorber for aircraft. The Curtiss Aeroplane and Motor Corp., Buffalo, assignor of Nelson W. Dalton, Garden City, Long Island, N. Y., U. S. A.
- 187,336. Chewing gum. The Ellis-Foster Co., Montclair, assignor of Harry Maximilian Weber, East Orange both in N. J., U. S. A.
- Machinery Patents on page 307.

- 187,397. Nipple for nursing bottles. M. C. B. Poore, née Buchanan, Boston, Mass., U. S. A.
- 187,449. Wheel with pneumatic cushion between bushing and rim. J. Greppi and A. Romanach, co-inventors, both of Buenos Aires, Argentina.
- 187,470. Reinforced tire casing. A. H. Gruber, Evanston, Ill.
- 187,565. Detachable rubber heel with washers for locking into position. Lavers Heels Patents, Limited, assignee of C. W. Lavers, both of Halifax, Nova Scotia.
- 187,566. Detachable rubber heel having slotted plate embedded therein for attaching to permanent heel. Lavers Heels Patents, Limited, assignee of C. W. Lavers, both of Halifax, Nova Scotia.
- 187,574. Machine packing made of rubber-impregnated canvas derived from waste vehicle tires. G. W. Beldam, Ealing, Middlesex, England.
- 187,597. Rubber boot with vacuum cup for holding washboard in place. M. C. Frank, Piedmont, Calif., U. S. A.
- 187,646. Fountain-pen cap and clip. The Conklin Pen Manufacturing Company, Inc., assignee of F. H. Mooney, Hinsdale, Ill., U. S. A.
- 187,656. Rim for vehicle wheels. The Standard Parts Co., assignee of O. H. Joshi, administrator—both of Cleveland, Ohio, U. S. A.
- 187,674. Sole protector made of combined vulcanized fiber, rubber, etc. F. Marsh, Leeds, assignor. W. Hey and J. W. Meadowcroft, both of York, each an assignee of 1/3 interest—all in England.

THE UNITED KINGDOM.

ISSUED DECEMBER 30, 1918.

- 120,106. Removable rubber pads for crutches, etc. F. C. Lynde, 51 King street, Manchester.
- 120,109. Hair-trimmer or safety razor, made of vulcanite, or similar substance. A. J. Mainwaring, 4 Park Place, St. James, London.
- 120,117. Rubber pads for crutches, etc. F. C. Lynde, 51 King street, Manchester.
- 120,148. Band for attaching rubber pipe to metal pipe. W. H. Clegg, 136 Broadhead Road, Burnley.
- 120,162. Rubber cap for supporting cross-piece of crutches. J. Curwood, Maxwellton, New Road, Littlehampton, Sussex.

ISSUED DECEMBER 31, 1918.

- 120,297. Rubber sole reinforced by canvas, wire, etc. F. Creasey, Upper Richmond street, Newington, London.
- 120,336. Electric insulators. H. Wade, 111 Hatton Garden, London. (Societa Metallurgica Italiana, Leghorn, Italy.)
- 120,374. Tire cover. Berendson's Section Tire Syndicate, 16 Valesplein, Amsterdam. (Not yet accepted.)

ISSUED JANUARY 8, 1919.

- 120,462. Inflatable bag for artificial respiration. P. and R. Schranz, 50 Margaret street, Oxford Circus, London.
- 120,485. Rubber-insulated electric cables. C. J. Beaver, Rangemore, Crescent Road, Hale, and E. A. Claremont, Broom Cottage, High Legh—both in Cheshire. (Addition to No. 114,872.)

ISSUED JANUARY 15, 1919.

- 120,589. Solid composite rubber tire. Dunlop Rubber Co. and J. V. Worthington, 14 Kent street, Westminster.
- 120,603. Fluid-tight joint for staying control-rod of gas-envelope valve. H. Lord, 1 Chelmsford street, Coppice, Oldham.
- 120,604. Pneumatic arm rests for crutches. F. A. Pennington, 10 Halesden Road, Heath-Chapel, Stockport, and T. K. Day, Bankfield, Davyhulme—both in Cheshire.
- 120,658. Golf ball. W. J. Meliers-Jackson, 28 Southampton Buildings, London. (Revere Rubber Co., 59 Rodeo street, New York City, U. S. A.)
- 120,667. Rubber-lined clip for repairing burst water pipes, etc. E. Hanif, 71 Hatherley street, Princes Park, Liverpool.
- 120,693. Apparatus for producing corrugated roofing tiles, with rubber wiper rolls. J. Adams, 80 Dover Road, Northfleet, Kent.
- 120,707. Outer sole for shoe, with staggered apertures for rubber insert. A. G. Knight, 9 Mount Nod Road, Streatham Hill, London.
- 120,751. Puncture-preventing rubber and vulcanite band for pneumatic tires. J. E. Dysart, Cadz, O.

ISSUED JANUARY 22, 1919.

- 120,837. Stuffing-box substitutes, with rubber diaphragm. W. E. Savery, Ivy Bank, Middleton, Hall Street, King's Norton, Birmingham.
- 120,864. Plastic composition for artificial linings, toys, etc., having elastic strips molded therein for operating. F. E. Eaton, 27 Newtown avenue, Blackrock, County Dublin.
- 120,874. Artificial feet with rubber cushions between parts. J. F. Rowley, 25 West Madison street, Chicago, Ill., U. S. A.
- 120,962. Electric cables with rubber sheath. W. T. Henley's Telegraph Works Co., 13 Blomfield street, London, Wall, and H. Savage, 77 Westcombe Park Road, Blackheath, both in London.

ISSUED JANUARY 29, 1919.

- 120,979. Tire tread composed of flexible metal band vulcanized to tread of solid rubber tire. H. L. Harding, Hill View, Queen's Road, Loughton, Essex.
- 121,028. Rubber reservoir nib for pens. H. Swann, Upper Court, Remerton, near Tewkesbury.
- 121,043. Attachable soles, heels, etc., made by vulcanizing a layer of rubber or rubber substitute on to a foundation of waste canvas from tire covers or waste balata.
- 121,044. Electric insulator with rubber washer. W. A. Davis, 48 King's Gardens, West End Lane, London.
- 121,051. Rubber pad for protecting boots, etc., with studs to permit attachment. H. T. Stephens, Tahoona, Ferryside, Carmarthen-shire.
- 121,067. Abdominal belt with elastic sections. F. G. Baugatz, 37 Boulevard des Capucines, Paris, France.
- 121,110. Saw-tooth non-slipping resilient heel. B. W. Brockett, 2824 Corydon Road, Cleveland Heights, Ohio, U. S. A.

- 121,143. Rubber disk suction device for artificial dentures. A. W. Fisher, Bryn Estyn, Whitechurch, Shropshire.
- 121,190. Container for paste, etc., having rubber cap perforated to admit air. F. M. Upward, 80 Estcourt Road, Woolside, London.

THE FRENCH REPUBLIC.

PATENTS ISSUED (WITH DATES OF APPLICATION).

- (January 17, 1918.) Adaptation of an air chamber in all the pockets of artificial legs. F. Jacquemin.
- (January 18, 1918.) Wheel with rubber hub for vehicles in general and motor trucks in particular. Savoia Pietro del to Luigi & Co.
- (July 9, 1917.) Improvements in the manufacture of airplane parts. Goodyear's India Rubber Glove Manufacturing Co., Naugatuck, Conn., U. S. A.
- (January 23, 1918.) Improvements in pneumatic tires to permit inflation while in motion. P. O. J. Kaerdsen.
- (May 14, 1915.) Insulating glove. Société Anonyme des Etalabes, Huthoum.
- (January 30, 1918.) Improvements in resilient wheels. J. L. Harlen.
- (February 1, 1918.) Life-saving costume. C. J. E. Chamon.
- (February 5, 1918.) Improvements in rubber pads for horse shoes. E. Linfield, W. H. Goldinich and A. W. Capener.
- (February 21, 1918.) Portable insubmersible apparatus for walking on water. L. Rousset.
- (February 6, 1918.) Improvements in fittings for horse shoes. R. P. Gray.

NEW ZEALAND.

ISSUED DECEMBER 12, 1918.

- 99,367. The structure composition. Puncture Cure, Limited, 117 8th Avenue, New York, assignee of E. Campbell and F. Cashman, all of Calgary, Alta., Can.

TRADE MARKS.

THE UNITED STATES.

- 99,635. The word SANARIN—chewing gum and chewing gum covered with candy. Frank H. Fleer Corp., Philadelphia, Pa.

- Pneumatic tire. Patented December 31, 1918. Term 14 years. H. H. Hazeltine, Tacoma, Wash.

The London View of the 1918 Market.

THE YEAR 1918 witnessed a complete upset of the normal development of crude rubber supply and demand. The trade had not foreseen how America's part in the war would restrict imports and curtail consumption of crude rubber, and especially that it would so drastically reduce the production of automobiles and pneumatic tires; but, notwithstanding the effort to curtail all plantation production correspondingly, the world's available stocks to-day are greater than ever before. Although the demands for war purposes were large, America probably used no more than two-thirds of the 1917 consumption, being helped by the large stocks there and afloat. The absence of the Russian demand added to the reduced consumption, and Germany and Austria can have had little to use.

The total visible supply of crude rubber on December 31 was estimated at about 87,000 tons, 7,000 tons afloat and 80,000 tons in British, American, East Russian and Middle Eastern stocks, or about 56,500 tons more than at the end of 1917. British stocks on December 31 totaled 19,000 tons, of which about 18,000 tons were plantation sorts. British imports and deliveries of all sorts for the year were only 42,800 and 39,461 tons, respectively, against 67,036 and 64,668 tons in 1917. Of these amounts 37,456 and 34,800 tons, respectively, were other than Pará and Peruvian.

With all American restrictions on the manufacture of motor vehicles and tires now removed; with the passenger-car market returning to normal, and the demand for trucks and solid tires greater than ever; with a world shortage of rubber goods of every sort; with the shipping situation constantly improving, the prospect for 1919 is much brighter. Pre-war conditions will gradually be reestablished, and this is believed to apply to the packing of rubber as well as many other matters.

The close press packing of plantation rubber to make a case contain greater weight, introduced partially in the late autumn, does not suit the European market and is liable to cause deterioration of the rubber. Bales are also objected to. Strong, planed wood cases of 1½-hundredweight size are preferred, especially for sheets, which should be carefully packed laid flat, not folded.

THE MARKET.

At the beginning of the year plantation rubbers were very close to their highest levels. In January standard crepe ranged from 2s. 3d. to 2s. 6½d. and smoked sheet from 2s. 2½d. to 2s. 5½d. In March crepe brought as high as 2s. 6½d. and sheet 2s. 5½d. Thereafter occurred a gradual decline with minor fluctuations until in August standard crepe dropped as low as 2s. 1d. and smoked sheet as low as 2s. An upward tendency then developed and continued until November, when crepe sold as high as 2s. 6d. and sheet as high as 2s. 5d. December quotations, however, ranged from 2s. 2½d. to 2s. 4d. for standard crepe, and from 2s. 1½d. to 2s. 3½d. for smoked sheet in response to the easing of shipping conditions following the signing of the armistice and the knowledge of accumulating stocks at Eastern shipping points.

February and March afforded opportunities to make sales at good prices, as unwise speculators forced prices up at one time to 2s. 8½d. forward, resulting in many losses to buyers. But estates took little advantage of making considerable sales forward. Although shipping facilities were uncertain, undue nervousness was shown in making forward sales, and good orders in the spring for forward delivery in the East and London were not executed, or only to a very limited degree.

In June came unforeseen the decision of America to reduce its importation and consumption of rubber by one-half. The effect of this was greatly increased by the fact that planters had sold such a small part of the 1918 crop for forward delivery. Prices were forced down; a glut of rubber in the East, despite

the efforts of the Rubber Growers' Association to stabilize the market by curtailment of production, aided the depression, and large sales at ridiculously low prices were made in the East—as low as 10½d. ex go-down for rubber now worth 1s. 9½d.

London brokers, well versed in the entire trade, believe this panic could have been averted had they been employed with confidence by the trade. They regard it as another proof that more concentration of trade through London channels of selling will secure a higher return to planters, is to the great advantage of estates, and will be more so. Such a large and growing trade,

(Malayan Tin & Rubber Journal.)

CRUDE RUBBER TOP PRICES IN LONDON AND SINGAPORE FROM JANUARY, 1917, TO SEPTEMBER, 1918.

they assert, must be conducted by larger sales of the succeeding year's crop; moreover, greater readiness to sell when there are eager buyers will result to the benefit of planters by offering large, long-established dealers a greater interest. Now that the war is over they point out that rubber can be readily distributed from England to all parts of the world and that larger London stocks need cause no alarm, either on the score of dock space, finance, or fear of deterioration of the rubber held in large stocks. It is commonly said that "the absurd restriction of exports" from England must cease.

Prices of Pará rubber have been well sustained and have shown a considerable premium over plantations. However, the large daily supply of the latter from the Middle East, sold forward or on arrival has naturally affected the demand for all Brazilian grades. Imports of medium descriptions have generally fallen off. For certain grades a fair demand has prevailed, but inferior, soft, weak rubbers have sold with difficulty at low prices. The demand for caucho ball has greatly declined and the price is much lower.

In January hard fine Pará ranged from 2s. 7½d. to 2s. 9½d. and in February sold as low as 2s. 6½d. Then occurred a gradual rise until in September it ranged from 3s. 2½d. to 3s. 8d. followed by a decline until in December it ranged from 2s. 7d. to 2s. 9½d.

The following closing prices for recent years are of interest:

	Hard Fine Pará	Negrohead Scrappy.	Negrohead Island.	Caucho Ball.
1914.....	2s. 10½d.	2s. 1½d.	1s. 3d.	2s. 4d.
1915.....	3s. 9d.	2s. 16d.	1s. 7d.	3s.
1916.....	3s. 3d.	1s. 11d.	1s. 3d.	2s. 2d.
1917.....	2s. 8½d.	1s. 5d.	1s.	1s. 6½d.
1918.....	2s. 7d.	1s. 7d.	1s.	1s. 8d.

Balata was in less supply and good demand throughout the year, closing at 4s. ½d. for sheet and 3s. 6½d. for block. Good qualities of gutta percha realized high prices and at one time jelutong prices were more than doubled, present quotations being about £40 c. i. f.

THE WORLD'S PRODUCTION.

The world's production of crude rubber of all grades for the year 1918 is estimated by authorities at about 257,000 tons. The amount would have been much greater but for curtailed production made necessary by the continued diversion of ship tonnage from normal business to war transport. The following table shows the total production of crude rubber for the last three years:

	1918.	1917.	1916.
Ceylon and India.....tons	33,000	35,000	24,500
Malaya, Dutch East India, etc.....	150,000	165,000	105,500
Amazonas (Brazil, Bolivia).....	26,000	31,771	28,255
Peruvian and Guayule.....	8,400	9,729	8,245
West Coast, Africa.....	3,100	2,000	2,000
Benguela and Mossamedes.....	3,200	3,500	5,000
Loanda.....	2,600	2,500	4,500
Congo, French Congo and Soudan.....	2,600	2,500	4,500
From other sources.....	257,000	240,500 ¹	178,000 ²

¹Underestimated.

The production of South American rubber was considerably decreased. Bolivia sent less; Mollendo and Venezuela via the Orinoco, none; Ceara, Maniçoba, Pernambuco, Assare, Manga-beira, very little; Mattogrosso, much less. Central America, including Nicaragua, Colombia and Ecuador, exported very little rubber: Mexico almost nothing, other than guayule rubber. Decreased amounts have been received from the West Coast of Africa especially Congo and Soudan, but good quantities sold well from the Niger, Gold Coast, Accra, etc., Cameroons, Sierra Leone, Gaboon, Onakry, French Congo and Soudan. Exports of lump have been much less. Very little rubber came from East Africa, Madagascar and Abyssinia. British and former German East Africa sent very little *Manihot* rubber; Zanzibar, scarcely any red rubber; Nyassaland and New Guinea, none. Penang reduced its supply of wild rubber, also Rangoon and Assam. Java, Sumatra and Borneo exported much less *Rambong* rubber but more *Hevea*. Amounts coming from Toulson and Cochín China were very small.

The following table shows the annual receipts and shipments at Pará for the last three years:

	1918.	1917.	1916.
Receipts of Pará.....tons	23,000	29,759	28,260
Receipts of Peruvian.....	8,600	9,591	8,245
Shipments of Pará and Peruvian to Europe.....	6,035	14,320	10,500
Shipments of Pará and Peruvian to America.....	19,350	23,950	22,185

PLANTATION RUBBER.

Owing to increased production capacity of plantations and curtailed consumption of crude rubber resulting from the war, also because of labor shortages and the high cost of estate operations, less than 100,000 planted acres were added to the total during 1918. All of the principal plantation rubber countries of the Middle East have made some progress, with the exception of the former German colonies, where, largely through neglect, the effective acreage has decreased to two-thirds of what it was in 1916.

Plantations, chiefly of *Castilloa*, in Mexico, West Indies and Central and South America have shown no progress and the yields have been insignificant. The same is true of Ceara plantations in East Africa. Plantations in India, Burma and the Mergui are being extended.

The approximate plantation acreages for three years past follow:

	1918.	1917.	1916.
Ceylon.....acres	300,000	296,000	230,000
Malaya.....	800,000	790,000	600,000
Borneo.....	50,000	40,000	30,000
Dutch East Indies, Java, Sumatra, etc.....	700,000	650,000	500,000
India and Burma.....	55,000	50,000	40,000
Former German colonies, Samoa, East and West Africa.....	8,000	10,000	12,000
Totals.....	1,913,000	1,820,000	1,412,000

DISTRIBUTION.

The consumption of crude rubber of the various grades, exclusive of large quantities of reclaimed rubber, has been estimated as follows:

	1918.	1917.	1916.
England.....tons	24,000	26,000	25,000
Germany, Austria, etc.....	1,000	1,000	1,000
France.....	14,000	10,000	8,500
Russia.....	2,000	7,000	20,000
Italy, Spain, Scandinavia, etc.....	5,000	5,500	4,000
Japan and Australia.....	5,000	5,000	5,000
America and Canada.....	187,000	155,000	114,000
Totals.....	238,000	210,000 ²	178,000 ²

²Underestimated.

Abnormal war-time influences have in many instances upset former distribution tendencies. Conservation of ship tonnage for war purposes reduced rubber consumption in England considerably and in Italy a little, while the rationing of neutrals by the Allies to prevent assistance to the enemy curtailed imports by Spain and the Scandinavian countries somewhat. The Central Powers found no way to increase their supply, and the Japanese and Australian demand has remained very nearly stationary. Continued chaotic conditions in Russia have reduced the consumption of rubber to one-tenth what it was in 1916. The big increases of the year have been in France and the United States; in the former almost entirely for war material, but in the latter partly because of wider use of rubber goods, especially pneumatic tires, by the entire population.

NOTE.—Much of the information contained in the above review was supplied by S. Figgis & Co., London.

RUBBER EXPORTS FROM THE STRAITS SETTLEMENTS AND FEDERATED MALAY STATES.

Statistics of the exports of rubber from the Federated Malay States and the Straits Settlements are now available to the general public. The official figures given below show that there is a falling off in the exports for the past year when compared with 1917, due, of course, to the lack of transport and the restrictions imposed upon imports by the United States government. Many of the rubber companies in Malaya adopted a policy of voluntary restriction of tapping; but there was at the end of the year a considerable amount of rubber stored at Singapore which will come into the present year's statistics when freer shipping facilities permit of its movement.

Appended are the exports for three years from the Federated Malay States:

	1916.	1917.	1918.
January.....tons	4,471	5,995	7,588
February.....	5,507	7,250	6,820
March.....	7,849	7,098	7,709

Review of the Crude Rubber Market.

NEW YORK.

EARLY in February, when large orders were placed by manufacturers, it seemed that the long-anticipated buying movement had actually commenced. The demand for plantation rubber, to arrive, was active, and spot stocks were quickly absorbed. As prices advanced, the activity subsided, however, indicating that manufacturers' requirements had been supplied, at least for the time being.

The reaction that followed resulted in lower prices that attracted a comparatively small volume of factory orders, and a limited amount of dealers' business was done. Quiet and easy conditions prevailed until later in the month when an active dealers' demand for near-by plantation rubber to cover short sales, gave strength to the market and prices advanced.

Generally speaking, the market for the month has been a favorable one for buyers whose requirements were not large, but with increasing arrivals of the crude material, conditions will undoubtedly continue to favor the manufacturers.

PLANTATIONS.—February 4, spot latex crepe was 58 cents; March arrival 56 cents and May-June arrival 52 cents. February 20 spot latex was 56 cents; March arrival 56 cents and May-June arrival 52 cents.

Spot ribs were 57½ cents on February 4; March arrival 55 cents and May-June arrivals, 50 cents. On February 20, spot ribs were 55 cents; March arrival 53½ cents; May arrival 51½ cents and June-December, 50½ cents.

February 4, No. 1 amber crepe was quoted March-April (East) 47½ cents. On February 20 the price of this grade was unchanged.

No. 1 roll brown crepe, spot, sold for 39½ cents, on February 4, and declined to 37½ cents on February 20.

PARAS.—February 4, upriver fine, spot, was 58 cents; islands fine, March-April, 48 cents; upriver coarse, spot, 34½ cents; upper cauchó ball, spot, 34 cents; cameté, coarse, April-May, 22½ cents.

February 20, upriver fine, spot, was 58½ cents and cameté, coarse, April-May, 22½ cents.

NEW YORK QUOTATIONS.

RECLAIMED RUBBER.

The conditions that prevailed in the reclaimed rubber market during February were noticeably better than last month owing to more frequent inquiries from the manufacturers. While the activities recorded in the market for crude rubber have not affected reclaims to any great extent, there is reason to believe that the anticipated demand for reclaimed rubber should materialize before many weeks. Prices have remained the same with the exception of shoe and tire stocks that are from one-quarter to one-half cent lower than last month.

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [January 31, 1919]: Following advices of declining prices in the London and American markets, the rubber auction opened on January 2, with a rather weak tone, and although values show a slight improvement, they are generally below the level of business done prior to the auction. On the first day of the sale ribbed smoked sheet sold up to 76 cents and fine pale crepe, for which there was less demand than usual, reached 77½ cents, an advance of 2½ cents on sheet and ½ cent on crepe. These prices were barely maintained as the sale proceeded and the auction closed at 76½ cents for sheet and 77 cents for crepe. Brown and black crepes were good demand at prices 2 to 4 cents up. Small quantities of plain smoked and unsmoked sheet were sold.

The sale occupied the greater part of three days and 922 tons changed hands out of 1,883 tons catalogued.

The following was the course of values:

	In Singapore per Pound. ¹	Sterling Equivalent per Pounds in London.
Sheet, fine ribbed smoked.....	74 @ 78c	2/ 17½ @ 2/ 3¼
Sheet, good ribbed smoked.....	63½ @ 67½	1/ 11½ @ 2/ 1¼
Sheet, plain smoked.....	60 @ 71	1/ 10 @ 2/ 1
Sheet, ribbed unsmoked.....	59½ @ 60½	1/ 9½ @ 1/ 10½
Sheet, plain unsmoked.....	50 @ 56	1/ 7½ @ 1/ 8½

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert B. Beers, broker in crude rubber and commercial paper, No. 68 William street, New York, advises as follows:

During February the demand for commercial paper has been rather erratic and mostly from out-of-town banks, the best rubber names going at 5¼ to 5¾ cent, and these not so well known 6 to 6½ per cent.

CRUDE RUBBER ARRIVALS AT THE PORT OF NEW YORK.

¹ A quintal = 20.46 pounds.² A lira = \$0.193.THE MARKET FOR COTTON AND OTHER FABRICS.
NEW YORK.

THE American cotton market has been fairly steady during the month when, with minor fluctuations, spot middling uplands has held around 26 cents. The steady undertone is due to current belief in the strong financial and commercial position of this country, and the certain prospects of increasing export trade in cotton. Lower prices, therefore, are not expected in the near future.

EGYPTIAN COTTON. It is estimated that the 1918 crop will amount to about five million cantars but on account of the quantity of the 1917 crop which was carried over and ginned with the 1918 crop, the final statistics will probably show about 5,400,000 cantars. A cantar is approximately 98 pounds.

It is doubtful if there will be enough cotton to cover present sales of government type No. 1. Owing to the poor quality of the crop, Sakellarides types of extra staple will be very scarce.

SEA ISLAND COTTON. The southern markets have been exceedingly quiet and quotations are nominal. From August 1, 1918, to January 31, 1919, 38,104 bales were received, compared with 47,813 bales last year. After deducting exports, the stock on hand was 15,268 bales, compared with 17,207 bales last year. On January 31, 1919, the crop in sight at all ports was 22,340 bales, compared with 46,599 bales a year ago.

DUCKS, DRILLS, AND OSNABURGS. While market conditions are not what they should be at this time, they are better than last month, owing to a noticeably better demand. Prices have declined.

RAINCOAT FABRICS. A few large sales were reported last month but nearly all orders were very small and for spot deliveries. Buyers who have kept out of the market for a long period may be at a disadvantage when the necessity comes for placing quantity orders.

TIRE FABRICS. Although the market was generally quiet and prices easier than a month ago, there has been a steady demand for comparatively small stocks for immediate delivery. Quotations are slightly lower than at this time last month and in fact considerably lower than a year ago when there was no immediate prospect of industrial activity.

NEW YORK QUOTATIONS.

FEBRUARY 24, 1919.

Prices subject to change without notice.

THE MARKET FOR CHEMICAL AND COMPOUNDING INGREDIENTS.
NEW YORK.

MARKET conditions on the base metals, lead, zinc, and antimony, have been quiet and dull during the past month and curtailment of output continues with regard to pig lead. The rubber trade in general is showing a decided improvement in buying activity, indicating confidence on the part of manufacturers, which doubtless will increase as knowledge is gained of the readjustment of economic factors involved in world peace. Prices are easing off and the general demand for price reduction is being anticipated in most lines.

ANILINE.—The decline of prices has resulted in improved demand which has now become active.

CARBON TETRACHLORIDE.—The demand continues rather light and prices steady.

BENZOL.—Similar conditions hold with regard to benzol as in the case of carbon tetrachloride.

DRY COLORS.—The demand is very light and prices tend to recede.

LITHARGE.—Quiet routine market with prices fixed.

LITHOPONE.—There has been some improvement in demand and the spring outlook is said to be decidedly good. Manufacturers are anticipating lower costs on their crude materials for the second quarter of the year.

PINE TAR and similar pitches are in very good demand by the rubber trade at fair prices.

SUBSTITUTES.—Prices are easing off rather more than is indicated in the limit prices given. Crude stocks are generally lower.

WHITING.—There has been a steady demand and unchanging prices. Imports are not yet increased. Consequently the short supply does not permit reduction in prices.

ZINC OXIDE.—Market conditions are very steady and no immediate change is anticipated by the manufacturers.

NEW YORK QUOTATIONS.

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

DURING the month of February the market for scrap rubber has been extremely quiet. Stocks throughout the country are large and constantly increasing. The reclaimers are far from busy and are anxiously awaiting the resumption of a normal demand for their product.

The impending influx of crude rubber from the Far East has a depressing effect on the prices of scrap rubber, since there seems to be no possibility of a marked advance in crude rubber prices. Scrap shoes and tires must come down to a basis which will permit competition with prices for new rubber. It is not a pleasant prospect, but it looks as though dealers in scrap rubber will find it expedient to devote their attention to other waste materials during the dull period.

BOOTS AND SHOES.—Scrap rubber dealers who are working on old orders are offering more for old shoes than any mill will offer. The price is nominal at 8 cents.

INNER TUBES.—Practically no demand.

MECHANICALS.—No inquiries at all. Prices unchanged.

TIRES.—Quotations for mixed remain at 5 cents with no sales worth mentioning.

No. 1.

SUBSCRIPTIONS: \$3.00 per year, \$1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, \$3.50 (or equivalent funds) per year, postpaid.

ADVERTISING. Rates will be made known on application.

REMITTANCES: Should always be made by bank draft. Post Office or Express money order on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**37,500,000 TIRES FOR 1919.**

THE total number of passenger automobiles and trucks registered in the United States for the year 1918 was 6,088,169, representing an increase of 1,026,555 cars over 1917, despite the war curtailment of manufacture. Nearly 70 per cent of these new cars were Fords, the Ford output of passenger cars and trucks for the fiscal year ended July 31, 1918, being 706,584 cars. The 1919 Ford campaign calls for an output of 1,000,000 cars, and as other companies contemplate similar increases, the 1919 registration will probably jump at least 1,500,000.

These statistics forecast an American output of some 37,500,000 tires for the year. Assuming five tires per car as the average yearly consumption—four in use and one spare, it will require 30,440,845 tires to operate the cars registered at the end of 1918. The 1919 production of cars will call for 6,000,000 tires as original equipment, and for each of these cars a spare will quickly be bought, thereby adding 1,500,000 to the grand total. It remains only to deduct something for the old cars that may go out of service during the year. This will hardly exceed and probably not equal 440,845 tires, the odd part of the first item, so that 37,500,000 tires may be regarded as a conservative estimate, especially in view of the depleted

condition of American tire stocks following the curtailment period.

LIGHTING THE RUBBER FACTORY.

IN this era of superproduction too much attention cannot be paid to the lighting system in a rubber factory. Upon its perfection and scientific arrangement depend the quality of the product, the standard of the output and the efficiency of the employee. In the early days of factories kerosene lamps and open-burner jets were the only sources of artificial light available. Then came the incandescent lamp in 1879, as great a revolution in its way as the gas jet was over the old whale-oil lamp or tallow dip. With the development of the Mazda and other types of lamps came practical perfection.

Wise factory managers now recognize that lighting is not an expense to be minimized, but is a most important aid to economic production and may even become the deciding factor between profit and loss. Here is a typical test to show the relation of light to output.

In a Chicago factory a lighting system using incandescent lamps in deep bowl reflectors, was carefully designed to provide four-foot candles of illumination. The men worked under these conditions for a period. Then the intensity was increased to 12-foot candles, in other words the lighting was trebled. This change was attended by an 8 to 27 per cent increase in production. These figures cover eight different operations, which averaged a 15 per cent increase.

Insurance companies recognize that suitable light is as essential to the safety of employees as any of the safeguards which are applied to belts, pulleys and gears. Codes of lighting have been devised in many states supervised by the Department of Labor for the protection of employees. These bodies have recognized that many accidents may be avoided by proper lighting. The plant operator should ask himself the questions: "Is there artificial illumination in every part of the plant likely to be traversed by workmen? Are all moving parts clearly visible, and are the lights so shielded that a man will not be temporarily blinded and thus not be able to see gears, belts, and other mechanisms?"

Good lighting is furthermore reflected in the faces of the operators, in healthful, buoyant spirits. Bad lighting is irritating because it makes it difficult to see, and the mind unconsciously becomes obsessed with the idea that it is being imposed upon. The experienced and trained man is not easily replaced, and under a bad lighting system he becomes incapacitated at the very time when he should be yielding the best returns.

Of the cost of a modern system an Edison expert says: "Assuming the rate of wage is 25 cents per hour, the power cost is 2 cents per kilowatt-hour, and that a 100-watt Mazda C lamp is provided for each operator, the total cost of operation of this lamp, including renewals and cleaning, would be about 4/10 cent per hour. Therefore, if with this lighting a man can save one minute per

hour, the extra cost of lighting is more than paid for in the saving on labor cost alone."

MR. ROCKEFELLER'S TIMELY CAUTION.

THAT Labor and Capital are partners, not enemies; that their interests are common, not opposed, and that neither can attain the fullest measure of prosperity at the expense of the other, but only in association with the other, is the preamble of a creed contained in a most timely pamphlet entitled "Representation in Industry," just issued by John D. Rockefeller, Jr. Mr. Rockefeller, than whom no employer in this country is better qualified to discuss industrial subjects, strikes at the root of the industrial question when he emphasizes that the Community is an essential party to industry and that it should have adequate representation with the other parties.

It is the purpose of Mr. Rockefeller to show that the four parties to industry—Labor, Capital, the Management and the Community—should be so represented that disputes should be equitably settled, fair wages and reasonable hours assured, capital be justly compensated and management be adequately recognized. He does so in a most convincing manner, and cites the example of the Standard Oil Co. in some of its branches where a system of representation has been adopted which has worked for the good of all concerned and which has minimized the troubles which constantly arise in large concerns.

In a keen, incisive manner, Mr. Rockefeller analyzes the cause of misunderstandings often so disastrous to all concerned and condemns the capitalists "who regard Labor as their legitimate prey," from whom they are justified in getting all they can for as little as may be, equally with the attitude of Labor whose sentiment is to wrest everything possible from Capital. These two forces he declares are to blame for the strike, the lockout and other incidents of industrial warfare. Mr. Rockefeller's system of mutual cooperation and discussion by the four parties interested for the purpose of eliminating these causes for turmoil, which of late seem to be multiplying not only in this country, but elsewhere, is a most valuable contribution and is well worth the perusal of all who want to see progress replace strife, and an era of good feeling succeed the present overcharged atmosphere of discontent and recrimination.

AS TO THE RAINY DAY.

CARTER GLASS, the new Secretary of the Treasury, has inaugurated his term of office with a government campaign to make "Thrift a Happy Habit." This is the title of a booklet issued by the Government to the people of the United States "to promote wise buying, avoidance of waste, intelligent saving, and safe investment, with the aim of meeting war obligations and promoting individual, community, and national prosperity"

and "to make earnings and time count more for the individual."

The governors of the 12 Federal Reserve Districts have been requested to develop special savings machinery in each district with the idea of stimulating the sale of Thrift and War Savings Stamps. On the subject of "Every Day Economics" the following pertinent advice is given:

"If the well-to-do would save all they could and furnish the Government with funds by buying bonds and thrift stamps and by paying taxes, and if those with smaller incomes would do likewise, together they might be able to save enough for the use of the Government and at the same time furnish it with funds to buy what they saved. But if many of them, either rich or less well-to-do, refused to do their part they would force others to do more than their share.

"Sane spending is the basis of intelligent saving and elimination of waste," continues Mr. Glass, "whether of commodity or time. In making purchases, the buyer should make certain whether he gets his money's worth in commodity, comfort, service, recreation or advancement."

"Provision must be made for the rainy day and unforeseen emergencies—or opportunities—when they occur. Intelligent saving is diametrically opposed to hoarding or miserliness. It consists largely in foregoing ill-considered or foolish present expenditures in order to be able to obtain in the future necessities or even luxuries."

The purpose of the great campaign is to pay all war bills, maintain our troops and to bring them home, to create a powerful agency for the Americanization of the foreign-born—and to establish a "practical eraser for the hyphen" as well as to afford the greatest benefits to the workers in protection for the future, and providing for a rainy day.

THE INDUSTRIAL BOARD OF THE DEPARTMENT OF Commerce is a new creation of great importance. The board in consultation with industrial leaders plans to stabilize prices through governmental purchases of basic materials. It is not price fixing. It is simply a big buyer coming into the market with the cooperation of all other big buyers, sellers and producers. Thus will stagnant business be energized, capital be freed, building operations be resumed and normal industrial activity be restored.

THE DAILY PRESS ANNOUNCES ANOTHER WORLD TOUR OF the yacht *Oneida*, under the personal command of the veteran rubber factor, Commodore E. C. Benedict. It is claimed, by the newspapers, that Commodore Benedict once penetrated to the head waters of the Orinoco in this same sea-going yacht. Not to seem too skeptical we will allow that if any man in the world could negotiate the rapids above Angostura in a big vessel it would likely be the Commodore.

The Production of Guayule Rubber—II.¹

From a special report by Henry C. Pearson, prepared for the Bureau of Foreign and Domestic Commerce.

HABITAT OF GUAYULE—PARASITIC ENEMIES.

GUAYULE at its best is found growing on the central Mexican plateau in great quantities. The district is nearly rainless and is very sparsely populated by a race partly Indian, partly Spanish. The region is practically grassless and contains no large trees, being a typical desert country. The alkali earth which is found over most of the plateau is in reality a rich soil, needing only sufficient water to make the region a very fertile one.

The guayule is indigenous in a comparatively small area in southwestern Texas and northern Mexico. It may be bounded as follows: from the western extremity of Presidio County, Texas, the line runs somewhat west of south till it reaches the northern boundary of Durango, Mexico, near Santa Barbara, Chihuahua; then southeast parallel with the Mexican Central

GATHERING AND TRANSPORTING THE SHRUB.

Although the most important guayule districts command good railway facilities, there are large areas whose exploitation is difficult on account of the lack of means of transportation. These difficulties are mainly due to the fact that water for the pack animals can not be found on these desert lands.

The gathering is done under contract by natives, who simply pull the plant and load it on the back of burros. It is then carried to a central station, where it is baled by ordinary hay balers. These bales are loaded upon large wagons, which are drawn across the desert by teams of mules, often 12 to 14 to the team. The cost of transporting the crude material is not great. A burro driver gathers the loads for two or three animals, each carrying an average load of 165 pounds. For an

FACTORY OF THE COMPANIA EXPLORADORA CHAHUATLENSE, S. A., PAPRAS, MEXICO.

Railway about 100 kilometers (62 miles). Beyond the State of Durango the boundary runs still farther east curving northward again not far from San Luis Potosi. The one hundred and first meridian marks roughly the eastern boundary, lying somewhat west of it till beyond Sahillo, where the line then curves slightly west of north, reaching the eastern limit in Texas at Langtry. The northern limit is marked approximately by Fort Stockton. The total area is approximately 130,000 square miles, a large part of which is in the Chihuahuan Desert. This area varies in altitude from 2,000 to 10,000 feet above sea level, and the most important acreage is not much above 6,000 to 6,500 feet.

According to Lloyd,² guayule has few parasitic enemies, either vegetable or animal. Of the former, two are species of fungi, the *Puccinia parthenii* and the dodder (*Cuscuta* sp.). Of the latter there are Coccidae that attack the tap root. There is also a scale, *Targionia dearnessii* Ckll., which attacks roots. The leaves are sometimes attacked by a gall insect, and there is a bark-boring beetle, the *Pitgophthorus nigricans* Bland.

entire day's journey (12 kilometers and return) and three loads (495 pounds) the transportation charges per ton of crude material would be, say, \$2.50 to \$3. For long distances, however, the cost sometimes runs as high as \$12.50 per ton.

PRICES OF SHRUB AND COST OF EXTRACTED RUBBER.

The price of dried guayule plants, including charges, began at \$7.50 a ton. Later, when several competing enterprises erected factories, the price rose to \$15 and \$20 per ton, according to the distance between the places of origin and the station or works. During the "boom" growing guayule was bought unharvested at \$30 gold per ton in the field and up to \$50 gold per ton delivered at the factory. A fair average of the cost of guayule shrub to the leading concerns was about \$30 gold per ton c. i. f. factory, allowing for shrinkage until used, which must be within 60 days of cutting to prevent deterioration of the rubber.

Calculating the high cost of coal and water, it was estimated that the rubber could be extracted and freighted to New York and sold there at a cost of 20 to 25 cents per pound. This included all costs, taxes, traveling options, office expenses, etc., but not royalties on processes used.

¹Continued from THE INDIA RUBBER WORLD, March 1, 1919.

²"Guayule, a Plant of the Chihuahuan Desert," page 40.

ESTIMATING THE SUPPLY OF SHRUB.

The supply of guayule in its territory is very unevenly distributed. In most parts the plants are isolated, growing sometimes in large and often in small numbers among other plants on mountain inclines rich in lime. At rare intervals small spaces are found where it predominates. The following estimate was made by Endlich:

An estimate of the average supply per hectare (2.47 acres) is very difficult to make, both on account of the uneven distribution of the growth and of the great differences in individual plants. In favorable territory I have on several occasions counted 26 to 41 plants to an area of 100 square meters, which would mean a total supply of 3,000 to 4,000 plants per hectare. The differences in size and weight are so great that in places where the plants are small and grow close together 10 plants have only the weight as much as 3 kilos each. The average weight will not exceed 500 grams (1.1 pounds) per plant. Estimates of the guayule supply in large areas vary from 500 to 800 kilos per hectare, but the distances between the distant places where the plants are found are often considerable and must be taken into consideration. The territory containing the more important places of supply includes a total area of about 75,000 square kilometers (about 27,000 square miles).

It is even more difficult to approximate the total supply of crude material. Let us assume that in the area of 75,000 square kilometers, comprising the districts where the guayule plant is principally found, one-tenth actually contains a supply; this would mean a territory of 7,500 kilometers. If we

in two ways, by seeds and by means of shoots (retones) which start up from the shallow-lying roots. Retones are relatively few in number, but their initial growth is rapid and they quickly produce flowers. Even the remaining portion of roots broken

COMPANIA EXPLOTADORA DE CAUCHO MEXICANO, SALTILLO, MEXICO.

off where the plants are uprooted frequently produce new plants, and this after dying back quite a distance. Thus with reasonable care the existing guayule fields may be preserved.

One of the large operators advised the writer concerning regrowth in these words:

On this point we have had great encouragement, as experiments made from territory cut over some years ago show that there will be a second cut of some size, and if the country is visited by rains we may count on a steady though slow development of this second growth. This can never reach proportions large enough to warrant us in expecting an output anywhere near the yield of 1910, but it will make it possible for some of the factories to maintain a constant if diminished output. From the present outlook and from the experiences gained in the past the rubber trade may count on an annual production indefinitely of somewhat over 2,000 tons. These figures are based on the supposition that the price of guayule will not go below 45 cents nor above 75 cents per pound. If the price should go below 45 cents there will be less guayule produced than the above figures, and if it goes above 75 cents there will be an increase over these figures temporarily, with acceleration of the consumption of the available shrub and the consequent reduction of the future supply. High prices for

CONTINENTAL RUBBER CO., TORREON, MEXICO

figure the output as one-half ton per hectare, we get a total supply of 375,000 tons, which at the rate of 7 to 10 per cent rubber, represents a total of 26,250 to 37,500 tons of rubber.

In 1906 a number of experts figured on the amount of shrub available for extraction. The following tabulation is based on their estimates and a selling price for crude rubber at 45 cents gold per pound:

Owners of Shrub.	Estimated Yield of Shrub, Metric Tons.	Estimated Yield of Rubber, Metric Tons.	Estimated Profit, Excluding Royalties.
No. 1	57,000	6,840	\$3,009,600
No. 2	40,000	4,800	2,112,000

REGROWTH IN WILD AREAS.

In the first collection of the guayule shrub the plant was uprooted. To a certain extent some roots were broken off and formed new growths. If, however, instead of being pulled up the plant is cut off under the surface of the soil, the root that remains will, if rain falls within a reasonable time after the cutting, reproduce a good plant. The self-sown seeds grow slowly, several years showing only a thin one-fourth-pound bush. Natural reproduction in the field therefore takes place

SALVADOR MADERO & CO., VANEGAS, MEXICO.

rubber mean high prices for the shrub and a resultant destruction of the young and growing shrub, as anything that appears like guayule will be cut and shipped to the factories by the shrub owners greedy for money.

(To be continued.)

SAMPLES OF CRUDE PLANTATION RUBBER.

The Bureau of Foreign and Domestic Commerce of the United States Department of Commerce has been furnished with samples of crude plantation rubber graded in accordance with the classifications, in use here as follows: unsmoked diamond sheet smoked diamond sheet (light), smoked diamond sheet (dark), unsmoked plain sheet, smoked plain sheet, pale crêpe (variable), brown crêpe (variable), blanket crêpe (variable). The samples may be examined at the Bureau of Foreign and Domestic Commerce, or its district offices, by referring to file No. 108614.

Chrysothamnus or Sierra Rubber.

WHETHER the United States in the near future is destined to produce its own rubber within its limits in commercial quantities is a problem which still remains to be solved. The investigation which was undertaken by experts of the University of California, shortly after the United States entered the war, and an account of which was printed in THE INDIA RUBBER WORLD June 1, 1918, is still proceeding, but up to date the investigators are of the opinion that it is not possible to obtain rubber commercially from the wild plants which grow so abundantly in the Sierras and in other parts of the West.

Professor H. M. Hall of the University of California, who is in charge of the research work, while declining to go into detail as to the extent of the discoveries until a complete report can be made, is authority for the broad statement that the total amount of wild shrub with a rubber content is "so great that it is safe to say there is enough rubber present to constitute an emergency supply in case we ever get into a war in which our importation would be curtailed, but the extraction of this would be an expensive process; since the average content for the whole West is probably not more than 2½ per cent, and even in the best districts it will not run more than 4 or 5 per cent on the average."

Professor Hall is quite certain that rubber cannot be obtained commercially from the wild plants with the price of rubber anywhere near what it now is. In connection with this matter he says: "It is sometimes stated that the plants can be profitably grown. This is entirely within the realm of possibility, and one phase of our work is looking toward investigation in that connection, for it would be impossible to demonstrate at the present time that there would be any profit in growing the plants."

Professor Hall's forthcoming report will contain a comprehensive résumé of the possibilities of the various wild plants of the western regions which are known to contain rubber. There are several of them in unlimited quantities, but the most "interesting sort" as Professor Hall terms it, has been designated the "Common Green." "This is a variety of the *Chrysothamnus nauseosus*," he continues, "but I cannot give the Latin equivalent for the varietal name at present, since the variety has not been described and it would not be well to use the name ahead of the description. . . . We are finding that this 'common green,' as we call it, averages only about 3 per cent, although individual plants, and some of them very large ones, carry as much as 6 per cent. These figures are for absolutely pure rubber and are based upon dry weight. There are many interesting developments in connection with our

studies, but it is not permitted me to speak of these at present."

That the United States may be on the verge of a discovery of the greatest importance to the rubber trade is entirely within the range of possibility, and that a most important beginning has been made is entirely apparent. The fact that the supply is sufficient for an emergency, despite the cost involved in its production, is alone well worth consideration, although the end of the war has rendered it exceedingly improbable that such an emergency will arise in the near future. Although sensational reports have been printed from time to time in the daily papers

as to the probabilities of a commercial supply of rubber existing in the West, Professor Hall has not gone farther than in his original statement on the rubber discovery, which is to be amplified in his complete report to be made this spring. He stated:

"For two months the writer carried on field surveys in eight Western States in order to make estimates of the tonnage and distribution of rubber-carrying shrubs and to gather samples for chemical analysis. The results indicate that the total amount of rubber present is much greater than we originally supposed, although the percentage content of the shrubs is perhaps less over much of the area covered.

"Four of our experimental plots in Eastern California have been studied and evidence obtained which indicates that it will be necessary to destroy the plants in order to harvest the rubber. On the other hand, a method is being developed which gives promise of increasing the weight of the rubber-carrying portions and will be particularly applicable if the plants are brought under cultivation.

"In order to get an expert opinion on the quality of the product 25 pounds of shrub were sent to Dr. D. Spence, chairman of the sub-committee on rubber and allied substances of the National Research Council. After some months, during which time deterioration probably took place, the rubber was separated by the ordinary mechanical means and a per cent of pure rubber obtained. This was tested and reported upon as of 'high grade and average quality—not as good as fine Pará, but a great deal better than most African low grade rubbers.' Dr. Spence also reported that 'the rubber vulcanizes readily and gives a product of very fine quality.'"

In order to give an idea of the inexhaustible supply of rubber-producing plants in California it may be stated that there are 70 species of them in that state, containing from 1 to 10 per cent rubber, according to Professor Marcus E. Jones, who has been assisting Professor Hall. Professor Jones, who was formerly with Colorado College, has extended investigations over Utah, Idaho, Nevada, Wyoming, and Colorado.

CHRYSOETHAMNUS NAUSEOSUS OR "COMMON GREEN."

The "Common Green," which Professor Hall describes as the "most interesting" which he has investigated, grows 7 feet high and an illustration of it accompanies this article. The specimen was taken from the north side of Mono Lake, Mono County, California. The rubber from it is said to be a little better than that from guayule. Another variety of rubber plant is the *Ericameria*, or "dwarf rabbit bush." It is very small and grows sparsely in rocky places. Its rubber content is 10 per cent, but the product is very short and very resinous.

The investigation now nearly concluded is certain to bring

up the subject of utilizing the great waste lands of the Sierras in the cultivation of these rubber producers. These lands are available and cheap, and need no irrigation. That the rubber is there is demonstrated, and undoubtedly other experiments are under way in greatly separated parts of the United States to demonstrate whether this supply cannot be utilized by stimulating the growth of these plants and demonstrating its commercial possibilities. The forthcoming report will be treated at length in *THE INDIA RUBBER WORLD* and should be of the greatest interest to the whole rubber trade.

What Won the War?

ARMAMENT makers, ship builders, explosive manufacturers, airplane and balloon constructors, naturally consider their own individual products as vital factors in the victory of the Allies.

Sidney Neu, of the great Westinghouse companies, however, claims that electricity won the war. Though it was not in evidence he argues that were it not for man's control of this subtle fluid there would have been no victory.

Developing the argument, he says:

Think back to the gunsmith of a century ago. Could he have armed an army of four million men in eighteen months? With four million men withdrawn from production, could any army have been equipped? Electrically driven machine tools made possible what human sweat and muscle never could have accomplished.

Unheard of tons of steel have been required, and those best able to judge have said that without electric drive to speed production in the mills we should have fallen short.

Uniforms were needed to clothe the men who fought. They could not go naked while weavers leisurely wove the cloth, cutters shaped it, and tailors sat cross-legged slowly stitching seams. Electricity was called on to do these things with speed, and the uniforms were made—breeches, shirts, leggings, shoes, underwear, hats, belts, millions of them.

The chemicals that speeded the shells on their way, that burst the shells to fragments, that made the very air untenable for the foe, owed their production in the tremendous quantities required to electricity. Electrochemical processes fashioned some, electric drive furnished the controllable mechanical power for making others.

The Army and the nation needed food and electricity produced it. Fertilizers produced by electrochemical means made the earth productive, electric drive threshed much of the wheat, prepared the meat, operated the packing plants, ground the flour, entered everywhere into the production of food to make human labor less and to release more men to carry fear to the hearts of barbarians.

In its gentler aspects electricity appeared even on the field of battle, guiding armies, battalions, even individual shells. The airman by his wireless telephone and telegraph guided the gunner far in the rear who would otherwise have been blind. The commander watched through his wire and wireless network the progress of his fighting units miles away, kept them correlated into one vast machine that acted as a whole, not as a multitude of unrelated parts.

Billions of billions of electric sparks daily ignited the cylinder charges of motor trucks, lorries, airplanes, motor cars, motorcycles and the victorious tanks. Without electricity for ignition these engines would have been unheard of.

Electricity enabled the ships at sea, with their precious freight of American manhood, to keep each other in touch, to avoid the hidden dangers that menaced, to signal back as each arrived, "We're here, and safe!"

The ships themselves—did not electricity produce them? Their plates were rolled and shaped and machined in electrically driven machinery. Electric cranes transported their parts, electric compressors furnished the power behind the busy riveters.

Speed won the war when it was won and saved millions of human lives and untold additional human suffering—America's speed. The world marvels at America's speed and even America marvels. America was capable of this unheard of speed because America has made electricity its servant. Many men have been needed to accomplish what has been done in preparation, but at least twice and probably three times as many men would have been needed had not electricity been ready to help; and there was not that many men.

Electric light in battlefield searchlights patrolled the sky and No Man's Land, guarding against surprise. At home protective electric lighting dispensed with many human guards who thus could lend their hands to much-needed production. Within the busy plants men worked through the long hours of night as swiftly as by day, because electric illumination was at hand.

So short was the man-power that even with electricity's help women were required to lend their aid in making ready our fighters' equipment. Without electricity women's help would have been but feeble. It is because electric drive tames rough forces and makes cumbersome machinery so simple to manipulate that it was possible for women to do what only men had done before. Work with machinery had been considered man's exclusive sphere because it had been rough work, heavy work. Electricity has made it such light work that it no longer fatigues the frailest sex.

Nor is this alone electricity's part in putting women at the lathe, the punch-press and the planer. It has simplified the home so that she can be spared. We forget the duties that women formerly had in the home. She was spinner and weaver and tailor, she was laundress and housemaid, baker and cook, milkmaid and charwoman. Electrical machinery and electrical transportation have taken many of these duties out of the home. Those that are left, washing, ironing, sweeping, cooking and sewing, electricity has so lightened that women have been able to take their part in saving the world for those that dwell in it. Where many women were needed in the "good old days" to keep one household running smoothly, one alone now finds time to spare.

Trace back to its source any thing or factor that has helped to end the struggle, and electricity is found, not once but many times to have touched it and hastened it on to consummation. Truly, electricity has won the war, electricity guided by American brains, led on by American energy, crowned by American valor.

In every instance, however, electricity was walled in, concentrated, guided, held in check, rendered efficient, made safe by rubber. In the last analysis, therefore, india rubber won the war!

Echoes of the Great War.

THE VICTORY LIBERTY LOAN.

THE Secretary of the Treasury, Carter Glass, in his first address to the people, issued an appeal to prepare for the Fifth Liberty Loan which the financial demands on the Government dictate must be floated at an early date. Mr. Glass urged the preservation of the same patriotic spirit that has been shown in raising previous loans and recommended that all bond-selling organizations be continued. He noticeably commented on the fact that Americans once for all have disproved the slander that they are merely a money-loving people, incapable of rising above materialistic things.

As reasons for exerting a particular effort in preparing to raise the Fifth Liberty Loan, which is to be called the Victory Liberty Loan, Mr. Glass stated that the expenditures of the Government for that portion of the fiscal year between July 1 and December 16, 1918, excluding transactions in the principal of the public debt, exceeded \$9,600,000,000; that it is estimated that the cash outflow from the Treasury during the fiscal year ended June 30, 1919, will be \$18,000,000,000, of which more than half was spent in the five and one-half months prior to January 1; and that bills incurred during the peak of production of war materials at the time of the signing of the armistice must be paid.

Mr. Glass took into account that the American people face the Victory Liberty Loan with the handicap of the tendency to feel exultant and self-satisfied with what has already been accomplished and the inclination, now that peace negotiations are under way, to resume individual and business activities; but he called attention to the fact that our boys still overseas have their work before them, in which we must support them as heretofore, and he finished his appeal with an expression of confidence in the American people that they will "respond once more to the call for service and will at once prepare the ground and sow the seed, so that the harvest may be abundantly fruitful."

The Victory Liberty Loan campaign will open Monday, April 21, and close three weeks later, Saturday, May 10. The loan will take the form of notes of the United States, maturing in not over five years from the date of issue, the rate of interest to be based on existing conditions just prior to the opening of the campaign, possibly in excess of 4½ per cent, the rate on the last two loans. The amount of notes to be offered has not been announced, but it has been generally understood that it would be a minimum of \$5,000,000,000, with the Treasury reserving the right to accept all oversubscriptions.

Patriotism first and investment opportunity will be among the chief appeals to the people to support this newest loan. Secretary Glass has also explained recently how necessary it is that the new notes secure the widest circulation possible among the people in order that the banks of the country may be relieved of the burden which would otherwise be imposed on them. The business of the country, he points out, looks to the banking system for credit wherewith to carry on its operations, and if this credit is absorbed to a large extent by the purchase of government securities there will be many limitations placed upon the supply of credit for business purposes. The wage-earner is also directly concerned, that full employment at good wages may continue.

REVISED FREE AND "RATIONED" EXPORT LISTS.

The War Trade Board announces that the following rubber products will be licensed freely for export when destined to Denmark, Norway, Sweden, Holland, Switzerland, Luxemburg, Finland and the occupied Rhine provinces. They may be consigned directly to the consignee named in the export license, or "to order." The rubber goods named in the revised list are:

athletic goods, bicycle pedal rubber, rubber erasers, toys, dolls and games of all kinds, including or consisting of rubber.

The "rational" list of exports to Sweden, for which a fixed ration has been provided under the terms of the agreement with the Government of Sweden, includes raw rubber and rubber manufactured goods other than tires and tubes, pedal rubbers, brake blocks of rubber for bicycles, and rubber erasers.

Applications for licenses to export these "rationed" commodities to Sweden will be considered by the War Trade Board only when such applications are accompanied by the numbers of the import certificates issued by the Swedish Handel's Kommission upon the guaranties of the appropriate importing associations, and shipments may be consigned only to such associations.

AMERICANIZATION ACTIVITIES IN AKRON.

If the great world war had served no other purpose than that of inspiring in the minds of the foreign-born people in America a desire to become, first, American, and then so well read and

AN AMERICANIZATION CLASS.

educated that customs and methods of all countries were disclosed to them, it would have achieved a great social change.

American industry has been upheld and operated smoothly by foreign labor, at least seventy per cent of which could not read nor speak the English language. This condition was unfair to both workmen and the industry. In full knowledge of this industrial concerns and educational leaders in Akron, Ohio, have taken up the project of Americanization among foreign workmen, and the Board of Education is urgently advocating the adoption of an Americanization program by every concern in the city.

Perhaps no concern in Akron has taken up this work more seriously than the Firestone Tire & Rubber Co. Classes may be seen assembled under the direction of instructors furnished by the city Board of Education nearly every day in the spacious lounging rooms of the Firestone Club House, which offers unusual facilities for work of this kind.

These men and women are instructed much as children are in the primary grades in school. Classes are divided according to the progress made by the student. Rudimentary English, reading, and the use of the English alphabet form the chief subjects for study in the first classes. As a man develops and acquires a sufficient working knowledge of the English language to carry on his studies for himself, he is urged to read the newspapers and magazines and to obtain for himself information relative to lands, governments, and customs outside of his own native country.

After a student completes a course as described herein, he is

given the privilege of passing an examination for citizenship papers. All aliens who have not already their first papers are urged to take them out, and this class work is intended to enable them to pass the examination which is given for second papers. Summit County common pleas judges have resolved to accept as final evidence that a man is ready for his second papers, his passing an examination which has been prepared by the Assistant Superintendent of Schools. This examination is in the form of a questionnaire.

By the time the student has reached this stage, he has become that for which this entire movement was conceived and placed in operation. He has become an American citizen, a student of civic government, a fellow-being to be respected, and a man whose normal intelligence will no longer be submerged beneath the barrier of foreign nativity.

GOVERNMENT SALVAGE OF WASTE TO CONTINUE.

The likelihood that the Government will maintain a permanent waste reclamation service as a needed conservation measure for the benefit of American industry in time of peace is of great interest to rubber-goods manufacturers. Of the waste materials of various kinds salvaged during the year 1918 by the War Prison Labor and National Waste Reclamation Section, Labor Division of the War Industries Board, and valued at \$1,500,000,000, old rubber was represented to the amount of \$300,000,000.

So good was the showing in salvaging the materials needed by the Government in the prosecution of the war that the work will probably be taken over at an early date by the Department of Commerce and put on a permanent basis. The eighty-six local reclamation councils in leading cities of the country, and some two hundred others in process of formation, are destined to form an endless chain ensuring the assistance of civic and other organizations and school children in establishing permanent municipal bureaus to collect and reclaim all waste materials for peace-time industries just as garbage and ashes are collected. It is the logical way to meet the unprecedented demand for raw materials and will tend to restore retail prices to pre-war levels.

SALES BY ALIEN PROPERTY CUSTODIAN.

A number of rubber and chemical properties of enemy ownership have recently been sold by the Alien Property Custodian. The names of the purchasers and the prices paid are as follows:

The Traun Rubber Co., New York City, bought by William Schrader, 249 Fourth avenue, New York City, for \$20,000. Sale to be approved.

Goetze Gasket & Packing Co., New Brunswick, New Jersey, bought by Peter F. Daly, New Brunswick, New Jersey, for \$57,100. Sale not yet approved.

A. W. Faber, Newark, New Jersey, bought by Theodor Friedberg, 30 Church street, New York City, for \$131,250. Sale has been approved.

Hevden Chemical Works, Garfield, New Jersey, was sold for \$605,000, but sale was not approved as to price by the Advisory Sales Committee. It was subsequently readvertised for sale.

CHEMICAL FOUNDATION, INC.

The Alien Property Custodian, acting under the authority of the amended Trading with the Enemy Act of November 4, 1918, has organized a corporation known as the Chemical Foundation, Inc., all of whose \$500,000 capital stock has been subscribed for at par in cash by a large number of American manufacturers of chemicals and dyestuffs. The Chemical Foundation, Inc., has purchased from the Alien Property Custodian, for \$250,000 about 4,500 patents covering chemical processes and products, registered in the United States by Germans and other enemy alien owners. The Chemical Foundation, Inc., will issue, without discrimination, non-exclusive licenses to any American manufacturer who may make application therefor, under the terms of which the American manufacturer may use or make the patented processes and products on a moderate royalty basis. The

effect of this plan will be to totally exclude from the United States the importation of any dyes or chemicals made in any country in the world under any of the patents held by the Chemical Foundation, Inc. Of the subscribed capital, \$250,000 is available as a working fund for the prosecution of actions involving the importation or manufacture of products infringing on the patents to which the Chemical Foundation, Inc., has acquired title.

The patents now held by the Chemical Foundation, Inc., cover most of the processes and products used in the dye industry and in addition to this protection afforded under the patent laws, there is now in effect the Tariff Act of September 8, 1916, which imposes a heavy ad valorem duty on finished dyestuffs made from coal tar and smaller ad valorem duties on intermediates, together with specific duties on both finished products and intermediates. These customs duties apply to all synthetic dyestuffs imported, wherever made and by whatever process.

RUBBER MEN RETURNED FROM SERVICE.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, reports the following men returned from service: Lieutenant George Blair, 18 months in the Naval Aviation service, manager of Philadelphia branch; P. F. Armitage, one year second machinist's mate in the Naval Reserve Force, in charge of northeastern Pennsylvania territory, with headquarters at Philadelphia branch; Milton H. Batz, first-class sergeant, representative in western New York; and William E. Littell, with the Motor Instruction Division, calling on the trade in Central Pennsylvania.

Fred M. Elvidge was recently discharged from the Army and has returned to his former position with the Ajax Rubber Co., Inc., New York City. At the time the armistice was signed he had worked his way up from private until he was about to receive a captain's commission.

WELLMAN-SEEVER-MORGAN DEMONSTRATION.

A novel method of showing how solid tires are put on and taken off the wheels of motor cars was recently inaugurated by an enterprising builder of tire-applying presses. A 200-ton press was installed at a prominent business corner in Cleveland, Ohio, and actual demonstrations of mounting and demounting tires were given.

The exhibit was attractively decorated with oil-painted posters and was flood-lighted at night. Grouped around the press were

AN OUTDOOR TIRE-APPLYING EXHIBIT.

various sizes of tires, up to the largest solids built, including the following well-known makes: Brunswick, Firestone, Good-year, Hood, Kelly-Springfield, Kokomo, Mason, McGraw, Owen, Polack, Republic, Sterling, Swinehart, United States.

The Aeronautical Exposition.

THE Aeronautical Exposition was held in the 69th Regiment Armory and Madison Square Garden, New York City, from March first to fifteenth, under the auspices of the Manufacturers' Aircraft Association. This exposition was a revelation of the remarkable development effected in aircraft by American inventors and manufacturers under the stimulus of the war, and afforded an

The B. F. Goodrich Co.

BLIMP TYPE DIRIGIBLE.

inspiring outlook on the commercial possibilities of aircraft applied to passenger transportation. In balloon construction particularly, much has depended on the resources of American rubber companies, since the envelopes of dirigible, kite or observation, and spherical balloons are built entirely of rubberized cloth.

In the United States the manufacture of balloons has been confined largely to The B. F. Goodrich Co., The Goodyear Tire & Rubber Co., and The Connecticut Aircraft Co. All of these companies were represented at the show by exhibits of their typical dirigibles, kite and spherical balloons, and various rubber accessories.

The prediction is freely expressed by those conversant with the problem that the day is at hand when passenger travel by air will be established on a commercial basis as a necessary form of modern transportation. As a commercial factor the dirigible is better adapted for aerial transportation in possessing wider cruising radius and carrying capacity than the airplane. The dirigible by its gas content in the bag is able to stay aloft at all times without the aid of its engines and these are chiefly used as a means of propulsion.

There was suspended in the Armory a navy coast patrol dirigible of Goodrich manufacture of the following dimensions: length, 167 feet; diameter, 33 feet; volume, 80,000 cubic feet. This dirigible had seen 17 months' service. Also in the Armory, The B. F. Goodrich Co. exhibited an interesting collection illustrative of balloon manufacture, such as rubberized balloon cloth; shock absorber cord, consisting of many square, pure rubber threads bound together in cylindrical form by a cover of braided cotton; Gammeter car suspension patches and gas valves; samples of rope knots used in balloon rigging; a model spherical balloon, and airplane cord tires.

In the field of aeronautical production The B. F. Goodrich Co. is credited with 14 dirigibles, 362 observation balloons, over 1,500,000 feet of airplane bumper cord and many Silvertown cord airplane tires, besides many improvements and inventions in balloon manhole flanges, gaskets, glands, etc.

An interesting feature of the Goodrich display was the periodic exhibition of a series of moving pictures showing the manufacture of balloons.

The Goodyear Tire & Rubber Co. exhibit, located in the

Garden, was similar in character and scope to that already described. A Goodyear kite or observation balloon was exhibited and a display made of riggers' knots; various metallic accessories; balloon cloth made from cotton raised on the Goodyear cotton plantation in Arizona; Goodyear balloon gas-valve; the illuminated inspecting table for examining rubberized fabrics; and a model compartment passenger car fitted with sleeping accommodations designed in connection with passenger traffic by dirigible balloon.

The Connecticut Aircraft Co. showed a spherical balloon and a model dirigible as planned for passenger service between New York and Atlantic City, beginning in the autumn of this year.

Wellington, Sears & Co. exhibited a line of balloon fabrics and non-tearing cotton airplane cloth designed for airplane wing covering. Crowning triumphs in this line were the five-and-five basket weave and three-ounce Warwick seamless aero-cord fabrics. The latter is woven similar in design to automobile cord-tire fabric, from chemically purified mercerized 3-ply warp yarns and single spun filling yarns. This fabric, weight for weight, tests 38 per cent stronger than 3½-ounce grade A linen made of unbleached, single-spun yarns. Similar non-tearing cloths of heavier weight were also shown, intended for balloon making. These deserve investigation on the part of makers

The B. F. Goodrich Co.

KITE OR OBSERVATION BALLOON.

of mechanical rubber goods, as to their adaptability for high-grade hose manufacture and other purposes.

The Bristol Co. exhibited instruments for measuring the speed of aircraft, simple recording thermometers for air, and wet and dry bulb thermometers for recording the hygroscopic state of the atmosphere.

RUBBER MANUFACTURES IMPORTED INTO BOMBAY. BRITISH INDIA.

Unofficial figures showing the general imports of Indian produce into Bombay during the year 1917, as given in the "Bombay Government Gazette," include the following comparisons: 1916—rubber manufactures, \$1,487,250; 1917—\$1,569,772.

The Evaluation of Rubber Plantations.

By *Kells Colfax Baker, M.S.F.*

THE evaluation of rubber plantations is a subject of increasing importance to the rubber world. The aggregate value of the planting industry is increasing rapidly because of increased acreage and increased yields per acre. The price of crude rubber is at the same time decreasing, or must necessarily do so in the near future, thereby leaving a smaller margin of profit to the producer. Hence arises the rapidly increasing need for a careful and scientific evaluation of plantation properties. The laxness of the industry in general in realizing the importance of this is seen in the fact that the exact value which most properties are to their owners has never been decided upon. Not only have these evaluations never been made, but there has been no system for calculating values yet evolved which is mathematically correct, and which will hold in court. Innumerable needs for this knowledge might at any time arise, common instances of which might be in the case of damage suits, unjust taxation, any need for accurate assessment, or in the case of selling and buying properties. It will, in short, allow planters and investors to maintain a complete and accurate inventory of their plantation investments.

Every large planter and investor in plantation securities must already have had some instances arise in which a definite system for evaluation would have been of great assistance, and would have added greatly to their sense of security in their investment. In most past evaluations of properties, taking, for example, the late evaluation of one of the largest holdings in the Orient, there have been no two men who have calculated in the same manner, and as a consequence no two evaluations are strictly comparable. For instance, one eminent V. A.—Mr. A.—calculates on the basis of a seven years' purchase of profits, while another equally eminent V. A.—Mr. B.—on the other hand, figures on the basis of a ten years' purchase of profits, and a third—Mr. C.—figures on still another system which includes a seven years' purchase of profits with some sort of an addition to include the value of the buildings, machinery, etc., on the property. Why is Mr. A. justified in assuming that the value of the property is seven years' profit while Mr. B. assumes that it is worth ten years' profit? It comes down merely to a question of the personal fancy of the evaluator. What is the basis of Mr. C.'s addition of an inventory to a seven years' profit? This instance is not exceptional, but typical.

There is more than a merely theoretical difference between a "guess" and "estimate." Any figure in order to be an estimate must have been derived from the combination of some basic assumptions with some definite and logical method for calculation. Otherwise it is a guess. It does not seem to the writer that it is reasonable for the planting industry to guess at the value of properties when there is every probability that by study of the problem there can be evolved a definite and mathematically correct method for estimating their value. The evolving of this method does not mean pioneering to any great extent, as the methods used by modern public utility engineers in evaluating their properties and the method used by bankers in evaluating long-term bonds can be used as guides. This value when obtained should be a maximum value in case of buying properties and a minimum value in case of selling properties. It may often be possible to purchase considerably below this maximum valuation or it may be possible to sell considerably above this minimum valuation, but in each case the negotiator would be very sure that he was doing so rather than merely guessing that he was.

In a memorandum replying to my letter of some months past to Mr. B., the prominent V. A. mentioned before, the advisability

of formulating some definite system was questioned on the point that by so doing "all the individuality of the reports of the different men would be lost." In answer to that the writer may say that any system of calculation, to be of any value whatever, must be elastic, but the calculations may be so systematized that we will have this elasticity, and yet have all the advantages of a definite method of calculation. In engineering reports and in the evaluation of engineering projects certain formulae are used, and certain evaluations are made by prescribed methods, yet engineering reports cannot be said to be "cut and dried" propositions in which no individuality can be shown. The assumptions of the planter may necessarily be less accurate than those of the engineer, but his methods of calculation should be just as accurate and as axiomatic as engineering methods. It is said that figures never lie, but it cannot be said that a system of figuring never lies.

In the memorandum mentioned above, the advisability of having a definite system was questioned by the statement that "although we should have a system, no two reports on one estate would agree." In answer to that the writer may say that this statement in itself is an admission that the use of a definite system for the calculation of estimates and values does not prevent the elasticity which is desired. On the other hand, it will allow two reports which vary in results to be really compared. If the systems of calculation are different they cannot be compared in the proper sense, because the effects of the different systems of calculation used may nullify or increase the effects of any differences in basic assumptions, as to future yields, future prices, future costs of production, etc.

In considering the standardization of any system for calculations there appear to the writer to be at present four main variables, three of which (No. 1, No. 2, No. 3) will ever remain variables, but one of which (No. 4) should become **standardized**. In order to make the reports on any particular property strictly comparable, No. 2 and No. 3 should also be standardized for that particular property. These variables are as follows:

No. 1. Estimates as to yields and cost of production.

No. 2. Estimates as to the price of the product and the profit per pound.

No. 3. Interest desired on the money expended.

No. 4. Method of calculating the value of the profits after the above have been ascertained.

The "estimates as to the yield and cost" (No. 1) will vary with the different men examining the property. In order to give the system the desired flexibility, and to allow each examiner an opportunity of using his individual judgment, this particular branch of the valuation cannot be systematized except in a very general way.

The "estimates as to the price of the product" (No. 2) should be fixed in most cases by the investors—not the V. A. (and in many valuations this has been fixed at an arbitrary figure by them at 40 cents gold per pound of dry rubber). This, with the estimates of the V. A., as to yields and cost of production, (No. 1) will give the "profit per pound."

The third item, or the "interest desired on the money expended," must be furnished by the investors for whom the valuation is being made. In this relation it must be considered that the rubber-planting industry represents an investment which ordinarily lies at a great distance from the investor, and that its success is in very many ways absolutely beyond human control—as is the case in all planting enterprises. It is possible to control quite completely the manufacturing and sales departments of the rubber industry, but the success of the planting and of the

enterprise depends so much upon the climatic factors, the sudden appearance of disease, pests, etc., none of which at the present time seems particularly dangerous, but which in so many planting enterprises have wrecked them, that we cannot say it is completely under control. Hence, there is a risk for which compensation can be made only by an increase in rate of interest demanded by the investor. A fair rate of interest should be: for the owner—the interest rate which he estimates he could get in new investments, with the same risk incurred; for the buyer—the interest rate which he desires to make on this particular investment, considering the risk involved. The writer's personal opinion is that 20 or 25 per cent is a fair rate of interest to use in the calculations for the value of rubber estates, but this will no doubt meet the adverse criticism of optimistic planters who are not buying.

The fourth item, or the "method of calculating the value of the property, after the above estimates of cost, yield, price of the product, and interest rate have been fixed," is the one of most importance to us in any attempt to standardize the evaluation.

The writer believes that a method to be correct must cause the values of the property to vary in correct ratio with the following estimates which form the basis for the evaluation:

- (1) Time required to bring the area into full bearing.
- (2) The amount of money which must be expended per acre to bring the estate into full bearing.
- (3) The time at which this money must be expended.
- (4) Profit on production per year until estate is in full bearing.
- (5) The wait necessary before profits will pay the desired rate of interest.
- (6) Profit on production per year when the estate is in full bearing.
- (7) The age at which we should consider a tree must be replaced.

(These items are, of course, all future estimates—not past expenditures.)

In other words, the calculated value of the property should have a mathematically correct relation to the estimated profits. There may occur instances, however, where, due to some external reason, the value of a property itself will be all out of proportion to the profits obtained, yet even in such a case it is necessary to know its value as a profit-earner before its extraordinary value can be estimated.

The seventh item—the age at which the tree must be replaced, or its economic death—is a very debatable question. The writer believes that generally this will occur in the neighborhood of from 60 to 70 years of age—that is, that the risk involved justifies the investor in considering that his income from the trees will cease to be profitable by that time unless the trees are replaced. This can be lengthened to 100 years, however, without any appreciable difference in result.

That the realization of this need for standardization is not original with the writer is evidenced by the fact that several attempts have been made to develop a system for the calculation. One of these, by a Ceylon and India V. A., has been tried out quite extensively by the writer, and was at one time considered by him to be a solution of the problem, but in the light of further investigation he regrets that he cannot recommend it. While it appears to give fairly good results for properties which are already paying a profit, it is not applicable to properties not yet in the producing stage.

A system, to be applicable, must include the features of farm valuation, in that after the yield starts there is an annual "crop," which in time becomes fairly uniform; and the feature of forest valuation in that there is considerable wait before yield starts, and that profits or "returns" are hence delayed; also, that the income will not continue indefinitely, but probably only a matter of fifty to sixty years.

Another matter which should be considered is the potential value of unplanted areas suitable for rubber planting. For in-

stance, many large planters are paying—and have paid for some years—rental on a large unplanted area, a good proportion of which is suitable for rubber cultivation. Due to its location it can be easily and efficiently managed in conjunction with the present planted area. Its inclusion within the property boundaries is a valuable asset and increases the value of the property as a whole. Consequently, in an evaluation of the property the potential value of this unplanted area should be included.

An adaptation of Schlich's formulae in common use in the evaluation of forests and forest lands can be made applicable to the rubber-planting industry. The principles upon which these formulae are based are as follows:

- (1) The present value of the entire property is equal to the sum of the present value of the planted area, plus the potential value of the unplanted area.
- (2) The present value of the planted area is equal to the estimated income value of the area when in full bearing, calculated at the desired rate of interest, less the total value of all estimated expenditures to be made in order to bring the area up to that state, calculated at the legal rate of interest, and this difference discounted to the present time at the desired rate of interest; plus the sum of the present values of all estimated profits to be made, until the area is in full bearing, calculated at the desired rate of interest.
- (3) The potential value of the unplanted area is equal to the result of the number of acres suitable for rubber planting, multiplied by the potential value of one such acre.
- (4) The potential value of an unplanted acre of rubber land is equal to the estimated income value of one acre when planted and in full bearing, calculated at the desired rate of interest, less the total value of all estimated expenditures to be made in order to bring the area up to that state calculated at the desired rate of interest, and this difference discounted to the present time at the desired rate of interest; plus the sum of the present values of all estimated profits to be made until the acre is in full bearing, calculated at the desired rate of interest.

The mathematical development of these formulae is a detail in which the writer assumes that the reader is not interested at present, but which can be found in Schlich's "Manual of Forest Valuation" and in Roi's "Forest Valuation." Suffice it to say that in these formulae can be included every variable mentioned in the previous paragraphs, and that it appears to the writer that the resultant calculated value of the property will bear a mathematically correct relation to the estimated expenditures and income.

In order to develop this theorizing into the form of concrete workable formulae, let us make the following assumptions:

- (1) Consider a property which contains both planted and unplanted areas;
- (2) Consider that the age of the planted area is five years;
- (3) That profits can be obtained from a planted area during the sixth year of its life;
- (4) That a plantation comes into full bearing at about 15 years of age, and that the yield then continues to be comparatively uniform;
- (5) That the economic life of the tree is ended at about 65 years of age, or 50 years after it is in full bearing.

Then allow these basic assumptions to be represented in the formulae as follows:

E = interest desired by the investor or evaluator;

e = interest at which money to be used for development can be procured;

N = number of unplanted acres available for planting;

$P_1, P_2, P_3, P_4, P_5, P_6, P_7, P_8, P_9$ = estimated net profits from total planted area for the first, second, third, fourth, fifth, sixth, seventh, eighth and ninth years of profits, respectively;

P_{10} = estimated annual net profits which start on the tenth year of profits (when the plantation comes into full bearing) and continues through the economic life of the trees;

the shape and size to make up into single boxes. The working of the scoring and cutting-machine is interesting. A sheet is fed under the series of circular knives or scorers, and emerges with deeply indented lines where folds are needed. As soon as the

the staying material, sometimes cloth, but usually a tough paper especially made for this purpose from rope stock. This stock is cut just the right width to go around the corners, and is then attached to the back of the cover strip as it goes forward. The

FIG. 3—MACHINES AND CONVEYOR BELTS FOR STAPLING CARTONS.

sheet has passed completely through, it automatically starts the mechanism that carries it at right angles through another series of scorers and cutters, the former completing the scoring, and the latter cutting the strips apart. These strips represent the two sides and bottom of a large single box or of two smaller boxes.

OLD AND NEW METHODS COMPARED.

The old-fashioned way of making a box was to make the ends, sides and bottoms of one piece, the flat shape resembling, to some extent, an exaggerated cross. Modern conservation, however, has resulted in eliminating the great waste of cutting out four square pieces the full height of the box by making the ends separate, and attaching them later to flanges on the larger part. Therefore, the strip which comes from the scorer and cutter is slightly wider than the length of the box, and is scored lengthwise with crosswise scorings where the sides bend up from the bottom.

These flat sheets are next taken to a corner-cutting and mitering machine, where miter-shaped triangles are cut out at the intersections of the scorings and the sheets thus made ready for the next operation. A machine takes these sheets, presses them so as to turn all the scorings, spreads adhesive on the turned flanges, and firmly attaches the box-ends, which are automatically fed from piles placed in the machine. Two girls keep the machine supplied with box-parts, and enable it to turn out thousands of boxes per day. These boxes, made of rough chip-board or mill-board, are to be covered with glazed paper, and here machinery has enabled greatly increased output and exact uniformity.

THE CORNER-STAYING PROCESS.

Naturally, the corners are the weak spots in such boxes, and corner-staying consists of pasting a strip of tough-fibered paper around each corner, or placing metal corners or inserting wire staples. The latest covering machinery, however, combines the corner-staying and the covering in one process. The boxes are placed, one at a time, on a form adjusted to fit the box. The glazed paper strip is fed from a roll, glue applied to its under side, and fed along, so that the paper may be properly "tempered" to prevent tearing, yet be of the right adhesive state to stick at once and smoothly. Meanwhile, from another roll, is applied

FIG. 4—PRESS FOR CUTTING, SCORING, AND PRINTING CARTONS.

box, or cover, is on the revolving form ready to receive the strip which is cut off at just the right length to overlap the ends. In covering box-lids the operator runs her forefinger along in front of the paper to lay the flange of the cover flat upon the form.

THE TOPPING MACHINE.

Next comes a topping machine which cuts, pastes, and applies the glazed-paper top to the lids, thus giving them the required finish. The machine is so built and adjusted that the paper is stretched just the right amount and "tempered" to fit properly, lie smoothly and dry flat, giving the lids a finished appearance. Such are the manipulations through which a common paste-board box must pass. Besides these, it must be labeled. A label may be pasted on, or it may be printed on the end of the box itself, and for this latter purpose an adaptation of the common job-printing press has been evolved.

MAKING PRINTED CARTONS.

So much for boxes which are covered. Besides these there are thousands of cartons made of more flexible, but tougher, stock, having a finish that will take printing, and present a handsome appearance. This stock is fed into a scoring and printing press, which cuts out the cartons, scores them and prints the sides and the label on the ends. Each revolution of the press produces six cartons, delivered in the flat, scored for folding, which are then cut apart with shears. These cartons, being of lighter stock, are corner-stayed by means of machines which cut small lengths of wire from coils and insert them as staples, six being used on each carton, which then drops, finished, upon a conveyor belt, and is transported to the packing department.

A NEW RUBBER GOODS FACTORY IN BRAZIL.

According to consular reports, after the present war, a large American concern, holding a concession from the Government of Brazil, will build an important rubber goods factory in Rio de Janeiro.

NEW SWEDISH RUBBER FACTORY.

A new factory which will manufacture rubber goods is under way at Landskrona, Sweden. It is being erected by the Aktiebolaget Landskrona Gummifabrik.

Scientific Lighting in the Rubber Factory.

By A. L. Powell, Edison Lamp Works of the General Electric Co.

THE importance of an efficient lighting system in the rubber factory cannot be overestimated. It is to the interest of the employer as well as the employee that the most up-to-date methods be adopted and that nothing be overlooked to provide the best facilities. The old-time carbon lamps are now as out of date as the kerosene lamps and open-burner jets which were used in the early days. Lighting has assumed almost as great an importance as the cost of labor and materials. It has been found that an actual increase of 15 per cent in output has followed the installation of a modern system equipped with the Mazda, or some other modern improvement of the old-fashioned carbon lamp. If the lighting is poor or inadequate, the workman will be less efficient. Good lighting is reflected in the faces of the operators, in the form of healthful, buoyant spirits. Bad lighting is irritating because it makes it difficult to see, and strain is involved in the efforts of workers to adapt themselves to unnatural conditions. Any plant manager knows that the experienced or trained man is an asset not easily replaced. He becomes incapacitated at the very time he should be yielding the biggest return on the investment made in training.

In line with the foregoing a scientific system for lighting a rubber shoe factory is outlined. Upon examination it will be evident that these suggestions also apply to nearly all lines of rubber manufacture. Thus, the lighting for the wash-room, mill-room and calender-room apply in all lines. So, too, in cutting, in making-up and in packing there are the same problems. In other words, the lighting plan designed for the rubber shoe factory is applicable with slight modifications to tires, clothing, druggists' sundries, mold work, specialties, in fact to all lines.

THE WASH-ROOM.

The band saw used to cut the crude rubber should be so clearly illuminated that there is no likelihood of accident. The writer encountered one case where a fairly high-powered lamp without reflector was placed about eye-level, close to the saw. This must have been most trying to the eyes of the workman and it was really good luck that he had not been seriously cut at some time. Everyone knows the blinding effect of a bright light source and with this lamp in close proximity to the saw, there must have been many occasions when the swiftly moving

material is handled in bulk and safety, really, is the determining factor. General illumination of a low intensity will be adequate, although, if feasible, units may be placed near the machines.

THE MILL-ROOM.

The mills are frequently arranged in rows along the sides of the room. If a row of outlets is located above them and lamps equipped with dome reflectors which give a fairly wide distribution of light, then the maximum light will be provided where most needed and the spread light will take care of the center of the room. A typical case might be such as shown in Figure 1. This room, 40 feet wide, has mills along the two sides on 10-foot centers; 75-watt Mazda lamps in RLM dome reflectors placed close to the 12-foot ceiling, spaced as indicated, will give excellent illumination. In cases where fairly uniform illumination is desired throughout the entire room, if modern, efficient equipment is employed, a suitable intensity will be obtained when one-quarter to one-half-watt per square foot of floor area is used.

COMPOUNDING-ROOM.

The room devoted to this work should be fairly well illuminated by the general system, allowing at least $\frac{1}{2}$ -watt per square foot of floor area. Good lighting here will prevent errors in the mixture and be a paying investment.

COATING AND CALENDERING.

As the material passes over these machines, it must be watched for defects and care must be taken to see that the coat-

FIG. 2—TYPICAL LAYOUT FOR CALENDERS.

⊗=200-WATT MAZDA C LAMP IN RLM STANDARD DOME REFLECTOR.

ing is being applied in the correct manner. Good lighting will make this work easier and more certain as to results. If machines should be located as indicated in Figure 2, which is typical of some conditions, then a general lighting system as shown in the plan will give good illumination on both ends of the machine and at the same time illuminate the entire area in a most satisfactory manner. This particular arrangement assumes the use of 200-watt Mazda C lamps in RLM standard dome reflectors on centers approximately 20 by 20, placed as close to the ceiling as practicable. If the room is not so arranged or there is a multiplicity of shafts, belts and the like, precluding the use of general illumination, then lighting outlets should be located at the ends of the machines. If the lamps are equipped with angle type reflectors, they will give the maximum illumination on the vertical surface or in other words on the material as it passes over the rolls.

FIG. 1—TYPICAL MILL-ROOM LAYOUT.

⊗=200-WATT MAZDA C LAMP IN RLM STANDARD DOME REFLECTOR.

blade was indistinct, if not totally invisible. Such conditions must be watched and avoided.

In washing there are no close demands on vision. It is merely necessary to provide sufficient light to load the crude rubber in the mills and make occasional adjustments. The ma-

SOLE-ROLLING MACHINES.

The center portion of most of these machines extends practically to the ceiling and a symmetric arrangement of outlets would probably cause bad shadows. It is, therefore, desirable to have outlets at both the front and rear of the machine approximately as indicated in Figure 3. Relatively small lamps can be used with deep bowl reflectors to direct the light on the work. Such an arrangement will enable the operators to make adjustments with facility and gage or inspect the stock accurately.

SOLE CUTTING.

The operators on this process are working rapidly with sharp knives and if the artificial light is of a character that is not well suited, the danger of cutting one's self is increased. It is well, therefore, to supply a fairly high intensity of evenly distributed light from units equipped with proper reflectors to shield the eye and hung well out of angle of view. The scheme pictured in Figure 4 will prove entirely satisfactory. It will be

FIG. 3—TYPICAL LAYOUT FOR SOLE-ROLLING MACHINES.

⊗=25 OR 40-WATT MAZDA LAMP WITH DEEP BOWL REFLECTOR. noted that this gives the maximum illumination at the ends of the boards or tables where the workmen stand and yet does not confine the bright illumination to a small circle, which is quite trying to the eyes. A row of the same units on slightly wider spacings is suggested for the center of the room. These would give good general illumination when the tables were not in use. All the lamps should be hung as close to the ceiling as

FIG. 4—TYPICAL SOLE-CUTTING-ROOM LAYOUT.

⊗=75-WATT MAZDA C LAMP IN RLM STANDARD DOME REFLECTOR.

possible. This is assuming that ceilings in general do not run over 12 or 14 feet in height.

CUTTING LININGS.

It would seem to be a rather difficult matter to get sufficient light beneath the head of the presses from an overhead unit,

but experience has shown that a moderate intensity of well diffused general illumination meets the conditions in an excellent manner. A typical case is pictured in the night photograph Figure 5. No drop lamps are used, but 100-watt Mazda C

FIG. 5. TYPICAL OVERHEAD ILLUMINATION OF PRESSES, ELIMINATING SHADOWS.

lamps in dome type steel reflectors are used on 12-foot centers close to the ceiling. Absence of drop cords makes a neater appearing shop.

UPPER CUTTING.

A high intensity of general illumination is advisable in this part of the plant. Work is done with sharp knives and must be cut accurately to line. It is advisable to supply approximately 1 to 1½ watts per square foot of floor area. A splendid example of the application of this method of lighting is given in the night photograph, Figure 6. Every board and bench is clearly

FIG. 6. TYPICAL OVERHEAD ILLUMINATION OF UPPER-CUTTING ROOM, ELIMINATING SHADOWS.

visible and there are no annoying shadows or bright light sources hung low to fatigue the eye.

MAKING-UP ROOM.

Here also the high intensity general lighting system should be applied. This is far more desirable than the system used in many instances of drop lamps hanging close to the racks. A typical layout might be such as that shown in Figure 7. This implies the use of 100-watt Mazda C lamps in dome reflectors on approximately 10-foot centers. In lighting work of this character it is essential to supply an intensity so that the most diffi-

FIG. 7—TYPICAL LAYOUT MAKING-UP ROOM.

⊗=100-WATT MAZDA C LAMP IN RLM STANDARD DOMA REFLECTOR.

cult operation can be performed with ease. Skiving is no doubt the step of manufacture which falls under this classification and with a scheme such as outlined, it can be readily accomplished.

VARNISHING AND VULCANIZING.

Here again the work is more or less handled in bulk although it is practically a finished product. There are no demands for close vision and a low intensity of general illumination will suffice. This can be supplied with 200-watt lamps on 20-foot centers if the ceiling is high, or 100-watt lamps on 14-foot centers or 75-watt lamps on 11-foot centers in the case of a low ceiling.

INSPECTING AND PACKING.

To prevent defective material getting in the hands of the customer, it is well to have this room brightly lighted so that all imperfections are clearly discernible. The high intensity of general illumination from 100-watt lamps on approximately 10-foot centers is essential. Where piles of material extend close to the ceiling, outlets should be located with reference to these so that bad shadows are eliminated.

Analysis of Antimony Pentasulphide.

By D. Repony.

AFTER having tried to analyze antimony pentasulphide, following the known methods, in no case could perfect results be obtained. Either the method required too much work or was not in accordance with the need of the rubber manufacturer. By most methods the main object is to determine the total antimony content. It is, however, altogether wrong to value the antimony pentasulphide by high content of antimony, the essential thing being that the product should show a high percentage of antimony pentasulphide.

Commercial antimony pentasulphide is produced by treating the mineral stibnite with sulphur and lime, obtaining calcium thioantimonate, which is decomposed by sulphuric acid into antimony pentasulphide and calcium sulphate. After the antimony compound is washed with water to remove the free acid and some of the water-soluble calcium sulphate, a large quantity of calcium sulphate still remains with the product. When, however, caustic soda is used in the reaction instead of lime, the antimony obtained is free from calcium sulphate, providing the product has been thoroughly washed. Thus the presence of calcium sulphate must not be considered as an adulterant but as a by-product of the reaction. The writer has found, also, all kinds of adulterants admixed with the antimony. The adulterants are mostly red oxide of iron and iron silicates, such as red clay, whiting and barytes. Therefore, to analyze for adulterants is considered very essential.

Before any attempt is made to analyze antimony submitted for rubber compounding it should be tried practically in some of the most important rubber compounds, replacing the same quantity of satisfactory lots previously used, and the rubber compound be subjected to a series of different heats of vulcanization. Should the rubber compound not change color during the vulcanization at 310 degrees F., it is probable that the antimony will show satisfactorily on aging. Should the color change on vulcanization at the above temperature and also at lower heat, further consideration will depend very much upon the price quoted and the quality of the rubber goods in which it is to be used. In cheap compounds generally the same shade of red which is obtainable by poor antimony can be readily duplicated with red oxide of iron. Should the antimony show satisfactorily in rubber compound under the heat of vulcanization, the next thing is to prove that it contains some adulterant.

TEST FOR ADULTERANTS.

Take about five grams of the sample in 100 cc. of ten per cent hot caustic soda solution, and stir with a glass rod on a steam

bath till no red particles can be observed; this usually requires ten minutes. Pure antimony should dissolve completely. Any red powdery residue indicates an adulterant, such as red oxide of iron or iron silicates. A white residue indicates, in most cases, calcium sulphate, which can be readily confirmed. If the residue is not soluble in cold water it is antimony tetroxide, whiting, barytes, silica, etc.

The method described below for the analysis of antimony pentasulphide yields satisfactory results from the point of view of the rubber manufacturer, and affords the analyst partial information with the least work, or, where time and facilities are available, the complete analysis may be effected.

METHOD FOR COMPLETE ANALYSIS OF ANTIMONY PENTASULPHIDE.

The antimony should be neutral and about 420 specific gravity. The crimson antimonies are mostly of slightly acid reaction. However, the acid content must be in any case not higher than 1/100 of one per cent. The acidity is determined qualitatively by wetting a little of the sample with water and testing it with litmus paper. The quantitative amount of the acid contained in the sample should be determined in the following manner: Take two grams of the sample, place it in filter, and wash it with water till the washing water is neutral; then titrate the obtained solution with 1/10 normal caustic soda, using phenolphthalein as indicator. Antimony containing more than 1/100 of one per cent of free acid should be rejected, as this is apt to cause blisters during vulcanization, especially in such rubber compounds as contain carbonates. Crimson antimony very seldom contains free sulphur. The amount of free sulphur in orange antimony ranges from none up to 30 per cent, the usual amount being between 15 and 20 per cent.

To determine free sulphur place five grams of the sample in a thimble of filter paper in such manner that the solvent during extraction cannot splash out any of the antimony. Fresh redistilled carbon disulphide must be used as solvent, and the extraction be continued for ten hours; this should be done overnight.

The following precautions should be noted. Carbon disulphide when not freshly distilled usually contains much free sulphur, and if used in extracting will lead to false results in the analysis. Also carbon disulphide readily decomposes under the influence of light, especially during boiling. The writer has observed that this result during day-time extraction is variable,

while in night extraction it is very constant. For example, crimson antimony which has shown perfectly free from free sulphur during night-time extraction with fresh redistilled carbon disulphide, gave during day extraction a variable result as high as four per cent. Following the night extraction the carbon disulphide is evaporated to dryness and the residue of free sulphur considered as the correct amount from the antimony present. The extracted sample is dried for about one hour at 60 degrees C., weighed and preserved for further analysis.

DETERMINATION OF MOISTURE AND WATER OF CRYSTALLIZATION.

The moisture in antimony is usually very small in amount although the water of crystallization present may run as high as 15 per cent. The amount of water of crystallization is always in proportion to the content of calcium sulphate. The water of crystallization is not readily volatilized, requiring at least six hours at 100 degrees C. to expel it completely if a vacuum is not used. To avoid volatilization of free sulphur it is better to use the sample which obtained from the free sulphur extraction. For example, if from five grams one gram of free sulphur has been extracted, and the antimony weighs 3.90, take .78 which is equal to one gram of the original substance, place it on a weighed watch glass, spreading the sample over a large area, and dry it at 100 degrees C. to constant weight. If the resulting weight is .74, then the moisture and water of crystallization is six per cent.

DETERMINATION OF CALCIUM SULPHATE, ADULTERANTS, AND ANTIMONY OF OTHER COMBINATION THAN ANTIMONY PENTASULPHIDE.

It is seldom that the antimony contains a number of different substances in the same sample, therefore a qualitative test may be omitted and quantitative analysis proceeded with. Since calcium sulphate is the material most frequently to be determined, and the work requires much time, it is a good plan to shake a small amount of the original sample with water, filter off the solution, and test with barium chloride solution. If no precipitate is obtained the antimony is ready for further investigation; otherwise proceed as follows:

Take the equivalent of one gram of the sample which has resulted from the free sulphur determination, place it on filter paper, wet it with a small quantity of alcohol and wash it with cold water. Use a glass funnel with a cock so that the wash water passes through very slowly allowing enough time to act upon the calcium sulphate. After about 200 cc. of water has been used, occasionally test with barium chloride solution a few drops of the wash water dropping from the funnel and proceed with the washing till the water-soluble calcium sulphate has passed completely into solution. Transfer the total wash water to a weighed beaker, evaporate it to dryness on steam bath, and dry it at 100 degrees C. to constant weight. This residue represents calcium sulphate.

After extraction of the calcium sulphate, the antimony is washed through a small hole in the bottom of the filter paper into a beaker. Allow it to settle, pour off the clear water and treat the antimony with approximately 100 cc. ten per cent caustic soda solution, stirring it for about 10 minutes on steam bath. If the antimony passes completely into solution, further analysis in this group is not required. If any residue is left, it may represent a complex mixture of adulterants, but in most cases it represents only a single substance.

Allow the residue to settle, pour off the clear solution, stir again with about 50 cc. water, transfer to filter, and wash with water till the reaction is neutral. Through a small hole in the bottom of the filter paper wash the residue completely down with water into a weighed beaker. Allow residue to settle, pour off the clear water, and evaporate the remaining water and residue to dryness, and dry to constant weight. This residue represents the amount of total adulterant of antimony tetra-

oxide. Red color of residue indicates red oxide of iron or iron silicates, which are the most frequently used adulterants. A white residue indicates barytes, antimony tetraoxide, whiting or magnesium carbonate, or silicates. To learn the true composition of the residue, test it qualitatively in the usual way.

In the whole course of analysis never use a platinum crucible as there is danger of mistaking the antimony tetraoxide for barytes or some other mineral filler and when the antimony tetraoxide is ignited with filter paper in platinum some of the antimony becomes reduced and will alloy with the platinum.

TIRE-TESTING SPEEDWAY.

A mile-high speedway, and the only one in the world for testing half-soled tires is that of the Gates Rubber Co. on one of their large factory buildings in Denver, Colorado. The machine consists of a long arm revolving in a huge circle, on the end

GATES' TIRE-TESTING TRACK.

of which is attached the tire. A weight equivalent to that of a heavily-loaded tire is suspended in such a way that the tire itself carries the load. The tire travels on a half-mile track, which is first a stretch of cement trackway on which it attains a speed of 35 miles an hour. It then strikes a sandy stretch which causes it to jump and skid. Then it traverses an imitation brick roadway, following which it plunges into water and mud. By way of variety an incline representing a rough mountain road is included with a 45 per cent slope. Thus, the tire continues its journey all day and every day until it has given the maximum amount of mileage. By this means, if defects exist they are discovered, and promptly remedied.

MORGAN & WRIGHT GET LARGE SHIPMENT OF RUBBER.

What is said to be one of the largest single-lot shipments of rubber ever received in America was recently landed at San Francisco by the S. S. *Siberia Maru* from Singapore and transferred to a train of 26 cars for shipment overland to Morgan & Wright, Detroit, Michigan. The shipment weighed 2,240,000 pounds and represents a portion of the accumulated crude rubber held in the Far East by the war-time embargo on importations of this material.

TIRES TO BE MADE IN SIZES NEEDED.

The National Automobile Chamber of Commerce, New York City, states, under date of March 21, 1919, that pneumatic tires of all sizes will be available for cars and rims already made or to be made, and that the manufacturers will not discontinue any particular size on a fixed date, as was at first anticipated. The sizes of the rims and tires in actual use or to be built will govern tire production.

What the Rubber Chemists Are Doing.

NATURE OF THE VULCANIZATION PROCESS.¹

THE following observations are condensed from the remarks of Dr. G. Van IJseron on the nature of the vulcanization process.

The investigations of the Institute were made primarily for technical purposes, but offer an opportunity for some theoretical considerations. In what follows, the results of others are taken into account but the object is not completeness in every direction.

1. A theory on the nature of the *hot vulcanization process*—and it is that with which I intend to deal exclusively—will have to reckon with the following established facts:

a. The process proceeds additively, and formation of sulphureted hydrogen is subordinate.

b. Sulphur is transferred into the so-called "combined" state. It is then practically insoluble in the usual solvents.

c. The "binding" may practically be deemed "complete," the opinion that part of the sulphur remains uncombined as "free" sulphur having been refuted.²

d. Very small quantities of combined sulphur make an important change in the properties of considerable quantities of rubber. Rubber with one per cent combined rubber is entirely different from a non-vulcanized rubber-sulphur with one per cent sulphur. The usual solvents do not dissolve non-vulcanized rubber from the vulcanized.

e. The change in the properties of rubber during vulcanization is perfectly continuous. Change of mechanical properties varies with the amount of sulphur being taken up. No boundaries can be delineated between prevulcanization, undervulcanization and overvulcanization.³

f. The velocity of combining has a coefficient of temperature between two and three.⁴ The binding of sulphur begins much below the ordinary vulcanization temperatures.⁵

g. The velocity of combining of sulphur varies considerably for different varieties of rubber under equal conditions of temperature, mixing, molding, etc.⁶

h. The velocity of vulcanization is strongly influenced by some inorganic and organic compounds. This influence, especially that of some organic compounds, is entirely catalytic.⁷ Acids act retardingly, alkalis in weak concentrations, acceleratingly.⁸

i. First latex plantation rubbers on being vulcanized under constant conditions produce mechanical properties which strongly correlate with the vulcanization coefficients.⁹ With accelerated vulcanization, by catalyst or by excess of sulphur, or under greatly deviating conditions, this correlation ceases.¹⁰

j. Powerful mechanical treatment of the raw rubber changes the mechanical properties of the vulcanized product, but not the velocity of vulcanization.¹¹

2. There is no agreement as to what is the maximum quantity of sulphur which can be combined during vulcanization. A review of the results of various investigators leads the author to

conclude that 32 per cent is probably not the maximum of sulphur which can be "combined" with caoutchouc, meaning such sulphur as cannot be extracted with the ordinary extraction liquids and under circumstances whereby all sulphur is removed from a non-vulcanized rubber-sulphur mixture.

3. An unsettled problem is that of the reversibility of the vulcanization process. The fact ascertained by Spence and Young, *i. e.*, that no free sulphur is extracted from a mixture with ten per cent of sulphur having previously been vulcanized for a long time, even when extracting for 48 hours, is a strong indication that there is no question of a reversibility by ordinary extraction. Bary and Weyndert¹² think themselves justified in concluding the reversibility from the fact ascertained by them, that sulphur can be extracted from vulcanized rubber, previously deprived by extraction of free sulphur and then heated in a carbon dioxide atmosphere. Unpublished experiments carried out at the Institute make it evident that on heating vulcanized rubber free from uncombined sulphur, a very important regeneration occurs, characterized by the product becoming plastic without sulphur being transformed from the combined into the free state. On further continued heating a part of the rubber is transformed into the soluble form and through this, part of the sulphur becomes "soluble."

4. It has not been certainly determined whether the combined sulphur takes the place of the bromine during bromination of vulcanized rubber.

5. Opinion is not settled as to the course of the combining of sulphur with the hot vulcanization.

Fol and Van Heurn found the following vulcanization coefficients after vulcanizing at 50 pounds with varying quantities of sulphur.

Mixture, (Parts S on 100 parts rubber.)	Vulcanization Coefficient.
2.57	1.08
5.27	2.38
8.13	3.01
11.11	4.06
14.30	6.85
17.70	7.68
21.20	8.32
25.00	9.66

Considering that about half the added sulphur was combined at the close of the vulcanization in the above table, it appears that for mixtures of 20 parts sulphur and less there is approximate proportionality between the vulcanization coefficient and the quantity of added sulphur.

6. Judging about the course of the combining of the sulphur, one has to take into consideration that at the temperatures of vulcanization in use in factories, only a limited quantity of free sulphur is being taken up by the rubber. Skellon has shown that at about 130 degrees C. ten per cent free sulphur can be taken up very rapidly in non-vulcanized rubber, by diffusion or adsorption.

7. For the explanation of a rectilinear course of the curve representing the binding of sulphur with the duration of the vulcanizing process one encounters difficulties when a rectilinear course is assumed for all sulphur binding lines. In that case a different rectilinear course will have to be explained for different additions of sulphur. Now the straight line points to an independence of the velocity of binding of the concentration of the free sulphur, while the different direction of straight lines would show precisely the dependence on increasing additions of sulphur. It is very probable that the rectilinear course with ten parts of sulphur and the doubly bent course with higher sulphur concentrations, must be attributed to the same cause, namely, an auto-catalytical acceleration of the process. In order to ex-

plain the curved course of the binding of sulphur the supposition could be made that the accelerating action diminishes on continued vulcanization, but it seems more plausible that the catalytic acceleration surpasses by far the auto-catalytic one (here $7\frac{1}{2}$ per cent of sulphur), the latter, therefore, acting only very slightly on the process.

In the remainder of his paper the author elaborates two working hypotheses on the vulcanization process. His suppositions are as follows:

First. That mentioned originally by Bernstein¹² as a possibility. According to that conception, the colloidal sulphur formed on heating the sulphur solution, would unite to one complex with the considerably depolymerized rubber during the vulcanization. This complex would be insoluble in the ordinary solvents for rubber.

Second. That an "active" sulphur modification exists and that it combines chemically with a part of the rubber to a compound insoluble in the usual solvents, and that the latter afterwards combines "colloidally" with the remainder of the rubber to an insoluble complex.

For the author's development of these hypotheses the reader must be referred to the original paper.

SOME PROBLEMS OF THE PLANTATION RUBBER INDUSTRY.

The relative advantages of the various methods for coagulating rubber latex employed in the plantation rubber industry are discussed by H. P. Stevens under the above title in the "Journal of the Society of Chemical Industry," June 29, 1918, page 237r.

The coagulation of latex was studied in Ceylon by Parkin who recommended the use of acetic acid. His choice of an organic acid in preference to a mineral acid was fortunate, but he considerably overestimated the proportions of acid necessary for coagulation. At this time some estates, for fear of using too much acid, were doing without acid altogether and relying on the so-called natural coagulation. This method of "natural" or spontaneous coagulation yields a satisfactory product, but at that time it was neither economical nor convenient. More recently, the method of spontaneous coagulation has been revised and modified by allowing the coagulation to be carried out under anaerobic conditions. It is known that when latex is coagulated spontaneously and exposed to the air the interior of the mass acquires an acid reaction brought about by lactic acid fermentation, while the surface develops a yellowish alkaline slime in which coagulation is very imperfect.

According to the most recent work, carbon dioxide gas given off from the mass is retained on the surface in the anaerobic process, and this prevents the putrefactive changes which give rise to the alkaline slime. The evidence at present appears to be in favor of an enzyme action as the primary cause of coagulation, although sufficient lactic acid soon develops to bring about coagulation in the ordinary manner. If the anaerobic process can be relied on to produce regular and complete coagulation within twenty-four hours, the process has a future and should eventually displace coagulation by acetic acid, at any rate for bulk coagulation in the manufacture of crepe rubber.

The author's original studies showed that rapid and complete coagulation could be obtained with a very small proportion of acetic acid—about one part per thousand of diluted latex. The coagulation was clear and the resulting rubber pale and more even in appearance than that produced by spontaneous coagulation. With the same end in view, small quantities such as one to two parts per 1,000 of sodium bisulphite are commonly added to the latex which inhibits the action of the oxydase present. This would otherwise produce a darkening of the surface of the coagulum, and eventually dark streaks or patches in the finished rubber. The bisulphite is without appreciable effect on the quality of the rubber, but it is questionable whether a pale, even-colored

rubber is the best that can be produced, whatever method be adopted to prevent the darkening. This pale rubber cures more slowly than a darker and less attractive-looking material which has been prepared by setting the coagulum aside for a few days to putrefy before making and creping. The putrefactive bases so formed accelerate vulcanization.

It is often stated that rapid-curing rubber is of better quality than the pale-colored product. To produce the technical effect of vulcanization it is necessary to heat the mixture of rubber and compounding ingredients, and it is argued that the heating detracts from the beneficial effect of vulcanization. The argument is based on the known fact that heating rubber by itself to vulcanizing temperature damages it. If this is so, the shorter the period of heating the better the product, provided an equal degree of vulcanization is produced. There is some evidence of a general nature to support this view, but conclusive experiments to this end have not been published.

Similar considerations may be applied to organic accelerators added to the rubber in the course of manufacture. One authority goes so far as to state that a good accelerating agent must not only facilitate vulcanization but should also toughen rubber and render it immune from deterioration.

Variation in rate of cure of *Hevea* rubbers must certainly be ascribed to a variation in the nature and proportion of the non-caoutchouc ingredients. The insoluble nitrogenous matter commonly referred to as the protein matter facilitates the combination of the rubber and sulphur, as is shown by the effect of its removal from the rubber. On the other hand, the putrefactive bases are far more active. It has been suggested that the fresh latex contains a substance having an accelerating action, presumably in addition to the insoluble nitrogenous matter and the putrefactive bases. It has not, however, been isolated, and nothing is known of its composition.

The ever-increasing supplies of plantation rubber have rendered the collection and marketing of the inferior grades of wild rubber unprofitable, but the supplies of fine *Para* have not diminished, and this rubber has for years commanded a premium over the best plantation grades. This is the more remarkable as the former requires to be first washed and dried, in which process it loses about 20 per cent of its weight. Standard plantation, on the other hand, can be used for the majority of purposes without preliminary treatment. Those who have made comparative vulcanizing tests agree that fine *Para* does not give a stronger vulcanized product than plantation, nor does it vulcanize very rapidly. It is claimed that fine *Para* is less variable than plantation, but this is open to question if fine *Para* be compared with regular consignments of any of the best marks of plantation. It is also admitted that fine *Para* shows some variation.

The explanation for the preference given to fine *Para* is probably to be found in hesitation on the part of manufacturers to employ plantation rubber for purposes where the cost of the rubber is a relatively small item in comparison with the value of the product, as, for example, in the case of a submarine cable, on the lasting qualities of which no chances can be taken.

AZO PROCESS ZINC OXIDES.

Lead-free zinc oxide is essential in the production of clear white rubber goods although the presence of small percentages of lead oxide is not objectionable in zinc oxide for rubber work where color is not important.

An American company has perfected a new process which accomplishes results previously considered impossible in the manufacture of zinc oxide. By this process zinc oxide of exceptional purity and physical properties is uniformly obtained. Manufacturing facilities have recently been extended to permit these lead-free and low-leaded oxides to be offered to the rubber trade.

¹²"Kolloid-Zeitschrift," 1913, page 273.

ESTIMATION OF RESIN AND IMPURITY IN BALATA AND GUTTA PERCHA.

Notes on the estimation of resin and impurity in balata and gutta percha by P. Dekker are abstracted as follows by the "Journal of the Society of Chemical Industry," volume 37, 341A:

Acetone is the most trustworthy solvent for the extraction of balata and gutta percha. Ether dissolves a part of the gutta or balata and so gives high results, while with alcohol the gutta becomes plastic on account of the higher boiling point of the solvent, and the extraction is thereby rendered incomplete. When balata is extracted with alcohol a portion of the material insoluble in xylene passes into solution and is included with the resinous matter.

DEPOLYMERIZATION OF RAW RUBBER.

The depolymerization of raw rubber as reported by A. Van Rossem is outlined in abstract as follows by the "Journal of the Society of Chemical Industry," volume 37, 341A:

When rubber is heated for six hours at 130 degrees C. in a sealed glass tube containing air, it melts to a brown syrup, whereas this change is not observed in a vacuum or in hydrogen, nitrogen, or carbon dioxide. With one per cent rubber solutions in xylene, oxidation does not set in until after several hours, commencing first when a certain limit of relative viscosity has been passed. Depolymerization occurs much more rapidly in the presence of oxygen than in that of other gases, oxygen appearing to exert a catalytic effect; the rate of depolymerization depends also on the nature of the solution.

CHEMICAL AND MECHANICAL-TECHNICAL EXAMINATION OF RUBBER.

The following abstract from the "Journal of the Society of Chemical Industry," volume 37, 341A, summarizes a contribution by J. G. Fol:

In order to form a correct judgment on the quality of rubber it is necessary, in addition to making chemical analysis and vulcanization tests, to ascertain whether the various original constituents of the rubber and any substances which have been subsequently incorporated in it, remain in the same relative proportions and can be rediscovered by chemical analysis. Preliminary experiments have led to the following conclusions:—the resin content remains practically constant throughout the various operations, although a slight decrease may sometimes be observed after vulcanization. The proportion of insoluble constituents is decreased by mechanical working. The protein matter is not quantitatively precipitated by the petroleum method applied for the separation of insoluble substances. When free sulphur is present to the extent of several units per cent, it cannot be oxidized quantitatively by nitric acid. The estimation of fillers by boiling with petroleum yielded low results with the mixture investigated (rubber 50, zinc oxide 62, magnesia 13, sulphur 5), as also did the determination of the ash. The viscosity of the rubber is diminished by mechanical working on the washing rolls, and still more by working on hot rolls; this is attributed to a reduction in the molecular complexity. The indirect method for the estimation of rubber in a vulcanized product gives results which deviate several units per cent from the quantity of rubber actually used.

YARN TWIST-TESTER.

Tests can be made on samples from one inch to 20 inches in length with the latest type twist-tester for yarns. The tension of thread between clamps is always the same, being regulated with small weights. As the yarn is unwound, one turn of the handle loosens ten turns of twist, the left-hand clamp is drawn to the left by small weights holding the yarn taut, and at the same time the take-up is registered on a special scale. The take-up, especially on hard-twisted yarns, is a very important factor in determining the size of the single yarn used in making the ply yarn. The spinning twist can be accurately determined by means of a magnifying glass through which the operator can watch the fibers unwind. A similar apparatus for yarn twist testing is also made by Goodbrand & Co., 19 Victoria street, Manchester, England. (Alfred Suter, 200 Fifth avenue, New York City.)

CHEMICAL PATENTS.

THE UNITED STATES.

PROCESS OF TREATING RUBBER WASTE.—The process consists of subjecting waste rubber containing cotton to the action of a reclaiming solution consisting of approximately two per cent by weight of sodium hydroxide, and also containing kerosene and resin in the approximate proportions of five pounds of resin and 15 pounds of kerosene to 100 pounds of waste rubber, maintaining the temperature of the reclaiming solution at about 300 degrees F., and agitating the solution and rubber waste. (John F. Johnston, Barberton, assignor to The Electric Rubber Reclaiming Co., Akron, both in Ohio. United States patent No. 1,291,535.)

COTTON CONTAINING RUBBER COMPOSITION.—A product prepared from rubber waste containing cotton and comprising reclaimed rubber containing substantially uniformly distributed cotton fiber which has been subjected to the action of a caustic alkali reclaimed from the cotton in the waste rubber. (John F. Johnston, Barberton, assignor to The Electric Rubber Reclaiming Co., Akron, both in Ohio. United States patent No. 1,291,536.)

PROCESS FOR VULCANIZING RUBBER AND PRODUCTS.—A process for treating rubber or similar material which comprises subjecting the rubber to beta-dinitroanthraquinone. (Willis A. Gibbon, Flushing, assignor to New York Belting & Packing Co., New York City—both in New York. United States patent No. 1,291,828.)

ADHESIVE MATERIAL.—An adhesive composition for uniting fabric surfaces, consisting of a dextrin, water, and castor oil held in emulsified condition. (Alfred E. Jury, New York City, assignor to National India Rubber Co., Bristol, Rhode Island. United States patent No. 1,292,333.)

THE DOMINION OF CANADA.

RUBBER COAGULUM.—The process of treating latex or similar material, which comprises subjecting the mass to an hydroxy derivative of a polycyclic member of the benzene series, forming a substance adapted to prevent slime formation and combining a vulcanizing agent with the mass. (The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada, assignee of Edward Mark Slocum, Medan, Deli, Sumatra, Dutch East Indies. Canadian patent No. 188,135.)

RUBBER COAGULUM.—The process of treating a mass of rubber coagulum or similar substance containing a protein and water, by applying to the mass an alcoholic solution of beta-naphthol, forming on the surface of the mass a semi-permeable membrane of water-insoluble compound of protein and beta-naphthol adapted to prevent passage of colloidal nitrogenous or similar material, and combining a vulcanizing agent with the mass. (The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada, assignee of Edward Mark Slocum, Medan, Deli, Sumatra, Dutch East Indies. Canadian patent No. 188,136.)

LATEX PRODUCT.—A compound rubber mass produced by vacuum evaporation, containing an insolubilized nitrogenous compound comprising a substance of the benzene series. (The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada, assignee of Edward Mark Slocum, Medan, Deli, Sumatra, Dutch East Indies. Canadian patent No. 188,137.)

BRAKE LINING.—A brake lining consisting of a body of fibrous material impregnated with the product of the vulcanization of asphalt, red lead, and sulphur. (The Thermoid Rubber Co., assignee of William Dolton Pardoe—both of Trenton, New Jersey. Canadian patent No. 188,392.)

TIRE FILLER.—A composition of ingredients substantially in the following proportions: soya bean oil, 24 pounds; chloride of sulphur, six pounds; oxide of magnesia, 17½ ounces, and Venetian red, three ounces. (The Universal Tire Filler Co., assignee of Frank A. Hager, both of Portland, Oregon. Canadian patent No. 188,448.)

New Machines and Appliances.

A SIMPLE AND EFFICIENT LINE-SHAFT COUPLING.

A LINE-shaft coupling that is simple yet strong in construction—that will not slip when installed and one that can be applied by means of only a hammer, is shown in the accompanying illustration. It is of the rigid type and obviates the trouble of slipping peculiar to friction grip couplings or poorly fitted keyed couplings.

This coupling is easy to install by inserting the end of each shaft into the bore of the coupling, and hammering the cupped-

THE PINTITE RIGID COUPLING.

end pins into place. These tempered tool steel pins cut their own seats in the shafts. They also wedge the shafts into the recess provided in the opposite side of the coupling, and so a very powerful driving grip is obtained. (Smith-Serrel Co., Inc., 90 West street, New York.)

COST OF STEAM REDUCED BY UNDERFEED STOKER.

The accompanying diagram furnishes the power-plant operator accurate information on the cost of coal for generating steam. Knowing the price, the amount of coal burned, and the quantity of water evaporated, the solution is easy. Start with the cost of coal per ton and project vertically, intersecting the oblique line corresponding to the evaporation being obtained from the boilers from and at 212 degrees F., then move horizontally to the left margin, where the cost of coal to evaporate one thousand pounds of water from and at 212 degrees F. is

given. The chart can also be used to determine the evaporation required to generate steam at a certain cost, by reversing the above process.

This chart should awaken interest in the relative efficiency of a mechanical stoker as compared with hand firing. The stoker shown in the illustration is the underfeed type in which air is forced into the fuel bed by a fan. A series of corrugated tuyeres, over-

WESTINGHOUSE UNDERFEED STOKER.

lapping one another, form ribs extending from the hopper on the outside of the furnace to the center of the bed. These rows of tuyeres are inclined and separate the retorts that carry the coal from the hopper to the bed. They rest on air-boxes connected with the main air-shaft. The forced draft enters these boxes and distributes itself to the burning coal through these multiple-openings in the tuyeres. In other words, the entire furnace bed is fed continuously and evenly with thousands of minute jets of air, which means perfect combustion of the coal and little or no smoke. (Westinghouse Electric & Engineering Co., East Pittsburgh, Pennsylvania.)

A NEW HORIZONTAL CEMENT CHURN.

The cement churn here pictured possesses several constructive features that will at once appeal to the maker of rubber cement. It is built along simple yet sturdy lines and with only two bearings that are exposed to wear. The shape of

A NOVEL CEMENT MIXER.

the barrel automatically works the contents from end to end, and over and over, as the churn revolves, thereby producing a thoroughly mixed solution in the shortest possible time.

The frames of the machine are of channel-shaped cast iron and rigidly supported by four tie-rods. The cast-iron spiders, riveted to each end of the barrel, are provided with journals that support the barrel in the side-frame bearings. The joints in the head of the barrel are riveted, and all joints and seams are soldered inside and outside as a prevention against leakage. The body of the barrel is constructed from triangular, galvanized-iron plates that churn the contents from side to side when the barrel rotates. A brass filler cap, with a lip on each side and a quick-opening clamp attachment, enables the operator to draw off the cement from the top, free from settlings. The machine is furnished with tight-and-loose pulleys and built according to the required capacity. (The Roy D. Quin Co., Willoughby, Ohio.)

THE "WESTERN" RETREADING MACHINE.

The growing interest in rebuilt tires has greatly stimulated the builders of retreading equipment in improving the design of repair vulcanizers. It is claimed that the new machine here illustrated will produce various non-skid tread designs, including the Silvertown ribbed tread. A new feature is the multiple-spring pressure plate and centering blocks that effect an even distribution of the curing pressure.

THE "WESTERN" RETREADER.

There are two molds to a complete outfit, retreading tires from 28 by 3 to 37 by 5. The equipment furnished with each set consists of six lever clamps, two multiple-leaf pressure springs, two sand-bags, one clamp-lever, one matrix bolt-wrench, one ratchet wrench, six centering blocks, four disk globe-valves, and all pipe fittings, etc., ready to connect to steam line. (Western Tire & Rubber Works, 321-323 North Crawford avenue, Chicago, Illinois.)

MACHINERY PATENTS.

MACHINE FOR APPLYING BEAD-CLAMPING RINGS.

BEAD-clamping rings used when curing tires on expansible cores or air bags, are quickly and accurately drawn into place by this machine. The figure is a vertical section through the center of the apparatus that consists of a circular table mounted on three legs at a convenient height for handling the tires. Mounted in the center of the table is a vertical screw, *A*, provided with a threaded nut and a collar, to which three links, *B*, are attached and adjustably connected to slides that terminate in vertical guides, *C*. A piston reciprocating in the cylinder, *D*, supports on its upper end a head with three arms *E*, to which are pivoted vertical arms terminating in hooks *F*. Pivotaly connected to the arms are links *G* terminating in spring slides that operate with the piston to control the clamping hooks.

BEAD-RING CLAMPING MACHINE.

The frames of the machine are of channel-shaped cast iron and rigidly supported by four tie-rods. The cast-iron spiders, riveted to each end of the barrel, are provided with journals that support the barrel in the side-frame bearings. The joints in the head of the barrel are riveted, and all joints and seams are soldered inside and outside as a prevention against leakage. The body of the barrel is constructed from triangular, galvanized-iron plates that churn the contents from side to side when the barrel rotates. A brass filler cap, with a lip on each side and a quick-opening clamp attachment, enables the operator to draw off the cement from the top, free from settlings. The machine is furnished with tight-and-loose pulleys and built according to the required capacity. (The Roy D. Quin Co., Willoughby, Ohio.)

Lower bead ring *H* is placed on the table by the operator and centered by guides *E*, when a tire containing an air bag is placed upon it and the upper bead ring *I* superposed. Air is admitted to the bag, meanwhile fluid pressure is admitted to the cylinder *D* whereby the hooks *C* engage the tongue of the upper head ring, thus drawing both rings together. When sufficient pressure has been forced into the air bag to properly seat the bag and the lower edges of the tire in the rings, the pressure is relieved and the piston forces the rings downwardly to the final position where they are secured by bolts through the tongues of the clamping rings. The piston is then forced in the opposite direction and the tire with the clamping rings is ready to be placed in the mold. (William C. Stevens, assignor to the Firestone Tire & Rubber Co., both of Akron, Ohio. United States patent No. 1,289,949.)

Money is cheaper than Blood

FRANCE and England gave ten to fifteen times more lives in the war than America was called on for. It cost them more in money as well.

America offered her men freely, and the way the soldiers of the "dollar-nation" fought was the bit too much that broke the enemy's spirit. They fought desperately, splendidly, reckless of wounds and death. They would not be stopped. And had the Allied armies been required to drive the enemy to the Rhine, the casualty lists would have been ghastly.

Money power saved those lives. The "dollar-nation" proved the might of its dollars. The enormous schedule of war preparation, the demonstration of the terrific potential power of the country, united for a common purpose, had its effect on the morale of the German people and hastened their collapse.

Industry is rapidly working back to peace production and production means money. Money—wealth—can be replaced, but lives never.

The Victory Liberty Loan represents lives saved, soldiers returned to their homes unharmed.

Everyone gives thanks that our casualties were no greater—but just how far will you go to prove it?

The Victory Liberty Loan is your chance.

How much will you take?

New Goods and Specialties.

A NOVEL FOUNTAIN-PEN FILLER.

A CONTRIVANCE to facilitate the filling of fountain pens has recently been invented, which consists of a compressible rubber bulb combined with an extension, also of rubber, having a conical mouth-piece into which the pen is put, and a base section intended to fit snugly over the top of an ink bottle as a stopper. This stopper is fitted with a tube reaching into the ink, and with air-vents at the top. When the rubber bulb is compressed, the air drawn from the pen is forced down the tube, through the ink, up and out through the air-vents, while the ink is forced up into the pen. (Parke J. Flournoy, 50 V street, Washington, District of Columbia.)

FOUNTAIN-PEN FILLER.

A NEW STYLE OF FOUNTAIN PEN.

Unlike the ordinary kinds of fountain pen, which must be unscrewed in order to fill them, the one shown in the accompanying illustration simply pulls apart in the center, revealing within the presser bar for filling. The extent of the

TO FILL

PULL APART READY FOR REFILLING
THE LAUGHLIN "SAFETY" FOUNTAIN PEN.
NON BREAKABLE CAP

opening is regulated by shoulders on the inner tubing and the holder which engage each other to prevent opening too far. This pen is patented in the United States and Canada. (Laughlin Manufacturing Co., Detroit, Michigan.)

RUBBER IN THE FLUOROSCOPE.

The extent of the use of rubber in modern science is shown in one of its more recent adaptations in the lining of the tube-box in fluoroscopes used by Roentgen-ray diagnosticians. In the accompanying illustration the box is in the rear of the long screen in front, only one end being visible. The box itself is made of hard-wood, lead-coated outside and lined with opaque rubber, thus insuring protection from rays to both operator and patient. The fluoroscope is made in both vertical and horizontal form, the vertical one being shown here. (Wappler Electric Co., Inc., 173 East 87th street, New York City.)

WAPPLER FLUOROSCOPE.

"AUTOGRAPHIC" RUBBERS.

A recent patent provides for the insertion of means for holding a name-plate inside the in-step of a rubber overshoe, covered by a transparent pane of celluloid or similar material. This arrangement is provided

for when the rubber is manufactured, and any name-plate or card may be inserted under the celluloid through an opening at one end. (Alba C. Booth, Burlington, Vermont.)

A NEW GAME BALL.

A new ball to be used in playing soccer, basket-ball, and similar games, is covered with a material embodying the good qualities of both leather and rubber and containing some rubber in its composition. This covering is said to be stronger than leather and as resilient as rubber. It is not affected by the weather and may be used on wet ground without injury to the ball, as it is waterproof. It also retains its shape under such conditions and wears better than leather. A rubber bladder of the usual type is used inside. The ball is of regulation size and weight. (Rawlings Manufacturing Co., St. Louis, Missouri.)

"RUGO" FOOTBALL.

"RAYBESTOS" MOLDED CLUTCH FACING.

The newest kind of clutch facing is molded instead of woven.

It is said to be a great improvement and is being adopted as standard equipment by manufacturers of automobiles and disk clutches. The company that makes these facings

has discontinued the manufacture of the woven type except to fill orders previously in hand for that style of facing. The molded facing is composed of asbestos fiber and rubber. (The Raybestos Co., Bridgeport, Connecticut.)

"EAGLE" WHEEL.

Wheel Co., Inc., 17 West 42nd street, New York City.)

PUNCTURE-PROOF WHEEL.

The wheel shown here practically accomplishes the feat of being puncture and blow-out proof by its unusual construction. At the tread is a tire of solid rubber vulcanized to a steel rim. Beneath this rim are engaged two pneumatic tires between which a shock absorber is positioned. This shock absorber comes into use only in case of an overload to the vehicle or excessive wheel shock. (The Eagle Puncture-Proof Tire & Wheel Co., Inc., 17 West 42nd street, New York City.)

WHEEL WITH PNEUMATIC HUB.

Another solution of the tire-puncture question is developed in a wheel illustrated herewith. This wheel has a solid rubber tire at the tread, while the pneumatic cushion is located around the hub. A covering plate which can be easily removed gives access to the inflating valve and it is claimed that inflation twice a month is sufficient. The steel wheel may be equipped with any standard solid single, or dual tire equipment, the pneumatic hub providing the desired resiliency. (The Houston Pneumatic Puncture-Proof Wheel Co., Houston, Texas.)

"HOUSTON" WHEEL.

Foreign Import Duties on Boots and Shoes.

THE following table, corrected to February 1, 1919, by the Bureau of Foreign and Domestic Commerce, shows the foreign import duties on rubber boots and shoes of all descriptions, imported into the various countries from the United States.

Owing to the frequency of tariff changes the figures and information given in this table should be periodically verified. It is also advised that small trial shipments be made in order to test the rates prior to sending more extensive shipments.

In the first column is given the country, while the next column contains the articles, with notes regarding surtaxes, basis of rates, etc. The third column specifies whether the weight is to be taken as gross or net and the last gives the ad valorem duty or the rate of specific duty in United States currency.

Due to the restrictions upon importations of rubber manufacturers in France, Italy, the United Kingdom and certain other European countries, it is necessary for the foreign importer to secure a license before making shipments to those countries.

COUNTRIES.	ARTICLES AND REMARKS.	Weight.	Duty (U. S. Currency).

Legal weight is not uniformly construed, but generally includes the weight of the immediate packing or container, though in some countries fixed rate allowances are made. In Argentina, Bolivia, Paraguay, and Uruguay, the duties are to be computed upon the official valuations at the rates given in the last column.

Foreign Import Duties on Rubber Tires.

THE following table, corrected to February 1, 1919, by the Bureau of Foreign and Domestic Commerce shows the foreign import duties on rubber tires of all descriptions imported into the various countries from the United States.

The column marked "Weight" shows whether duties are levied on net or gross weight, or include simply the inner packings. The next two columns give the rate of the duty for each one hundred pounds in United States currency or the rate per cent ad valorem.

In the following monograph the surtaxes have been included

COUNTRIES.	Weight.	Rate per 100 Pounds, U. S. Currency.	Rate Per Cent—Ad Valorem.
Canada			42.5
(Ad valorem duties are based on the fair market value of the articles when sold for home consumption in the country where exported direct to Canada.)			
Central American States—			
British Honduras			15
(Duties based on price in the port of export.)			
Costa Rica	Gross	\$4.22	
(In addition, there is a warlike tax of 10.5 cents per 100 pounds.)			
Guatemala	Gross	7.21	
(A new tariff was adopted in 1917, but the enforcement has been indefinitely postponed.)			
Honduras	Gross	4.28	
Nicaragua	Net	30.62	
(A surtax of 12½ per cent of the duties is included.)			
Panama			15
Salvador	Gross	13.81	
(A surtax of 12½ per cent of the duty is included.)			
Hawaii			Free
(Imports from foreign countries are subject to the provisions of the United States tariff.)			
Mexico—Auto and motorcycle tires.....	Gross	16.94	
	Bicycle tires	Legal	45.18
(Not including variable paper surtax.)			
Newfoundland			49.5
(A surtax of 10 per cent of the duty is included.)			
West Indies—			
British—			
*Antigua			13.33
*Bahamas			22
*Barbados			11.25
*Dominica			12.5
*Grenada			10
*Jamaica			16.66
(Tires for motor vehicles are subject to a surtax of 20 per cent of the duty, which is to be added.)			
*Montserrat			13.33
*St. Christopher-Nevis			11
*St. Lucia			16.5
*St. Vincent			17.2
*Trinidad and Tobago			10
Turks and Caicos Islands			10
Virgin Islands			10
Cuba			25
Dominican Republic	Net	36.29	
Dutch Colonies			3

* When imported from the United Kingdom, Canada or Newfoundland, admitted at a reduction of one-fifth of the duty. The cost of packing is excluded, except in Dominica, St. Lucia and Grenada, where it is included.

† A surtax of 10 per cent is included.

and the converted rates therefore indicate the actual duty payable.

Certain charges such as warehousing, customs handling, local taxes, revenue stamps, etc., are not included. The rates of duty shown, including the surtaxes as noted, should therefore be regarded as the minima. As changes in duties are likely to occur at any time, frequent verifications of these figures is advised.

Due to the restrictions upon importations of rubber manufactures in France, Italy, and the United Kingdom, it is necessary for the foreign importer to secure a license before making shipments to those countries. The same is true of the neutral countries of Europe other than Spain.

COUNTRIES.	Weight.	Rate per 100 Pounds, U. S. Currency.	Rate Per Cent—Ad Valorem.
French—

PNEUMATIC TIRES AND THEIR CARE.

WILL car owners continue to practice the economy methods adopted during the war? This is the big question to-day.

With tire manufacturers gradually resuming pre-war production and as the supply of tires reaches normal, will owners soon forget war's tire lesson and return to the old way of negligence and waste?

Statistics compiled by The B. F. Goodrich Rubber Co. disclose a tremendous increase in the sale of tire repair material and accessories during 1918. Tire sleeves, blow-out patches and plastic for plugging holes were used on a far greater scale than

ever before in the history of motoring. Car owners took the tire-care problem seriously. They were surprised themselves at the saving realized, and the added mileage they got from their tires. They saw the folly of their previous extravagance.

The accompanying illustrations show some of the most commonly neglected injuries to pneumatic tires.

INJURED BY CHAINS.

A.—The result of improper application of tire chains. Leave chains just loose enough so that every time the wheel turns the cross chains will not strike the same spot in the tire.

SKIDDING.

B.—The effect of skidding, caused by a sudden application of the brakes. Part of the face of this tire has been scraped off.

BLOW-OUTS.

C.—The result of neglect. First, the tire was cut entirely through by some sharp object. An inside temporary patch was applied but a permanent repair postponed too long. The temporary patch gradually pulled away from its original position and was forced through the break. Whenever inside patches are used, an outside emergency band should also be applied, and both

Copyright, 1919, T. B. F. Goodrich Rubber Co.

TYPICAL INJURIES TO PNEUMATIC TIRES

removed and a permanent repair made as quickly as possible while the injury is small.

UNDERINFLATION.

D.—The damage done by underinflation. The wavy condition of the tread of this tire is due to its having been run soft, with insufficient air, with consequent loosening from the fabric through no fault of manufacture. Most tire manufacturers have inflation schedules which they are very anxious to place in the hands of every tire user.

NEGLECTED CUTC.

E.—A casing with two-thirds of its life wasted. Neglected cuts in the tough rubber tread always cause it to blister. Sand

and dirt are forced into the cuts and work around under the tread. Note several large "bumps" where these have accumulated. If a tire is carefully watched for these cuts, a little plastic will heal them quickly and no damage will result.

RUNNING IN CAR TRACKS.

Tire F has given less than 2,000 miles service, but it has been run in car tracks and the rubber is worn down to the fabric in a line following the circumference of the tire. Furthermore, the fabric has become worn and blistered. The casing is beyond repair.

FAULTY ALIGNMENT.

A more common tire injury is shown in illustration G. This effect is due to faulty alignment of the front wheels. A bent axle or steering knuckle may be responsible or possibly the demountable rim was not perfectly applied.

Accidents are not always responsible for the front wheels being out of alignment but frequently this is the case. All cars, through no fault in manufacture, are subject to this condition, and the first indication will be given when the tread of one or both tires wears as though a rough file had been used on them. If the tread becomes worn through, and the fabric affected, the tire is beyond repair. Test your front wheels frequently and be sure that they are in proper alignment.

RUT WORN.

H.—A tire that has been run in ruts. This wear on the side-walls occurs regardless of whether the ruts in the road are too large or too small for the tire. What's the answer? Keep out of the ruts. Tires were not made to withstand wear of this kind.

THE EDITOR'S BOOK TABLE.

THE PAN AMERICAN REVIEW. PUBLISHED MONTHLY BY THE Pan American Society of the United States, Inc., 15 Broad street, New York City. Price to non-members \$2 per annum; single copies, 20 cents.

THE first issue of this little publication contains fifteen pages. It is published by a group of prominent men who desire to help in developing and conserving mutual knowledge, understanding and friendship among the American republics and peoples.

ACCOUNTING AS AN AID TO BUSINESS PROFITS. BY WILLIAM R. Bassett. A. W. Shaw Co., Chicago, Illinois. (Cloth, octavo, 320 pages. Price, \$5.30 postpaid.)

Not a treatise on accounting in the ordinary sense, this work is rather an explanation of accounting for the every-day business man who wants to know best how to manage his business and demands that his bookkeeping be a real living history rather than a mere collection of figures. The assumption throughout is that the only accounting worth while is that which combines an exact book record of transactions with an exact book record of operations, so that causes as well as effects may be analyzed. Many tested plans, labor-saving methods, and 114 forms that have been successfully used by concerns throughout the country amplify the text, their object being less waste, dependable costs, faster turnover, savings in labor and lower selling expense. The chapters on statements of condition and operation, the value of good-will, depreciation, purchasing, costs of materials and labor, determining overhead and selling expenses, and control reports for the executive, are especially valuable to every progressive business man.

THE EDITOR IS THE PROUD RECIPIENT OF A COPY OF "GOVERNMENT WAR ADVERTISING," the report of the Division of Advertising, Committee on Public Information, inscribed to THE INDIA RUBBER WORLD, "whose patriotic contribution of space or services has helped to win the war through advertising." The report is a handsome 48-page quarto publication on dull finish paper with light-brown paper covers. It sets forth in detail the work of the Division of Advertising, describes the several advertising campaigns that helped to win the war, and lists

the contributions of space and services. In these lists the rubber and allied industries are represented by the following firms: Converse Rubber Shoe Co.; Cutler-Hammer Manufacturing Co.; E. I. du Pont de Nemours & Co.; Firestone Tire & Rubber Co.; General Electric Co.; Goodyear Tire & Rubber Co.; McGraw Tire & Rubber Co.; Star Rubber Co.; Taylor Instrument Cos.; L. E. Waterman Co.; Westinghouse Electric & Manufacturing Co.;

NEW TRADE PUBLICATIONS.

"WARP AND WEFT" IS THE NAME OF AN 8-PAGE ILLUSTRATED newspaper published "every little while" by the employees of the Brighton Mills, Passaic and Allwood, New Jersey. It is a breezy paper of general articles, news and personal mention of particular interest to Brighton operatives.

* * *

THE MORSE CHAIN CO., ITHACA, NEW YORK, IS DISTRIBUTING Publication No. 16 of the "Chain of Evidence" series devoted to small-power drives. It is a handsome 24-page pamphlet with many illustrations showing the application of Morse silent chains to a great variety of machinery.

* * *

THE SCHAEFFER & BUDENBERG MANUFACTURING CO., BROOKLYN, New York, has issued a large and handsome catalog of Columbia recording thermometers now extensively used in connection with rubber vulcanizers. Many illustrations and data render intelligent selection of the proper instrument an easy matter.

* * *

THE RUBBER COMPOUND BUREAU, AKRON, OHIO, IS distributing among rubber manufacturers of the United States and foreign countries a folder enabling the rubber chemist and superintendent to select any formula that he may need to improve his present line of manufacture.

* * *

"WHERE TO BUY NEOLIN SOLED SHOES FOR THEM ALL," IS THE title of a booklet recently issued by The Goodyear Tire & Rubber Co. of Canada, Limited, Toronto, Ontario. Other booklets from the same company of interest to the trade include: "Neolin—A Handbook of Information for Retailers and Their Salespeople," and "For Comfort and Hard Wear." These booklets contain a brief account of the inception of Neolin, testimonials from shoe manufacturers' lists of manufacturers who use these soles on their product, lists of styles, etc. They are printed on good stock with poster covers in colors.

THE OBITUARY RECORD.

INVENTED THE RUBBER STEP FOR VEHICLES.

GEORGE A. KEENE, inventor of the rubber step, or tread for vehicles and many other useful articles, died at the residence of his son in Rockford, Illinois, March 7, 1919, aged 87 years. He was a life-long resident of Lynn, Massachusetts. He is survived by his widow, one son and four daughters, besides ten grandchildren and seven great-grandchildren.

DAUGHTER OF A NOTED RUBBER MAN.

Miss G. Lillian Clapp, who died at her home in Boston, March 15, 1919, was the daughter of the late Charles M. Clapp, one of the pioneers of the rubber industry, who, with R. D. Evans, was proprietor of the old Aetna Rubber Mills in Boston in the 'sixties and 'seventies of the last century. Miss Clapp, who was born in 1858, was a public-spirited woman who devoted herself whole-heartedly to philanthropic work, being especially active as a member of the board of managers of the Bethesda Society, and holding similar offices with the Norfolk House Centre, Little Wanderers' Home and Homeopathic Hospital, and during the late war was prominent in Red Cross work. She is survived by her sister, Mrs. N. Hugh Cotton, who was Miss Harriet E. Clapp.

Interesting Letters From Our Readers.

FIRST-HAND NEWS OF BELGIAN RUBBER MILLS.

PROBABLY no man in the world is better known to the rubber trade than Captain Ernest B. Buckleton. His genial optimism and friendly tolerance have not been in the least dimmed by financial sacrifice, by months on the Western Front, by trench fever or by shell shock. Since the signing of the armistice, Captain Buckleton is able to resume business, and is visiting old friends among the European rubber manufacturers. A personal letter from him to the Editor is of such general interest that we take the liberty of letting his many friends read it also.

TO THE EDITOR OF THE INDIA RUBBER WORLD.

DEAR SIR:—I am now in Italy for a few days after a most interesting trip through Belgium and northern France.

I visited Liege first and had the pleasure after four and a half years of meeting Mr. Englebert, the head of the firm of Englebert & Co., and he gave me an account of the invasion of the Germans in 1914. He had the pleasure (?) of a visit from two of the leading German rubber manufacturers who took an inventory of his stock and machinery, the former of which was entirely commandeered by the Germans and part of the latter dismantled and sent back to Germany. These two gentlemen, both well known to us, told Englebert the German army would be in Paris in three weeks, and when Paris was taken would go to Russia and clean them up. This was the first time that I had heard at first hand of their intentions. Englebert is one of the greatest Belgian patriots and would not work for the Germans, so they took his plant and turned it into a barracks, where they quartered over 2,000 troops during the whole of the war and it was there that the first red flag of the German revolution was hoisted. Englebert, on account of his loyalty, had a most uncomfortable time during the whole of the war. Fortunately, however, for him, he was Consul for Spain, which saved his scalp.

They left his works in very bad shape, stripped of all raw materials, and it will take several months to replace all the brass parts of his machinery, which they took. In this part of Belgium and Brussels, all the door knobs, knockers and brass plates have all been removed and in a great many places replaced with wooden ones.

During the German occupation the destruction was very severe and life must have been almost intolerable. You could be out at night only until a certain time; after that a permit was necessary, and if by any chance you overstayed your time five minutes, you were arrested. What a time these people had!

The price of food in Belgium has been and is very high. But-

ter has been \$5 a pound, is now \$2.50; eggs, 50 cents, now 20 cents each; meat, \$3, now nearly \$2 a pound; potatoes, 60 cents a pound; boots, now from \$25 to \$30 a pair; soap, 75 cents a small cake.

After leaving Brussels I went through the war zone of northern France, which was a good rubber centre. Michel-Jackson's plants at Menin and Halluin were in direct line of fire and nothing remains but the bare walls, two other small factories are nothing but ruins, and from there to Lille three other plants are wrecks. You can picture what this zone looks like if you could picture Trenton after a fire which swept the place from one end to the other, leaving nothing but the bare walls standing. I cannot see that this part of France can be rebuilt in this generation. It took me 10 hours from Brussels to Lille and 14 hours from Lille to Paris, usually a five-hour trip, and the journey is most uncomfortable. Most of the trains have no windows, no heat and people packed like sardines. I had to stand up for eight hours of my trip from Lille to Paris.

After staying in Paris for a week, I came to Milan and have had a good talk with young Dr. Pirelli, who has just got out of the army. He tells me that economic conditions in Italy are very bad. Very few people know how much Italy has done and how much she has suffered. She has had 480,000 killed and spent more than three-quarters of her wealth. How the country can be reconstructed is a grave problem. It certainly looks as if America is going to have her hands full for a generation in helping to reconstruct Europe, and the American business man will be asked to make many sacrifices as his part in this world's war.

Restrictions must necessarily be placed on imports to all countries in Europe that have taken an active part in the war, and a good many American manufacturers will chafe under them. I am confident they will keep up the good work and continue the good example shown in their wonderful response to the call for charities. I think it will take several years for France,

OSCAR ENGLEBERT.

THE MICHEL-JACKSON FACTORY BEFORE THE WAR.

England, Italy and Belgium to reconstruct, and during this period America will help as her part in the three years when she stayed out of the war, which I think you will all admit was as much hers as ours in Europe.

Yours sincerely,

ERNEST B. BUCKLETON.

Milan, Italy.

FROM A WELL-KNOWN FRENCHMAN.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

Dear Sir.—I send you enclosed a short note on rubber factories in the occupied territories, which have been destroyed by the Boches.

Among them were two particularly important factories, that of Englebert at Liege, which employed 3,000 to 4,000 workers, and that of Wolber at Soissons, which had as numerous a staff. Nothing remains and all the stolen equipment has been methodically transported to Germany. The damage done to the rubber industry in the invaded territories amounts to about forty millions of francs. To that must be added the formidable stocks of crude rubber which were at Antwerp, especially those consigned to Messrs. Osterieth & de Bude of a value of fifty or sixty millions, and which were simply stolen by the Boches.

Many factories using rubber and others making products used in rubber factories were situated in the territories occupied by the Germans. Of all these establishments nothing remains; the equipment has been sent to Germany. The generators, the steam engines, the electric motors, the transmissions, have also disappeared, stolen or destroyed. In many places the buildings themselves have been destroyed, either by bombardment or by fire.

The factory of Le Frant & Co., which was at Ham (Somme), one of the greatest manufacturers of substitutes, has disappeared.

The factory of Lufbery and Chardonner at Chauny (Aisne), has also disappeared.

The rubber factory of Boinet, formerly Lefebure, at St. Quentin, has been leveled to the ground.

The same is the case with the factories of electric cables of Jeumont (Nord), the Destrieux factory at Pont à Marq (Nord), the Henry factory at Soissons (Aisne), the factory of the Colonial Rubber Co., at Urian and at Gand (Belgium), the Jackson factories at Halluin and at Menin (Belgium), and the two groups of Wolber factories at Soissons. About a dozen important factories disappeared during the war.

Yours sincerely,

ANDRÉ DUBOSC.

Bapaume-les-Rouen.

JUDICIAL DECISIONS.

NATIONAL METAL MO DING CO. v. TUBULAR WOVEN FABRIC CO.—Circuit Court of Appeals, First Circuit, November 14, 1917.

A decision declaring the Osborn patent No. 652,806 for flexible electric conduit valid and infringed by the Tubular people's product was given in November, 1915, and the latter were enjoined from making their product. They changed it to eliminate the infringing feature.

Contempt proceedings were started by the National people when they started to make their modified article. The Court refused to hold them in contempt on the ground that the new article raised a new question of infringement. A supplemental bill of infringement was presented and the modified structure was held not to infringe the Osborn patent No. 652,806 for flexible electrical conduit. (Federal Reporter, Volume 254, page 304.)

DOWSE v. FEDERAL RUBBER COMPANY ET AL.—District Court, N. D., Illinois, E. D., December 7, 1918.

Byron C. Dowse, while employed by the Federal Rubber Co., being one of the largest stockholders and virtually in charge of the entire works of the company, invented a method of reinforcing automobile tires, known as the "double cable base." After applying for the patent, but before it was issued to him, Dowse sold his stock and severed his connection with the company. Suit was brought to test the validity of the patent and to ascertain the ownership of the patent.

If Dowse had been employed by the manufacturing company

taking orders from another officer of the company, then the patent would have been his personal property, and the company would only have an implied shop right to the invention. However, he being an officer the patent belongs to the company. It was also adjudged valid. (Federal Reporter, Volume 254, page 308.)

HOOD RUBBER CO. v. S. NEEDHAM TIRE CO.—Court of Appeals of the District of Columbia. Decided December 2, 1918. Patent appeals Nos. 1,180 and 1,181.

In trade-mark cancellation proceedings where each party sought the cancellation of the other's mark, a trade-mark consisting of the word "Needham," with the barb and feather of an arrow projecting beyond the end of the word, was held to conflict with a mark consisting of the picture of an arrow, the arrow being an essential and prominent part of the first trade-mark which had been in longer use.

The Examiner of Interferences dismissed the Needham company's petition for cancellation and sustained that of the Hood company, but on appeal an assistant commissioner cancelled the registration of the Hood company, ruling that because the arrow is one of the widest known and most useful functional signs, it could not be registered as a trade-mark.

After consideration of the evidence it was held that the appellant used the arrow-mark as a trade-mark and not as a functional sign, and that its use of this mark could in no way abridge the right of the general public to use the representation of an arrow as a functional sign. It was further contended that other persons have used the word "Arrow" or the picture of an arrow as a trade-mark in a similar manner, but the appellee was not allowed to raise that question.

The registration of the Needham Tire Co. was cancelled and that of the Hood Rubber Co. sustained on reversal.

FRASCHE SULPHUR LIQUEFACTION PATENTS INVALID.

The United States Circuit Court, sitting at Philadelphia, Pennsylvania, has just rendered a decision reversing that of the lower tribunal, decreeing that the so-called Franche patents covering methods and processes of mining sulphur are not of basic patentability and that no control of certain mining methods is given by them. Sulphur deposits are, therefore, opened up and the studies and experiences which Franche made and had are now open to the world. This decision debars the holders of the Franche patents from otherwise exercising a monopoly for 31 years of underground sulphur liquefaction by the heat process.

This decision is of special interest, since the rubber industry of the United States is estimated to consume annually about 15,000 tons of sulphur.

A complete illustrated account of this Franche method of sulphur mining will be found in THE INDIA RUBBER WORLD August 1, 1914, pages 597-599.

TRIED TO SELL REMADE TIRES AS NEW.

Early in February the Federal Trade Commission issued formal complaints against E. P. Jones and S. A. Paul and four concerns alleged to be operated by them in New York City, The Mercury Tire Co., Inc., New York City, The Akron Tire Co., Inc., Long Island City, New York, and William H. and George Batcheller, "dominant factors" in the Long Island City concern, charging attempts to "deceive and mislead the public" in selling remade old automobile tires under new names and brands as new tires.

The concerns, the Commission says it has reason to believe, purchased old and discarded automobile tires in various parts of the United States, cause them to be repaired and coated with a thin coating of rubber or composition of similar appearance, thus removing or concealing the name or brand of the original makers, and restamp them with new names or brands with the

purpose of misleading and deceiving purchasers into believing the tires are new tires.

The Commission points out that "it is the common belief and impression among dealers and consumers and the purchasing public generally, that automobile tires having the appearance and sold as new tires, are manufactured from new and unused material." The concerns, it is further charged, have "at all times" concealed and wholly failed to disclose that their tires are remade; and have circulated advertising to the effect that their tires are new and not made over.

In addition, the complaints charge false representations in advertising to the effect that the tires were guaranteed to run 4,000 miles, when "they well knew that said tires have been worn and discarded before being coated with the thin film of rubber or composition."

E. P. Jones and S. A. Paul were cited to appear before the Commission in Washington, March 11; the Mercury concern was cited to appear April 3, and the Akron company April 4.

GOODYEAR SALES METHODS LEGAL.

The methods of The Goodyear Tire & Rubber Co., Akron, Ohio, in doing business with its dealers and in refusing to sell to those who will not maintain its resale prices, is legal, according to a recent decision by Judge Augustus N. Hand, of the United States Court for the Southern District of New York, in which he sustained the demurrer filed by the Goodyear company in the suit filed against it by H. P. Baran, a Goodyear dealer, claiming infringement of the Sherman and Clayton laws.

The allegations of the plaintiff were substantially the same as the complaint of the Federal Trade Commission, as published on page 731 of THE INDIA RUBBER WORLD of September 1, 1918.

The Goodyear company contended that its object was to protect the public and insure maximum service from Goodyear products.

Judge Hand ruled that no decision of an Appellate Court "prevents a single trader from rejecting a customer because he does not like the prices at which the customer resold, or otherwise disapproved of his mode of conduct," and found nothing to show "how the alleged discrimination might substantially lessen competition" or "tend to create a monopoly."

This decision upholding the principle of price-fixing is particularly interesting for its far-reaching effect on the manner of distributing manufactured products to the consumer.

RUBBER TRADE INQUIRIES.

*Tr*ade inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(700.) A correspondent requests the names of manufacturers of hand-operated machines for cutting rubber valves and washers.

(701.) An inquiry has been received for the names of concerns in the East that grind hard rubber dust for the trade.

(702.) A request is made for addresses of concerns dealing in white stainless rubber cement used in the millinery trade.

(703.) A correspondent desires information concerning a process for covering inner-tube poles with aluminum.

(704.) A manufacturer requests information concerning the manufacture of tennis balls and tennis shoes.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce or its district or cooperative offices. Request for each should be on a separate sheet, and state number.

(28431.) A Belgian importer in England desires an agency for rubber soles.

(28434.) An agency is desired for the sale in England and France of waterproof textiles, etc.

(28449.) A firm in India desires to purchase and an agency for the sale of tires, tubes, and accessories.

(28452.) A commercial agency in Honduras desires to represent sporting goods firms, f. o. b. American port. Correspondence may be in English.

(28512.) A man in France desires an agency to sell rubber articles. Correspondence in French.

(28518.) A man in France desires an agency and to establish a depot for the sale of asbestos, rubber, etc. Correspondence in French.

(28504.) An Italian desires to represent American firms for the sale of rubber goods, etc.

(28572.) A firm in India desires an agency for the sale of fountain pens.

(28585.) A firm in Spain desires an agency for the sale of belting.

(28601.) A man in France desires an agency for the sale of mechanical rubber goods.

(28605.) Representative of an Australian firm, now in America, desires sole representation and to purchase rubber manufacturers' supplies.

(28612.) A man in France desires an agency for the sale of rubber overshoes. Correspondence in French.

(28621.) Member of a New Zealand firm desires exclusive agencies for sale of beltings, packing, etc.

(28624.) A Norwegian concern desires agency for sale of rubber and rubber goods.

(28636.) A man in Switzerland desires agency for sale of dress shields, suspenders, etc. Correspondence in French.

(28642.) A man in Switzerland desires agency for sale of, or to purchase, balata belting, etc.

(28656.) A Norwegian firm desires agency for sale of wire-insulating materials, belting, packing, etc.

(28668.) A man in Italy desires to purchase or agency for rubber heels.

(28680.) A Norwegian firm desires to purchase belting, asbestos and magnesia products, and rubber goods. Payment, banker's confirmed credit in New York. Correspondence may be in English.

(28683.) A wholesale dealer in France desires to purchase and secure agency for sale of rubber and black-dyed caoutchouc for surgery, industry, etc. Correspondence in French.

(28724.) A commercial agent in France desires agency for sale of rubber heels. Correspondence in French.

(28727.) A commercial agent in France desires agency for sale of automobile tires and accessories.

(28730.) A company in Australia desires to purchase rubber and composition floor-coverings, both in rolls and in art squares, f. o. b. New York. Cash against documents, less discounts. Correspondence may be in English.

(28749.) Member of New Zealand firm desires agency from manufacturers only for sale of motor-vehicle tires.

(28756.) A man in Belgium desires agency for sale of rubber. Correspondence may be in English.

(28773.) Italian firm desires agency for sale of rubber goods. Correspondence may be in English.

(28781.) Head of American firm in South Africa, now in this country, desires exclusive agency for sale of rubber goods.

(28794.) A British Indian company, purchasing headquarters in New York, desires to buy direct from manufacturers, waterproofing materials. Payment against documents in New York.

MONTREY HAS CHAMBER OF COMMERCE.

An American chamber of commerce has been organized at Monterey, Mexico, and desires the cooperation of similar bodies in the United States. Wilbur T. Gracey is consul in that city.

News of the American Rubber Industry.

REELECTED OFFICERS OF THE B. F. GOODRICH CO.

THE B. F. Goodrich Co., at its annual meeting held on March 12, 1919, at its New York City office, reelected for three years its six directors whose terms of office expired, as follows:

B. G. WORK.

L. D. Brown, W. C. Geer, C. C. Goodrich, F. H. Mason, W. A. Means, and A. H. Noah. E. C. Shaw, who has served the company in an advisory capacity for the last year, will continue a director.

At the subsequent meeting of directors, the officers of the company were also reelected, namely: B. G. Work, president; H. E. Raymond, vice-president; C. B. Raymond, W. A. Means, W. C. Geer, A. B. Jones, H. K. Raymond, and W. O. Rutherford, second vice-presidents; F. C. Van Cleef, secretary; L. D. Brown, treasurer; H. Hough, controller; J. C. Lawrence, assistant treasurer; H. C. Miller, manager tire sales.

DIVIDENDS.

The Apsley Rubber Co., Hudson, Massachusetts, manufacturer of rubber clothing and footwear, has declared its semi-annual dividend of three and one-half per cent on its common stock of record March 31, payable April 1, 1919.

The Dodge Manufacturing Co., Mishawaka, Indiana, manufacturer of transmission machinery, has declared the following dividends: quarterly, one and one-half per cent and one and three-quarters per cent, respectively, on its common and preferred stock, and extra, one per cent; due April 1 on stock of record March 28, 21 and 28, respectively.

E. I. du Pont de Nemours & Co., Wilmington, Delaware, manufacturers of rubber chemicals and artificial leather, have declared the regular quarterly dividend of four and one-half per cent on its stock of record February 27, payable February 14, and one of one and one-half per cent on its debenture stock of record April 10, payable April 25, 1919.

The Firestone Tire & Rubber Co., Firestone Park, Akron, Ohio, manufacturer of tires, rubber footwear and other kinds of rubber goods, declared its quarterly dividend of \$1.50 per share, payable March 20 to stock of record March 10, 1919.

The General Electric Co., Schenectady, New York, manufacturer of electrical machinery and equipment, has declared a dividend of \$2 per share, payable April 15 to stock of record March 15, 1919.

The Goodyear Tire & Rubber Co., Akron, Ohio, manufacturer of tires, balloons and all kinds of rubber goods, declared its quarterly dividend of three percent, payable March 15 on stock of record March 1, 1919.

The Kelly-Springfield Tire Co., New York City, tire manufacturer, has declared its quarterly dividend of \$1.50 per share on its six per cent preferred stock, payable April 1 to stock of record March 17, 1919.

The Keystone Tire & Rubber Co., New York City, tire manufacturer, has declared a stock dividend of 15 per cent on stock of record May 1, payable May 20, and the regular quarterly dividend of three per cent on its common stock of record March 21, payable April 1.

The Portage Rubber Co., Barberton, Ohio, tire manufacturer, has declared a quarterly dividend of three per cent on its common stock of record May 5, payable May 15, and one of one and three-quarters per cent on its preferred stock of record March 20, payable April 1, 1919.

The Standard Four Tire Co., tire manufacturer, Keokuk, Iowa, recently paid a cash dividend of 20 per cent on its common stock.

ALLEN MACHINE CO.'S NEW PLANT.

The Allen Machine Co. is now operating its new plant at Erie, Pennsylvania. It comprises a group of modern buildings specially designed and erected for engineering purposes, and includes, besides the office and engineering departments, buildings for patterns, storage, foundry and machine departments.

The foundry is 250 by 120 feet, divided into bays served by several cranes ranging from four to thirty tons in capacity. Two cupolas permit 100 tons of metal to be melted per day and individual castings up to 35 tons can be handled.

The machine department is 332 by 200 feet, with a gallery 250 by 60 feet for the lighter machine tools and assembling of small machines.

The Allen Machine Co. manufacture an extensive line of rubber mill machinery, including crackers, washers, and refiners. Mills up to 22 and 26 by 84 and calenders up to 32 by 92 are now in process of manufacture. The well-known Allen tubing

NEW PLANT OF ALLEN MACHINE CO.

machine is built in sizes inclusive of 12 inches bore, with heads adapted for straining stock, running solid truck tires, insulating, etc. cetera.

Other rubber working machinery produced by this company comprises vulcanizer presses, accumulators, hydraulic presses of all sizes, spreaders, fabric dryers, and a complete line for the manufacture and finishing of inner tubes.

WASTE MATERIAL DEALERS' CONVENTION.

The sixth annual meeting of the National Association of Waste Material Dealers was held at the Hotel Astor, New York City, on March 18 and 19, 1919.

The following are the newly elected officers for the ensuing year: Frederick W. Reidenbach, president; James Rosenberg, first vice-president; Henry Lessberger, second vice-president; Ivan Reiter, third vice-president; Paul H. Loewenthal, fourth vice-president; Mark B. Speer, fifth vice-president; Harry Klonick, sixth vice-president; David Feinburg, treasurer; Charles M. Haskins, secretary; directors for two years—George B. Smitheman, Julius Rosenberg, Herman Muehlstein, Herman Goldstein; other directors—Emanuel Salomon, ex-officio; Louis Birkenstein, ex-officio; Clarence White, H. H. Cummings, F. C. Overton, Daniel M. Hicks, Henry Atterbury.

The Scrap Rubber Division met under the chairmanship of David Fomborg. The present conditions in the scrap rubber market were the center of interest and it was the sense of the meeting that readjustment is in progress and will continue for some time. One of the difficulties of restoring normal market conditions on scrap rubber is the uncertainty of the course of the prices for crude rubber sorts, which directly influence the scrap situation.

NEW INCORPORATIONS

[illegible]

United States Comb Co., Inc., January 2, 1919 (New York), \$1,000.
 F. Achels, W. W. Weithing, E. W. Decker—all of 11 Mercer street,
 New York City. To manufacture rubber goods.
 Valley Tire & Rubber Co., Inc., March 4, 1919 (New York), \$2,000.
 J. Jacobs, S. Bernheim, W. Loewenthal—all of 1877 Broadway, New York
 City. To manufacture tires, etc.
 Wear-Well Tire Co., February 20, 1919 (Delaware), \$50,000. I. H.
 McCann, 913 West Clayton street; G. C. Large, 207 Second street; M. F.
 Sheaffer, Liberty street—all of New Castle, Pennsylvania. Principal
 office with the Colonial Charter Co., 927 Market street, Wilmington, Dela-
 ware. To manufacture, sell, and repair pneumatic automobile tires and
 tubes.
 Webster Tire Co., Inc., March 5, 1919 (New York), \$500. S. Dorfman,
 511 West 178th street; L. Bernstein, 656 West 163d street; L. F. Gahan,
 221 Sherman avenue—all of New York City. To manufacture tires, etc.
 Wellington Rubber & Novelty Co., Inc., March 10, 1919 (Ohio), \$15,000.
 G. E. Gorr, president; R. Koontz, treasurer and general superintendent;
 J. M. Oberholzer, vice-president and secretary—all of Wellington, Ohio.
 Principal office, Wellington, Ohio. To manufacture balloons and dipped
 rubber goods.
 Weston Rubber Products Co., March 3, 1919 (Delaware), \$500,000.
 S. C. Wood, A. M. Brody—all of 39 North La Salle street, Chicago,
 Illinois; L. B. Phillips, Dover, Delaware. Delaware agent, United States
 Corporation Co., Dover, Delaware. To manufacture and deal in rub-
 ber, etc.
 West Gate Tire & Rubber Co., Inc., March 18, 1919 (New York),
 \$5,000. J. Jacobs, S. Bernheim, W. Loewenthal—all of 1877 Broadway, New
 York City. To manufacture tires.

CRUDE RUBBER CONCERN INCORPORATES.

X. W. Obalski & Co., Inc., is a new concern incorporated by
 Xavier W. Obalski and others under the laws of New York, with
 a capital of \$200,000, to deal in crude rubber and rubber products.
 The offices of the new company are at 291 Broadway, known as
 the East River Savings Institution Building. Mr. Obalski was
 formerly a member of Obalski & Sweeney, Inc., incorporated in
 1915, which recently dissolved under the laws of the State of
 New York.

NEW CRUDE RUBBER CONCERN.

Sweeney & Co., Inc., is the title of a new corporation, or-
 ganized under New York laws with a capital of \$200,000, for
 the purpose of importing and dealing in crude rubber, with
 offices at 59-61 Pearl street, New York City, formerly occupied
 by Obalski & Sweeney, Inc., of which company Mr. Sweeney was
 president.

Mr. E. C. Sweeney, Jr., president of Sweeney & Co., Inc., has
 an extensive acquaintance and connections among the rubber
 manufacturers of this country and Canada and the new company
 commences business under the happiest possible auspices.

The other officers of the company are: George R. Sweeney,
 brother of the president, who has been elected treasurer and
 secretary, and George W. Sniffen, assistant secretary.

CAMERON MACHINE CO.'S ADDITION.

The Cameron Machine Co., 57-61 Poplar street, Brooklyn,
 New York, manufacturer of cutting and rolling machinery, slit-

ASSEMBLY SHOP OF CAMERON MACHINE CO.

ters, rewinders, et cetera, has recently completed a one-story
 addition to its plant, to be used as an assembly shop. It has been
 equipped at an approximate cost of \$20,000, and is now in use.

A PIONEER IN ELECTRICAL INSULATION.

AN interesting double anniversary was recently celebrated in
 Newark, New Jersey.

It commemorated the nineteenth birthday of Henry A. Reed,
 president of the Bishop Gutta Percha Co., and the fifth birth-
 day of his second son, Henry D. Reed, vice-president of the same
 company. The great age of the "gutta percha pioneer" as well
 as his industrial accomplishments make a review of his career
 of more than passing interest.

Henry A. Reed was born in Carmel, New York, February 11,
 1829. At the age of 17 he began teaching school in Carmel, and
 learned telegraphy. In 1849 he was given charge of the tele-
 graph office in Carmel, and later transferred to Croton Falls,
 then to Hudson, and in 1852 was appointed one of the three
 operators in the New York City office of the New York, Albany
 and Buffalo Telegraph Co. Taking charge of the telegraph business

HENRY D. REED.

HENRY A. REED.

in Poughkeepsie in 1853, he had much time on his hands and
 thereupon opened a book store, and successfully managed both
 businesses. In 1876 he sold the book business, taking up expert
 accounting, and soon after assisted in the management of the
 estate of Mrs. Samuel C. Bishop, which was operating the Bishop
 Gutta Percha Works, and which was at that time threatened
 with a law-suit for infringement of the Sampson patent, cover-
 ing the use of gutta percha as an insulating material. A similar
 action had been decided against the Western Union Telegraph
 Co., but through the investigations of Mr. Reed an arrangement
 was made, whereby the suit against the Bishop company was
 withdrawn, the company agreeing to pay a royalty during the
 few remaining years of the patent.

Mr. Reed was made secretary of the company in 1885, and
 two years later, general manager. In 1893 he was elected treas-
 urer. In 1905 he became president of the company, the position
 he now holds. Mr. Reed has always taken a practical interest
 in electrical science and development. Believing that rubber
 would serve better than gutta percha for insulation, except under
 water, he engaged an experienced engineer to design and install
 machinery to insulate wire and cables with rubber. He collab-
 orated with the United States Light House Board in 1887 in de-
 vising a system for lighting river channels by lighted buoys and
 range lights. In 1888 he designed the first high-tension cables
 to be used underground. He was the first man in America to
 test faults by the galvanometer. He exhibited at the Electric
 Club in New York the first perfected phonograph made by Mr.
 Edison. He was one of the organizers of the Electric Club, and
 also of the Electric Trade Society, and is a member of the
 American Institute of Electrical Engineers.

Mr. Reed carries his ninety years lightly and is without ques-
 tion the youngest man of his age in the whole rubber trade.

TRADE NOTES.

The Rubber Trading Co., 9-15 Murray street, New York City, by unanimous consent of its stockholders has dissolved and a co-partnership has been formed to take over the business. The name remains the same and the members of the co-partnership are William T., Collier W., and Robert Lyle Baird, general partners, with Robert B. Baird as special partner.

The Gillette Tire Co., 1122 South Michigan avenue, Chicago, Illinois, has opened a distributing office at 347 Locust street, St. Louis, Missouri.

The Story Rubber Corp., 1328 Broadway, New York City, has purchased a plant at Hempstead, Long Island, where it expects soon to manufacture its "Bonner" tubes. The officers of the company are: Ernest D. Story, president; Elmer G. Story, vice-president, and Charles S. Fowler, treasurer.

The Kelly-Springfield Tire Co., New York City, at its annual meeting of stockholders, held March 14, 1919, reelected the following directors: Van H. Cartmell, Stephen Peabody, A. L. Scheuer, Jacob Oppenheim, Gustavus Maas, A. M. Poole, O. R. Cook, and F. A. Seaman.

The Lincoln Tire & Rubber Co., Detroit, Mich., has leased the entire building at No. 224, in addition to its previous location at No. 226, Jefferson Avenue East. This concern sells Meyer, Portage, Mohawk, Pennsylvania, and United States tires, and is sole distributor of Meyer tires for seven of the Central States. Guy B. Cross, president, is one of the directors of The Meyer Rubber Co., Cleveland, Ohio.

The Batavia Rubber Co., Batavia, New York, has been granted an order in the United States Circuit Court, terminating the receivership of M. H. Bochow. Mr. Bochow continues, however, as president. The creditors of the company received 50 per cent of their claims during the receivership and will now be paid the remainder. The company's plant is now running 24 hours daily, with three shifts of workmen.

The Ford Motor Co., automobile manufacturer, Detroit, Michigan, has built and is operating a small rubber tire factory, "simply learning how," it says, without intending at the present time to go into the manufacture of tires in any volume.

The Horseshoe Rubber Co., distributor of the Racine Auto Tire Co., Racine, Wisconsin, now has branches in fifteen cities of the United States.

The Broadway Tire Jobbers, Inc., 250 West 54th street, New York City, recently incorporated at \$125,000, carries standard makes of factory-blemished tires converted into seconds, as well as tubes, which it supplies to dealers.

The Lee Rubber & Tire Corp., New York City, held its annual meeting of stockholders on March 27, 1919, at its offices at 61 Broadway. The third annual report of the company for the fiscal year ended December 31, 1918, shows net sales for the year amounting to \$4,099,247, and a net profit of \$300,348.20, after deducting for federal taxes.

The Parker Tire & Rubber Co., 1014 Merchants Bank Building, Indianapolis, Indiana, is specializing on supersizes of cord tires. The company has completed its plant, 250 by 60 feet, with a boiler house 60 by 30 feet.

The Overland Tire & Rubber Co., Omaha, Nebraska, at its stockholders' annual meeting in January elected the following officers: James H. Davies, president; W. R. Blowers, vice-president and general manager, and Harry Hildreth, Jr., secretary-treasurer. The concern also voted to spend \$200,000 for machinery and an equal amount for buildings to comprise the first unit of its factory. The foundations and footings up to the first floor are now completed. The company expects to operate the factory about September 1, 1919. It will manufacture pneumatic tires and tubes, solid truck tires, and a general line of mechanical rubber goods.

The Nebraska Tire & Rubber Co., Inc., 3167 Spaulding street,

Omaha, Nebraska, has recently elected W. W. Wuchter treasurer and general manager of the company, succeeding E. G. Wolfe, resigned. The other officers are: Alva Smith, president; G. C. Feironnet, vice-president, and F. M. Holloway, secretary. These, with J. E. Cornish and S. C. Wolfe, compose the directorate. The concern is reorganizing under these officials and will equip its plant with the latest improved machinery, to begin operations July 1, 1919.

The Globe Rubber Tire Manufacturing Co., 1851 Broadway, New York City, at its annual stockholders' meeting on February 4, 1919, elected the following officers: J. B. Linder, president; H. W. Kugler and H. L. Hornberger, vice-presidents; F. H. Craig, secretary; H. B. James, treasurer, and R. E. Glass, assistant treasurer.

The Advance Rubber Co., 1717 Eighth avenue, Brooklyn, New York, has increased its capital from \$150,000 to \$1,000,000.

The McGraw Tire & Rubber Co. of New York, Inc., has leased the store at 1891 Broadway, New York City, and has also recently opened several new branches in other cities.

The Standard Four Tire Co., Keokuk, Iowa, is to build a two-story addition with basement to its plant, 60 by 125 feet. It will be equipped with new machinery with a view to increasing the company's production to about 1,000 tires daily. It is now turning out about 425 tires and 150 tubes a day.

The Johnstone Tire & Rubber Co., Peoples Gas Building, Chicago, Illinois, at its meeting held January 22, 1919, elected the following officers: E. C. Walton, president; B. R. Blackwelder, vice-president, and C. W. Mussey, secretary-treasurer. The concern is preparing to put on the market its patented braided cord tire, but at present is manufacturing solid truck and pneumatic fabric tires.

Henry P. and LeRoy H. Rindskopf, president and secretary-treasurer, respectively, of the Brooklyn Shield & Rubber Co., 397 Sumner avenue, Brooklyn, New York, have changed their name to Rand. Announcement of this was made March 10, 1919.

The Traveler Rubber Co. of Bethlehem, U. S. A., with offices in the Traveler Building, Philadelphia, Pennsylvania, will break ground about April 1, for a new two-story automobile tire plant, 60 by 200 feet, with power plant, at Bethlehem, Pennsylvania. The cost is estimated at \$250,000.

The Chester Novelty Co., Inc., Chester, New York, manufacturer of novelties, including the "American Inkless War Pen," illustrated in our issue of August 1, 1918, has increased its capital from \$15,000 to \$60,000.

The trade-mark "Lowell," used by the J. Spencer Turner Co., New York City, on its yacht duck, is now to be used also on its tire fabric. These goods were formerly sold by the Boston Yarn Co., Boston, Massachusetts, but are now handled exclusively by the Turner company.

The New Jersey Zinc Co. held a house-warming at its new home, 160 Front street, New York City, on March 7, 1919, arranged by C. A. Stedman, advertising manager. Moving pictures were shown and views of the company's mines at Franklin, New Jersey. F. C. Ryan gave a talk on the development of the industry. Before leaving, the guests were shown over the building, which contains, among other interesting features, a museum of a great variety of zinc products. A detailed description of the building, illustrated, was given in our issue of February 1, 1919.

The Okonite Co., 501 Fifth avenue, New York City, has increased its capital stock from \$650,000 to \$1,500,000, to consist of \$1,000,000 common and \$500,000 preferred, of which only \$200,000 preferred is to be issued at present.

The Morse Chain Co., Ithaca, New York, has announced the removal of the Kansas City office of its western representative, the Morse Engineering Co. from the R. A. Long Building, to 211-212 Finance Building. W. V. Warner is district manager in Kansas City.

The Belden Manufacturing Co., 23d street and Western avenue, Chicago, Illinois, manufacturer of rubber-insulated wire and cable, has increased its capital from \$1,000,000 to \$1,500,000, the additional stock to be issued as the demands of the business necessitate.

L. H. Homer, former treasurer of the Smith & Dove Manufacturing Co., Andover, Massachusetts, has been elected treasurer of the Carlisle Cord Tire Co., Inc., of the same town.

The Hood Rubber Co., Watertown, Massachusetts, is building a one-story addition to its garage, to cost approximately \$12,000.

SIXTH ANNUAL REPORT OF THE FISK RUBBER CO.

The sixth annual report of The Fisk Rubber Co., Chicopee Falls, Massachusetts, shows the following figures after being summarized:

ASSETS.		
Property, equipment, etc., less depreciation, replacements, etc.,	\$7,775,479.95	
Leasehold property	5,169.39	
Good will	8,000,000.00	
Investments, including Liberty Bonds, less deductions...	\$15,780,649.34	
Current assets, including supplies, notes and accounts receivable, cash, etc.,	334,599.18	
Deferred charges, including rents and other prepaid items	22,298,491.03	
Capital stock outstanding	315,038.53	
	21,129,590.00	
LIABILITIES.		
Current liabilities, including accounts payable, accrued wages, etc.,	9,742,184.79	
Provision for Federal taxes	1,253,426.61	
Reserves for insurance, mileage, etc.,	238,801.14	
Surplus for retirement of preferred stocks	1,938,542.19	
Surplus after stated statement.	4,425,923.35	
PROFIT AND LOSS AND SURPLUS ACCOUNT.		
Surplus—balance December 31, 1917, less Federal taxes, 1917	3,455,479.34	
Net profits, year ended December 31, 1918, after deductions	3,760,279.84	
Dividends paid	\$946,750.00	
Appropriation for retirement of preferred stocks in 1919	589,659.22	
Estimated Federal taxes, 1918	1,253,426.61	
	2,789,835.83	
Surplus balance December 31, 1918.	\$4,425,923.35	
(Net sales, \$36,682,163.78.)		

HOOD RUBBER CO. STATEMENT.

The Hood Rubber Co., Watertown, Massachusetts, has issued the following condensed balance sheet dated December 31, 1918, and subject to a reserve for income and excess profits taxes.

ASSETS		
Plant (real estate, machinery, etc.)	\$4,000,000.00	
Merchandise	\$8,012,861.89	
Accounts receivable	1,203,350.50	
Cash	1,022,877.49	
Investments in other corporations	285,400.00	
Patents	1,000.00	
Liberty Bond account	521,020.13	
	\$15,045,509.71	
LIABILITIES		
Capital Stock—common	\$3,000,000.00	
—preferred	4,000,000.00	
Notes payable	\$7,000,000.00	
Accounts payable	4,735,000.00	
Surplus	148,904.73	
Liberty Bond account	2,606,604.98	
	505,000.00	
	\$15,045,509.71	

Merchandise in process of importation and letters of credit and drafts discounted in connection therewith, are not included in the foregoing statement.

FIRST DIVIDEND TO PETLEY CREDITORS.

The trustee for the Petley Rubber Co., Julius J. Goetz, 28 Miller Block, Milwaukee, Wisconsin, has paid a first dividend of 20 per cent to creditors and states that another will be paid in about two months when the final payment is due from the Everwear Rubber Co. which purchased the machinery from the Petley company. The trustee also states that there will be considerable shrinkage on the accounts receivable, due to apparently legitimate disputes.

CONNECTICUT NOTES.

Hartford was host, beginning with the evening of March 17, to fifty salesmen of the United States Tire Co. and officers of the United States Rubber Co. and the Hartford Rubber Works. A banquet was held at the Hotel Bond, and the out-of-town men remained for several days to hear addresses on sales efficiency and kindred topics.

The L. Candee Rubber Co., New Haven, Connecticut, has curtailed its running time to five days weekly, but it is expected to be a temporary schedule.

The bowling team of the L. Candee Rubber Co., New Haven, Connecticut, recently won from the bowling team of The Good-year's Metallic Rubber Shoe Co., Naugatuck, the United States Rubber Co.'s trophy by winning two games out of three. The teams are now even, and two more matches must be played before the permanent ownership of the cup will be determined.

The American Tire Co., Inc., New Britain, Connecticut, has opened an office at 166 Main street and expects soon to increase its capitalization. It was incorporated in 1918 at \$50,000, with the following officers: George L. Giller, president; Albert W. Meyers, vice-president; Philip Bardeck, treasurer; Louis W. Podt, secretary. These, with John C. Calloghan of Cohoes, New York, compose the directorate.

The Kelly-Springfield Tire Co., New York City, has established a direct factory branch at 359 Fairfield avenue, Bridgeport, Connecticut, in connection with a service station. A complete stock of tires and tubes will be carried.

A PROGRESSIVE CONCERN.

The Plant Rubber & Asbestos Co., 537-539 Brannan street, San Francisco, California, maker of mechanical rubber goods, and pipe and boiler coverings, has recently installed an up-to-date equipment for the manufacture of high-pressure asbestos packing.

This company that began business in 1898, specializing in steam packing and engineers' supplies, has grown steadily from the start and now occupies a three-story building comprising 40,000 square feet of floor space, and employs from 80 to 100

NEW FACTORY OF THE PLANT RUBBER & ASBESTOS CO.

hands. The officers are: S. L. Plant, president; Charles A. Wright, vice-president; E. H. Pierce, secretary, and George J. Sivers, treasurer.

The Meyer Rubber Co., Cleveland, Ohio, has purchased the plant of The Columbian Manufacturing Co., Columbiana, and is equipping it for the manufacture of pneumatic tires. It expects to operate the factory about April 15.

PERSONAL MENTION.

C. S. Putnam has been appointed branch manager of the United States Tire Co., New York City, at 245 Jefferson avenue, East, Detroit, Michigan. He has been with the company since 1911, advancing from the position of stock record clerk to city sales manager.

John B. Maus, export sales manager of The Fisk Rubber Co., Chicopee Falls, Massachusetts, has recently been elected chairman of the Foreign Trade Division of the Springfield (Massachusetts) Associated Interests.

A. F. Hill, for nine years with the New York Commercial Co. and for five years subsequently with the Rubber & Guayule Agency, has opened an office at 290 Broadway, New York City, where he will operate as a broker in crude rubber and allied gums. For the last year and a half Mr. Hill has been stationed at Camp Merritt as a government auditor.

A. G. Langher, former central district manager for the Diamond Rubber Co., Akron, Ohio, has been made central district manager of the Carlisle Cord Tire Co., Inc., Andover, Massachusetts, with headquarters at Chicago, Illinois.

Lee Anderson, formerly supervisor of wholesale branches, sales manager, and general manager, successively, of the Hupp Motor Car Corp., Detroit, Michigan, has become associated with Theodore F. McManus, Inc., a well-known advertising agency of the same city, which handles a number of automobile and rubber company accounts.

Miss Alice Nash, the well-known golf specialist, has become associated with the New York City office of Thos. E. Wilson & Co., Chicago, Illinois, manufacturers of sporting goods, game balls, etc.

W. G. Westlake has been appointed eastern sales manager of the motor truck tire department of The McGraw Tire & Rubber Co. of New York, Inc., 1891 Broadway, New York City.

R. S. Hardy has opened an office at 82 Beaver street, New York City, as a broker in crude rubber and allied products. He was formerly with J. T. Johnstone & Co.

C. F. Troupe has succeeded Frank M. Lee, resigned, as Milwaukee branch manager of The Fisk Rubber Co., Chicopee Falls, Massachusetts, with headquarters at 452 Milwaukee street, Milwaukee, Wisconsin. His territory covers twelve counties of the State of Wisconsin. He has been in the employ of the Fisk company nine years as special representative in different localities.

W. J. Gallagher, managing director of the United States Rubber Plantations, Inc., is returning from a visit to Ireland with his wife, and will go on to the company's plantations in Sumatra via the Pacific after a short stay in New York City. His recently elected executive assistant, George H. Seybold, left early in March for the plantations, by way of Liverpool from New York City.

David M. Figart, manager of the Singapore office of the United States Rubber Plantations, Inc., sailed with his wife late in February for the plantations after a visit in the States.

Philip Belford, manager of the Singapore office of the General Rubber Co., is visiting New York City.

L. J. D. Healy, for three years chief chemist and director of development work at the plant of the Federal Rubber Co., Cudahy, Wisconsin, has been placed in charge of the construction of the new "Horsehoe" cord tire and the new "Re-Cord" inner tube of the Racine Auto Tire Co., Racine, Wisconsin.

Myron H. Clark, general footwear factory manager of the United States Rubber Co., sailed recently for an extended business trip abroad in the interests of the company. His plans are to visit England, France and Italy.

Frank C. Thompson has been appointed purchasing agent for the Indianapolis plant of the Link-Belt Co., Chicago, Illinois, succeeding John E. Shideler.

Fred Stadelman, with the Wellman-Seaver-Morgan Co., Cleveland, Ohio, has been elected a director of the newly formed

Material Handling Machinery Manufacturers' Association, which has offices at 35 West 39th street, New York City.

C. W. Johnson has been appointed assistant manager of works of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, in whose employ he has been since 1907, first as chief inspector of works, and later as general superintendent. Mr. Johnson is a member of the American Society of Mechanical Engineers, American Institute of Mining Engineers, and the Engineers' Society of Western Pennsylvania.

W. J. Glendenning, consulting engineer and rubber, asbestos and balata expert, recently installed a department for the manufacture of asbestos high-pressure packing for the Plant Rubber & Asbestos Co., 537-539 Brannon street, San Francisco, California.

C. D. Studebaker has been appointed New York district manager for the Firestone Tire & Rubber Co., Akron, Ohio, to which position he has risen from that of credit manager for the New York branch seven years ago, subsequently becoming office manager and branch manager.

E. P. Jones succeeds C. D. Studebaker as New York branch manager of the Firestone Tire & Rubber Co., Akron, Ohio. He was formerly branch manager of the same company at Newark, New Jersey.

FREDERICK J. MAYWALD, F. C. S.

ONE of the best equipped laboratories in New York devoted to general analytic and chemical consulting work may be found in lower Manhattan not far from the "Swamp." Here, in fact, is a very interesting series of laboratories which occupy

FREDERICK J. MAYWALD.

four floors of an old-time brick structure where the owner, Frederick J. Maywald, and his corps of assistants conduct investigations on the chemistry of many manufacturing processes, specializing in problems relating to rubber.

Mr. Maywald is a native New Yorker, born June 25, 1870. His education was obtained in the New York public schools and Cooper Union from which he graduated in 1889, and promptly opened at Bartow, Florida, a laboratory in connection with the development of the land pebble phosphate mines, of that section. In 1893 and 1894 he was a private student of the late Doctor Peter T. Austin at the Brooklyn Polytechnic Institute and conducted a general analytic and consulting laboratory in New York City. In 1894, Maywald joined Professor Austin in consulting work in the latter's laboratory and succeeded to the business on the death of Professor Austin, December 30, 1907. He has since conducted the laboratories on an enlarged basis. They are now equipped with facilities unsurpassed in New York, for practically every line of manufacture and test.

Among the laboratory departments should be noted the technical library of 4,000 volumes, and special departments for electro-chemical work, ultra-violet ray tests, underwriters' hydraulic tests on hose, spraying apparatus for study of air-conditioning and drying problems, and a complete rubber-manufacturing plant including machinery for washing and

vacuum-drying crude rubber, compounding, calendering, vulcanizing, etc.

During the war the resources of the Maywald laboratory have been devoted to inspecting specification goods for the United States Shipping Board and other government departments.

JAMES H. LEARNED.

JAMES H. LEARNED, who sails next month on another trip across the Atlantic, has had a varied experience since he graduated at the age of 15 from the public schools at Chelsea, Massachusetts. For a year he did clerical work in the office of Judge W. H. H. Emmons in Boston. The lawyer's profession not suiting his commercial ideas, he transferred his services to the sales department of the Revere Sugar Refinery, leaving there in 1888, and serving one year as bookkeeper at the shoe factory of Faunce & Spinney, Lynn, Massachusetts.

JAMES H. LEARNED.

But bookkeeping was not to his taste, and in 1890 he joined the force of the Revere Rubber Co., Boston, as city salesman, afterwards becoming sales manager of the New England department. Besides covering this territory, special business for the company required him to make one or two trips abroad annually for ten years previous to the opening of the European war, some of them extending over the Continent as far as Petrograd and Moscow, Russia.

As manager of the specialty department of the company, Mr. Learned has a widespread list of customers who regard him as a personal friend. He is fond of sports and is a crack golfer. He is a member of the Art Club and City Club of Boston, the Commonwealth and Country Clubs of Brookline, Massachusetts; the Rubber Association of America, New York City, and is high in Masonic bodies. He resides in Brookline, Massachusetts.

FISK SALES DISTRICTS REORGANIZED

The remarkable growth of the business of The Fisk Rubber Co. in the East has made necessary the division of its New England and New York territories into two separate sales districts. These will be known as the New England district, with Walter Oakes as district manager, and the western New York district, with George T. Newton holding the district managership.

GEORGE T. NEWTON.

WALTER OAKES.

In his elevation to the New England district managership, Walter Oakes receives a promotion for which he is well fitted by twelve deserving years of service with the Fisk company. His long association with the tire trade of Boston, Massachusetts,

has won for him a wide acquaintance whose best wishes go with him in his greater opportunity.

George T. Newton, who for the last three years has been in charge of Fisk sales in the two territories, will hereafter concentrate his efforts upon the supervision of direct factory branches in eight cities, including Buffalo, Syracuse, Rochester, Utica, Binghamton, Elmira and Albany, New York, and Erie, Pennsylvania. His headquarters will be at the Rochester branch.

FIRESTONE'S NEW ADVERTISING MANAGER.

Justin R. Weddell, who has recently been appointed advertising manager of the Firestone Tire & Rubber Co., Akron, Ohio, comes from the Corday & Gross Co., the well-known printing and advertising concern in Cleveland, Ohio, of which he was sales manager.

Mr. Weddell's wide acquaintance with national advertisers was acquired during his ten years' service with one of the large advertising agencies in Chicago, Illinois, and later with the Barnes-Crosby Engraving Co. of that city, of the Cleveland branch, of which concern he later became manager, developing the office by building up a special advertising service, with a large staff of artists and copy writers. This led to establishing the Weddell-Schmidt Co., in Cleveland, which enlarged still further Mr. Weddell's circle of clients and acquaintances.

JUSTIN R. WEDDELL.

This large business was amalgamated with the Corday & Gross Co., where Mr. Weddell's abilities as an organizer and developer of business were given full play, and he was appointed sales manager three years ago. He brings to his new position a thorough practical knowledge of every branch of the advertising business.

BABCOX GOES TO THE RUBBER PRODUCTS CO.

At the completion of its twentieth year of prosperous growth, The Rubber Products Co., Barberton, Ohio, announces the appointment of Edward S. Babcox as sales manager.

Mr. Babcox goes to a company whose well-known products have been giving satisfaction to increasing thousands of users, and which, with the new Stronghold cord tire, soon to be ready for the trade, will offer a complete pneumatic tire line of great excellence. On the other hand, Mr. Babcox brings a wide experience to his new post. For the past six years he has been advertising manager of the Firestone Tire & Rubber Co., Akron, Ohio, and before that had been in charge of the advertising of the Burroughs Adding Machine Co., Detroit, Michigan, the Yawman & Erbe Manufacturing Co., Rochester, New York, and other nationally known organizations. He recently retired as president of the Audit Bureau of Circulations, and as vice-president of the Association of National Advertisers.

EDWARD S. BABCOX.

The Rubber Reclaimers' Division of The Rubber Association.

THE Rubber Reclaimers' Division of The Rubber Association of America is one of the most active divisions of that association, having an excellent record of accomplished results that are of benefit to the reclaiming industry. Therefore, some facts regarding the organization and its predecessor club may be of interest at this time.

Like many other trade associations, the Rubber Reclaimers' Club was the result of a get-together sentiment of the members of the trade to bring about better business relations among competitors, to solve business problems, and to eliminate trade abuses. A preliminary meeting was held in New York City on October 19, 1906, at which there were representatives from twelve leading reclaiming concerns. At this meeting, of which F. H. Appleton was chairman, and W. C. Coleman secretary, a committee was appointed to formulate a plan for forming an association. This committee consisted of F. H. Appleton, R. Loewenthal, A. W. Clapp, W. T. Rodenbach, and F. Schwab. The committee reported at a meeting at Hotel Belmont, New York City, on October 30, 1906, when the Rubber Reclaimers' Club was formed "to promote social intercourse and further the business interests of its members."

The charter membership in-

succeeded, in 1910, by Joseph F. McLean, of the Pequanon Rubber Co., who had previously held the office of secretary. In 1911 F. H. Appleton, who had held the office of treasurer since the organization of the club, was elected president, and served in that capacity until the dissolution of the club in 1917.

At first the meetings were held monthly, but later, quarterly; meanwhile frequent committee meetings were held when necessary. At these quarterly meetings many important business questions were discussed, trade disputes considered, discussed and adjusted, and the whole trade brought into closer acquaintance. At each meeting the order of exercises was divided be-

tween "New Business" and "Experience Meeting," and during the latter many trade subjects were discussed to the benefit of the trade generally.

The most important measure in the history of the club, and the one which, aside from all others, would well justify its creation, was the establishment of a trade circular standardizing the sorting, packing and handling of rubber scrap. The first circular was issued in February, 1907, and others have been sent out annually each July since that date. This circular gives minute details which must be observed by the waste rubber dealers selling to the reclaimers and today the rules laid

FRANCIS H. APPLETON,
Chairman.

Underwood & Underwood, N. Y.

J. F. MCLEAN.

cluded F. H. Appleton & Son, Bloomingdale Soft Rubber Works, E. H. Clapp Rubber Co., Canadian Consolidated Rubber Co., W. C. Coleman Co., Derby Rubber Co., Eureka Rubber Manufacturing Co., Hood Rubber Co., Loando Hard Rubber Co., Mechanical Rubber Co., New Jersey Rubber Co., Pequanon Rubber Co., Philadelphia Rubber Works, Rickaby Rubber Co., Stockton Rubber Co., Joseph Stokes Rubber Co., United States Rubber Co., United States Rubber Reclaiming Works, and Westmoreland Rubber Co. At the meeting of November 8, 1906, the following were chosen as officers: A. W. Clapp, president; R. W. Seabury, secretary, and F. H. Appleton, treasurer.

On the death of President Clapp in 1907, W. T. Rodenbach, of the United States Rubber Reclaiming Co., was elected president, and on his resignation in November, 1908, J. A. Lambert, of the Empire Rubber Co., was chosen to that office. He was

down in the current circular form the basis for all such sales.

The circular gives rules for separating waste rubber into 31 grades, and has registered a telegraphic code for these grades which is much used in the business. It gives rules for methods of packing, circumstances under which consignments may be rejected, procedure for arbitration of disputes and similar rules which govern the methods of the business of buying and selling scrap rubber.

In 1917 it was decided that the activities of the club could be facilitated and advantage redound to the members if the club, as such, were dissolved and the members form a division of The Rubber Association of America. Accordingly, action to that effect was taken on February 8 of that year, and The Reclaimers' Division was instituted. The present officers are: Francis H. Appleton, chairman, F. H. Appleton & Sons, Inc.,

Boston, Massachusetts; Clark W. Harrison, vice-chairman, Bloomingdale Rubber Co., New York City; Harry S. Vorhis, secretary and treasurer, The Rubber Association of America, Inc., New York City. **EXECUTIVE COMMITTEE:** Francis H. Appleton, chairman; Clark W. Harrison, vice-chairman; E. A. Andersen, Rubber Regenerating Co., Naugatuck, Connecticut; John S. Clapp, E. H. Clapp Rubber Co., Boston, Massachusetts; R. A. Low, United States Rubber Reclaiming Co., Inc., New York City; John S. Lowman, Philadelphia Rubber Works Co., Akron, Ohio; Joseph F. McLean, Pequanoc Rubber Co., Butler, New Jersey.

The executive committee meets the second Tuesday in each month, and the division holds meetings quarterly. At one of the meetings plans were made to compile a complete census of the reclaiming industry and a technical committee was appointed to take up all matters of a technical nature presented by the reclaimers for research and experiment.

The present membership of the Division includes: F. H. Appleton & Son, Inc., Boston, Massachusetts; Bloomingdale Rubber Co., New York City; Boston Woven Hose Co., Cambridge, Massachusetts; E. H. Clapp Rubber Co., Boston, Massachusetts; Corona Rubber Reclaiming Co., Philadelphia, Pennsylvania; Goodyear Tire & Rubber Co., Akron, Ohio; Gutta Percha & Rubber, Limited, Toronto, Ontario, Canada; Hood Rubber Co., Watertown, Massachusetts; New Jersey Rubber Co., Boston, Massachusetts; Pennsylvania Rubber Co., Jeannette, Pennsylvania; Pequanoc Rubber Co., Butler, New Jersey; Philadelphia Rubber Works Co., Akron, Ohio, and Philadelphia, Pennsylvania; Republic Rubber Corp., Youngstown, Ohio; Rubber Regenerating Co., Naugatuck, Connecticut; Rubber Regenerating Co. of Canada, Montreal, Quebec, Canada; Stockton Rubber Co., Stockton, New Jersey; United States Rubber Reclaiming Co., New York City, New York, and the Xylos Rubber Co., Akron, Ohio.

Activities of The Rubber Association of America, Inc.

MANUFACTURERS SUPPORT THE CRUDE RUBBER CHARGE.

MANUFACTURERS representing 95 per cent of the crude rubber consumed annually in the United States have agreed to pay The Rubber Association three cents per hundred pounds on all crude rubber purchased by them. The amount is to

be added to the manufacturer's invoice by the importer, dealer, or broker who will remit the monthly collections to The Rubber Association. This charge became effective on and after March 1, 1919, on all rubber invoiced to the following manufacturers who are members of the Association:

PLAN FOR COLLECTING RUBBER INDUSTRY STATISTICS.

MARCH 24, 1919.

To the Members: The Rubber Association of America.

The statistics on the rubber industry collected by our War Service Committee in 1918 were of value not only to the Government but also to the individual members of the industry. They presented, for the first time in the history of the rubber trade, a complete picture of the industry—its size, the amount of rubber consumed in total and by classes of articles, the value and quantity of output, and stocks of crude rubber on hand and in transit at various periods.

The unquestioned value of these statistics suggests the desirability of our continuing to collect them in 1919 and thereafter, under conditions which would insure proper secrecy for the returns from separate manufacturers, and which would provide for the publication of total figures only for the entire industry and the distribution of these totals to manufacturers who co-operated by making returns for their plants. The value to the Government, as well as to the industry, of a continuation of the statistics is indicated by the following quotation from a letter from the Honorable W. C. Redfield, Secretary of Commerce:

"I deem it of importance to the country and of value to this department to have the collection of rubber industry statistics continued. I earnestly hope the work will go on, and we shall be more than glad to have the privilege of using the statistics when they are gathered."

It is assumed by your directors that if proper means may be provided for insuring the secret custody of the individual reports, the main objection to rendering such reports—if any—may be obviated. To this end negotiations have been taken up with one of the largest trust companies in the country, and it will be possible to arrange for all questionnaires to be sent to them and tabulated by them as to the end-figures for distribution to the trade. To start with, we will not ask for questionnaires at more frequent intervals than semi-annually.

Would you be willing to continue making returns of the sort suggested herein, provided.

(1) That manufacturers representing approximately 90 per cent of the industry (based on volume of business) agreed to cooperate in furnishing the statistics?

(2) That publication of the information given confidentially should be only of total figures for the entire industry, and this data should be distributed only to manufacturers who aided in collecting it, by furnishing the necessary statistics?

We are enclosing herewith a blank which we hope you will be willing to sign and return to the Secretary in the enclosed stamped envelope.

THE SECRETARY.

CALENDERED RUBBER CLOTHING SECTION FORMED.

The Calendered Rubber Clothing Section of the Rubber Clothing Manufacturers' Division of The Rubber Association of America, Inc., was formed at a meeting held at the office of the United States Rubber Company, 130 Essex street, Boston, Massachusetts, on March 4, 1919, with the following officers: N. Lincoln Greene, chairman; George G. Bryant, vice-chairman; Harry S. Vorhis, secretary. EXECUTIVE COMMITTEE: N. Lincoln Greene, chairman, United States Rubber Co.; George G. Bryant, Chicago Rubber Clothing Co.; S. T. Hodgman, Hodgman Rubber Co.; William M. Tenney, Clifton Manufacturing Co.

The membership of the section is as follows: Apsley Rubber Co.; Archer Rubber Co.; Boston Woven Hose & Rubber Co.; Cambridge Rubber Co.; Chicago Rubber Clothing Co.; Clifton Manufacturing Co.; The B. F. Goodrich Co.; Hodgman Rubber Co.; United States Rubber Co.

STANDING COMMITTEES RECENTLY APPOINTED.

NOMINATING COMMITTEE.

Bertram G. Work, chairman, The B. F. Goodrich Co., New York City.

Harvey S. Firestone, Firestone Tire & Rubber Co., Akron, Ohio.

George B. Hodgman, Hodgman Rubber Co., Tuckahoe, New York.

Frederic C. Hood, Hood Rubber Co., Watertown, Massachusetts.

Henry C. Pearson, THE INDIA RUBBER WORLD, New York City.

The above are the last five past-presidents in the order named, and the Executive Committee expressed the hope that this precedent would be followed in succeeding years, as the last five past-presidents would be best qualified to nominate directors of the Association.

LEGISLATIVE COMMITTEE.

Charles Neave, chairman, general counsel, The Rubber Association of America, Inc., New York City.

F. C. Van Cleef, The B. F. Goodrich Co., New York City.

Ernest Hopkinson, United States Rubber Co., New York City.

AUDITING COMMITTEE.

Edward E. Huber, Eberhard Faber Rubber Co., chairman, Brooklyn, New York.

W. J. Kelly, Poel & Kelly, New York City.

OUTING COMMITTEE.

Francis R. Henderson, chairman, F. R. Henderson & Co., New York City.

A. A. Garthwaite, Lee Tire & Rubber Co., New York City.

L. P. MacMichael, L. P. MacMichael, New York City.

ARBITRATION COMMITTEE.

Horace DeLisser, Ajax Rubber Co., Inc., New York City.

Andrew H. Brown, Meyer & Brown, New York City.

— 22 members to serve three years to succeed those whose terms expired at the last annual meeting.

THE MID-SUMMER OUTING.

The Outing Committee held a meeting late last month and completed arrangements for a mid-summer outing of The Rubber Association to be held some time in June.

TRANSPORTATION IN SINGAPORE.

The commissioners of the municipality of Singapore have appointed a committee to report on means for improving the city system of transportation, with particular reference to the introduction of a municipal motor-transport service. The present tramway system is a private enterprise, the franchise under which it operates still having 19 years to run, but the service is already considered unsatisfactory and inadequate. In addition to the tramway route covering about 16 miles, there are operated approximately 9,000 jinrikshas and 468 hackney carriages, including over 200 motor vehicles for hire, besides 900 private jinrikshas. The tramways alone carried about 13,000,000 passengers in 1917.

RUBBER PRODUCTION IN BRITISH GUIANA DURING 1917.

The United States Commerce Reports give some interesting figures concerning rubber and balata production in British Guiana during 1917. Twenty new balata licenses were issued, making a total of 629 at the end of the year. The amount of balata produced from licensed tracts amounted to 1,291,241 pounds, as against 1,483,449 pounds in 1916. The number of laborers employed was 4,061 and the value of the balata exported amounted to \$1,024,176.

On the other hand, the amount of rubber produced decreased, the amount for 1917 being 14,781 pounds, as against 15,586 pounds in 1916.

It was hoped that the early rapid growth of the Pará rubber planted in the colony would continue, but in recent years the trees have been attacked by a leaf disease which has retarded their growth and even proved fatal in some cases. It is believed, however, that this disease will be conquered and that plantation rubber will become an important article of export.

EXPORTS.

Product.	1916.		1917.	
	Pounds.	Value.	Pounds.	Value.

THE RUBBER TRADE IN OHIO.

By Our Special Correspondent.

UNDER the direction of the Government during the last year there has been a saving of \$300,000,000, it is estimated, accomplished through the reclaiming of rubber alone, and a proportionate salvage of other materials.

Ohio cities, among others all over the country, conducted campaigns in connection with Red Cross work to induce their citizens to save rubber. In Cincinnati, "Mt. Rubber" was built in Fountain Square, composed of old automobile tires, inner tubes, and rubber accessories of all kinds. The illustration shows only the nucleus of the "mountain" that was afterward piled up, but the truck was contributed tires and all, because its owners "could not get the tires off," which was duly announced by the placard on the side. The sale of the rubber thus collected netted the Red Cross more than \$2,000.

In Akron, one of the big rubber companies announced in its publicity matter that it had reclaimed waste rubber and other materials to the amount of \$3,000,000 during the year.

In Denver, Colorado; Baltimore, Maryland; Detroit, Michigan, and Providence, Rhode Island, among other cities, the same idea of soliciting waste rubber goods from their citizens was utilized in various campaigns, some for the benefit of the Red Cross, some for the sale of War Savings Stamps. The idea even went across the sea, the British Ministry of National Service issuing a similar appeal for the benefit of the Red Cross.

Everywhere, throughout our country, the spirit of thrift and economy developed during the war has brought about a realization of the value of so-called waste matter which was formerly thrown away when it had served its original purpose.

MISCELLANEOUS OHIO NOTES.

In order to meet its need for tire fabric, The Mason Tire & Rubber Co., Kent, and the Mason Brothers Co., Cleveland, have incorporated The Mason Cotton Fabrics Co. and have had plans prepared for a \$3,000,000 mill to be built at Kent for spinning and weaving cotton, to have about 125,000 square feet of floor space. It will be of steel and concrete construction and will be equipped with modern machinery and apparatus so as to attain the exact degree of humidity and other conditions essential for the manufacture of raw cotton into tire fabric. The new plant will employ about 200 workmen. Both cord and flat tire fabric will be manufactured. The officers of The Mason Cotton Fabrics Co. are as follows: O. M. Mason, president; R. W. MacKinnon, vice-president; J. H. Diehl, vice-president; D. M. Mason, treasurer, and W. A. Cluff, secretary.

The Knight Tire and Rubber Co., Youngstown, Ohio, has changed its name to The Canton-Blackstone Co. This is a subsidiary of The Republic Rubber Corp.

R. J. Firestone, Akron, former vice-president of the Firestone Tire & Rubber Co., has bought the old plant of The Standard Tire & Rubber Manufacturing Co., Willoughby, Ohio, which was recently in the hands of a receiver. A new company has been organized under the name of the Standard Tire Co., with the following officers: R. J. Firestone, president; C. A. McCul-

lough, vice-president; E. A. Tinnman, second vice-president and factory manager; Tom A. Palmer, secretary and treasurer.

The Acme Rubber Heel & Sole Co., Elyria, Ohio, manufacturer of fibrous heels and soles, elected the following officers at its stockholders' meeting on January 14, 1919: C. C. McDonald, president; A. J. Robson, vice-president; R. E. Griswold, secretary; H. A. Crandall, treasurer; B. W. Rote, general manager; G. Kolinski and E. M. Brush, directors in addition to the foregoing. This concern was incorporated in September, 1917, but did not actively engage in business until June, 1918. In January of the present year it opened a distributing station for "Acco" fiber products in Chicago, in charge of B. W. Elwert, at room 400, 208 North Wells street.

The Chillicothe Tire & Rubber Co., Chillicothe, Ohio, has purchased a factory building and is buying machinery for making automobile tires. The company was incorporated in 1918. The officers are: C. A. Hertenstein, president; S. S. Wortley, Jr., vice-president, and W. W. Boulger, secretary and treasurer.

"COULDN'T GET TIRES OFF, SO DONATED TRUCK."

A. G. Snow, Paulding, Ohio, has been appointed state registrar of automobiles for the current year, succeeding W. A. McCurdy, of Columbus. Mr. Snow is at present chief drug inspector in the drug and food department of the State Agricultural Department.

AKRON NOTES.

The B. F. Goodrich Co., Akron, Ohio, undertook to reach its former employees overseas through their relatives and families in order to let them know that as soon as they return, there are positions waiting for them in the Goodrich organization. In almost every case this plan has been successful and the soldier or sailor located.

Lieutenant C. D. Sperry, formerly in the railway sales department of The B. F. Goodrich Co., Akron, Ohio, was recently decorated at Vallender, on the Rhine, with a French war cross, for his work in the Second Division in turning back the Germans at Château-Thierry.

W. O. Rutlerford, one of the vice-presidents of The B. F. Goodrich Co., Akron, Ohio, has been elected president of the Better Letters Association. H. E. Ammerman, with The Goodyear Tire & Rubber Co., Akron, is one of the directors. The organization is national in scope and aims to make business correspondence uniformly efficient by the elimination of unnecessary practices and an extensive educational campaign.

H. T. Waller, organizer of the educational system of The B. F. Goodrich Co., Akron, Ohio, has been appointed general secretary of the Akron Y. M. C. A. He will have particular charge of work in connection with young men coming into the city; broadening the Americanization program; and providing for the colored young men of Akron. During his two and one-half years in charge of the Goodrich Bureau of Education, the department has taught a working knowledge of English to more than 2,000 foreign employees. A farewell reception was given Mr. Waller in the Goodrich cafeteria on February 28. The orchestra of Department No. 2 and the Goodrich male quartet furnished music. Refreshments were served after the speeches.

THE RUBBER TRADE IN LOS ANGELES.

By Our Regular Correspondent.

REPORTS from the leading rubber firms and rubber goods distributors in this section of Southern California report that the advance rubber business is much ahead of that of last year and that large orders are being placed for goods for the fall trade. There is a strong demand all up and down the Coast for rubber boots of all kinds, and consignments from the East are coming in rapidly. The constantly growing fishing industry of Southern California makes it an especially fruitful territory for the disposal of various lines of rubber boots, although at present the canneries are inactive just prior to the big spring run of fish. Fishermen are stocking up, however.

"Southern California has always been an exceptionally good territory for the sale of sporting lines of rubber footwear," says Lou M. Simpson, in charge of the rubber clothing and footwear section of the United States Rubber Co. "The climate of Southern California throughout the winter is such as to be conducive to outdoor sports, and there is always a demand for tennis and golfing footwear, while the sportsmen who use sportsmen's rubber boots are numbered in the thousands. The first of May sees the trout season in this part of the country in full blast, and the wise sportsman prepares for it in advance, while there are two or three open months in the winter when trout fishing is allowed in and around Ventura. There is no part of the country where the demand for rubber boots is greater than here, where the market fishing industry has assumed such proportions, especially when the war created such a demand for fish. Of course, all this created a demand for rubber products. There is no reason for any pessimistic cry of hard times at present. Of course, the principal demand on the part of buyers just now is for protection, and, assured of that, they are going ahead to replenish their stock of fall goods."

* * *

George B. Clark, better known to his trade associates and intimates as "Nipples" Clark, from the plant of the Revere Rubber Co., Providence, Rhode Island, was in the city early in the month at the Hotel Alexandria. He spent a week or so among the trade explaining the merits of his line of golf balls.

* * *

J. B. McGee, manager of the United States Rubber Co. for Arizona and Southern California, spent a week in Arizona in various sections, conferring with the rubber trade. The closing of the United Verde mines in Jerome and Bisbee was a temporary setback for the spring trade, but there are good prospects for a revival with the resumption of activities.

* * *

The United States Rubber Co. in Los Angeles is taking an extra 20,000 feet of floor space for the accommodation of its business at its local establishment.

* * *

"The abnormal conditions precipitated by the entry of this country into the war are rapidly passing," said D. M. Bixby, local manager of The B. F. Goodrich Co., "and this is resulting in a more stable condition generally. In Southern California business is continuing good, and we are looking forward to one of the best years in the history of the local branch.

"There is nothing to support the contention of some of the pessimists that the cessation of hostilities will result in curtailment and business depression. Conditions were never so good in Southern California. The influx of tourists is at present, and has been for some time past, in the nature of a record-breaker. This has stimulated the automobile trade in all its branches.

"The great volume of business which has been side-tracked for war activities is once more flowing into its accustomed channels, and every industry is resuming its normal proportions, and getting back to a peace basis founded on a substantial and legiti-

mate demand, but yet quickened by the necessity for supplying all the essentials of which the people of the United States have been denying themselves for so long, as well as many of the luxuries.

"Economic conditions are unquestionably adjusting themselves, but with increased foreign trade and the development all over the North American continent the prospect is encouraging rather than discouraging."

* * *

H. S. Firestone, president of the Firestone Tire & Rubber Co., Akron, Ohio, has leased the house of the late R. A. Rowan at Pasadena. Mr. Firestone arrived here just in time to give greetings and farewell to Henry Ford, who had been here for several weeks but was just on his way East. The close friendship of Mr. Firestone with Mr. Ford has given rise to the sensational report that has been the subject of endless discussion in the East that the tire magnate will be associated with the Detroit man in the production of the new \$250 automobile which Mr. Ford announced while here he intended to put on the market in a year from now to compete with his own noted vehicle.

Mr. Firestone made his first visit to Los Angeles in 1906, when he established a branch house here which was one of the first to be located on the Coast. His visit at this time is to make a thorough study of the commercial possibilities of this part of the country with the view of extending his business interests here and perhaps for the establishment of a branch factory. The local branch of his company in Los Angeles is under the direct management of his brother, E. S. Firestone.

Mr. Firestone declares that rubber is destined to be one of the chief industries of the United States in the near future. Now that most of the rubber plantations of the world are in the Orient, Mr. Firestone maintains that the logical course of this branch of commerce is through Pacific ports. It is his belief that many of the large Eastern concerns which buy through the London markets will in time divert the product through Western channels. He declares that the growth of the rubber industry on the Coast will naturally be followed by the establishment of large factories, as the accessibility of the Coast cities to the rubber plantations will be a great inducement to tire manufacturers to locate here. Mr. Firestone is confident that the automobile industry is only in its infancy, and that shipping by trucks will be the favorite means of future transportation.

Rubber, he predicts, will be cheaper, as will automobiles, just as soon as things are adjusted to a peace basis. He paid a particular tribute to the magnificent road system of California, which is the greatest asset to the development of the automobile business.

"The automobile has done almost as much to develop the country as have the railroads," concluded Mr. Firestone, "and if the industry continues to grow as it has done in the past, the result will be greater than can be dreamed of at present."

* * *

Among the leaders in the rubber trade who have visited the Pacific Coast this winter, some of them to stay for months, are Colonel Samuel P. Colt and Charles B. Seger, of the United States Rubber Co.; Harvey E. Firestone, of the Firestone Tire & Rubber Co.; Joseph O. Stokes, president of the Thermoid Rubber Co., and Frank A. Seiberling, of The Goodyear Tire & Rubber Co.

* * *

At a dinner given to Harvey S. Firestone by the Los Angeles Chamber of Commerce, the guest uttered the following part-prmise: "Your Imperial Valley cotton is the best in the world, and as 75 per cent of the rubber coming into the United States is now being brought through the Pacific Coast ports, there is no reason why, if you build the cotton mills and the rubber plants, we should not make tires here."

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

BOSTON'S automobile show, held last month, was pronounced the most successful that ever occurred in this city, both in the attendance and in the number of cars exhibited. However, there were but few tires shown and not many exhibits of accessories specially interesting to the rubber trade. In many cases, such goods were shown not as exclusive exhibits by their manufacturers, but as units of stock of local general automobile supply dealers.

Among the many patching outfits and vulcanizing devices, there was included the Sepco vulcanizer, in which the heat is obtained by electric current, for which are claimed a number of points of superiority. Among the anti-puncture devices might be mentioned the Auto-Seal inner tube, manufactured by the Shaw Tire Co., Inc., Boston, and the Coffield tire protector, made by the Coffield Tire Protector Co., Dayton, Ohio.

The business of retreading tires is becoming important, and the Wakefield Tire Co., Wakefield, Massachusetts, had a fine exhibit of rebuilt and retreaded tires. Another exhibit was that of the American Retreading Corp., Chelsea, Massachusetts.

Among other exhibitors known to the readers of THE INDIA RUBBER WORLD might be mentioned the Boston Blacking Co., whose cements and tire paints call for crude rubber in the making. The Westinghouse air spring was on exhibition. The Joseph Dixon Crucible Co., Jersey City, New Jersey, showed a line of its graphite lubricants. The Sewell Cushion Wheel Co. exhibited its specialty. The United States Rubber Co. had a general line of accessories, and the L. C. Chase Co. had a beautiful exhibit of its automobile and carriage cloth, as well as other specialties less related to the rubber industry. In the Willard storage battery exhibit was shown the component parts of that battery, including the threaded rubber insulators which make an important part of its construction.

The Monatiquot Rubber Works Co., the well-known reclaimer of South Braintree, Massachusetts, will celebrate its tenth year of manufacturing on April 19.

This company's success has been due to the employment of a reclaiming method having features of special value in the processing of automobile tires. It claims to have been the first firm to grade the different makes and qualities of old tires, thereby guarding the uniformity and quality of the output.

It is an interesting fact that the original organization of 1909 remains practically unchanged in its personnel. Robert C. Harlow is president and factory manager; James H. Stedman, treasurer; Merton A. Turner, sales manager; Benjamin Ayer, production superintendent; M. H. Pingree, chief chemist.

The Hipco Manufacturing Co., Boston, has been incorporated with a capital stock of \$50,000 for manufacturing a number of automobile specialties, among them a running board mat of special rubber composition reinforced with a strip of fabric for waterproofing purposes, and adapted to cause the mat to lie flat and tight when fastened in place by bolts or screws running through copper-plated washers embedded in the rubber. The officers of the company are Thomas A. Glennon, president; Frederick J. Gleason, treasurer; and William E. Fleet, clerk. The directors are Elizabeth Gleason, James F. Guilhop and Charles Prinkworth.

At the annual meeting of the board of directors of the Franklin Rubber Co., held early last month, C. T. Small, one of the founders of the business in 1882, resigned the presidency because of impaired health. Asa C. Merrill was elected to fill the vacancy. Mr. Merrill has been connected with the rubber trade more than thirty years, having learned the business at the old Alfread Hale store on School street, associating himself with the Franklin Rubber Co. nineteen years ago. Everett L. Fuller was

re-elected treasurer. He is the senior of the old firm of Fuller, Leonard & Small, the predecessors of the Franklin Rubber Co. Linn L. Fuller, who was elected assistant treasurer, joined the company in 1907, but two years afterward entered the garage business, returning to the Franklin Rubber Co. in 1917 to take charge of the automobile department. The company is in a flourishing condition, and its store premises modern and in every way greatly improved by its reconstruction and renovations, following the fire damage of a few months ago.

The Converse Rubber Shoe Co., Malden, Massachusetts, is expanding. An addition, 40 by 80 feet, is being erected adjoining the main factory, which when finished will be occupied as the business offices, thus giving additional room in the factory building. The addition is of the same construction and design as the factory, and is so planned that further stories can be added when more room is needed.

M. M. Converse, president and manager of the company, at this writing is in Europe taking the opportunity to enjoy a brief respite from business. His youngest son accompanies him.

Americanization is progressing, hereabouts. One day last month eight automobiles containing 46 aliens, the greater part of them employed by the Converse Rubber Shoe Co., Malden, and all members of the Americanization classes of the Central Evening High School in that city, arrived at the Federal Building in Boston, and applied for their first citizenship papers. The evening before, they were given a lecture on the uses of the public library and then later were taken to police headquarters, where they were shown the rudiments of city government. During the time they have attended school they have been paid twenty-five cents an hour by their employers, who have been instrumental in their taking this step towards becoming citizens of the United States.

Frederic C. Hood, of the Hood Rubber Co., presided at a meeting and luncheon of the Associated Industries of Massachusetts, of which he is president, when 300 members gathered at Worcester, Massachusetts, March 4, to consider transportation and legislative matters. This association endeavors to render three distinct lines of service: first, service to the individual members of the association; secondly, services which are of value to manufacturers as a class; and thirdly, it endeavors to render service of a broader nature, which may be called perhaps community service; finally, the association is also interested in lessening the delay and cost of appeals from the decisions of the industrial accident board.

George W. Chase, one of the oldest workers in the Edgeworth factory of the Boston Rubber Shoe Co., Malden, died at his home in that city, March 7, aged 61 years. He entered the employ of this company 41 years ago, and for many years was a department foreman.

President B. T. Martin, of Everlastik, Inc., Boston, left recently for a trip to the Pacific Coast and will probably be gone until the early part of April.

The Hazen-Brown Co., manufacturers of rubber cements, has removed its business offices from Brockton to 727 Atlantic avenue, Boston, Massachusetts.

The rubber-cement factory of the Hazen-Brown Co., at Brockton, was threatened with destruction last month when a friction spark from the main belt ignited some gasoline which was being used by a woman employee. Unmindful of her own danger, she fought to extinguish the flames, and her efforts are said to have saved the factory, though she was severely burned about the head and body.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

THE Trenton rubber manufacturers are experiencing a slump in business at the present time, due to the after-effects of the world war. At first the tire and tube business remained good when the other departments began to show signs of slackening, but now the former departments are beginning to be affected. Rubber company officials are optimistic over the future, however, and say that when matters have become readjusted business will remain prosperous for years to come. Two Trenton rubber manufacturers are anxious to build additions to their plants and are awaiting a drop in the cost of materials before they start operations.

The India Rubber Co., New Brunswick, conducted a St. Patrick's social on March 17 at the New Brunswick club. R. S. Butler, of the United States Rubber Co., New York City, gave an address on "Organization and Management."

The United States Rubber Co., New Brunswick, has posted notices in its plant to the effect that hereafter the works will be operated only five days a week and that there will be no work on Saturdays. It is understood that the curtailment is due to the unprecedented weather conditions and that orders for rubber footwear have fallen off to a great extent.

Trenton rubber manufacturers are benefiting by the better shipping facilities and the cheaper rates of transportation due to the establishment of the new municipal dock along the Delaware River in South Trenton. The dock was recently opened and the Joseph Stokes, Thermoid, and Essex Rubber companies were the first Trenton rubber concerns to ship goods on the opening day.

The Joseph Stokes Rubber Co. has asked the Trenton City Commission for permission to construct an additional railroad spur track from its plant across Assanpink Park, which is owned by the city. The company desires better railroad facilities.

More than four hundred employees of the Thermoid Rubber Co. Beneficial Association recently held a banquet at the Hotel Hamilton with the young women of the office force as guests. Following the dinner, dancing was enjoyed. R. F. Lee, Jr., was the toastmaster.

Fire on March 19 caused a loss of \$20,000 at the plant of the Empire Rubber & Tire Corp. The blaze started among cotton fabric and spread to the cotton hose department on the third floor. Much of the damage was caused by water. A quantity of rubber stock was burned, but the building was little damaged. The sprinkler system at the plant saved the building from destruction.

The United & Globe Rubber Manufacturing Cos. have filed a certificate in the office of the Secretary of State showing that at a recent meeting of the stockholders it was decided to amend the certificate of incorporation by changing the name to the United & Globe Rubber Co. It was also stated in the certificate that there are 2457 shares of stock issued and outstanding.

The Howe Rubber Co., of New Brunswick, is building a two-story addition, 76 by 105 feet, to cost \$30,000. Approximately one-half of this building will be used for manufacturing purposes and the balance for new executive offices. The company is also building a one-story warehouse, 200 by 40 feet.

Almus E. Vinton has been appointed sales manager of the

New Jersey Car Spring & Rubber Co., Inc., Jersey City, New Jersey.

F. F. Fox, Trenton, New Jersey, has been appointed New Jersey representative of the Monaquiot Rubber Works Co., South Braintree, Massachusetts.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent

NOW that the top-speed rush of the Rhode Island rubber manufacturing plants on contracts and sub-contracts for the Government and the Allies is practically over, all the concerns are now looking to orders on regular goods that have been given scant attention during all these months. A majority of the firms are taking advantage of this opportunity to overhaul the machinery, and to make necessary repairs and improvements. Because of this the plants have recently been closed in part or in whole for periods varying from a couple of days to a week.

About the middle of the month a five-day-a-week schedule was put into operation at the factory of the National India Rubber Co. at Bristol. The rubber goods on hand, it was stated, warranted a curtailment of the production, at least for the time being, although there are 4,500 hands working full time each day except Saturdays.

The American Wringer Co.'s adjourned annual corporate meeting, held last month at the office in the Grosvenor building, Providence, was presided over by Walter S. Ballou, president. The reports of the treasurer and secretary were read and accepted and the president gave a résumé of the past year's work, stating that the outlook for the next year is particularly bright. The directors for the ensuing year were elected as follows: Walter S. Ballou, Lyman Mills, A. J. Beardsley, J. F. Hemingway, R. J. B. Sullivan, Latimer W. Ballou and J. F. Fletcher, the latter being elected treasurer. The gross earnings of the company for the year 1918 were \$121,760; the expenses were \$106,834.41, and the net, \$14,925.92, but this was absorbed by the Government taxes of \$13,113.55 and a depreciation charge of \$1,812.37.

Extensive alterations, additions and repairs are being made at the plant of the Washburn Wire Co., Phillipsdale, East Providence. The entire plant will be completely overhauled by sections so as not to interfere with the operations of the concern.

The plant of the National India Rubber Co., at Bristol will undergo a general overhauling and renovation calculated to improve and increase the capacity of the various departments. The management's intention of continuing the general plan of increased efficiency, as well as the educational and physical welfare of the employees is shown by the recent formation of the National India Rubber Co. Foreman Club, which includes in its membership several hundred of the foremen, forewomen, and other officials of the factory force.

At the organization meeting Ralph S. Butler, of the commercial research section of the United States Rubber Co., New York, delivered an instructive address on "The Development of Team-Work" and his remarks were supplemented by Arthur Reeves, supervisor of production, vice-president George Schlosser and assistant superintendent Edwin I. Cooper. The following officers were elected: James W. Franklin, president; Miss Mary Reynolds, vice-president; Edward E. Bunn, secretary; George McClure, treasurer; directors for three years, George Schlosser and Miss Mary Connery; for two years, F. L. Dunbar, Douglas Morey, and Miss Bride Curley; for one year, T. E. Johnson, M. C. Smith, Jr., R. W. Holt, J. A. Wahlgren, Peter Vaccaro, Manuel Andrade, Miss Sadie Congdon, and Miss Mary Angello.

The day nursery, located at the corner of High and Bourn streets, which was organized by the management for children of the employees of the company, is ready for service and is certain to be of inestimable benefit to the workers. The rooms are finely furnished for the purpose and an isolation room provided where children affected with contagious sickness may be cared for. Mrs. John F. Reynolds is the matron.

The National India Rubber Co., Bristol, is fitting up a dental parlor for the benefit of its employees.

Miss Ruth Graham, formerly a nurse at the National factory, but now in the Navy, and recently returned from Queenstown, Ireland, where she was with a base hospital unit, has been at Bristol on a leave of absence with her parents.

* * *

One of the many Providence concerns which played an important part in the production of war material was the Revere Rubber Co., a subsidiary of the United States Rubber Co. Thousands of balloons were turned out at the plant of this concern on Valley street, Providence, for use in dropping bundles of printed matter behind the German lines. These balloons, which were the result of tests carried on at the balloon school at Fort Omaha, Nebraska, under authority of General Churchill, commanding the Military Intelligence Section, were from six to nine inches in diameter when inflated, and were made of pure rubber of the transparent sort used in rubber gloves. When Uncle Sam had a message for the Boches in the front lines, he sent up one of these little balloons on a string. When it had reached the desired location a parachute was released by a pull of the string, and the propaganda thus distributed.

The plant of the Revere Rubber Co., Providence, is the scene of an unusual amount of improvement, either actively under way or to be commenced in the immediate future. This includes a new one-story boiler house of brick, 90 by 50 feet, for which the contract was awarded the past month. The contract for a new transforming house has also been recently awarded and work thereon has already commenced.

* * *

The United States Rubber Co. has recently acquired a considerable tract of land on Kinsley avenue, Providence, located near the plant of the Nicholson File Co., containing approximately 43,000 square feet. Approximately \$60,000 changed hands on the transaction.

* * *

Joseph Mawson, John Broadbent and Thomas Swain, have formed a copartnership as M. B. S. Company, located at 9-11 Winter street, Providence. They will carry Hartford and Alco bicycle tires.

* * *

The Kelly-Springfield Tire Co., which recently opened warehouses at 143 Broad street, Providence, has leased the premises from the estate of B. B. Lederer for a period of five years.

* * *

The Park Vulcanizing Co., 1198 Broad street, Providence, is being conducted by Edward N. Sheffers, according to information filed at the city clerk's office.

* * *

The Goodyear Raincoat Co. has opened a fine large retail store at 425 Westminster street, corner of Union street, in one of the best locations in the downtown shopping section.

* * *

The National Rubber Co., 36 Franklin street, Providence, is owned by Mildred E. Willis, according to her statement placed on file at the office of city clerk.

* * *

The Broadway Vulcanizing Co., 31 Broadway, Pawtucket, is owned by Josephine C. Lee, according to the returns filed at the city clerk's office.

CANADIAN NOTES.

A LARGE and representative meeting of rubber shoe manufacturers and distributors was held on February 19, 1919, at the Windsor Hotel, Montreal, Quebec. T. H. Kieder, of the Dominion Rubber System, was chairman and R. H. Greene, of Gutta Percha & Rubber, Limited, secretary. The topics discussed included methods of sale, cash terms, datings and prices of different lines, bonuses, and the formation of jobbers' associations in various provinces where none at present exist. A committee was appointed to take charge of this last matter and arrange for forming such organizations in the Maritime provinces, Ontario, and Quebec. After the meeting, the guests were given a luncheon by the local members, at which interesting speeches were made by Colonel Massie, J. A. Connor, W. H. Alderson, R. B. Griffith, and others.

Among those who attended the recent third annual banquet of the Toronto Shoe Repairers' Association, at the Carl's Rite Hotel, were the following: Messrs. Thompson, Rogerson, and Thompson, representing the Dunlop Rubber Goods & Tire Co., Limited; Messrs. Harris, Johnston, Stewart, and Williams, representing The Goodyear Tire & Rubber Co. of Canada, Limited; and Messrs. Jeffrey, Mahaffy, and Wilson, representing the I. T. S. Rubber Heel Co., Limited.

The National Motor Show of Eastern Canada is to be held at the Victoria Rink, Montreal, Quebec, April 5-12, 1919. T. C. Kirby is manager.

The Canadian trade press reports the formation of the Canadian Trade Commission at Ottawa, Ontario, for the purpose of assisting in the maintenance and development of trade relations with foreign countries. Sir Charles B. Gordon is chairman, but will continue to act as chairman of the British War Mission, as he has done during the last two years; C. B. McNaught and H. W. Thomson will carry on the business in Ottawa. The Commission will keep in close touch with the Canadian Mission in London under Lloyd Harris.

The Van der Linde Rubber Co., Limited, Toronto, Ontario, is reported to have announced that it is anxious to give every possible preference to returned soldiers seeking positions.

The F. E. Partridge Rubber Co., Limited, Guelph, Ontario, is beginning the construction of a four-story addition to its plant, to be 100 by 65 feet, of reinforced concrete. It plans to use some of the space thus afforded, for the manufacture of cord tires on which it has been experimenting for some time. The Partridge company will also build soon a factory for the manufacture of rubber footwear. This unit also will be four stories high, 200 by 80 feet.

The Columbus Rubber Co. of Montreal, Limited, Montreal, Quebec, has appointed Emile Larose sales manager. Mr. Larose was formerly with the Canadian Footwear Co. in a similar position.

The Columbus Rubber Co. of Montreal, Limited, has designated as its Montreal branch the warehouse which it has recently taken over at 1464 St. Catherine street, East. It will maintain its sales offices in this building and ship to all customers and jobbers in Eastern Canada from this office.

Paul E. Lefebvre has been appointed manager of the Montreal branch of the above company, and A. D. Porcheron, acting manager of the Ottawa, Ontario, branch, succeeding R. Gratton, resigned.

The Kaufman Rubber Co., Limited, Kitchener, Ontario, intends to build a six-story reinforced concrete addition to its factory, 160 by 80 feet, as soon as building material can be obtained at prices nearer normal. The manufacturing capacity of the company will then be considerably increased and permit the use of more rubber machinery. This concern makes "Life-buoy" rubber footwear.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE annual meeting of the India Rubber Manufacturers' Association, held in Manchester at the end of January, was noticeable for the large attendance representative of the trade, several former outstanding firms of importance being now within the pale. The chairman, J. T. Goudie, presided and his survey of the past year's proceedings and his administrations of those to come were couched in equally optimistic tones. He quoted high official opinion to the effect that their association was recognized as one of the best equipped and progressive organizations in the country. Referring to the Government Rubber Control Committee, on which they were represented by Stewart A. Russell, of The Silvertown Company, he said that the committee was still retained by the Government in a purely advisory capacity though it seemed very improbable that any control would now be exercised over the imports of raw rubber.

The interesting announcement was made of the formation of a Reclaimed Rubber Manufacturers' Association, thus necessitating an amendment in the articles of association. Not having any special information, I do not know whether membership will be limited to reclaimers or whether those who do reclaiming as a part of a general substitute and rubber chemical business will be eligible. Since the introduction of American capital and American methods into the reclaiming industry of Britain, the business has, of course, assumed a more important position than it held twenty years ago and its products are not now referred to with bated breath in the trade. Another point is that its existence as an important industry has become known to government departments now that the country has so much discarded rubber on which it wants to realize at full value.

The association has now become associated with the Federation of British Industries and a special sub-committee has compiled a voluminous report on the rubber trade for the information of the Government. A topic of interest touched upon by the chairman was the government-aided association for industrial research in the rubber trade, the formation of which was in an advanced stage. Naturally there are not wanting among ordinary tax-payers connected with the various industries to be assisted those who view with some alarm the numerous raids made upon our depleted exchequer, and it is therefore in the first degree imperative that the various research associations should be conducted on lines conducive to the general welfare.

With regard to the formal business of the meeting Mr. Goudie was somewhat against his inclination reelected chairman for the fifth year in succession, a glowing tribute to his sterling qualities. The following men were elected members of the General Committee, a much larger body than was the case only a few years ago, due to the formation of sectional committees which nominate one or more of their members to serve on the general committee:

F. C. Baisley, The Dunlop Rubber Co., Limited, Birmingham; P. A. Birley, Chas. Macintosh & Co., Limited, Manchester; J. H. C. Brooking, St. Helens Cable & Rubber Co., Limited, Warrington; A. Cairns, A. Cairns & Co., Glasgow; H. C. Coles, Wm. Warne & Co., Limited, Tottenham, London; R. Eccles, F. R. Red-laway & Co., Limited, Manchester; Col. J. Gardiner, The Rubber Co. of Scotland, Limited, Stirling; J. T. Goudie, Leyland & Birmingham Rubber Co., Limited, Leyland; E. Healey, W. A. Bates, Limited, Leicester; A. D. Ingram, J. G. Ingram & Son, Limited, Hackney Wick, London; Alexander Johnston, The North British Rubber Co., Limited, Edinburgh; Sir G. C. Mandelberg, J. Mandelberg Co., Limited, Manchester; David Moseley, David Moseley & Sons, Limited, Manchester; C. R. Inart-

ley, George Spencer Moulton & Co., Limited, Bradford-on-Avon; T. C. Redfern, Redfern's Rubber Works, Limited, Hyde; Stuart A. Russell, The Silvertown Company, London; G. Spencer, Monarch Waterproof Co., Limited, Manchester; H. Standing, I. Frankenburg & Sons, Limited, Manchester; James Tinto, The Irwell & Eastern Rubber Co., Limited, Manchester; F. Webster, The Avon Rubber Co., Limited, Melksham; W. Wotherpoon, James Wotherpoon & Sons, Glasgow.

The secretary of the Association is W. G. Wilson, 16 Deansgate, Manchester.

DUNLOP RUBBER CO., LIMITED.

This concern continues to show increased strength and prosperity with a profit of £959,503 for 1917-18, against £435,100 for the preceding year, the ordinary dividend being raised from 15 to 23½ per cent. What, with rubber plantations and cotton mills and the incidents of the excess profits duty, the accounts are not particularly easy to follow or to compare with former years, so only a few lines of reference will be made here. The rubber estates are valued at £977,100, the planted area being 34,000 acres. The profits from this source and also from the cotton mills in Lancashire, of course, go some way to explain the net profits of the company, having almost doubled in a year of war trading.

XYLOS RUBBER CO., LIMITED.

An acceptable New Year's gift was received by the customers of this company in the form of a leather pocket wallet and detachable-leaf notebook combined. Some useful tables relating to specific gravities of compounding materials, properties of steam, etc., find inclusion, as well as a brief account of the company and its activities. From the information given it appears that the company was formed in 1913 for the purpose of reclaiming vulcanized rubber by a patented process, and judging by the clientele it has obtained in four years' business, its progress has been by no means slow. The management is in the hands of an experienced directorate, of which Marshall Stevens, M. P., is chairman, and Edwin L. Curbishley managing director. The works are situated in Trafford Park, the flourishing industrial suburb of Manchester, Mr. Stevens being the chairman of the Trafford Park Estates Co., Limited. The Xylos company claims that its special process gives marked advantages in the production of reclaimed rubber in black, white, and red colors for use in various branches of rubber manufacture. The process yields a soluble material which can be used with or without the addition of crude rubber-filling ingredients, etc., and which require only a percentage of sulphur to vulcanize into commercial articles of soft vulcanized rubber. Great attention is paid to elimination of all traces of metal and to keeping up uniform standards of value, matters of the first importance in a business whose products go not only to home consumers, but also to our overseas dominions and foreign countries.

SOCIETY OF CHEMICAL INDUSTRY REPORTS.

A bound volume is now issued annually by the Society showing the recent progress made in official chemistry in various branches of industry. As was the case in the volume for 1916, the chapter on rubber in the volume for 1917, which is now before me, is written by H. P. Stevens. Those in the manufacture who have had time to keep in touch with current literature in the trade journals and scientific publications will not find anything novel in Dr. Stevens' summary, though they cannot fail to find it very convenient as a reminder and a reference. Dr. Stevens, of course, is well known as an able experimenter and as a leading authority on plantation rubber, and it is this ground which is covered by his compilation. It seems somewhat doubtful whether chemistry, which has not got beyond the laboratory and

the scientific journal, is really entitled to be called applied chemistry. Perhaps, however, it may be argued that it is entitled to be called applied even in the embryonic stage while awaiting the stage at which the applicator comes forward with confidence. With regard to vulcanization, it is remarked that from various published papers it appears that there is no standard state of cure in manufacturing practice. When adjusting the condition of vulcanization time, heat, percentage of sulphur, accelerators, etc., the manufacturer has in mind the ultimate purpose for which the goods are required. There is, therefore, in practice no one optimum cure, but rather an optimum cure for each individual article. This expression of opinion will, I feel sure, be generally endorsed in the trade. It is stated that as regards vulcanization with niter-aromatic derivatives and organic peroxides it would appear that so far the results obtained are not comparable with a fully vulcanized rubber manufactured with sulphur as the vulcanizing agent. I do not suppose that this statement will cause much perturbation in the trade, as all work of importance lately has been done to strict government specifications which enjoin the use of sulphur. Items of progress which might find mention are the greatly extended use, both in America and Great Britain, of carbon black in the manufacture of solid goods and the fact that such black is now used in a dustless form which greatly facilitates its employment. The replacement of lime by magnesium oxide as a mineral accelerator, the substitution of zinc oxide by lithopone, and the recognition by government departments that there is no gain in buying an expensive rubber if a cheap one will answer the purpose equally as well, are other items of progress that seem to call for mention in a review of 1917.

MACINTOSH CABLE CO., LIMITED.

An amalgamation has been effected between William Rickard, Limited, electric cable manufacturer of Derby, and Macintosh Cable Co., Limited, of Rice Lane, Walton, Liverpool. The title of the new firm is the Macintosh Cable Co., Limited, with registered offices at Ashbourne Road Mills, Derby. Rubber and bitumen cables will be made at Derby, and paper-insulated, low-tension and extra high-tension cables at the Liverpool works. There is nothing very startling about this combination, as Chas. Macintosh & Co., Limited, had a business arrangement with Mr. Rickard for many years prior to taking over the two Liverpool rubber works for specializing in insulation and rubber boots and galoshes.

TRADE NOTES.

The retail shops seem rather anxious to get rid of their stocks in view of lower prices becoming general, though the importance to the purchaser of the reduced prices ticketed on the goods is more apparent than real. Thus, the label on a mackintosh shows the usual price to be 45 shillings; sale price, 30 shillings, or even lower, as the case may be. The usual price, however, is merely the fancy price that the dealer hoped to get out of a long-suffering public and does not represent any genuine business value. Although in the waterproofing line prices are bound to come down, and indeed have come down, these are retarded by the position of cloth. Cotton cloth is certainly down in view of the expected increased supplies of the raw material from America, but there has been no reduction affecting the cotton and wool which are so largely used in the waterproof garment trade; the price of these, in fact has gone up.

The further rise of 10 per cent in the price of pneumatic tires on top of the 10 per cent of last year is presumably due largely to the fabric, though it has been received with a good deal of grumbling among motorists.

A branch of the industry which has suffered eclipse during the war is that dealing with sports' requisites. Now that our national games are getting into full swing again, and the rubber works are no longer barred from putting labor onto non-essentials, this branch is becoming active again.

Somewhat late in the season galoshes, which have been very

scarce, are now appearing in the retailers' windows again. Under existing conditions our home producers have a more extended opportunity of doing business than they have had in the past and no doubt the six firms in the Rubber Shoe Manufacturers' Association will take full advantage of the situation. The chairman of this association is Alexander Johnston, of the North British Rubber Co., Limited, and in the course of a letter to the press correcting some misstatements which had gained publicity, he said that one firm alone in Britain was able to turn out 30,000 pairs of rubber shoes, boots, etc., per day. Presumably this is his own firm. The figure seems a huge one, though I believe it is exceeded by more than one American firm.

RUBBER GOODS IMPORTED INTO SOUTH AFRICA.

International competition for the South African market for all kinds of imported products has undergone remarkable changes since the middle of 1914. The following table shows how these changes affect the importation of manufactured rubber goods:

Country	1913	1917.
United Kingdom	£29,151	£31,700
United States	2,769	151,843
Germany	2,648
France	37,379
Italy	57,882
Totals, all countries	£34,533	£368,804

1 £1 equals \$4.8665 United States currency.

STRAITS SETTLEMENTS IMPORTS AND EXPORTS.

Reports of trade conditions in the Straits Settlements for the year 1917 show that, in spite of the war and the resulting limitations, the trade of the colony has increased yearly. This is attributed chiefly to the rubber industry which is the principal one in British Malaya, Singapore being today the world's greatest crude-rubber market. Other causes for good business are the favorable transportation facilities by the Pacific route and the demand in the United States and other countries for British Malayan products, in which rubber leads.

It is predicted that the Straits Settlements will offer, after the war, an excellent market for industrial machinery, building materials, motor cars, trucks, and accessories, cotton goods, telephone and telegraph materials, boots and shoes, etc. Factors of importance in both the retention and expansion of this trade are good organization, personal representation in the field, and individual and continuous effort.

GERMAN SUBSTITUTES FOR RUBBER TIRES.

BEFORE the war English, French and Americans were the inventors of and experimenters with spring wheels. When rubber became scarce in Germany, however, Teutonic imitative genius attempted to work out substitutes for both solid and pneumatic tires. Many types were produced, but of them all none were anywhere near the equal of the rubber tire. A European correspondent of The B. F. Goodrich Co., who has studied German spring wheels on the Western front, groups them as follows:

GERMAN DOUBLE RIM COMPENSATING SPRING SUSPENSION WHEEL.

GERMAN DOUBLE RIM SPIRAL SPRING SUSPENSION WHEEL.

Group 1: (a) The spring wheel uses spiral springs wound from square steel and mounted radially in one or two rows between cups secured to the inner and outer wheels. There is a risk of the springs being displaced when running over obstacles or round corners, particularly, at more than moderate speed. (b) The Moll wheel is of similar construction, except that side plates are used to protect the springs from dirt, and telescopic tubes are used inside the springs to prevent lateral displacement. These tubes are extended as spherical end caps, which give the requisite degree of transverse flexibility. (c) The Fruth wheel uses a series of oval springs placed on their sides in troughs attached to the outer and inner rims. Bolts through the troughs pass through the overlapping loops of consecutive springs. The wheel is rather less flexible radially, since the springs are compressed in the plane of their winding instead of axially. One of the troughs

slides in the other, and so takes up transverse forces. The construction provides circumferential flexibility against accelerating and braking forces. The whole can be mounted as a unit in place of a rubber tire. (d) The Sievert wheel retains rubber or similar material for elasticity

GERMAN SPRING SUSPENSION WHEEL.

and uses a wood road rim. A rubber ring is held on each side of the fellos by through-bolts, which also secure steel side rings carrying the outer wood rim clear of the inner wheel. All wear comes on the wood rim, and the only connection between this and the inner wheel is through the rubber side rings. These are rather flexible and liable to side-slip. Group 2: (a) The Siemens and Halske wheel uses radially mounted spiral springs (imperfectly protected against dirt and transverse forces) and a

flexible outer rim. The outer rim is built up from spring steel wound to form a hoop. (b) The Flohr wheel is similar save that the outer rim has steel links (resembling link belting), the pins of which serve also to carry cups for the radial springs. The rim pins are exposed to dirt and moisture.

The section of a steel spring tire, shown herewith, was used on a German vehicle belonging to the personal messenger and bodyguard of Prince Eitel Friederich of Bavaria, and was sent to The B. F. Goodrich Rubber Co. by one of its former truck-tire salesmen, Captain August Barth, who is serving in France with the 303rd repair unit of the Motor Transport Corps of the Army.

SECTION OF GERMAN SPRING TIRE USED IN THE WAR.

In this tire spiral springs were mounted radially on the rim of the wheel and the tread comprised three plies of springs steel to which was bolted a heavy strip of leather. The tire was fairly satisfactory when the roads were good and the rate of speed moderate, but was practically useless when excessive speeds were called for, because the radially mounted spiral springs became easily misplaced when turning corners or when obstacles were encountered.

BARCELONA FIRM INCORPORATES.

On the first of October, 1918, the well-known firm of Tusell Brothers, rubber manufacturers, Barcelona, Spain, was dissolved and a new company incorporated, which will henceforth conduct its business as: *Fabricas Reunidas de Caucho y Apósitos Sociedad Anonima*. The new concern will continue to make mechanical rubber goods, hard rubber goods, druggists' and surgical sundries and sporting goods. The products of this company are sold under the trade marks: "La Hermana" and "Caracol." The officers of the company are: *Matias Tusell*, president; *M. Alántara Gusart*, treasurer; *Juan Inglés*, secretary; *Jairer Tusell*, manager.

FOR BETTER AFRICAN RUBBER.

The Colonial Institute of Marseilles has just sent G. Van Pelt, Chief of its Rubber Service, on a mission to West Africa, with the object of establishing at the place of production a program of research to be carried out in connection with technical experiments which the Institute will make to determine the best methods for preparing African rubber.

Mr. Van Pelt will investigate particularly the cleaning of the raw rubber in order to determine whether this should be undertaken at the places of production or in the ports of shipping, or whether it is necessary to rely on the central installations established in France at the ports of entry. Mr. Van Pelt has carried with him the machinery necessary for these experiments and before his departure he completed a series of preliminary studies at the laboratories of the Institute, covering the principal objects of his investigations. The expense of this mission is borne by the *Compagnie Française de l'Afrique Occidentale* and the *Compagnie Commerciale de l'Ouest Africain*.

A PORT FOR SUMATRA'S EAST COAST.

Work will be started early this year at Belemar, on the East Coast of Sumatra, near Medan, to construct a harbor for ocean steamers drawing 30 feet, to be completed within three years, at a cost of \$4,000,000. It is estimated that shipments from this port will amount to about 125,000 tons a year, some 35,000 tons of which are expected to be rubber.

Recent Patents Relating to Rubber.

THE UNITED STATES.

JANUARY 14, 1919.

- N**O. 1,290,873. Detachable rim for tires. F. W. Baker and J. S. Foley, Stonbridge, Eng.
- 1,290,880. Demountable rim for tires. H. Bretscher, New York City, assignor of one-half to Felix Spitzner.
- 1,290,900. Combined rubber and steel craser for lead pencils. F. K. Butler, Seattle, Wash.
- 1,290,927. Life-preserver. W. H. de Fontaine, Sr. and Jr., New York City.
- 1,290,979. Balloon, with inner vacuum chamber and controllable means for inflating inner chamber for purpose of descent, etc. P. T. Griffith, New York City.
- 1,291,156. Resilient tire. W. J. Robinson, Denver, Colo.
- 1,291,187. Tire-pressure gage. M. C. Schweitzer, West Hoboken, N. J.
- 1,291,345. Internal tire armor. J. B. Zimdars, San Francisco, Calif. (Original application divided.)
- 1,291,346. Inner tube for pneumatic tires. J. B. Zimdars, San Francisco, Calif. (Original application divided.)
- 1,291,357. Demountable tire rim. J. H. Jones, Covington, Ky.
- 1,291,554. Carbonator with perforated rubber disk for admitting minute streams of gas into receptacle for liquid. A. L. Koenig, assignor to The Koenig Carbonators, Inc.—both of Chicago, Ill.
- 1,291,639. Arch support for shoes. T. Coffey, West Tulsa, Okla.
- 1,291,648. Life-saving garment. E. M. Lowy, assignor to Lowy Life Saving Suit Co.—both of New York City.
- 1,291,649. Life-saving garment. E. M. Lowy, assignor to Lowy Life Saving Suit Co.—both of New York City.
- 1,291,650. Life-saving garment. E. M. Lowy, assignor to Lowy Life Saving Suit Co.—both of New York City.
- 1,291,676. Pneumatic tire structure, combining a pneumatic tire with a slip joining a side cover for wheel. I. K. Gammetter, Akron, O., assignor to The B. F. Goodrich Co., New York City.
- JANUARY 21, 1919.**
- 1,291,727. Resilient wheel. B. Baylis, St. Louis, Mo.
- 1,291,739. Name plate for rubbers. A. C. Booth, Burlington, Vt.
- 1,291,835. Fountain-jan blotter. J. Goldstein, West Hazleton, Pa.
- 1,291,896. Demountable rim for tires. J. J. and C. C. Hruby, St. Joseph, Mo.
- 1,291,930. Demountable rim for pneumatic tires. M. B. Korman, Washington, D. C.
- 1,291,948. Inner tubular support for pneumatic tires, molded from plastic, unvulcanized rubber. J. T. Lister, near Wellington, O.
- 1,291,972. Soft rubber sleeve for attaching to pencils and penholders. M. J. McGowan, Ashland, Wis.
- 1,291,991. Toy balloon. H. Marzi, New York City.
- 1,292,042. Waterproof garment-supporter. I. Phillips, Brookline, Mass.
- 1,292,115. Respirator. W. Soderling, New York City.
- 1,292,120. Concave rolled suction-cup heel. E. D. Stalford, Baltimore, Md.
- 1,292,139. Demountable rim for tires. G. L. Summers, Huntington, W. Va.
- 1,292,161. Resilient tire. J. R. Valdes, Key West, Fla.
- 1,292,299. Cushioned wheel. F. A. Frommann, Chicago, Ill.
- 1,292,300. Cushion tire. F. A. Frommann, Chicago, Ill.
- 1,292,345. Cushion tire. W. C. Martin, assignor by direct and mesne assignments to Morand Bros-Marion Cushman Wheel Co.—both of Chicago, Ill.
- 1,292,357. Resilient wheel. V. H. Naline, Brussels, Belgium.
- 1,292,360. Rubber heel. F. A. Nolen, St. Paul, Minn.
- 1,292,405. Pneumatic tire. L. Loeb, New York City.

JANUARY 28, 1919.

- 1,292,564. Wheel with demountable and permanent rims for tires. G. A. Mitchell, assignor of one-half to H. A. Gilbert—both of Aberdeen, Md.
- 1,292,519. Punctureproof tread-block for pneumatic tires. A. Rosenberg and A. H. Rosenthal, Brooklyn, N. Y.
- 1,292,524. Device for connecting hose to faucets of varying size. L. W. Serrell, Plainfield, N. J.
- 1,292,564. Fastener for cushion tires on elincher rims. T. Barnes, assignor to Barnes Cushion Tire Co.—both of Denver, Colo.
- 1,292,587. Life-preserver with inflatable portions. D. Del Re, Iron River, Mich.
- 1,292,596. Stay-fastener for balloons. J. R. Gammetter, Akron, O., and J. B. Goodrich, New York City.
- 1,292,601. Combination wheel and demountable rim. L. B. Harvey, assignor to Interlocking Auto Rim Co.—both of Stockton, Calif.
- 1,292,690. Hot-water and ice-bag closure. J. J. Doves, Jr., Pensacola, Fla.
- 1,292,736. Fountain pen. A. G. Elser, assignor to C. F. Barrett—both of Chicago, Ill.
- 1,292,826. Reinforced tread for automobile tires. J. F. Loughran, Chelalis, Wash.
- 1,292,945. Collapsible demountable rim for tires. E. H. Wulfi, Toledo, O.
- 1,292,961. Tire casing. L. A. Page, Providence, R. I.

ISSUED FEBRUARY 4, 1919.

- 1,292,993. Rubber apparel with vamp cut on the straight and its upper portion folded over on itself. J. J. Bateman, assignor to Battenman Rubber Co.—both of Boston, Mass.
- 1,293,015. Demountable rim for vehicle wheels. B. E. Braucht, Cartwright, N. D.
- 1,293,089. Shoulder and body brace. W. D. Hardy, New York City.
- 1,293,158. C. W. Miesel, Jersey City, N. J.
- 1,293,221. Veil with elastic cord in edge. I. Silverberg, Far Rockaway, N. Y., assignor to Silverberg Import Co., Inc., New York City.
- 1,293,283. Demountable rim for vehicle wheels. C. C. Wolf, assignor of one-half to A. A. Bourneham, both of Morrison, Wis.
- 1,293,337. Rubber-soled canvas shoe. M. H. Clark, Hastings-on-Hudson, N. Y., assignor to The Goodyear's Metallic Rubber Shoe Co., Naugatuck, Conn.
- 1,293,427. Corset with elastic inserts. J. E. Heilner, New York City.
- 1,293,473. Resilient tire. J. H. Krall, Portland, Ore.
- 1,293,498. Pneumatic tire. P. Marino, Brooklyn, N. Y., assignor of one-third to C. Marino, Brooklyn, N. Y., and one-third to D. Marino, West Hoboken, N. J.
- 1,293,528. Pneumatic tire in combination with means for making it wider than deep, restricting radial distortion, etc. J. F. Palmer, Riverside, Ill.
- 1,293,558. Cushion wheel. M. S. Schwartz, Brooklyn, N. Y.
- 1,293,645. Waterproof hat-covering. L. Henschel, New York City.

THE DOMINION OF CANADA.

ISSUED JANUARY 7, 1919.

- 188,138. Sound deadener composed of composite sheet material comprising a metallic sheet and alternate sheets of asbestos and rubber composition, contacted by pressure and vulcanized. The Canadian Consolidated Rubber Co., Limited, Montreal, Que., assignor of N. D. Crawford, Elizabeth, N. J., U. S. A.
- 188,149. Collapsible bucket. The Du Pont Fabrikoid Co., Wilmington, assignor of G. F. Lord, Holly Oak—both in Del., U. S. A.

ISSUED JANUARY 14, 1919.

- 188,233. Pneumatic tire and wheel. W. J. Vincent, Cardiff, Wales.

ISSUED JANUARY 21, 1919.

- 188,310. Resilient tire. W. A. Anglemeyer, Indianapolis, Ind., U. S. A.
- 188,353. Gasket for air-cup couplings. J. W. Stinson, Vancouver, B. C.

ISSUED JANUARY 28, 1919.

- 188,461. Tire casing. W. Kline, Lake, and J. P. Frisby, Akron, assignor of 1/2 interest—both in Ohio, U. S. A.
- 188,463. Punctureproof filler. H. G. Garman, assignor of F. Riesenbergh—both of New York City, U. S. A.

ISSUED FEBRUARY 11, 1919.

- 188,668. Golf ball. E. Miller, London, England.
- 188,697. Bath mat. L. D. Tolley, Algiers, La., U. S. A.
- 188,700. Trousers support. W. Baake, West Hoboken, N. J., U. S. A.
- 188,702. Device for removing bulbs from electric lamps. H. D. Grinnell, Pittsfield, Mass., U. S. A.

ISSUED FEBRUARY 25, 1919.

- 188,883. Pressure gage. A. Schrader's Son, Inc., New York City, assignor of W. A. Allen, Yonkers—both in N. Y., U. S. A.

ISSUED MARCH 4, 1919.

- 188,905. Demountable rim for tires. E. G. Budd, Philadelphia, Pa.
- 188,969. Stopper for hot-water bottle. H. P. Kraft, Ridgewood, N. J.

THE UNITED KINGDOM.

ISSUED FEBRUARY 5, 1919.

- 121,244. Detachable wearing surface for the soles of rubber and rubber-soled footwear. J. H. Gill and J. D. Rea, High street, Dunedin, New Zealand.
- 121,411. Pneumatic tires with leaded edges comprising hard-rubber cores having wire embedded therein. G. H. Thomas, 27 Buckingham Gate, and E. J. Edgar, 16 Teignmouth Road, Brompton, London.
- 121,443. Kneeling pad with inflatable cushion. E. M. Hamilton, 10 Chester Crescent, Newcastle-on-Tyne.

ISSUED FEBRUARY 12, 1919.

- 9,956. Valves for respirators. R. Donald, 39 Parliament Hill Mansions, Highgate Road, London. (Not yet accepted.)
- 121,495. Electrically heated clothing for aviators, etc. A. A. Lemercier, 147 avenue de Chilly, Paris.
- 121,538. Rubber-covered spring tire. E. D. Drury, 24 Norfolk Row, Springfield.

ISSUED FEBRUARY 19, 1919.

- 121,634. Waterproof soles for boots, etc. S. Frizzoni, 24 Via Mancini, Rome.
- 121,657. Garment for airmen. R. H. Davis, 187 Westminster Bridge Road, Westminster.
- 121,703. Rubber horseshoes. F. Kuski, 410 West 56th street, New York City, U. S. A.
- 121,706. Soles with staggered recesses, for boots, etc. A. G. Knight, 9 Mount Noad Road, Streatham Hill, London.

ISSUED FEBRUARY 26, 1919.

- 121,770. Demountable rim for tires. W. Ormsby, 366 High street, Smethwick, Staffordshire.
- 121,829. Mattress with aperture to receive hot-water bottle. J. Hill, 14 Townsend street, London.
- 121,838. Rubber cement for armies and others, to serve as wax mask. R. G. Jakar, 6 Kirkdale Road, Leytonstone, London.
- 121,841. Rubber mats for crutches, etc. M. Lynde, 23 Amherst Road, Winton, Manchester.
- 121,843. Horseshoe with rubber pad. R. Tattersall, Hey Houses, and J. Lawrence, Montauban, Clifton Drive—both of St. Anne's-on-the-Sea, Lancashire.
- 121,845. Watch wristlet composed of rubber band, etc. C. J. Keep, 33 Lanark Villas, Maiden Vale, London.

SWITZERLAND.
NOVEMBER 16, 1918.

- 80,157. Tire support for automobile wheels. Edward Downing, 637 Turk street, San Francisco, Calif., U. S. A. (E. Imer-Schneider, Geneva.) Priorities U. S. A., February 21 and December 1, 1916, and January 2, 1917.
- 80,221. Arch support for shoes. Erich Schenk, 466 Washington street, Newark, N. J. (Fritz Isler, Zurich.) Priority U. S. A., October 16, 1917.

INDIA.

(PATENTS ISSUED, WITH DATES OF APPLICATION.)

- 3,711. (June 11, 1918.) Improvements in resilient wheels for motor cars and other vehicles. A. A. Crozier.
- 3,758. (July 12, 1918.) Improvements in rubber heels. C. V. Chamberlain.
- 3,807. (July 29, 1918.) Improvements in rubber tires. E. B. Killen.
- 3,899. (September 23, 1918.) Rubber seed-removing knife. V. Marston.

NEW ZEALAND.

ISSUED DECEMBER 31, 1918.

- 40,634. Child's comforter. H. S. Briggs, 92 Toorak Road, South Yarra, Victoria, Australia.

THE FRENCH REPUBLIC.

PATENTS ISSUED (WITH DATES OF APPLICATION.)

- 487,984. (December 14, 1917.) Dust caps for valves of pneumatic tires. A. Schrader's Son, Inc., Brooklyn, N. Y., U. S. A.
- 487,964. (December 12, 1917.) Device for the treatment of invalids by air. J. Clares.
- 488,120. (December 22, 1917.) Pneumatic camp bed. L. Avorio.
- 488,371. (January 3, 1918.) Apparatus for chloroform anesthesia. G. E. Brochet, 4 rue de la Grande-Chaumière, Paris.
- 488,448. (October 5, 1915.) Improvements in dirigibles. W. M. Webber.
- 488,557. (May 22, 1916.) Metallic and resilient wheel. A. E. Jourrier, 90 rue St. Alexandre, Bédarieux (Hérault), Paris.
- 488,923. (February 15, 1918.) Improvements in vehicle wheels. A. W. Benjamin.
- 488,945. (February 16, 1918.) Improved resilient wheel. J. Stuart.
- 488,974. (April 20, 1917.) Soles and parts of leather and rubber for shoes. Société Française du cuir Armé.
- 489,043. (February 26, 1918.) Improvement in vehicle wheels. W. Brown.

Review of the Crude Rubber Market.

NEW YORK.

THE active dealers' demand, in evidence the last of February, for near-by plantation rubber to cover short sales gave strength to the market for an advance. On the first of March first latex spot was quoted at 55½-56 and upriver fine Pará at 58½ with very little demand. During the entire month buyers have displayed little or no interest in the market which sank into a state of practical stagnation with slowly falling quotations reaching 51 for first latex and 55½ for upriver fine.

The outlook is still favorable to buyers whose needs, however, are not urgent because of the prevailing industrial uncertainties.

The course of the market quotations on plantations and Pará during the month were as follows:

PLANTATIONS.—March 4, spot latex crêpe, 55 cents; March arrivals, 54 cents; May to June arrivals, 50½ cents; July to December arrivals, 50 cents. On March 20 the prices were: spot, 52 cents; March arrivals, 51½ cents; May arrivals, 51 cents; June arrivals, 50½ cents.

March 4, spot ribs, 54 cents; spot, c. i. f. Pacific Coast, 50½ cents; April arrivals, 52 cents; May-July arrivals, 50½ cents. March 20, 51 cents; April arrivals, 50½ cents; May arrivals, 50 cents; June arrivals, 49½ cents.

March 4, No. 1 amber gristly crêpe was quoted at 51½ cents for near-by and 47 cents for July to December arrivals. March 20, April to June arrivals were quoted at 47½ cents, and July to December arrivals at 46 cents.

March 4, No. 1 roll brown crêpe, spot, sold for 36½ cents; July to December arrivals, at 32 cents. On March 20 these prices had declined to 35½ cents and 31 cents, respectively.

PARÁS.—March 4, upriver fine, spot, was 58 cents; islands fine March-April, 47½ cents; upriver coarse, spot 34½ cents; cameté, coarse, March-May, 22 cents.

March 20, upriver fine, spot, was 56 cents; upriver coarse, spot, 34½ cents, and April-June, 34 cents.

NEW YORK QUOTATIONS.

**Numeral.

RECLAIMED RUBBER.

The anticipated demand for reclaimed rubber mentioned last month has begun to materialize under the stimulation of a distinct easing up in prices on all grades of reclaimed except red, which remains fixed. The market, however, is not active and the reclaiming mills are still operating on part time. The sentiment of the reclaimers grows more hopeful with the approach of peace and resumption of general industrial activity.

(Compiled by the Bureau of Foreign and Domestic Commerce, Department of Commerce, Washington, D. C.)

THE MARKET FOR COTTON AND OTHER FABRICS.

NEW YORK.

AMERICAN cotton has been in steady demand, both here and abroad. Middling uplands spot cotton advanced from 26.10 cents on March 1, to 28.70 cents March 17, when the market declined, and 27.40 cents was quoted on March 26. The unsettled European situation and heavy liquidations were the causes of the decline.

The Government reports 12,022,601 equivalent 500-pound bales of ginned cotton for 1918, compared with 11,302,375 bales for 1917, and 11,449,930 bales for 1916. Included in the 1918 figures were 35,511 bales of American Egyptian cotton and 51,389 bales of Sea Island, compared with 92,501 bales last year.

EGYPTIAN COTTON.—The market has not yet returned to a normal condition; few sales were reported, and quotations are therefore largely nominal. A large consignment of Egyptian was due to arrive late last month.

SEA ISLAND COTTON.—The Southern markets have been fairly active, but holders were not disposed to accept present prices for large quantities.

SHEETINGS, DUCKS, DRILLS AND OSNABURGS.—While the market has not yet recovered from the effects of government regulation, the general situation is constantly improving; all quotations, however, are nominal.

RAINCOAT FABRICS.—There was a decided improvement last month in the cotton piece goods trade, and prices show a slight advance over last month's quotations.

TIRE FABRICS.—Some activity was reported in this market, being particularly noticeable later in the month. From the inquiries received and the orders placed, it would appear that manufacturers are now planning for increased tire production.

NEW YORK QUOTATIONS.

MARCH 26, 1919.

Prices subject to change without notice.

THE MARKET FOR CHEMICAL AND COMPOUNDING INGREDIENTS.

NEW YORK.

THE pig lead producers have made a radical cut in the price of the metal to the level at which a demand was created and lead is now selling on an advancing market. The strength shown in the lead market was reflected in that for spelter early in the month. During most of the last month the market in both lead and zinc has been dull and weak.

In general the market for compounding ingredients has not materially changed.

ANILINE. There has been a fairly active and steady demand, with prices declining from 24 to 23 cents per pound.

DRY COLORS. The demand has been very moderate. A marked tendency has been noted to make price reductions.

BARYTES. Toward the last of the month a better tone has prevailed, with some strengthening of price.

BENZOL. The demand has been light and prices have fallen off to 18 cents per gallon.

CARBON TETRACHLORIDE. Although the market has been dull and weak there has been no decline in price.

LITHOPONE. The cut in price early last month stimulated a demand which has held up fairly well. The bottom figure seems to have been 7 cents per pound in carload lots.

LITHARGE. The market has remained quiet, the price averaging 10 cents per pound.

SUBLIMED LEAD. The market has been inactive at 8 1/4 to 8 1/2 cents per pound.

WHITING. The market has been featureless, with moderate, steady demand.

ZINC OXIDE. The market has shown an improved and steady demand. Prices are about to be announced for the coming quarter. A new process zinc oxide is now being offered to the trade.

NEW YORK QUOTATIONS.

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

DURING the past month there has been no activity in the market for scrap rubber. The stagnant condition for both scrap and reclaimed rubber is attributed to the low level of crude rubber and also to the lack of demand for mechanical goods by such large consumers as the railroads. The latter factor is regarded as soon to be eliminated in considerable degree when consuming demand revives under the process of readjustment.

The reclaimers at present are operating their plants at less than half capacity and naturally are unresponsive to all scrap offers, particularly in view of the fact that the spring collections are expected to be larger than usual and still further depress prices.

Scrap dealers are facing a perplexing situation with no immediate relief in the way of improved conditions. Their available propositions are described as of the "starvation" variety.

BOOTS AND SHOES. Very little has been done. March average prices have averaged 75¢ cents.

INNER TUBES. Practically no demand. Prices nominal.

MECHANICALS. No improvement can be noted and prices tend downward.

TIRES. The demand is insignificant even at reduced prices.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.***The Victory Loan.***

NOT a ragged finish, nor even a grandstand finish, but a strong, clean finish, is both duty and privilege. On the part of the rubber industry we confidently predict it.

THE NEW HIGH-PRICE LEVEL.

THE HALT in production, the slowing of industry, the unemployment of labor, complaints of which are to be heard from many quarters, in the belief of experts are due to but one thing, the general opinion that prices must drop. No less an authority than Irving Fisher, professor of political economy of Yale University, points out that we are threatened with a widespread business depression, notwithstanding the unsound conditions usually preceding such depression are absent.

People cannot forget the prices existing "before the war," holding to the opinion that these are "normal." This attitude is putting the brakes upon business everywhere. But those who are waiting for prices to come down are not putting their own prices down. Neither is anybody else. Professor Fisher declares:

"Business men should face the facts. To talk reverently of 1913-14 prices is to speak in a dead language

to-day. The buyers of the country, since the armistice, have made an unexampled attack upon prices through their waiting attitude, and yet price recessions have been insignificant. The reason is that we are on a new high-price level, which will be found a stubborn reality. Business men are going to find out that the clever man is not the man who waits, but the one who finds out the new price facts and acts accordingly."

TRADE AND INTERNATIONALIZATION.

THE PLAN which is being worked out at the peace conference for the disposition and future government of the German colonies possesses great possibilities for the business world in general and the United States in particular. Under the system of mandatory government sponsored by President Wilson and now looked upon with favor by most of the governments of the entente, it is apparent that there will be an equal opportunity for trade for all nations, whereas, had the colonies been apportioned among the several powers, it is quite probable that there would have been a tendency for the government most interested to hold the trade of its own particular colony for itself exclusive of the claims of others.

Under the mandatory plan each territory, while nominally responsible to a certain one of the powers to be designated when the most equitable method is agreed upon, will be given a freedom which is almost equivalent to self-government. The former German colony once emancipated from the stifling influences of Kultur, is quite likely to establish trade channels of its own, and will be under no obligation to confine its commerce to its sponsor government. As long as Germany had its clutches on Kiao-chau, a valuable territory in China practically the size of Illinois, the chances for any except a German business house to transact any business there were small indeed. And the opportunity for fair competition in trade would not have been much better, had the colony Kiao-chau been awarded to Japan. Enterprising American firms should have no difficulty in securing their share of the trade of the former German colonies, if the plans of the far-seeing American President are carried through.

Furthermore, suppose in the general apportionment of the colonies Germany were given an opportunity to exercise mandatory power over one or more of them, as a result of the display of a proper spirit of cooperation, and an abandonment of her old ruthless, monopolistic spirit toward those she considered her subjects. If she were then able to keep up her commercial gait under a free and open competition with other nations, it might instill in the minds of her business men principles of respect for others which they have never had before. And should Germany find herself outdistanced in the scramble for trade, it might justly be taken as an indication that the business acumen with which she was formerly credited was somewhat exaggerated.

GETTING CLOSER TO BRAZIL.

IF American business men do not grasp the opportunities that are now offered them for improving trade relations with the South American republics it will be their own fault. The Brazilian Association of Commerce has set the example for similar organizations in other Latin states by the adoption of an agreement which should minimize the disputes over merchandise which have long been a source of ill feeling between South American firms and the United States exporters. The plan is for permanent arbitration committees appointed jointly by the Brazilian and American commercial organizations. It includes a standard form of contract, and any disagreement arising between the parties is to be settled impartially, inexpensively and expeditiously without recourse to the courts. The misunderstandings which have heretofore arisen over goods which do not match samples and shipments under weight should be absolutely eliminated. It is evident that the good feeling engendered by Brazil's prompt support of the United States in its declaration of war against Germany is already beginning to bear fruit.

ABANDON TIRE MILEAGE GUARANTIES.

BRITISH rubber tire manufacturers have practically decided to abandon guaranteeing minimum mileage for solid rubber tires, which dates back to the infancy of the commercial vehicle. They present sound reasons for so doing and point out that the perpetuation of the mileage guaranties is marked by certain disadvantages. It is declared that the mileage guaranty induces the user to expect that amount of mileage and no more, and encourages carelessness on the part of the driver who regards the responsibility of the tire as solely that of the maker. The members of the British Rubber Tire Manufacturers' Association have therefore decided to abolish the standard mileage guaranty completely and will be content to allow their products to be judged by the service given in the future. They hereby pledge themselves to see that their tires give the biggest mileage, the best service and the fullest satisfaction to their customers. They further state that users can be assured of prompt and generous treatment whenever unsatisfactory results are shown.

HEAVY TAXES AND NEW ENTERPRISES.

GOVERNMENT officials are now especially active in urging capital to take prompt advantage of trade opportunities which the war has left open on every side. Secretary of Labor Wilson especially is at the forefront insisting that the wheels of industry turn and that the spirit of unrest be quelled by providing employment for the wage-earning population. Excellent advice, but the outlook is that if the business succeeds, taxes may claim 50 to 80 per cent of the profits. That taxes must be heavy is acknowledged, but should they be too heavy? The

incoming Congress will have a most important duty before it in determining whether it will not be better to provide more moderate levies spread over a longer period, which would probably yield better returns and not act as a brake on legitimate enterprise. Established business will continue despite the handicap of heavy taxes, but the fear of such taxes will inevitably be a bar to new developments.

THE ENGLISH VIEWPOINT.

BRITISH dealers in rubber goods look for the import restrictions on rubber goods to be continued for a further period, and the quantity to be imported fixed at 15 per cent of the imports during the year 1916, which is the year when imports attained their maximum. This restriction, it is believed, will apply particularly to tires and general rubber goods, but there may be slight modification as regards rubber boots and shoes.

The situation was brought about during the war by the government requiring the rubber manufacturers to turn over most of their machinery for war purposes as well as a large proportion of the stocks held at their works and at warehouses, and the calling in of stocks held by motor agents. This gave American manufacturers, who for years had been struggling for a foothold in England, an opportunity for the sale of their goods, which they could not have attained in any other circumstances, the English manufacturers believe.

Imports of rubber boots and shoes, tires, waterproofed apparel and belting rose to unprecedented figures, which caused great misgivings to our cousins across the water. The situation was modified when the United States entered the war, and an agreement was entered into cutting down imports to 15 per cent of the figures for 1916. It is reasonable to suppose, however, that a considerable demand has been created for American goods across the water and it may take some time for British manufacturers to recover.

THAT THE SALE OF NON-SKID TIRES IS NOW FAR BEYOND that of plain is due to the realization of the general public that the non-skid type possesses far superior wearing qualities, due to the additional rubber, and to the greater utility of the non-skids as savers of gasoline because of the better traction they afford. Four years ago one company reports it was selling as many plain treads as non-skids, but to-day the latter sell in the proportion of ten to one. The late C. J. Bailey in bringing out the "Bailey Tread," the first all-rubber anti-skid, was both pioneer and prophet in this development.

ALONG THE LINE OF THE EDITORIAL POSITION TAKEN by this paper in its November issue, the United States Chamber of Commerce favors an international convention of commercial organizations. Needless to say, we think the suggestion very timely.

Cotton and Guayule in Lower California.

THE controversy that has raged in the daily press for the last few weeks concerning developments in Lower California is an indication that matters may be coming to a head regarding this vast tract of practically undeveloped territory. It is a country of illimitable possibilities and it may eventuate into considerable importance to the rubber industry. Already large crops of cotton are being harvested annually, and it remains to be seen whether the country is also to be planted with guayule. It is declared that anything that can be raised in Arizona can be raised in the watered part of Lower California, and it is said that plans for trying out guayule on a large scale have already been discussed.

Briefly the question which has stirred California and which that state is trying to get the rest of the country excited over, is whether there is to be a large Japanese colony located on the immense holdings of the California-Mexico Land & Cattle Co., consisting of 800,000 acres, more or less, in the northern part of Lower California. The west line of the property runs almost due south of Calexico, thence east across the head of the gulf to the original bed of the Colorado River which forms the eastern boundary of the tract. The north line is the international boundary. The whole tract comprises the Mexican portion of the Imperial Valley, which valley is practically all under irrigation canals and susceptible to intensive cultivation.

It is admitted that there have been negotiations with a Japanese syndicate to take over the property, which is valued in the millions, some say as high as \$50,000,000, and that these negotiations have been submitted to the State Department to determine whether such a deal would be in violation of the

is above tilling the soil and the source of the anti-Japanese agitation in California can generally be traced to this element.

A few facts concerning the remarkable status of Lower California are interesting. While nominally a part of the Mexican government under Carranza, since the overthrow of Madero the country has been almost an independent principality. It is governed by Esteban Cantu, whose headquarters are at Mexicali, just over the American border. In fact, the other side of the main street of Mexicali is Calexico, the American town, the dividing line being the middle of the street. Calexico is dry, orderly and run according to the laws of California. If you want excitement, step across the street into Mexicali, and you can have all the excitement that saloons, gaming houses, dance halls and other modes of entertainment afford. Needless to say the sporting element makes the most of this situation. It is reported that Mexicali and other Mexican towns along the border are preparing to reap untold harvests from the situation in the United States, and that sites for breweries, distilleries, wineries, etc., are at a premium.

Governor Cantu's policy toward the paternal government in Mexico City is simple. He has an independent army, well paid at the end of each month in gold, armed to the teeth, well equipped, capable and willing of giving the hungry and ill-paid armies of Carranza the fight of their lives if they ever succeed in getting into his domains. President Carranza is said to be much peeved when he thinks of Governor Cantu reigning in affluence in Lower California with money rolling in from imports and taxes. About every so often Carranza feels he should have a share in it, and sends an emissary to confer with the

TYPICAL SCENE ON THE C. & M. RANCH IN LOWER CALIFORNIA.

Monroe Doctrine. The mention of anything connected with Japanese is sufficient to set all California aflame, and politicians who have capitalized this feeling to their political advantage for years are making the most of it. Meanwhile it is admitted that the Japanese, once located there, would undoubtedly make the property bloom like a rose, as they have done the desert lands all over California, wherever they have been permitted to obtain a foothold.

Your true native son of the Golden West, however, would prefer to see the arid lands remain arid and the agitator and soap-box orator orate instead of working, to allowing the industrious Japanese make use of the idle lands. The true I. W. W.

Governor on the subject. The emissary is always treated very politely, given plenty to drink, and in the morning finds himself aboard a train with a return ticket to Mexico City. Cantu is the President, Lord High Executioner, and Board of Education of Lower California, and it is commonly reported his stipend is \$50,000 a year, with a few perquisites on the side. Just now he is engaged in building a highway to Ensenada, the capital of the lower peninsula. It is impossible for Carranza to get an army over into Cantu's realms without going through the United States, which the United States, in the interest of peace and harmony, would not countenance. It is reported, however, that Carranza is now contemplating a railroad into Lower California.

but by the time it gets there it is probable that Governor Cantu will have taken up his residence in some American city, or possibly Europe.

The C. & M. ranch is in reality the delta of the Colorado and is the only land in America that is overflowed and enriched annually like the delta of the Nile. The cultivated, irrigated land is protected by levees, but the uncultivated area is inundated annually and enriched by the silt. This has been going on for centuries, so that wells put down 1,100 feet have not penetrated the strata of productive soil.

The total area of the irrigable district on both sides of the international line is about 1,200,000 acres; on the American side are the Imperial and Coachella valleys, and on the Mexican side

IRRIGATION DITCH AND FLUME ON THE C. & M. RANCH IN LOWER CALIFORNIA.

is the property known as the C. & M. ranch. In 20 years of operation the property has not paid any dividends, all the profits having been put back into improvements. It was originally acquired by the late Harrison Gray Otis of Los Angeles by straight purchase from the Mexican Government, and the title is said to be perfect. The land is now controlled by Harry Chandler of Los Angeles, the son-in-law of General Otis, and the other heirs of the Otis estate and their associates. Mr. Chandler, when the Japanese project was first broached, made the following statement to the State Department at Washington:

"While my company is anxious to secure these reliable tenants, amply financed, to develop our property in Mexico, we are, first of all, American citizens, and do not wish to make any move which could in any way prejudice a question which always appears to be subject for agitation between the two countries. We will not, under the circumstances, consider making any lease of this kind to Japanese, where colonization is probable, until we are first authoritatively informed that such an arrangement will be agreeable to the Government of our own country. We believe that most of the Japanese labor for this enterprise will come from the Pacific Coast States, and thus relieve to some extent the pressure of this class of people now in the United States, and will be an advantage, rather than a disadvantage."

A CHANCE FOR RUBBER TOYS.

At a recent meeting of the toy manufacturers of the United States it was announced that the association had been invited by the Smithsonian Institution, of Washington, D. C., to gather a complete collection of all American toys that were popular during the war, to be placed on permanent exhibition, and a special committee was appointed for that purpose. Rubber toys will, of course, form an important part of the exhibit. Taking advantage of war conditions, the toy industry in the United States has reached a gross retail volume of \$40,000,000 annually and includes about everything that the youthful heart desires. No longer will young Americans be dependent on toys "Made in Germany."

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(705.) An inquiry has been received for names of manufacturers of tissue-paper transfers for marking inner tubes.

(706.) A correspondent desires to obtain African paste, formerly used as a substitute for chicle.

(707.) A manufacturer requests information as to the nature of india rubber pulp, where it can be obtained, and its cost.

(708.) Inquiry is made for a varnish that will give a high gloss to rubber goods.

(709.) A correspondent requests the address of the maker of rubber fishes used in surf bathing.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce or its district or cooperative officers. Request for each should be on a separate sheet, and state number.

(28,866.) A firm in France desires agency for and to purchase waterproofed cloth, rubber materials, etc. Correspondence in French.

(28,868.) A merchant in France desires agency for sale of rubber overshoes. Correspondence in French or Spanish.

(28,886.) A man in France desires agency for sale of rubber goods. Correspondence may be in English.

(28,970.) A firm in Norway desires agency for and to purchase rubber tires.

(28,928.) A man in Italy desires agency for sale of pneumatic tires, rubber articles, asbestos fittings, etc. Correspondence in Italian.

(28,931.) A man in Cuba desires exclusive agency for and to purchase hard-rubber tubes to cover wire of the leaves of green and white porcelain and metal flowers and foliage.

(28,948.) A company in Sweden desires to purchase rubber goods for technical and industrial purposes, gutta percha goods, machine and engine packings, asbestos manufactures, machine beltings, woven hose and fittings, diving apparatus, insulating materials, etc. Quotations should be given f. o. b. Payment 30 days after invoice, or against documents.

(28,985.) A merchant in France desires agency for sale of rubber goods.

(28,991.) A company in Norway desires agencies for sale of rubber, rubber goods, etc.

(28,993.) A man in Sweden desires to purchase cables.

(29,011.) A company in Italy desires agency for and to purchase rubber shoes, heels, and other rubber goods. Correspondence may be in English.

(29,015.) A man in Italy desires agency for sale of rubber heels and fountain pens.

(29,030.) A firm in Greece desires to purchase 40,000 pairs of rubber shoes for men, women, and children. Quotations should be given f. o. b. New York. Samples requested. Payment to be as required.

(29,045.) A man in Norway desires agency for and to purchase waterproofed fabrics and garments, belting, rubber, rubber goods, etc. Terms, cash against documents in Norway.

(29,059.) A firm in Sweden desires to purchase automobile tires, rubber sundries, etc. Quotations should be f. o. b. New York. Terms, cash against documents.

(29,062.) A company in Norway desires agency for and to purchase rubber goods. Payment against documents.

(29,068.) An American firm with established connections in Denmark desires to purchase pneumatic and solid tires and tubes, brake lining, etc.

Echoes of The Great War.

THE VICTORY LIBERTY LOAN AS AN INVESTMENT.

THE VICTORY LIBERTY LOAN campaign began Monday, April 21, and will continue until Saturday, May 10, 1919, inclusive. The terms of the loan, announced by the Treasury Department, are in brief as follows: the issue will be limited to \$4,500,000,000, except as it may be necessary to increase or decrease the amount to facilitate allotment on a graduated scale similar to that employed in connection with the First Liberty Loan. The loan will take the form of three to four-year $4\frac{3}{4}$ per cent gold notes convertible at the will of the holder into $3\frac{3}{4}$ per cent notes free from all except estate and inheritance taxes. The $4\frac{3}{4}$ per cent notes are exempt from State and local taxes, except estate and inheritance taxes, and from Federal normal income taxes.

The limitation of the offering, the rate of interest, and the short maturity render these notes an attractive investment for all classes of buyers. Moreover, they seem likely to have a favorable effect upon the Government issues now outstanding. As this will be the last Liberty Loan, capital and labor throughout the country are patriotically disposed to finish the job with flying colors, and most trades are pledged to full support.

Large buyers are reminded by the Treasury Department that a person may hold up to \$200,000 worth of bonds of the First Liberty Loan converted and Second, Third and Fourth Liberty Loans, with interest received after January 1, 1919, exempt from surtaxes, excess profits and war profits taxes, on condition that he holds at least one-third as many Victory Loan notes. This exemption continues during the life of the Victory notes.

THE DRIVE IN GREATER NEW YORK.

The response in the Fourth Liberty Loan campaign on the part of the rubber industry was most gratifying in that over \$11,000,000 was subscribed as against the quota of \$10,000,000 assigned to it.

In the present drive the rubber industry of Greater New York has been assigned a quota of \$6,500,000, which amount it is safe to assume will not only be fully subscribed but oversubscribed, and to accomplish this every possible source will be solicited.

Committees representing the various branches of the industry, namely, tires, boots and shoes, crude rubber, mechanical rubber goods, medical rubber goods, hard rubber goods and reclaimed rubber, have been appointed, whose representatives will solicit subscriptions from the trade, and needless to say, the committee hopes for a most generous response.

The following is the personnel of the Special Liberty Loan Committee for the Rubber Industry of Greater New York:

CHAIRMAN.

W. J. Kelly, Poel & Kelly, New York City.

VICE-CHAIRMAN.

George B. Hodgman, Hodgman Rubber Co., Tuckahoe, N. Y.

SECRETARY.

J. Abercrombie, The Rubber Association of America, Inc., New York City.

CENTRAL COMMITTEE.

W. J. Kelly, chairman, Poel & Kelly.
G. B. Hodgman, vice-chairman, Hodgman Rubber Company.
T. S. Lindsey, Kelly-Springfield Tire Co.

A. H. Brown, Meyer & Brown.

G. H. Mayo, United States Rubber Co.

S. H. Jones, United States Rubber Co., Goodyear's India Rubber Glove Division.

J. Stuart Brown, Gutta Percha & Rubber Mfg. Co.

Clarence H. Low, United States Rubber Reclaiming Co.

Samuel Dodd, Vulcanized Rubber Co.

H. C. Pearson, editor, "The India Rubber World."

H. M. Williams, general manager, "The Rubber Age and Tire News."

DIVISION COMMITTEES.

TIRES:

T. S. Lindsey, chairman, Kelly-Springfield Tire Co.

E. P. Jones, Firestone Tire & Rubber Co.

J. B. Cothran, The Fisk Rubber Co.

H. J. Morehead, The B. F. Goodrich Rubber Co.

W. B. Bedford, The Goodyear Tire & Rubber Co.

E. S. Roe, United States Tire Co.

Harold W. Stimpson, Ajax Rubber Co., Inc.

CRUDE RUBBER:

A. H. Brown, chairman, Meyer & Brown.

Harold French, Gore & French, Inc.

S. A. Schaeffer, Gaston, Williams & Wigmore.

Collier W. Baird, Rubber Trading Co.

F. H. Peaty, A. H. Astlett & Co.

W. H. Stiles, William H. Stiles & Co.

Bancroft Henderson, F. R. Henderson & Co.

BOOTS AND SHOES:

G. H. Mayo, chairman, United States Rubber Co.

E. C. Beard, Beacon Falls Rubber Shoe Co.

D. A. Hawkins, United States Rubber Co.

F. H. Edmester, J. E. Bates & Co.

F. M. Sheppard, Jr., Goodyear Rubber Co.

RUBBER MEDICAL GOODS:

S. H. Jones, chairman, United States Rubber Co., Goodyear's India Rubber Glove Division.

J. S. White, Hodgman Rubber Co.

N. B. Quick, The Miller Rubber Co.

J. T. Humphrey, United States Rubber Co.

Edward T. McCreery, United States Rubber Co., Goodyear's India Rubber Glove Division.

Leo Plant, United States Rubber Co., Goodyear's India Rubber Glove Division.

MECHANICAL RUBBER GOODS:

J. Stuart Brown, chairman, Gutta Percha & Rubber Manufacturing Co.

A. S. Hardy, Manhattan Rubber Manufacturing Co.

W. V. Aydelotte, The Goodyear Tire & Rubber Co.

L. E. Purtill, New York Belting & Packing Co.

William Wise, chairman, United States Rubber Co.

RECLAIMED RUBBER:

Clarence H. Low, chairman, United States Rubber Reclaiming Co.

Clark W. Harrison, Bloomingdale Rubber Co.

Lloyd Appleton, F. H. Appleton & Son, Inc.

Nat E. Berzen.

HARD RUBBER:

Samuel Dodd, chairman, Vulcanized Rubber Co.

H. Weida, India Rubber Co.

Bruce Bedford, Lucerne Rubber Co.

PUBLICITY:

H. C. Pearson, "The India Rubber World."

H. M. Williams, "The Rubber Age and Tire News."

W. J. KELLY, CHAIRMAN,
SPECIAL LIBERTY LOAN AND CENTRAL COMMITTEES.

THE SUCKER LIST.

A slangy expression and not at all pleasant, and it is applied to small owners of Liberty Bonds by sharpers who sell fake stock. When the Government started its Liberty Loan campaign, the get-rich-quick swindlers, who saw their game endangered, put themselves and all their employees at work selling Liberty Bonds and kept lists of the names of all to whom bonds were sold. The lists of such owners make what the sharks regard as the biggest and best "sucker list" the gentry ever had.

Any one who has a Liberty Bond or a book of War Savings Stamps is a "prospect" for fake stock. His name may be on the list of the oily-tongued sharper.

The American people are paying out some half a billion dollars a year to the support of worthless stock schemes. They reap therefrom \$500,000,000 worth of—thin air.

That is not a guess. It is the figure given by the Capital Issues Committee of the United States Treasury. And, the committee assures us that it is conservative.

Happily there is a Government agency to-day on the trail of the stock sharp. It is the Federal Trade Commission, empowered by Congress to prevent unfair methods of competition in interstate commerce. The Commission may well be expected to look upon the fleecing of Americans of their Liberty Bonds as decidedly "unfair."

Manufacturers are advised that their employees will doubtless have early calls from one of the pleasant representatives of the sharper outfit. When they do, just advise them to drop a postal to the Federal Trade Commission at Washington and tell them about that visit and send them the attractive literature that is handed them. Or, send it in to THE INDIA RUBBER WORLD and we will forward it to Uncle Sam's men.

BRITISH IMPORT RESTRICTIONS MODIFIED.

The War Trade Board announced April 3, 1919, that British import restrictions have been modified to permit the importation freely under general license of the following commodities previously importable only under special license: reclaimed rubber, rubber-covered rollers for clothes wringers, medical syringes of all kinds, acetic acid of all kinds, barytes, chewing gum, diatomite, pumice stone, and pumice powder.

RESUMPTION OF TRADE WITH GERMAN AUSTRIA.

Effective April 2, 1919, the War Trade Board announced the resumption of trade and communication with German Austria, subject to the rules and regulations of the War Trade Board. Applications will be considered for licenses to export or import all commodities, except that for military reasons, export licenses for certain specified commodities will be granted only in exceptional cases. The restricted list includes aircraft of all kinds, including airplanes, airships, balloons and the component parts, together with accessories and articles suitable for use in connection with aircraft; also clothing and equipment of a distinctly military character.

Merchandise is permitted to be exported only upon the understanding that it is intended to supply the internal domestic needs of German Austria; and that, without the consent of the Inter-Allied Trade Committee at Vienna, the reexportation of such merchandise is forbidden to countries with which commercial relations are not authorized, and further, that such reexportation constitutes a violation of the Trading with the Enemy Act.

For the exportation of commodities, applications should be filed on Form X-A. No supplemental information sheet will be required for commodities identified with the rubber industry.

For importations into the United States individual import licenses will be required, in accordance with the regulations applicable to importations from the neutral countries of Europe.

The War Trade Board has received no official advices concerning the regulations governing importations into German

Austria, and prospective exporters should therefore communicate with their customers abroad before making definite commitments, so that the importers may comply with any import regulations that may be in effect.

SPECIAL FOOTWEAR LASTS FOR CRIPPLED SOLDIERS.

The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada, is ready to do its share in assisting such returning soldiers as are in need of special footwear. In its catalog sent out to dealers it has this notice:

Hundreds of our brave Canadian boys will be returning with foot deformities, that to a large extent may be overcome by wearing properly fitted footwear. For such cases we will make special lasts for rubbers free of charge. From these special lasts, properly fitting rubbers, arctics or excluders will be made at the same prices as our regular lines.

SERVICE NOTES AND PERSONALS.

Captain E. E. Williams, of the Canadian Army Service Corps, and formerly manager of the London, Ontario, branch of the Dunlop Tire & Rubber Goods Co., Limited, Toronto, Ontario, has returned to the Dunlop company as manager of the pneumatic and truck tire department, Toronto. Enlisting in August, 1914, he was in France with the 1st Canadian Divisional Train as supply and transport officer during the whole of 1915 and the early part of 1916. His engagements include Festubert, Givenchy, Loos, and two battles at Ypres, where the Germans first used gas. Returning to England in the spring of 1916 for an appointment with what was then the Canadian Training Division, he did staff work there, latterly as Inspector of Catering, until his return to Canada in March of this year.

E. E. Hellman, employed by the Electric Hose & Rubber Co., Wilmington, Delaware, prior to his enlistment as a private in K company, 339th Infantry, with which he has been serving in Northern Russia, has been decorated by the British Government for bravery in action. Under heavy fire, he coolly stood and held off the enemy by firing a Lewis gun from his shoulder.

Charles C. and David Goodrich, sons of the late Dr. B. F. Goodrich, founder of The B. F. Goodrich Rubber Co., Akron, Ohio, have been promoted by the War Department; Major Charles C. Goodrich is now a colonel and Major David Goodrich has become a lieutenant-colonel.

MARTYRS TO THE CAUSE OF LIBERTY.

LIEUTENANT GORDON ROBERT HALL, of the 308th Field Artillery, died of wounds, September 18, 1918, and was buried with military honors in France.

LIEUT. G. R. HALL.

Lieutenant Hall was born February 23, 1887, in Chicago, where his early education was obtained, and in 1909 he was graduated from Amherst. At first joining the editorial staff of the "Chicago Daily News," he was later appointed publicity director of the W. D. Allen Co., Chicago, Illinois. In the summer of 1917 he entered the second officers' training camp at Fort Sheridan, and was commissioned a second lieutenant. Sailing for France in December, he attended the artillery school at Saumur for three months, and was sent behind the front line for two months, then ordered back to the school as an instructor. He was afterward attached to the 129th Field Artillery, later being reassigned to the 308th regiment and promoted to a first lieutenancy. In both regiments he was in action on the front lines. By his sincere character, his integrity, loyalty and devotion, Lieutenant Hall had endeared himself to a wide circle of friends who mourn his untimely death.

DISABLED SOLDIERS IN THE RUBBER INDUSTRY.

By Gilbert I. Stodola.

THE casualty lists of the great war, although perhaps not so large, compared with the total number of our men under arms, as some feared they would be, yet show a by no means inconsiderable number who, because of wounds or other disablement, will be unfitted to return to their former vocations. These men are already beginning to return from abroad and the number homeward bound will continue to increase.

The Vocational Rehabilitation Act passed expressly by Congress for the purpose, provides for the reeducation of these disabled soldiers, sailors, and marines under the joint authority of the Surgeon General of the Army and the Federal Board for Vocational Education. Reconstruction hospitals have been established in various parts of the country. In connection with these, after a man has been restored to health and furnished with the most modern type of artificial limbs, where the latter are necessary, there have been established thorough courses in various trades and occupations. While the men are taking these courses an allowance will be paid them, and their families will receive an allotment just as though they were still in active service.

There are so many instances of men who have done and are doing efficient and often remarkable work in spite of physical handicaps that it would be almost a truism to say that no man is so badly handicapped that he is not capable of doing some work as effectively as an able-bodied worker.

The Red Cross Institute for Crippled and Disabled Men, New York City, made a careful survey of the rubber industry with respect to the opportunities it offers for disabled men. This investigation was confined largely to the factories in the vicinity of New York. It was found that the rubber industry offers many opportunities for the handicapped man, and that employers were very willing to cooperate, being quite ready to accept learners. The factories are for the most part large and have plenty of light and air, certainly a distinct advantage.

Considering the possibilities in detail, it may be said that there are many kinds of work which a man who has lost a leg, but has the full use of both arms, could successfully perform. They include such work as operating riveting, spreading, washing, milling, and mixing machines; running power, sewing or power cutting machines, or performing such work as cementing seams, helping on calenders, threading, vulcanizing, cutting, press molding, etc. The opportunities for the man who has lost an arm are somewhat limited, however, being confined to lighter work in connection with the tubing-machines, rubber-band cutters and rubber-ball machines.

Of course, there are many positions connected with the executive end of the rubber industry which a reeducated crippled man could fill in an entirely satisfactory manner. It should be understood, however, that the causes of military disability are to the extent of at least 50 per cent, of a medical nature. The disabled soldier or sailor is not necessarily a man without legs or arms. He may suffer some injury which leaves no outward sign or may be a victim of gas or shell shock. Even the blind can turn their faculties to profitable account. The employer who accustoms himself to this way of thinking broadens his view of the war cripple to his own advantage. He need not consider an operation in his factory as a possibility for a one-legged or one-armed man. A great many other forms of physical handicap involving whole men can be drawn upon.

In adapting himself to changed conditions, the injured man's mind becomes surprisingly alert. His inventive faculty is quickened, and he often turns out to be an extremely valuable worker, especially in industrial lines. Moreover, nature has its compensations. For instance, a young man who had lost a leg was placed by the Employment Department of the Red Cross Institute for Crippled and Disabled Men in a factory where gyroscopes, used for stabilizers for airplanes, were manufactured. The

young man's sense of touch became so responsive that his skill soon enabled him to earn \$75 a week by piece-work.

The work of the Red Cross Institute was started with the industrial cripple to pave the way for the war cripple. However, it has been found that these men greatly outnumber the cases of soldiers permanently hurt in battle, and that while public interest is easily focused on the war cripple it is not so easily directed sympathetically to the case of workmen who are injured in the shops. The advisability of including them in the Government's program of caring for the disabled soldier has been brought to the attention of Congress and it is possible that something will soon be done along these lines. These industrial cripples are quite as able to work if properly reeducated as the soldier. The matter is one which is already receiving considerable attention among progressive business men.

Thomas Edison, that colossus of the electrical world, has for years had to contend with the handicap of almost complete deafness. In a recent picture of Mr. Edison he is shown with Mr. F. R. Bigler, discussing the problem of reconstruction. The latter has "made good" despite the loss of his right arm and leg. He worked himself up to the position of purchasing agent for the Kansas City Gas Co. and was for a while industrial agent for the Red Cross Institute for Crippled and Disabled Men.

Another remarkable instance of pure grit overcoming almost insurmountable obstacles is that of Michael J. Dowling, president of the State Bank of Olivia, Minnesota, and formerly speaker of the Minnesota House of Representatives, who attained success in life after the loss of both legs, his left arm and the fingers of his right hand. He drives a car, rides horseback and engages in the activities of the able-bodied man.

The writer believes that American business men and manufacturers may be depended upon to give the reeducated cripple employment. They can help him in no better way than by enabling him to become a useful and self-supporting citizen. Think of the extraordinary courage, patience, ambition, and perseverance exhibited by the crippled man in reeducating himself. Surely these qualities are highly valuable in a worker who will perforce become a better thinker.

A DEMOCRATIC FORM OF RUBBER FACTORY MANAGEMENT.

The establishment of a council of industrial relations, giving representation to all employees over eighteen years of age, who are American citizens and have had six months' continuous service or one year's total service with the factory, has been announced by the Goodyear Tire & Rubber Co., Akron, Ohio.

It will take the form of an executive council consisting of five men named by the factory management, the manager and assistant manager of the labor department, two foremen to be selected by all the factory foremen, and six non-salaried employees. All questions of industrial relations will be passed upon by this body, and its first duty will be to formulate a plan to establish a legislative body somewhat along the lines of the national congress which will give representation to the employees eligible to vote. Through this legislative body more than 20,000 employees will in future have a large voice in shaping the policy of the factory on such subjects as employment, working conditions and the reconstruction problems incident to the return of business to a peace basis.

Of this important step in the policy of the company, P. W. Litchfield, vice-president and factory manager, says:

During the last two years our organization was shaped to conform with the policy of our country, and our aims and plans were set aside until the emergency was over. That time is now past, and we have started again towards the goal of a greater and a better Goodyear. After a period of drain on our resources of personnel, and meeting of problems on an emergency basis, we now find ourselves with our old men returning to us, and we are able to plan in a broad and consistent way.

Coordinating the Rubber Interests, Foreign and Domestic.

By Alfred C. Eggers.¹

MANY times of late, the attention of American manufacturers has been brought definitely to the necessity of becoming less dependent upon foreign intermediate agencies for crude rubber supplies. The automobile industry is similarly interested in the problem, as are also the rubber planter, collector and dealer.

There is no present practical method for the rubber manufacturing industry to become independent of foreign countries for its supply of crude rubber, nor would it necessarily desire this. But, if a way could be devised by which the common interests of producer, consumer and trader could be co-ordinated to their mutual advantage, then they need no longer be dependent upon foreign capital to keep permanent the flow of crude and manufactured rubber between them.

Because finance is essentially the life of any business, the problem above presented is, necessarily, a banking one. It would first be required that a condition of mutual faith between seller and buyer be created; and secondly, the proper machinery must be maintained to bring buyers and sellers together on an equitable basis. For these purposes a well-organized bank is the best instrument known.

How then to coordinate the interests of producer, consumer and trader to their mutual advantage! As an example, it might serve to consider the markets of North and South America; and it may be supposed that there exists a mercantile bank in each country, which to all intents and purposes is a purely local bank financing the local market, but under joint North American and local management.

Through the medium of these several local banks, the rubber markets of the Americas would be coordinated to the highest mutual advantage by a cooperative organization that would offer the following:

1. The United States offices to form an indispensable, helpful and dependable link between trade abroad and trade at home.
2. A series of affiliated banks which would operate in one country only, and be, to all intents and purposes, local banks; and would thus render an indispensable service to local producers and North American consumers.
3. A dependable structure supported by producer, consumer and trader, and rendering a like service to each, because interested in furthering the success of all.
4. A sound cooperation which would clear the path between

Our Trading Power for Rubber.

By L. W. Alwyn-Schmidt.

IT has been one of the achievements of the late Willard D. Straight that he has drawn the attention of American industry to the fact that many of its most essential raw materials are produced outside the frontiers of the United States and that the continuous well-being of these industries makes essential special safeguards for the regular supply of these materials. India rubber belongs to these industrial raw materials. Our large rubber industry, the most important in the world, could not exist without the corresponding importation of more than 300,000,000 pounds of india rubber annually, not an ounce of rubber being grown in our own country. The position of the American rubber industry in this respect differs very little from the European rubber industry. No rubber is grown in any European country. But the English, French, Belgian, and Dutch rubber industries have at least the support of their large colonial rubber production. The German and Austrian rubber industries have operated very much under the same conditions as the American.

In normal times little discrimination exists in the distribution of the world's industrial raw materials. The British rubber growers of Ceylon or the Straits Settlements were just as ready before the war to supply German rubber factories as they were to supply English or American. Times, however, are not normal any more. The war has shown that the possession of primary raw materials gives a great strength to the country owning them, and all the countries at war have made a very effective use of the economic weapon placed in their hands by the sole ownership of important industrial raw materials. England withheld rubber from Germany, and America, cotton. Germany retaliated by not permitting the export of potash. Germany was the loser in this economic battle, because her power of withholding raw materials from her enemies was less than that of her opponents.

For a while the Allies seriously contemplated the idea of an economic alliance binding the allied powers to a mutual economic support, principally against what were then their enemies. The underlying idea of this alliance, pronounced in more or less certain terms during the famous Paris Conference, was a pooling of the mutual raw material resources which were to be used, first, for the industries of the Allies and secondarily, for the industries of other countries. The governing principle of this arrangement was the old preferential trading theory based upon a series of commercial treaties between a number of countries, promising each other special benefits, which were not to be attained by countries not being parties to these treaties. Germany had been the main culprit in creating this policy of egoism. It had made during the last twenty years a series of special tariff treaties, securing to its commerce special preferential rights in France, Belgium, Russia, Austria-Hungary, Roumania, Servia, and Japan. Other nations had become parties to these treaties by way of the so-called most favored nation clause which was inserted in many international treaties and gave to the country in question the right to participate in all preferential treatment accorded by the contracting parties to other nations.

Let us consider shortly how such a development might have affected the American rubber industry. The principal countries participating in the conference were England, France, Belgium, Russia, Italy, and Japan. Three of these countries control very considerable rubber interests in all parts of the world and supply great quantities of india rubber to the United States rubber industry. During the year 1916 when the conference took place we received 72,000,000 pounds of rubber from England, 78,000,000

pounds came directly from the Straits Settlements, and 26,000,000 pounds from other British possessions. From Belgium we had nothing and very little from France, which, however, does not mean essentially that the adherence of the two countries to the alliance would not be felt severely in the United States rubber industry. Belgium before the war had sent 11,000,000 pounds of rubber to this country and France nearly 3,000,000 pounds. As it is, of the 267,000,000 pounds of india rubber imported into the United States, 176,000,000 pounds came from British sources, and the total control exerted by the former allied power interests on the American rubber supply amounts to approximately three-fifths of the total rubber consumption of the United States rubber industry.

There is now little chance that the program of the so-called Paris Conference will be carried out. The League of Nations will doubtless replace the Conference and through it a fair distribution of all the industrial raw materials of the world may be ensured to the members of the League. Without the foundation of such a league, however, remains the menace that our big rubber industry might find itself suddenly cut off from its most essential raw material by a coalition of foreign interests. It would then be the question how far the United States would be able to import the supply of rubber and other raw materials not found in the United States, by withholding from other countries essential American raw materials.

In normal years the consumption of india rubber by our industry probably will total from approximately 200,000,000 pounds to 220,000,000 pounds. This consumption will increase from year to year with the progress of the American rubber industry. The supply will be augmented by the use of balata, guayule, reclaimed rubber and plastics. To make up the total requirements of india rubber we may probably rely on England for a supply of 50,000,000 pounds annually. The Straits Settlements will give us the same quantity and 20,000,000 pounds may be had from Ceylon and other British sources. Brazil is able to send us 50,000,000 pounds, Belgium may have available 7,000,000 pounds for American consumption and France approximately 2,000,000 pounds or slightly more. Germany, which in former years was able to send us as much as 7,000,000 pounds, may drop out from the sources of supply, as she has no rubber-producing territories of her own and is not likely to collect sufficient stocks of rubber. The Netherlands, on the other hand, may be very helpful by way of the Asiatic possessions which in recent years have largely increased their shipments of rubber to this country. Allowing for withdrawals on German and Dutch account, the Dutch East Indies should have, nevertheless, approximately 15,000,000 pounds of rubber for our purposes. Mexico may send us 2,000,000 pounds and Peru another 2,000,000. From all the other sources 10,000,000 pounds finally should be expected. This makes in all an approximate supply of 209,000,000 pounds or just enough for the wants of our rubber industry.

It may be assumed that these supplies will be given to us only too willingly. However, it is always pleasant to know that just the countries on which we rely most for our supplies have a very material interest in keeping our economic friendship, as we also have to offer certain supplies in exchange which cannot be had at present anywhere else in the world in like quality and quantity.

Cotton is the first and principal one of these materials. Of an average total production of 27,000,000 bales of cotton in the world, 14,000,000 bales are produced in the United States, 4,000,000 in British East India, 1,000,000 in Egypt, and the rest scat-

tered, including such producers as Russia, Brazil, and other minor cotton-growing centers. All the great industrial countries of the world make a very extensive use of American cotton. England consumed 3,800,000 bales of cotton during the year 1913, of which 3,200,000 bales were American. Of 1,600,000 bales consumed in Germany, 1,300,000 were American, and of nearly 1,000,000 bales consumed in France, nearly 800,000 were American. American cotton is indispensable to cotton industry of these countries. It can not be replaced by the cotton grown in other countries and the whole surplus production of the world outside the United States, for instance, would be insufficient to cover even the wants of England alone, let alone all the combined consumption of Germany, France, Austria-Hungary, Italy, and others.

There are several other materials which might be used by this country effectively as articles to be used in bargaining for rubber or any other raw material. Copper should be mentioned among these and, in a lesser respect, iron and lead, although the control of the latter two is not as complete as that of cotton and copper. Oil, also, might form an effective bargaining commodity.

It is not always the power of withholding other supplies which has been thrown in the scale by the bargaining countries but sometimes that of being a great consumer of some other

product in the sale of which the other country is very much interested. Germany, in fact, has used her own buying power very frequently for that purpose, especially in enforcing the compliance of its Russian treaty of commerce, the dispute over which nearly led to a German-Russian war many years before the outbreak of that just ended. An imperial Germany might have made a similar attempt in another direction. It might, for instance, have tried to avoid the results of the economic isolation proposed by the Paris Conference by cornering as large a part as possible of the Brazilian rubber production. Such a step would have been very detrimental to the American rubber industry in view of the general effect of the Paris alliance on the American supply of raw materials. America in such a case might very well have enforced the free marketing of Brazilian rubber by declining to take Brazilian coffee unless a quantity of rubber was also allotted to the United States industry.

Commercial agreements of this character were frequently made in former years, and it is one of the blessings expected from the constitution of the League of Nations that it may make impossible agreements of this character and thereby also remove the necessity of countries taking action to enforce their equitable rights in other markets by committing exactly the same act against which they protest.

Canadian Import Tariff on Rubber Goods.

CANADA has three classes of import tariff rates, namely, British preferential tariff, intermediate tariff and general tariff.

The British preferential tariff rates of customs duties, if any, apply to goods produced or manufactured in Great Britain or her colonies, when imported direct from any British country, but applies to such goods only when brought into Canada by ship direct to a Canadian seaport. This rate, as noted below, is markedly lower than the other two rates.

The intermediate tariff rates apply to goods which are the produce or manufacture of any British or foreign country to which the benefits of such tariff have been extended, when imported direct from such British or foreign country,¹ as herein after provided. The accompanying list gives the latest amended tariffs on rubber and manufactures thereof as compiled from the Act of April 12, 1907, and the various amendments authorized since that date:

CANADA.

(The rates under the third column marked "General" are those applicable to imports from the United States.)

Tariff No.	British Preference	Intermediate	General
CRUDE RUBBER, ETC.

620.	Webbing, elastic, for artificial limbs.....	Free	Free

The total exports of rubber goods to Canada for the fiscal year ended June 30, 1918, was valued at \$4,502,525 and included: belting, hose, and packing, \$539,496; boots and shoes, \$423,236; druggists' sundries, \$306,490; automobile tires, \$1,766,518; all other tires, \$92,707; all other manufactures of rubber, \$1,474,078.

POSSIBILITIES FOR EXPANSION IN EUROPE.

By E. H. Huxley, President U. S. Rubber Export Co., Limited.

IT is a little too early to make any very definite prophecies as to future business with Europe, as most plans cannot be made definite until the peace conference has concluded its labors

and the treaty been signed, and until the attitude of the governments of the various countries in which we do business is known, and any artificial economic barriers set up by government action are removed or made permanent.

The one great outstanding fact is the universal need of manufactured products. Where these are to be obtained and how paid for is the problem. There is scarcely a country of any importance which, to-day, is not attempting to control its imports by more or less

drastic laws and regulations; and until these are removed, or greatly modified, trade with the countries wherein they exist will be more or less curtailed. The demand and the need, however, remain and must be supplied from some source, and the natural source is the United States. Nations cannot be blamed for desiring to develop their own resources and supplying their domestic requirements as largely as possible with home products, but until these products can be produced, destroyed factories and those that have been turned to war materials must be restored. That in itself creates a substantial demand.

There is a shortage existing in most countries which cannot be supplied locally, particularly in view of the extraordinary efforts being made by those countries which produce manufactured rubber goods to maintain their foreign connections and their export trade. This is being done even at the expense of their domestic trade, and the curious situation exists, at least in England, that there is a local domestic demand which cannot be supplied by local factories and yet the government largely curtails imports. It would seem the part of wisdom to remove all artificial economic barriers and to let commercial nature take its course in the adjustment of supply and demand.

The question of the payment for goods imported is, of course, a serious one. The United States is a heavy creditor to most important European nations, and those nations, naturally, hesitate to increase their indebtedness. Trade balances cannot be restored speedily by means of imports from Europe, first, because the material is not there to be exported, and, secondly, because the United States is becoming less and less dependent upon imports of manufactured products. The cessation of import of French wines alone will be a serious handicap to France. Obviously unfavorable trade balances cannot be liquidated through the shipment of gold; first, because the United States has more gold now than is good for her, and, secondly, because any further depletion of gold reserves abroad would bring disaster there. The most feasible and likely method of payment

seems to be by heavy investment of American funds in foreign markets.

The existing situation in England is what amounts practically to an embargo against United States products, the exception being small percentage allocations, but free and unrestricted admission of colonial products. This situation is to be reviewed in September, 1919, and it is to be hoped that it will be discontinued and that the products of the United States will be again freely admitted.

France still continues to refuse pretty generally licenses for the import of United States products, even though the need for them is great. Numerous instances have been revealed where France has refused permits for the import of material, especially machinery, which could not be obtained elsewhere, and which could not be manufactured in France. It is to be hoped that relief will come after the peace treaty is signed.

Italy is refusing import licenses for United States products and advising those who have heretofore purchased in the United States to purchase in England and France. Her argument is that since she is already owing the United States great sums for credits, loans and previous imports, this indebtedness should not be increased. It is difficult to detect the advantage to Italy in owing money to France or England rather than to the United States, provided she is obliged to owe the money to some one; and it would appear a rather severe penalty to refuse trade from the United States, because the United States during the war has sent over large credits and loaned large sums of money to Italy. This situation appears to be the most indefensible, and it is hoped will be speedily discontinued.

It is interesting to observe in passing the keen interest of all business men in Europe to resume commerce. Conversation which one hears generally is not political and does not touch on the deliberations of the peace conference, but, on the contrary, is wholly commercial and wholly with a view to the speedy resumption of normal trade relations. One hears many expressions of willingness to resume trade relations with Germany, which is, of course, rather surprising, but serves to emphasize the rapidity with which events move and with which things are forgotten.

With the great potential possibilities, it will be a calamity if the United States does not benefit by the present European situation and if much of the war trade does not turn to commercial trade.

HIGH GEAR IN EXPORT TRADE.

Reach out for the export trade, is the watchword of American manufacturers, and the word goes forth from Washington that the Government, through the Bureau of Foreign and Domestic Commerce, is prepared to assist in every way it legitimately can. The United States is now a creditor instead of a debtor nation. During the past year it did an export business of about \$6,150,000,000, as against an import business of \$3,031,000,000. The month of January, 1919, showed larger exports than any other single month in American history.

Reports of special representatives giving complete descriptions of the life and customs of the people in foreign lands, together with the class of commodities they purchase, the prices and the terms, are published every day and a compact publication is issued to over 6,000 subscribers. In the past few weeks representatives of the Bureau of Foreign and Domestic Commerce have gone to Great Britain, France, Switzerland, Italy, Denmark, Norway and Sweden, Greece, Rumania, South America, Japan, and other countries. Valuable information for the rubber trade may be expected from this activity on the part of this alert government department.

"Rubber Machinery," by Henry C. Pearson, is filled with valuable information for rubber manufacturers. Price, \$6.

E. H. HUXLEY.

BALATA BELTING: ITS MANUFACTURE AND USE.

By Hancock Haskins.

THAT balata belting is better than rubber, leather, or even cotton belting for every purpose is not true. Where water, acid, or acid fumes are present, it is, however, better than any other. It will not stand high heat, but on the other hand, the moderate heat developed by running a balata belt softens the gum a little and brings it to the surface, thus renewing the belt cover for a long time. It should never be used in rooms that are over 100 degrees in temperature, nor is it advisable to use it where it is constantly exposed to steam.

Properly made balata belting is possessed of great tensile strength and its pulling power is wonderful. It clings to the pulley better than any other material and needs no belt dressing. It also has the added advantage of running true. Furthermore no belt fasteners are needed in splicing. In making a joint the ends are simply heated until they become loose and sticky. The splice is then made on an angle of 45 degrees, stepped in about one inch to each ply, pressed down hard and ironed. When cooled it is as strong at that point as at any other.

The use of balata belting is very large for conveying purposes in mines, but especially in acid works, dye houses, bleacheries, ammonia works, slaughter houses, tanneries, breweries, and also in shoe and hat factories, and in special chemical industries.

The preparation of balata for belt manufacture is very simple. Rubber manufacturers who are not equipped for handling plastics like gutta percha and balata often do the cleaning and massing on ordinary washers and mixers. The better way, however, is to have a cutter (a circular knife is excellent) that cuts the raw blocks or sheets into strips and pieces that are more easily handled. This is done dry and cold and is much like cutting leather or rawhide. The resulting strips are then shredded by a variety of tearing machines. A common one is a spiked drum, revolving in a trough. The shredded mass is next thrown into a tub of cold water and agitated. The heavy adulterants, if there are any, sink to the bottom, while the shredded gum particles float. The partially cleansed shreds are put into a tub of hot water where with a little manipulation they unite into a plastic mass. This can be used just as soon as the water is expressed.

For the best work, however, the gum should be put into a closed washer or a masticator-washer and thoroughly washed in hot water into which steam is forced. The remaining impurities are thus freed and either sink to the bottom or are forced out through apertures in the inner walls of the washer. The

this is not absolutely necessary in belt making, but some manufacturers insist that it gives a better product.

So far, the handling of balata is practically the same as of gutta percha. It should be noted, however, that balata is softer than gutta percha and, furthermore, that it is not so easily at-

FIG. 2. BELT-STICKING MACHINE.

tacked by the air. It also cools much more slowly so that, once heated, it can be handled and made up more easily. These facts and the further one that the crude gum is often very clean, allow of its being simply treated in hot water, in a tub washer, and dried on ordinary mixing rolls. The product is not as smooth as gutta percha, but is more elastic and adhesive.

In this connection details of balata belt-making as practiced in a European factory are very interesting. The crude balata is first washed in machines that are very similar to those employed for washing crude rubber. They are, however, of considerably lighter construction, having smooth rolls instead of corrugated. These rolls revolve at different speeds to tear the balata while it is washed in order to effect as thorough a cleaning as possible. The balata sheets, after drying, are put into a slightly warmed, jacketed mixing machine, and with the addition of benzine, and by constant stirring, are reduced to a solution. As soon as a thorough mixture has been obtained, the thick compound is transferred to a jacketed solution trough, which is fixed above a spreading machine. In this trough, which is heated, the mass is raised to a temperature that makes it sufficiently plastic to permit spreading.

The solution trough has a capacity of 40 gallons and can be closed in order to keep out dust. The belting fabric is wound on a roller provided with a brake and passes over another roller, under the solution trough, between a roller and the spreader knife. While the cloth unrolls, the balata solution is distributed over the cloth surface in front of the knife, through three cocks that are equidistant throughout the length of the solution trough.

The cloth absorbs the solution as it is spread by the knife or "doctor," which can be adjusted to regulate the thickness of the solution. The treated fabric then passes over other rollers and is led to a winding apparatus. To wind up the spread cloth, a windlass-rack is fitted to hold short lengths of pipe in its arms. These short pipes are fed as fast as the cloth advances, and by this means the sticky fabric is kept from adhering to itself as it is wound up, the windlass holding up to 600 feet of impregnated cloth, which is thus air-dried.

The fabric is spread thick on one side and thin on the other and is then transferred to a grooving and cutting machine, to be trimmed and cut to the required length and width. The material is wound on a roller which has a brake, and from this it

FIG. 1. BALATA-WASHING MACHINE.

cleaned mass is then put on heated rolls that express much of the water. If a thoroughly dense homogeneous mass is required, the almost dried gum is forced through a press-strainer containing a battery of sieves, each of different mesh. This removes the remainder of the water and all air bubbles. Of course,

is passed through plunger rods and over a grooved roller. The grooves are at equal distances and in them are knives which cut and trim the cloth. After this the pieces of cloth are passed through guide rollers to a wind-up roller operated by hand. The knives are interchangeable and can be adjusted at will from top to bottom, and from right to left, from groove to groove. For trimming, sharp knives are used, and for grooving, blunt round ones. The latter knives impress a very distinct line on the coated cloth where the belting will later be folded.

The trimmed and grooved fabric then leaves the winder and passes to a steam-heated warming table where the heat softens the solution and makes it sticky. As soon as it is sufficiently warmed, it is folded over where the grooving machine has made lines, with the thick coating inside. Then it is pressed together by hand-rollers and wound upon a reel at the end of the warming table, which usually consists of five heating plates, six feet wide and ten feet long, placed end to end to form a slide about 52 feet long.

The next and most important part of the work consists in stretching, coating and fluting the belting. This takes place on a stretching and coating calender. The belts are wound on a braked winding roll and then passed over a steam-heated warming roller, under a heating plate and through the stretching machines. These consist of a three-roll calender with a two-roll calender of the same size standing 6 feet behind it. The two-roll calender makes 15 per cent fewer revolutions, but has a 20 per cent faster surface travel than the three-roll calender. When the rolls are properly set, the higher surface speed of the two-roll calender causes the belting to be evenly stretched. In the stretching operation, the rolls are well heated so that the balata in the fabric may become as plastic as possible and penetrate farther into it. But the warmer the rolls, the greater the danger of the belt being made crooked. For instance, in a three-ply belt very hot rolls will easily pull one side more than the other because one or the other tends to slip. There is no standard for heat, but an experienced and observant operator always finds the right heat and accordingly adjusts the distances between rolls.

The belt is later run again through the rolls of the stretching machine. This time the rolls of the two-roll calender are not set up tight and the friction is just enough to rub against the belt surface and make it smooth. After again rolling up, the belt is prepared for its coating with balata. This often takes

FIG. 3. BELT-COVERING MACHINE.

place on the two-roll calender above mentioned, but better results are obtained with a special two-roll calender. The balata needed for coating is prepared on a mixing mill. The stretched and smoothed belt is wound on a reel, passed through the coating calender, and is rolled up again on the other side. During the

passage, the upper roll takes up a part of the balata mixture and presses it against the belt. To obtain a coating of even thickness, the distance of the rolls is fixed with chucks of metal or wood, and a pair is needed for every size. These chucks are arranged on a bridge mounted on the calender, are adjustable

FIG. 4. BELT-TRIMMING MACHINE.

and can be exchanged. They can therefore be adjusted over the working width of the rolls according to the width of the belt and at the same time act as guides. During the coating process, the lower roll is cold, the upper being slightly warmed so that the balata mixture has the softness needed to press it on to the belt with ease. To prevent the coating from clinging to the upper roll it is continually moistened with spirit. The belt is now transferred to a table 90 feet long where it is cleaned and trimmed with knives by hand to free the edges of balata coating and of the mixture that has worked out of the inside during calendaring.

The next operation is that of grooving. This takes place on a grooving machine which consists of two horizontal rolls mounted one above the other in stands. The belt passes through these rolls once, and in order to make the grooved side glossy it is slightly moistened with water before going through the rolls. To make the grooves parallel to the edges, it is necessary to guide the belt during the operations from start to finish. The grooving machine is put up in front of a work table where the belt is inspected before it is passed as being free of factory defects.

The above practice is not, however, universal, for some manufacturers mix with balata a certain amount of rubber, and some add plastics of the refined elaterite variety. Others use only the cleaned balata. As a matter of fact, the process of balata belt making is very similar to that employed in the manufacture of rubber belts. There is this difference, however—no balata belt is vulcanized; first, because it is not necessary, and second, because it could not be done. As for the rest of the processes, the frictioning of the fabric, the making up, the stretching, the pressing for solidifying and surface, are almost identical.

BALATA SOLING IN ENGLAND.

A British branch of an American leather concern makes the following announcement in a London trade journal:

Balata, the satisfactory soling substitute. Like leather, it is adapted to be trodden under foot by the million. Light in weight, absolutely waterproof and non-slipping, easy to work through the factory, favorable in cost, economical in cutting, wears twice as long as leather. Supplied in sheets, in various substances, providing a range for all soling requirements, from the light slipper to the gent's heavy boot.

Official Cotton Standards of the United States.

AMERICAN EGYPTIAN COTTON.

THE readers of THE INDIA RUBBER WORLD are already familiar with the development of the American Egyptian cotton of the Salt River valley in Arizona and some districts of California. Those who are not can find some interesting facts in Service and Regulatory Announcement No. 41, published by the Bureau of Markets of the United States Department of Agriculture.

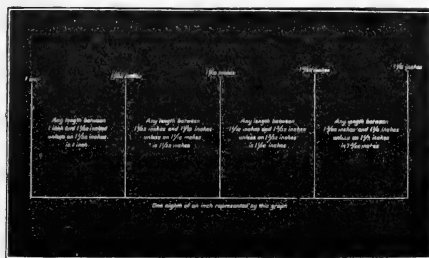

ILLUSTRATION OF STEPS FROM 1 TO 1 1/4 INCHES.

ment of Agriculture, which is mainly devoted to the announcement of official standards of grades and lengths of these and the Sea Island varieties of cotton.

When the Yuma cotton was developed from careful experimental breeding, and proved of greater strength of fiber, the Department of Agriculture established and introduced grades and lengths of staples, which have largely formed the basis for description of such cotton in transactions between cotton mills and producers.

In 1910 a single plant of distinct type was found growing in a field of the Yuma variety, at Sacaton, Arizona, from the seed of which a progeny row was grown in 1911 and more extensive plantings were made in 1912 and 1913. The most careful examinations failed to reveal any noteworthy departure from the original plant found in 1910. This variety was named Pima. The important differences between the Pima and the Yuma varieties are that the Pima has a whiter color and a longer staple. The Yuma variety has a staple from 1-7/16 to 1 1/4 inches in length, and the Pima a staple from 1 3/8 to 1 3/4 inches, or an increase of from 3/16 to 1/4 of an inch.

The grading and stapling of 2,100 bales of the 1917 crop were done by a representative of the Bureau of Markets of the United States Department of Agriculture, and material was collected for types. It was then decided to replace the tentative standards for Yuma cotton with the official cotton standards of the United States for American Egyptian cotton, made up of types of the Pima variety. Heretofore the grades of Pima cotton have been designated by the names Fancy, Extra, Choice, Standard, and Medium. In the official cotton standards for American Egyptian cotton numbers are substituted for the grade names—No. 1 for Fancy; No. 2 for Extra; No. 3 for Choice; No. 4 for Standard; and No. 5 for Medium.

Furthermore, American Egyptian cotton which in grade is between any two adjoining grades represented by types in the standards, are designated by the grade number of the higher grade, followed by "1/2"; for example, cotton between grades No. 1 and No. 2 is grade 1 1/2. Also, cotton inferior to grade No. 5 is designated "Below grade 5." The lengths of staple formerly known by numbers are designated by their actual measurements,

determined in the manner set forth in the order establishing the standards for length of staple.

SEA ISLAND COTTON.

Standards for Sea Island cotton are also established.

In the standards for Sea Island cotton, as in the case of American Egyptian cotton, numbers are substituted for grade names, No. 1 for Fancy; No. 2 for Extra Choice; No. 3 for Choice; No. 4 for Extra Fine; No. 5 for Fine; and No. 6 for Medium Fine.

Likewise, Sea Island cotton which in grade is between any two adjoining grades represented by types in the standards, is designated by the grade number of the higher grade, followed by "1/2"; for example, cotton between grades No. 1 and No. 2 is grade 1 1/2. Also, cotton inferior to grade No. 6 is designated "Below grade 6." The lengths of staple will be designated by their actual measurements determined in the manner set forth in the order establishing the standards for length of staple.

LENGTH OF STAPLE COTTON.

The Department of Agriculture has been making investigations for several years, looking to the establishment of standards of length of cotton. Specialists interviewed mill-owners, merchants, buyers, brokers and shippers in the North and South, and the result which met the approval of more than 70 per cent of those consulted, was that instead of the lengths of staple being designated by numbers, they are hereafter to be known by the actual measurements, in inches, of the length of the fibers, according to the standard rule, under a relative humidity of the atmosphere of 65 per cent and a temperature of 70 degrees Fahrenheit, without regard to the quality or value of the staple.

It was also determined that length of staple of less than 3/4 inch should be designated "Below 3/4"; from three-fourths to one inch should be designated in steps of sixteenths of an inch, and from one inch upwards should be designated in steps of thirty-seconds of an inch. When cotton more than three-fourths of an inch in length of staple is not actually one of the measurements specified, it is to be designated by the specified length which comes nearest under its actual measurement. An illustration of the steps from one to one and one-eighth inches, both inclusive, is shown in the accompanying graph. The following lengths specified in the standards, nine in all, are represented by

OFFICIAL COTTON STANDARDS. LENGTHS OF STAPLE FOR WHICH TYPES ARE READY FOR DISTRIBUTION.

physical types: 3/4, 7/8, 1, 1 1/8, 1 1/4, 1 3/8, 1 1/2, 1 3/4 and 1 1/2. Reproductions of samples of cotton having these lengths are shown in the half-tone illustration.

As different methods of pulling staple may cause variations in results obtained by different classifiers, the Bureau of Markets has made a study of methods used by acknowledged experts in this work, and has devised a method, the adoption of which it recommends. Photographs of the various steps or successive motions involved in this method are given in the document here mentioned.

What the Rubber Chemists Are Doing.

THE AGING OF VULCANIZED PLANTATION RUBBER.

THE following abstracts of five important papers dealing with the deterioration of vulcanized rubber by aging, present the latest results of elaborate research on the part of three highly esteemed authorities, Dr. H. P. Stevens,¹ Dr. O. de Vries,^{2,3,4} and W. Spoon.⁵

RESULTS BY DR. H. P. STEVENS.

Lack of space compels omission of the curves illustrating Dr. Stevens' papers. The results in his first paper are reviewed by Dr. Stevens as follows:

Experiments were conducted on crêpe and sheet rubbers of which the vulcanized specimens were retested physically at intervals of a few months. It was shown that in those cases in which the coefficient of vulcanization exceeded 3.2 per cent, deterioration set in a short time after vulcanization, and that the higher the coefficient the more rapid the deterioration.

These experiments were extended to carry out again tests over a longer period, and to comprise a wider range of types, including rubber from matured coagulum (slabs). The mixings of 90 parts of rubber 10 parts of sulphur were cured at 35 pounds steam pressure for 2, 2½, 3, 3½, 4 and 4½ hours, and the specimens tested one week after vulcanizing and subsequently at intervals extending over 120 weeks. The specimens were preserved in the dark, or in semi-darkness, but otherwise no particular care was taken with them and they were exposed to the ordinary fluctuations of room temperature.

When comparing the results it must not be forgotten that determinations of breaking strain are subject to appreciable experimental error when the rubber is overcured and brittle or "perished."

The effect of aging on the physical properties is more evident at summer temperatures than at those of winter.

The coefficient of vulcanization was determined shortly after vulcanization and again at the conclusion of the aging period. The results were as follows:

Hours Vulcanized.	ROLLED SHEET.		UNROLLED SHEET (SLAB).	
	Beginning of Aging Period.	End of Aging Period.	of Aging Period.	End of Aging Period.
2	2.33	2.16	3.16	3.44
2½	2.62	2.72	4.17	4.30
3	3.05	3.33	4.93	5.11
3½	3.98	3.90	5.71	5.81
4	4.36	4.62	6.41	6.82
4½	4.73	4.96	7.01

These figures indicate that with coefficients of over three, there is a tendency for the coefficient to increase with the aging of the specimen, the effect being greater the higher the coefficient. It is probable that this increase is accompanied by decomposition of the rubber. It is well known that sulphuric acid is formed when rubber perishes. It appears, however, that where the coefficient is low appreciable deterioration does not set in during the period under test, and little or no increase takes place in the coefficient.

The higher the coefficient the shorter the period of increase in breaking strain. The figures are approximately as follows:

Co-efficient.	Period During Which Increase of Breaking Strain Takes Place.		Co-efficient.	Period During Which Increase of Breaking Strain Takes Place.	
	35 weeks	3.2		21 weeks	3.2
2.6	22 "	4.2	15 "	6 "	4.9
3.1	18 "	4.9	6 "	2 "	5.7
4.0	10 "	5.7	nil	nil	6.4
4.4	7 "	6.4	nil	nil	8.1
4.7	5 "	8.1	nil	nil

These results confirm the conclusion drawn from earlier experiments that a rubber vulcanized to give a coefficient of 3.5 is certainly overcured and cannot be expected to retain its physical properties for a reasonable length of time. To secure approximate permanency the coefficient should not exceed three per cent. Finally, it is clearly seen that the maximum breaking strain cannot be obtained without overcuring the rubber to such a stage that it commences to deteriorate within a few days of vulcanization and loses tensile strength at an average rate of about one per cent per week.

In his subsequent communication, Dr. Stevens gives the results of a series of experiments exactly similar to those above reported, on smoked sheet, smoked "slab," ordinary pale crêpe, and smoked crêpe.

The figures for the coefficients of vulcanization determined at the commencement and conclusion of the aging experiments were as follows:

Hours Vul- canized.	(1) Smoked sheet		(2) Smoked slab		(3) Pale crêpe		(4) Smoked crêpe	
	Start.	End.	Start.	End.	Start.	End.	Start.	End.
2	2.66	2.57	2.82	2.92	2.01	2.26	2.11	2.25
2½	3.06	3.04	3.37	3.53	2.86	2.66	2.75	2.80
3	3.72	4.14	4.42	3.62	3.58	3.45
3½	4.33	4.38	4.84	5.63	4.27	4.28	4.17	4.21
4	4.87	5.31	5.54	6.16	4.86	4.92	5.11
4½	5.66	6.34	6.27	6.80	5.94	5.57	5.88

These figures confirm the previous conclusion, namely, that the increase with age in the coefficient is more noticeable in the overvulcanized samples. Thus, an analysis of the above figures and those given in the previous paper gives the following results:

Average Coefficients Between	Average Increase in Coefficient During Aging Period.
2 and 3 = 2.52	0.02
3 and 4 = 3.43	0.10
4 and 5 = 4.35	0.25
5 and 6 = 5.69	0.51

Tabulating the maximum breaking strains corresponding to coefficients of four to five, obtained from tests made shortly after vulcanization, we have the following:

Average Coefficients Between	Maximum Breaking Strain.
2 and 3 = 2.52	1.560
3 and 4 = 3.43	1.930
4 and 5 = 4.35	2.090
5 and 6 = 5.69	1.790
over 6 = 6.36	1.580

These figures show clearly that the maximum breaking strain is not attained without considerably overcuring the rubber. All types of rubber, when cured to give a coefficient of 4-5, attain the maximum breaking strain within 10 or 15 weeks of vulcanization, after which they rapidly lose strength. In a year or so they become hardened and perished. On the other hand, if the vulcanization be carried only so far as corresponds to a coefficient of 2-3, there is obtained with all types of rubber a product which, although only of medium strength when freshly cured, improves on an average for about a year and then only very slowly loses strength, so that at the end of two years the rubber is still stronger than when first vulcanized.

The correlation of the coefficient and the period during which

⁴O. de Vries, "Changes in Vulcanized Rubber at Elevated Temperature," "Archief voor de Rubbercultuur in Nederlandsch-Indië," November, 1918.

⁵W. Spoon, "The Effect of Aging on the Physical Properties of Rubber," "The India-Rubber Journal," January 11, 1919.

increase in breaking strain takes place, when analyzed and averaged gives the following figures:

Average Coefficients Between	Average Period (Weeks)	
	During Which Increase in Breaking Strain Takes Place.	
2 and 3	2.57	53
3 and 4	3.42	50
4 and 5	4.55	33
5 and 6	5.67	2
over 6	5.71	0

The position of the breaking-strength curves is dependent on the coefficient and not necessarily on the time of cure, showing that the coefficient is the essential index of the degree of vulcanization.

The load required to produce a given elongation in sheet rubber is greater than in crepe rubber when both types are cured to give the same coefficient. The curves for elongation all slope downward, showing a gradual reduction in the final length with the period of aging. With low coefficients the reduction is very gradual; with coefficients over five the vulcanized specimens are perished before the full period of aging is completed.

The average figures are as follows:

Average Coefficients Between	Percentage Increase in Final Length.
2 and 3	2.57
3 and 4	3.42
4 and 5	4.55
over 5	6.02

CONCLUSIONS.

These experiments illustrate the general instability of vulcanized rubber in contrast to the raw material. Plantation rubber may be stored for ten years and, when vulcanized, give results comparable with those yielded by the freshly gathered raw material. Vulcanized rubber, however carefully vulcanized, commences to change in physical properties the moment the vulcanization process is completed. When the original coefficient exceeds three, appreciable deterioration takes place in two years. This may result in a loss of 50 per cent of the tensile strength when the coefficient reaches four, and complete "perishing" with a coefficient of five or more. A reasonably permanent product of primary vulcanization can be obtained only when the coefficient does not exceed three, which figure is regarded by the author as a suitable standard for vulcanization when comparing the physical properties of different specimens of vulcanized rubber.

RESULTS BY DR. O. DE VRIES AND W. SPOON.

The changes in vulcanized rubber during the first days after vulcanization have been reported by O. de Vries and W. Spoon in "Archief Voor De Rubbercultuur," November, 1918, page 814.

In order to determine if a rest of only 24 hours is ample for stabilization of the physical properties of vulcanized mixtures of rubber and sulphur, de Vries and Spoon tested a large number of samples of first-quality crepe, smoked sheet, and lower grades of plantation rubbers. The tests were made on mixtures of 92½ parts of rubber and 7½ parts of sulphur vulcanized as slabs in an autoclave in live steam at 148 degrees C. It was found that during a rest period of five days the tensile strength showed no change.

When tested 24 hours after vulcanization the stress-strain curve is found somewhat higher than when tested after intervals of 72 or 96 hours, but the difference amounts to only five or ten per cent in length at 1.30 kilograms, corresponding to an increase of two to three minutes in time of cure. The change for crepe rubber seems to be somewhat smaller than for smoked sheet or for lower grades.

Experiments to determine whether testing 24 hours after vulcanization gives results as regular and as reliable as testing after a longer period of rest showed that the figures for the position of the stress-strain curve are at least as regular and as reliable when testing 24 hours after vulcanization as compared with a rest of 72 hours.

RESULTS BY DR. O. DE VRIES

Remarking on the aging of vulcanized rubber, Dr. O. de Vries, in "The India-Rubber Journal," January 11, 1919, summarizes his results on vulcanized mixtures of 92½ parts of rubber and 7½ parts of sulphur, as follows:

The evidence seems sufficient to prove that for the above rubber-sulphur mixture there is no specially stable state of cure with a coefficient of vulcanization of nearly three per cent. The changes on aging are in a general sense the same as for mixtures cured to a coefficient of vulcanization of two or four per cent. The coefficient of vulcanization alone does not constitute a sufficient guide to judge of the aging properties. In cases where comparison is to be made of vulcanized rubbers which are not prepared according to the same procedure, both the stress strain and the coefficient of vulcanization, and perhaps other properties, will have to be taken into account to gain an insight into the state of the sample and its probable life or aging.

Aging of mixtures of 92½ rubber and 7½ sulphur at elevated temperatures (65-72 degrees C.), had the following effects:

(1.) The stress-strain curve shifted position in the same way as in ordinary vulcanization. The change during the first 24 hours was greater the shorter the time during which the sample was cured before aging. The change on further heating is practically the same for cures with a coefficient of vulcanization of two to four per cent. The change on prolonged heating becomes progressively less until brittleness is reached.

(2.) The tensile strength for a given stress-strain curve, though increasing in prolonged vulcanization, does not reach the value obtained by ordinary vulcanization. Samples with a coefficient of two, three, and four per cent first show an increase of tensile strength and later on the rubber becomes brittle.

(3.) At temperatures below 80 degrees C. the coefficient of vulcanization shows only a small increase. The physical changes in aging which in ordinary vulcanization accompany an increase in the combination of sulphur and rubber are not coupled with this chemical reaction.

For practical testing purposes the changes during the first days after vulcanization are of special interest. As the vulcanized product is not stable, a fixed period of rest must be observed before the sample is tested.

An extended study to determine the proper duration of this period of rest was made on 27 different grades of rubber, sample mixings being tested, respectively, 24, 48, 72, 96 and 120 hours after vulcanization. In the first 24 hours after vulcanization the change was great but during a further period of six days the figures did not show greater oscillations than the error of determination. A shifting in the position of the stress-strain curve is to be expected by aging during the days after vulcanization, but the change is only small.

In conclusion, the method adopted at the Central Rubber Station, Buitenzorg, Java, based on these studies, is to test 24 hours after vulcanization. This procedure is found to give regular and reliable results.

CHANGES IN VULCANIZED RUBBER AT ELEVATED TEMPERATURE.

Dr. O. de Vries summarizes on this topic as follows:⁵

The following changes in vulcanized slabs (92½ rubber and 7½ sulphur) were obtained by aging at 65 to 72 degrees C. (equivalent to 149 to 161.6 degrees F.).

1. The stress-strain curve shifted its position in a way analogous to that in ordinary vulcanization. The change during the first day was smaller the longer the specimen subjected to the aging test was cured, but during following days the changes for differently cured specimens were parallel.

2. The tensile strength changed in the same sense as in ordinary vulcanization, but the values obtained remained more and more behind those obtained in ordinary vulcanization. Rubber

⁵ "Archief voor de Rubbercultuur," November, 1918, page 805.

not cured to its maximum tensile strength showed an increase in tensile strength in aging, but the increase was smaller than in continued vulcanization. After-vulcanization, as in ordinary vulcanization, brought the curves at last into the brittle state.

3. The coefficient of vulcanization by aging at temperatures below 80 degrees C., equivalent to 176 degrees F., increased only little. A curve obtained by aging showed a much lower coefficient than when obtained by ordinary vulcanization.

4. By prolonged aging these changes continued in the same manner without stop, though in diminishing degree. A definite final stage can in no case be reached before the rubber becomes brittle.

CHEMICAL PATENTS. THE UNITED STATES.

COMPOUNDING RUBBER WITH POWDERY SUBSTANCES.—An impalpable powder, such as lampblack, is mixed with a concreting and binding liquid such as starch paste, producing a granular condition; the water is evaporated and the dry granular lampblack incorporated with rubber. (Wilbur Clark Knowlton, and Harry A. Hoffman, Akron, Ohio, assignors to The B. F. Goodrich Co., New York City. United States patent No. 1,286,024.)

COATING MATERIAL FOR HANDLES OF SPORTING AND TRADE IMPLEMENTS AND METHOD OF APPLYING.—A coating comprising material including gutta percha and balata soluble in a suitable solvent and when applied readily drying out and leaving the material in the form of an adherent, elastic, non-absorptive surface free from stickiness under ordinary temperatures and use. (William S. Sellars, Brooklyn, and Wyatt W. Taylor, Spuyten Duyvil—both in New York. United States patent No. 1,293,949.)

ADHESIVE RUBBER COMPOSITION.—A process for producing an adhesive material which comprises mixing thickened castor oil, dissolved in a volatile solvent, with rubber-containing latex, and coagulating the mass. (Edward Mark Slocum, Medan, Province of Deli, Sumatra, Dutch East Indies, assignor to General Rubber Co., New York City. United States patent No. 1,293,957.)

PRODUCING SUBSTANCES RESEMBLING CAOUTCHOUC.—The process of producing substances resembling caoutchouc but insoluble in benzene, by polymerizing a hydrocarbon of the butadiene series in the presence of about three per cent of an oxidized but undecomposed terpene containing at least ten carbon atoms in the molecule, otherwise described as an organic substance consisting of an ozonide containing oxygen in a loosely combined state and active chemically, said organic substance being soluble in the hydrocarbon and capable of mixing with and reaching every part of it. (Henry S. A. Holt and Gerhard Stemmig, assignors to Badische Anilin & Soda Fabrik—all of Ludwigshafen, Germany. United States patent No. 1,294,662.)

THE UNITED KINGDOM.

INDIA RUBBER COMPOSITIONS.—A mixture of pure rubber, flour from waste vulcanized rubber, and sulphur with which may be mixed other material such as Pontianak, a clear sticky gum, castor oil, ground fiber, white lead and dissolved resin. The composition is intended for use in making artificial leather, floor cloth or tires, vulcanized by hot or cold process. (W. Stocks, 334 George street, Fitzroy, Victoria, Australia. British patent No. 121,136.)

WATERPROOF COMPOSITIONS.—A composition for waterproofing boots, shoes, and other leather articles, consisting of grease, gum, wax, oil, and rubber in the proportion of 25, 5, 30, 35 and 5 per cent, respectively. The grease, gum, and wax are first mixed together under heat, the oil is then added and finally the rubber. (H. C. Trenaman, 56 Catherine Street North, Hamilton, Ontario, Canada. British patent No. 121,587.)

REGENERATING INDIA RUBBER.—Vulcanized rubber is regenerated by grinding, dissolving under mechanical action in the smallest possible quantity of oil, such as linseed or castor oil, which is vulcanized into factice, and exposed to a temperature of 150 degrees C. The solution is subsequently heated with as much sulphur, at such a temperature, and for such a period, as will convert the oil into factice. The product may, with or without the addition of new rubber, be vulcanized or otherwise treated as new rubber is treated. (S. van Raap, 102 Weesperzijde, Amsterdam, Holland. British patent No. 122,188.)

LABORATORY APPARATUS. IMPROVED SPIRAL BALANCE.

THE well-known Jolly's spiral spring balance, useful in the rubber laboratory for determining the specific gravity of compounded rubber, has been improved to facilitate the reading of the instrument. The improvement consists of a small mirror attached to the sliding index, bearing a horizontal line etched upon it, and a device for limiting the motion of the spring. The indicator attached to the end of the spring is a small metal disk which may be set very accurately in line with its own image and the etched line on the glass.

JOLLY SPIRAL BALANCE.

REGISTERING DOUBLE CALIPER.

The registering double caliper shown in the cut will be found a decidedly convenient tool for the testing laboratory for measuring the diameter of hose under test for expansion. Hose makers and inspectors will also find this caliper a handy tool in their departments, as it is adapted for measuring both external and internal diameters. The dimensions may be read to sixteenths of an inch on the graduated arc. Central Scientific Co., 460 East Ohio street, Chicago, Illinois.)

REGISTERING
CALIPER.

RUBPRON MINERAL RUBBER.

Rubpron is a recently perfected hydrocarbon product designed for use as a preservative and filler in rubber compounding. It is a combination product based on pure asphaltum. It possesses great ductility and freedom from hardening or oxidizing effect. Its melting point is 315 degrees-F., specific gravity 1.058, and it contains two per cent of sulphur.

LIQUID CAUSTIC SODA.

Liquid caustic soda in water solution of different strengths is available to the rubber reclaiming trade. It is shipped in tank cars and used according to strength. The object is to effect a saving in manufacturing cost by avoiding complete evaporation and the use of the drums in which the solid caustic is packed. The liquid caustic is extensively used where the freight rate is not high enough to offset this saving.

REPLETE WITH INFORMATION FOR RUBBER MANUFACTURERS.—H. C. Pearson's "Crude Rubber and Compounding Ingredients."

The Rubber Division of the American Chemical Society.¹

ON April 7, 1919, the Council of the American Chemical Society, in meeting at Buffalo, New York, recognized the efforts of American rubber chemists to promote the standard of scientific attainment in their industry, by permitting them to organize as a division of the American Chemical Society. This is the first industry which has been thus honored, the other divisions being confined to the various branches of chemical science. With this recognition, there comes the obligation on the part of the rubber chemists to co-operate to the fullest extent in raising the standard of their work, so that in the future the industry may serve the public to a greater extent than it has in the past. It means that the rubber chemist must have a broader vision than ever before, to develop this industry to the place it deserves in the commerce of the country. The first meeting of the Rubber Division will take place in September of this year at Philadelphia during the meeting of the American Chemical Society.

It is worth while to call attention to the difference between the Rubber Division of the American Chemical Society and the position occupied by the old Rubber Section. It is essentially the same group of men, but previously we had no authority to choose who should lead the work of the rubber chemists, and such organization as existed was from meeting to meeting only. The supervision of the Section was entirely in the hands of the president and secretary of the American Chemical Society. Now, however, the rubber chemists have a permanent organization, with officers and Executive Committee elected by themselves; they may enroll their own members, and in general, act as a permanent body.

Membership in the Division is open to any member of the American Chemical Society who will take the trouble to write to the secretary and ask to be placed on the roll. Every member of the American Chemical Society who is interested in this work should, therefore, immediately send this notice to the secretary, A. H. Smith, Bureau of Standards, Washington, D. C. The annual dues are placed at \$1 a year to cover the cost of mailing notices and the general office work of the secretary. Anyone who fails to send in his name has no cause for complaint for not being notified of meetings, advance notice of programs, etc. The officers of the Division feel that at the first meeting in Philadelphia there should be at least 150 rubber chemists to start the new division on its way.

It should also be noted that only members of the American Chemical Society have any voice in the affairs of the Rubber Division. Those rubber chemists who have not yet joined the American Chemical Society are urged to do it at once. It needs little argument to show that an organization which has grown to 13,000 members is an organization to be encouraged and assisted in every way possible. An American chemist who does not belong to the Chemical Society is not fair to himself or to the organization, and merely because the journals of the Society are already accessible is no excuse for not joining. The dues of the Chemical Society are \$10 a year and include subscriptions to the three journals published by the Society, viz., "Journal of the American Chemical Society," "Journal of Industrial and Engineering Chemistry" and "Chemical Abstracts."

BY-LAWS.

The by-laws approved by the Council of the American Chemical Society are given below:

ARTICLE I. MEMBERSHIP.

Membership in the Division shall be open to all members of the American Chemical Society and any member of the Society shall, upon request to the secretary of the Division, be registered as a member of the Division.

ARTICLE II. OFFICERS.

Section 1. The officers of the Division shall be a chairman, a vice-chairman, a recording secretary and an executive committee.

Section 2. The chairman, vice-chairman and secretary shall be members of the Executive Committee ex-officio.

Section 3. The chairman of the Division shall be chairman of the Executive Committee.

Section 4. The Executive Committee shall consist of five registered members of the Division and the members ex-officio, provided by Section 2 of this Article.

Section 5. At the first session of the Division coincident with the annual meeting of the Society, and following the report of the secretary, the chairman shall appoint, from the members present at the meeting, a committee of three whose duty shall be to nominate officers for the ensuing year. This committee shall present the list of nominations immediately preceding the election of officers at the last session held during that annual meeting.

Section 6. All officers of the Division shall be elected annually by ballot at the last session of the Division held during the annual meeting of the Society and shall take office at the close of the meeting at which they were elected. They shall hold office for one year or until their successors are elected. Voting by proxy or by letter shall not be allowed.

Section 7. The Executive Committee shall fill any vacancies occurring through death or resignation among officers of the Division.

Section 8. It shall be the duty of the chairman to represent the Division in the Council of the Society, to preside at the meetings of the Executive Committee, to carry into effect the decisions and recommendations of that committee, to preside at stated meetings of the Division, and to report to the Society at its regular meetings.

Section 9. In the absence of the chairman, the duties of the office shall devolve upon the vice-chairman. The vice-chairman shall be ex-officio chairman of the Committee on Research Problems.

Section 10. It shall be the duty of the recording secretary to keep a record of the proceedings of the Division and of the Executive Committee, to maintain a list of registered members, to send to registered members such notices as the business of the Division may require, and to transmit to the secretary of the Society the names of all the officers and standing committees of the Division within three weeks of their appointment; and, in like manner, to notify the secretary of the Society of any change of officers or standing committees during the year.

Section 11. The recording secretary shall be the custodian of the files of the Division. He shall have charge of the funds of the Division and shall make all disbursements, subject to the authorization of the Executive Committee. He shall report to the Division at each annual meeting.

Section 12. The Executive Committee shall conduct the business of the Division and direct its activities. The Committee shall at each general session, and as occasion may require, hold a meeting to consider the affairs of the Division and receive reports of its committees. The voting majority of the Executive Committee shall be responsible for all expenditures which it may authorize, except so far as the action of the Council shall previously have provided for such expenditures.

ARTICLE III. MEETINGS.

There shall be a meeting of the Division at each general meeting of the Society. Business affecting the organization of the Division shall be transacted only at the meeting coincident with the annual meeting of the Society. The order of business shall be as follows:

- Reading of minutes.
- Report of Executive Committee.
- Report of secretary.
- Report of committees and discussions.
- Reading of papers and discussions.
- Miscellaneous business.

And at the annual meeting:

- Appointment of Nominating Committee.
- Report of Nominating Committee.
- Election of officers.
- Unfinished business.

The regular order of business of the Division may be suspended at any session by the consent of three-fourths of the members of the Society present.

ARTICLE IV. SPECIAL COMMITTEES.

The chairman shall with the advice and approval of the Executive Committee appoint from time to time standing committees of the Division to consider, conduct, and report upon such special matters as may be delegated to them.

ARTICLE V. PUBLICATIONS.

The official organ of the Division shall be the "Journal of Industrial and Engineering Chemistry."

The Executive Committee may at its discretion provide for the issue of other non-serial publications for distribution to registered members of the Division or for sale. Such publications must be approved by the Council of the American Chemical Society.

ARTICLE VI. ASSESSMENTS.

The Executive Committee may at its discretion impose dues not to exceed one dollar (\$1) per year upon registered members of the Division, said dues to be collected by the secretary, and the receipts therefrom to be devoted to the purposes of the Division.

ARTICLE VII. AMENDMENTS.

These by-laws may be amended at any annual meeting of the Division by a three-fifths vote of the registered members present, provided two weeks' notice of the proposed amendment with the text thereof has been sent to the registered members of the Division. Amendments to be effective must be approved by the Council and accepted by that body as not inconsistent with the constitution and by-laws of the Society.

¹By John B. Tuttle, assistant chief chemist, Firestone Tire & Rubber Co., Akron, Ohio.

WEIGHTS OF RUBBER TUBING.

By F. L. Pinkham.

THE accompanying table of weights of cylinders of water has been prepared to facilitate the computation of theoretical weights of rubber tubing of one inch outside diameter and smaller. Rubber tubing is usually specified by the inside diameter and wall thickness and the following is an example of the method of using the table:

Required the theoretical weight of 100 feet of tubing 9/32-inch inside diameter by 1/16-inch wall having a specific gravity of 1.77.

Inside diameter of tubing plus twice the wall thickness = 9/32-inch + 1/16-inch + 1/16 = 13/32-inch = outside diameter of tubing. In column "B" we find 13/32-inch and opposite this diameter in column "H" it is found that the weight of a cylinder of water of the same diameter 100 feet long is 5.614213 pounds. In column "H" opposite 9/32-inch it is found that the weight of a cylinder of water of that diameter 100 feet long is 2.691024 pounds. Subtracting the smaller cylinder from the larger we have: 5.614213 - 2.691024 = 2.923189 and this multiplied by the specific gravity, i. e. 1.77, = 5.174 pounds, the required weight per 100 feet. The weight per 100 feet being found, it is of course easy to find the weight of any number of feet.

From this it will be seen that, the specific gravity being given, the theoretical weight of any of the 2016 sizes of tubing within the range of the table may be computed rapidly and accurately.

WEIGHTS OF CYLINDERS OF WATER 100 FEET LONG OF VARIOUS DIAMETERS FROM 1/64-INCH TO 1-INCH INCLUSIVE.

THE INFLAMMABILITY OF GAS BLACK.¹

By Alan Leighton, assistant chemist of the Bureau of Mines.

THE following is an account of inflammability tests made on a sample of gas black submitted to the Bureau of Mines by The B. F. Goodrich Co., Akron, Ohio. It is likely that this gas black was produced by the incomplete combustion of natural gas. The sample was first sent to the coal laboratory for the analysis regularly given to coal dusts which are to be tested for explosibility. The results of the analysis of the sample as received follow:

	Per Cent.		Per Cent.
Moisture	1.66	Fixed carbon	92.04
Volatile matter	6.14	Ash16

It is to be noted from this analysis that the volatile content is very low, also the moisture content. It was impossible to obtain a true size-test since the material balled up and would not pass through the screens. Microscopic examination shows it to be very finely divided.

GENERAL DISCUSSION OF THE EXPLOSIBILITY OF THE DUST.

It has been established in the experimental mine of the Bureau of Mines at Bruceton, Pennsylvania, that a mixture of 200-mesh Pittsburgh coal dust with shale dust, in the proportion of 30 per cent coal to 70 per cent shale, will propagate an explosion. The volatile content of this mixture is about 12 per cent, nearly 100 per cent higher than that of gas black. While this coal dust mixture is about 15 per cent carbon, the gas black is 85 per cent carbon. It is apparent, that if the gas black is explosive, its explosive properties will be due to the finely divided carbon rather than to the volatile content. Generally speaking, the finer a dust, the more easily it is ignited. In connection with certain factory explosions, C. Engler² has recorded experiments on the inflammability of soot. He could not explode a mixture of air and soot, but found that a mixture of gas and air otherwise non-explosive could be made to explode by introducing a soot cloud.

EXPERIMENTAL WORK.

To get a relative idea of the inflammability of the dust, a cloud was blown from a glass tube across the flame of a Bunsen burner. No inflammation was obtained, the particles directly in the flame appeared to burn. This seemed to indicate that considerable difficulty would be encountered in getting an ignition of the dust.

Tests were then made with the Clement-Frazier apparatus. This apparatus (described in Technical Paper 141 of the Bureau of Mines) consists essentially of a small electrically heated platinum coil within a glass globe. In it a sample of dust is blown up against the coil, and the pressure of the explosion, as recorded by a pressure-indicator, is taken as an index of the inflammability of the sample. In this case, 100 and 300-mg. samples of the gas black were projected up against the coil, and in spite of the fact that the coil was heated to 1200 degrees C., no inflammation took place. This test cannot be regarded as conclusive, for, although this apparatus has been found to be very efficient in testing highly inflammable coal and other dusts, it has failed to ignite a number of dusts undoubtedly

¹Published by permission of the Director of the Bureau of Mines.²C. Engler, "Engineering News," volume 14, 1885, page 299; "Abstract Journal," Society of Chemical Industry, volume 8, page 171.

very inflammable. This was the case, for example, with aluminum dust (see Technical Paper 152 of the Bureau of Mines). Probably the failure to ignite these dusts is due to the fact that the heat coil has too little heat capacity to heat the dust sufficiently in the short time of contact. Experiment seems to justify this explanation, since aluminum dust, when poured into or blown across a small earthenware dish heated to 800 degrees C. has been found to ignite readily, with a blinding flash. This latter test was tried with the carbon black, but, when poured into a dish heated to 1100 degrees C., this dust gave no ignition whatever.

There is being developed in the Pittsburgh laboratory a dust explosion gallery in which it is hoped that the explosibility tests at the experimental mine can be duplicated. The gallery is not yet completely standardized, but the work has been carried far enough so that tests of finely divided dusts can be made. In this gallery a prearranged dust cloud is formed by the explosion of a small charge of powder which blows the dust into the gallery from a number of jets arranged throughout the length of 14 feet. A second powder shot ignites this dust cloud. Very inflammable dusts are ignited by a quiet flame produced by the burning of ten grams of rifle powder piled loosely on the floor of the gallery at the rear. Dusts not so inflammable can be ignited under high pressure in the gallery. This pressure is obtained by stopping down the front end of the gallery and greatly increasing the force of the powder shot through loading the powder into a small cannon.

It was found that the gas black would easily ignite and readily propagate a flame under the conditions first described, when the gallery was loaded with 12-gms. per cubic foot of space. This easy ignition was probably due to the fact that the concussion of the dust-raising shot separated the gas black and caused a good mixture with the air.

Experiments were then conducted to determine the amount of shale dust which it was necessary to add to the gas black to make it non-explosive under the conditions at the experimental mine. This was done in order to make a comparison of its explosibility with that of Pittsburgh coal dust. By using the second method outlined for the experimental gallery, it was found that a mixture of 60 per cent by weight shale dust and 40 per cent gas black would just fail to explode under mine conditions. Since the corresponding mixture of shale dust and coal dust is 75 per cent shale and 25 per cent coal, the gas black appears to be nearly as inflammable as coal dust, if the right conditions are obtained for its ignition.

SUMMARY OF CONCLUSIONS.

The above experiments show clearly that the sample of gas black is not easily ignited, but that, if conditions are right for ignition, it is very explosive. In other words, the gas black can be classed with dangerous factory dusts.

COMMITTEE ON STANDARDIZATION OF PHYSICAL TESTS OF RUBBER GOODS APPOINTED.

J. B. Tuttle, chairman of the Rubber Division of the American Chemical Society, announces the following Committee on the Standardization of Physical Tests of Rubber Goods:

Professor H. E. Simmons, University of Akron, Akron, Ohio, chairman; Earl L. Davies, The Goodyear Tire & Rubber Co., Akron, Ohio; W. W. Sanders, Empire Rubber & Tire Co., Trenton, New Jersey; Joseph H. Russell, Rubber Regenerating Co., Naugatuck, Connecticut; Helen C. Gillette, Prest-O-Lite Co., Indianapolis, Indiana.

NEW YORK TO HAVE LIBERTY LOAN PAGEANT OCTOBER 24.

The Publicity Department of the Liberty Loan Committee of New York has established a Parade Pageant Bureau to arrange for a pageant parade under the auspices of the committee on October 24.

The object of the parade is to symbolize the various elements that make up American life.

All merchants and manufacturers are invited to get in touch immediately with the Parade Pageant Bureau.

A DETERMINATION OF THE RATE OF SETTLING OF 200-MESH LEAD OXIDE IN RUBBER CEMENTS.

By S. Albert Kaufman, S.R.

ALTHOUGH a large percentage of the particles in 200-mesh lead oxide (litharge) would have a diameter less than the opening of a 200-mesh screen, which is 0.074 mm., yet by assuming that all the particles have a diameter equal to the opening mentioned above, the worst possibility is taken into consideration, consequently working in a factor of safety into the calculations.

The formula which enables us to calculate the desired result is the so-called Stokes' formula.

$$v = \frac{2R^2(S-S')G}{9\eta}$$

Where

v = Settling velocity in cm. per second.

R = Radius of particle = 0.037 mm.

S = Specific gravity of particle = 9.39.

S' = Specific gravity of liquid = 0.74.

η = Viscosity coefficient of the liquid.

G = Gravity constant = 980.

Before calculating v, the coefficient of viscosity of the cement was necessary. This was easily obtained by means of the following formula:

$$\eta = \frac{\pi Pr^4}{8 l V}$$

P = Difference in pressure between top and bottom of the tube.

r = radius of the tube.

l = length of the tube.

V = volume per second passing out of the tube.

η = coefficient of viscosity.

The viscosity coefficient for water being known as .001, that for our cement could easily be determined by means of a burette and stop-watch, whereby V could be found for both water and the cement. After correcting P for the specific gravities of water and cement, η for cement was readily determined.

25 cc. of water passed through the burette in 13 seconds.

25 cc. of cement passed through the burette in 634 seconds.

$$V, \text{ water} = \frac{25}{13} = 1.925 \text{ cc. per second.}$$

$$V, \text{ cement} = \frac{25}{634} = 0.039 \text{ cc. per second.}$$

$\frac{\pi Pr^4}{8 l V}$	P cem.	0.74
$\eta \text{ cement}$	V cem.	0.039
$\frac{\pi Pr^4}{8 l V}$	P H ₂ O	1
$\eta \text{ water}$	V H ₂ O	1.925

$\eta \text{ cement} = 0.361$.

Substituting this value in Stokes' equation.

$$v = \frac{2R^2(S-S')G}{9\eta}$$

$$= \frac{2 (0.0074)^2 (9.39 - 0.74) 980}{9 (0.361)}$$

$$v = 0.071 \text{ cm. per second.}$$

$$v = 255 \text{ cm. per hour.}$$

New Machines and Appliances.

A NEW CRUDE-RUBBER WASHER.

FROM the Far East comes a mechanical development in washing-machine construction that owes its origin to the needs of rubber planters for an efficient rubber-scrap washer. For several years this machine has given satisfactory results in washing the various grades of plantation scrap and now

THE U. E. RUBBER WASHER.

it is being used in rubber factories in England for washing Pará, Africans, Centrals, Manicobas, and in fact all kinds of material containing crude rubber.

The mechanical principle involved is that of pressing the rubber across a closely perforated steel grating during the milling operation, the design of the grating permitting the ejection of impurities while the rubber is retained. The arrangement of the disks, division plates, and steel cutters that cut and disintegrate the rubber is shown in the illustration. The rotar shaft, disks, and collars, *A, B, and C*, respectively, are made in one solid casting, the removable steel cutters *D* being attached to the back-plate. Other principal parts comprise the division plates *E*, that are cast solid with the back-plate, a three-sectioned grating *F*, hopper *G*, water seal bearings *H*, outer bearings *I*, gear wheel and pinion *J* and *K*, friction clutch *L*, driving shaft *M*, and water spray fitting *N*. (United Engineers, Limited, Singapore, Straits Settlements.)

THE ALLEN TWELVE-INCH TUBING MACHINE.

Insistent demands from rubber manufacturers for larger production and greater efficiency in forcing machines have resulted in marked development in the American tubing machine. The accompanying illustration shows an example of the large size and improved construction that are necessary to meet the requirements of modern rubber mills.

It is a 12-inch machine, driven by a three-bearing motor with a raw-hide pinion and wide-gear faces, insuring quiet operation.

A TWELVE-INCH TUBER.

Vertical gearing has been eliminated and the shafts are carried in ring-oiled bearings. The low type of design facilitates feeding, the center of the machine being 33 $\frac{3}{4}$ inches above the floor

and the top of the feed box, 13 $\frac{1}{2}$ inches higher. The importance of this point can be realized when it is known that a 10-inch machine running on double tread solid tires has a capacity of 165,000 pounds per day. The rubber when entering this machine has a temperature of about 80 degrees C. and tests have shown an increase of only 5 degrees C. in the finished product. This efficiency is due to the improved method of regulating the temperature of the cylinder and worm.

The machine is also built for use as a strainer, having a double strainer 13 $\frac{1}{2}$ inches in diameter by 17 inches long.

The 12-inch machine weighs 27,000 pounds and occupies a floor space of 6 feet 3 inches by 12 feet 8 inches. Motor of from 75 horse-power to 100 horse-power is required, depending on the speed of the machine and the class of work to be produced. (Allen Machine Co., Erie, Pennsylvania.)

A ROTARY HAND-PUMP.

The manufacturer who has liquids in bulk will appreciate the convenience of this rotary pump for emptying barrels or transferring from one container to another. Discharge may be taken at the pump for filling oil cans or vessels or may be carried through hose to vats or tanks. When the pump is intended for use with steel drums having threaded bungs, a special bung-holder is furnished to order, this holder being conical and with a taper thread suitable for any usual bung tapping.

Each outfit is furnished complete with suction pipe, adjustable bung-holder, hose coupling and tank hook as illustrated. Hose

THE RUMSEY PUMP.

is not regularly included but can be supplied to order in any length desired. (Rumsey Pump Co., Ltd., Seneca Falls, New York.)

PERFECTED NEW MODEL STEAM VULCANIZER.

Retreading casings and providing for plain, ribbed and non-skid treads, by the use of specially designed molds, is the province of the vulcanizer here pictured.

This machine is equipped with an aluminum non-skid or ribbed-tread matrix and a radiating insulated flange to protect the tire from over-curing at the laps. It has a self-contained boiler and is also equipped with steam safety valve and gage. There are three models, H, K, and L. With its use, it is claimed, the tire man is able to rebuild an old casing into an apparently new tire, adding from 2,000 to 5,000 additional miles at a very nominal cost. (Wilkinson Vulcanizer Manufacturing Co., San Bernardino, California.)

A NON-SKID RETREADING VULCANIZER.

MACHINERY PATENTS.

MACHINE FOR PRESERVING PRESSURE IN TENNIS BALLS.

CONTAINERS for tennis balls and other objects containing fluid under pressure are sealed under pressure by this machine. Each object is placed in a container having a fluid inlet opening, and the containers are placed in a common chamber supplied with fluid under pressure, the containers being sealed hermetically when the required pressure is reached. As shown, the containers 9' for the balls 9 are placed on a movable platform 7 in an annular chamber 1 adapted to be closed by a hinged door. Fluid under pressure is introduced into the chamber through pipe 21 having a valve 23 and a pressure gage 24, the fluid entering the containers through an opening 35 over which is placed a disk 36 of solder. The disks of solder on the containers are fused in succession, as the platform 7 is rotated, by an electrically-heated soldering-iron 32 movable through a resilient washer 33 in a dome 31 provided with an electric lamp 38 and a window. When the soldering is completed, the pressure in the chamber is released and the containers are removed through the hinged door. (F. W. Stockton, 3132 Avalon street, Pittsburgh, Pennsylvania. British patent No. 122,483.)

MACHINE FOR PRESERVING TENNIS BALL PRESSURE.

MACHINE FOR VULCANIZING RUBBER ARTICLES.

This invention provides means for closing the openings in hot-water bottles through which the core has been removed. The illustration is a side-elevation of the central cross-section of the machine that may be made of suitable length for simultaneously curing a number of articles.

In operating this machine the movable platens A and B are separated from the stationary platen C, by means of hand-wheels D and E. Steam being applied to the platens, the bottles are suspended, mouth downward, on dowel pins arranged on both sides of the central platen.

HOT-WATER-BOTTLE VULCANIZER.

The movable platens are then brought in contact with the central platen whereby the bottle-ends are cured by heat and pressure. (Jeremiah L. Mahoney, New Haven, assignor to The Goodyear's India Rubber Glove Manufacturing Co., Naugatuck—both in Connecticut. United States patent No. 1,295,087.)

THRIFT AMONG RAYBESTOS EMPLOYEES.

The Raybestos Savings Club is a novel scheme inaugurated by the Raybestos Co., Bridgeport, Connecticut, its object being to promote thrift among employees and to get a better and more nearly permanent class of men and women operatives for the company. The plan is to deduct from 50 cents to \$2 per week, as the worker elects, from each weekly pay envelope to be placed to his account in a local bank. The money will not only draw the regular savings bank interest, but at the end of every year the Raybestos Co. will also pay to each worker who has saved 50 cents or more every week an additional 10 per cent of the total amount. About 75 per cent of the employees of the company are taking advantage of the plan, their savings averaging about \$2 per week per person.

New Goods and Specialties.

RUBBER-FINISHED VACUUM BOTTLE.

THE handicaps of the ordinary type of vacuum bottle are said to be overcome in the type shown here. Instead of fragile glass, the bottle is made with non-breakable welded steel vacuum walls. The usual glass filler or container is done

THE "FERROSTAT."

away with and its place is taken by a highly glazed flexible enamel fused to the steel shell. There are, therefore, no removable parts but the cork and the cup which forms the cover. There are also no unsealed openings at the neck, into which liquids may leak. The type of bottle shown in the accompanying illustration is surfaced with dull-black rubber composition applied to the steel and baked. Another style is finished in nickel and a third has a tan leather covering. The cup on all is heavily nickel-plated, and only first-class materials are used throughout. The bottle is made in one and two-quart sizes, the latter being successfully possible because of its non-breakability. Liquids may be kept hot for 20 hours and cold for over 40, it is claimed, by the use of the "Ferroatat" non-breakable bottle, as it is called. The one-quart size weighs approximately 2¾ pounds and the two-quart, 4¼. (Stanley Insulating Co., 43 Exchange Place, New York City, and Great Barrington, Massachusetts.)

TOY SUBMARINE.

A new toy submarine is one of the recent developments of the toy-makers. It is constructed of metal and has a motor made of a rubber band which is easily replaced. By a simple adjustment, the submarine can be made to run on top of the water or submerged, straight ahead or in circles. It will dive and rise to the surface, and shoot a projectile from the gun on its deck. (American Toyland Creators, Inc., Brooklyn, New York.)

U. S. 7 DIVING SUBMARINE.

A STEEL-CORED GOLF BALL.

A new golf ball has been devised which, it is claimed, goes straight when started straight, due to its perfect roundness and a steel core in its exact center which thereby provides a fixed center of gravity. Air chambers or indentations on the surface, arranged according to a scientific plan, offer a minimum of resistance to the wind. The outer covering is of rubber and is tough and durable as well as resilient. The ball is one of the products of the mechanical goods division of the United States Rubber Co. (Thomas E. Wilson & Co., Chicago.)

U. S. "NOBBY" GOLF BALL.

"SAFEPAK KREPEKRAFT" FOR WRAPPING TIRES.

An elastic tire-wrapping paper, put up in narrow strips suitable for winding around tires so as to conform to their shape and make an absolutely smooth wrapping, is waterproof and made in colors to add to the attractiveness of the package. (Safeback Mills, 727 Atlantic Avenue, Boston, Massachusetts.)

A ONE-RUBBER DENTURE.

The latest development of rubber for dental use has resulted in what is known as pink denture rubber. Because of the difficulty formerly experienced in obtaining a natural-looking pink rubber that was also sufficiently resilient and strong enough to hold the pins of artificial teeth, it was usual to employ a base-plate rubber of red, maroon, brown, or some other color, and veneer it with another rubber nearer the color of the gum tissue but not having the qualities required in the base plate. The new "pink denture rubber" shown in the accompanying illustration possesses tensile strength, density, and resilience, as well as the natural pink color of the gums throughout. It is easily packed by hand in the unvulcanized state, and vulcanizes and polishes by the ordinary methods. Varying tones of pink can be obtained by exposing the finished plate to sunlight, the process being called solarization. Of this rubber, the entire plate can be made in one piece. The illustration shows a denture made in this way, from which half of the porcelain teeth have been removed by dissolving the rubber, the object being to show the retention of the tooth pins and how the teeth are surrounded at the points of attachment by the one homogeneous plate of rubber. The material used in the manufacture of this denture is first latex crepe. (The S. S. White Dental Manufacturing Co., 211 South Twelfth street, Philadelphia, Pa.)

PINK DENTURE RUBBER.

ANOTHER RESILIENT WHEEL.

Here is shown a wheel which has six rubber cushions arranged in steel frames around the hub. Through these cushions all shock is transmitted and the load "floated." The frames are covered with a steel plate that is riveted to the felloe band, and this band is made to S. A. E. dimensions to permit the use of

JAXON FULL-FLOATING WHEEL.

any standard make of solid rubber tires on the outside. These wheels are said to give greater speed and mileage with less fuel, fewer repairs, and decreased tendency to skid. (Jaxon Steel Products Co., Detroit, Michigan.)

Activities of The Rubber Association of America, Inc.

WAR SERVICES OF RUBBER ASSOCIATION RECOGNIZED BY WAR TRADE BOARD.

THE WAR TRADE BOARD adopted the following resolution of thanks to The Rubber Association of America for valuable services rendered during the war:

RESOLVED, That the War Trade Board hereby extend their thanks to the Rubber Association of America, and to its officers, members and employees, for the valuable services which they have rendered to the War Trade Board during the war; and the War Trade Board do hereby further express their full appreciation of the able, efficient and conscientious manner in which said organization, its officers, members and employees, have cooperated with the Bureau of Imports in the administration of the Import Regulations of the War Trade Board;

FURTHER RESOLVED, That the secretary of the Board is hereby instructed to transmit a copy of these resolutions to The Rubber Association of America.

ADDITIONAL RUBBER MANUFACTURERS AGREE TO THE CRUDE RUBBER CHARGE.

Supplementing the list published in our last issue, the following manufacturers have since signed the agreement to pay the Rubber Association three cents per 100 pounds on all crude rubber purchased by them.

Advance Rubber Co., The. Oak Rubber Co., The.
Gregory Rubber Co., The. Owen Tire & Rubber Co.
Lion Tire & Rubber Corp., The. Porter Rubber Co., The.
Western Reserve Rubber Co., The.

FIRM AND ASSOCIATE MEMBERS ELECTED.

At the meeting of the Executive Committee, held February 21, 1919, the following members were elected:

SPECIAL COMMITTEE INVESTIGATING FEDERAL EXCISE TAXES.

At a joint meeting of the Executive Committees of the Pneumatic and Solid-Tire Divisions held in New York City, the following committee was appointed to investigate fully the provisions of the new federal excise tax on tires, tubes, parts and accessories:

Charles Neave, chairman, counsel of The Rubber Association of America; J. C. Weston, United States Tire Co.; Kennedy M. Thompson, United States Rubber Co.; Bernard M. Robinson, Firestone Tire & Rubber Co.; F. C. Van Cleef, The B. F. Goodrich Co.; C. L. Landon, The Goodyear Tire & Rubber Co., and W. B. Stratton, The Fisk Rubber Co.

ASSOCIATION NOTES.

The Outing Committee is working on the plans for the mid-summer outing that will be held June 17, 1919. Details of the program and place of meeting will be published later.

Louis V. Keeler has returned from the West after a successful business trip in the interests of the Association.

The Government has thousands of motion-picture reels and photographs taken during the war, covering every achievement that led to victory. By means of a projection machine they may be brought to every rubber mill and shown free to the people. Apply to the Bureau of Education, Washington, D. C., for particulars.

Eighty-five per cent of the firm members have signified their willingness to support the plan, published in our last issue, for collecting statistics of the rubber industry.

The Traffic Division has sent out an important circular of the United States Railroad Administration relating to the change in the export and domestic seaboard terminal control of permits which has superseded the former North Atlantic ports traffic committee.

A new circular has been issued by the Great Lakes Transit Corp., respecting the opening of navigation and the establishment of rates by this company.

CENTRAL AND SOUTH AMERICAN RUBBER STILL UNDER LICENSE.

The general import license, known as PBF No. 36, effective April 7, 1919, and covering the importation of many commodities into the United States from Mexico, Cuba, Haiti, Santo Domingo, and all countries of Central and South America, except British and French possessions, does not include rubber. As heretofore, rubber from these countries will be licensed freely for import when the applications therefor are otherwise in order.

Importations from British and French possessions in Central and South America are covered by General Import License PBF No. 34.

AMENDMENTS TO FREE LIST.

The War Trade Board announces, effective April 22, 1919, the following amendments of the revised free list (W. T. B. R. 648, March 15, 1919,) for Denmark, Norway, Sweden, European Holland, Switzerland, Finland, Luxemburg, and the occupied Rhine territory: The item beginning "Fancy goods of paper, ivory, mother-of-pearl," etc. has been amended to include xylonite, ebonite and vulcanite.

TWENTY-FIRST ANNIVERSARY BANQUET, RUBBER SUNDRIES MANUFACTURERS' DIVISION.

THE twenty-first annual banquet of the Rubber Sundries Manufacturers' Division of The Rubber Association of America, was held at the Hotel Biltmore, New York City, on the evening of April 23, 1919. The banquet hall was elaborately decorated with flowers and exotic plants in artistic profusion. A sunken garden and pool with live fishes and aquatic plants occupied the table center. Popular melodies were sung by colored jubilee singers while the menu was served. The guests of honor were H. E. Raymond and Henry C. Corson, and the toastmaster, C. J. Davol, who introduced the various speakers with fitting remarks. A silent standing toast was drunk to George F. Hodgman, H. C. Burton, Joseph Davol, and other deceased members.

Edward E. Huber gave an interesting history of the Rubber Manufacturers Association's activities from the first meeting, held September 9, 1898, at the Fifth Avenue Hotel, New York City, until its merger with The

Rubber Association of America. A vote of thanks was given to Mr. Huber at the conclusion of his address.

Henry C. Corson spoke of the days when the rubber industry was young, recalling older meetings, in a delightfully reminiscent manner. Since retiring from the rubber business "to make room for the younger generation," he has found that the philosopher's stone for keeping young is to be interested in helping others.

H. E. Raymond was eloquent, as always, and said that he was one of the younger generation alluded to by the previous speaker, and next year he would retire, like Mr. Corson, to make room for the younger generation.

The other speakers included George B. Hodgman, F. H. Jones, W. H. Balch, W. S. Davison, and H. A. Bauman.

Letters of regret were read from Homer E. Sawyer, president of the Rubber Association of America, and Henry C. Pearson, editor of THE INDIA RUBBER WORLD.

Thus closed one of the most interesting and enjoyable meetings known to members of the Rubber Sundries Division. A list of those present follows:

E. E. HUBER.

H. C. CORSON.

TWENTY-FIRST ANNIVERSARY BANQUET OF THE RUBBER SUNDRIES TRADE.

C. J. Davol, Davol Rubber Co.
Henry C. Corson, honorary member Sundries Division.
H. E. Raymond, The B. F. Goodrich Co.
George B. Hodgman, Hodgman Rubber Co.
F. H. Jones, Tyer Rubber Co.
J. Russell Parker, Parker, Stearns & Co.
T. W. Miller, Faultless Rubber Co.
W. H. Balch, Faultless Rubber Co.
I. W. Miller, Faultless Rubber Co.
C. E. Campbell, Faultless Rubber Co.
H. A. Bauman, The B. F. Goodrich Co.
P. R. Westley, Davol Rubber Co.
S. T. Hodgman, Hodgman Rubber Co.

W. G. Brewer, Hodgman Rubber Co.
J. W. Kuhne, Hodgman Rubber Co.
Eberhard Faber, Eberhard Faber Rubber Co.
E. Lothar Faber, Eberhard Faber Rubber Co.
Lothar W. Faber, Eberhard Faber Rubber Co.
Edward E. Huber, Eberhard Faber Rubber Co.
W. S. Davison, The Miller Rubber Co.
Lloyd P. Jones, Canton Rubber Co.
S. H. Jones, United States Rubber Co.
W. L. Pitcher, Easthampton Rubber Thread Co.
H. H. Reddy, Whitall-Tatum Co.
Frank L. Williams, Tyer Rubber Co.
W. Dudley Yates, Tyer Rubber Co.

Harry S. Vorhis, The Rubber Association of America.

Interesting Letters From Our Readers.

PLANS SUBMITTED TO THE GOVERNMENT.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—Now that the war is over, I want to say a bit about what I have tried to do to help. You know, of course, of my boy who went "Over There" and did his bit. As I was beyond the draft age I tried to use my rubber knowledge for my country. I am, therefore, sending two plans that I submitted. I do not know whether or not they were useful, but anyhow, Uncle Sam knows I tried.

PROTECTION OF THE GASOLINE TANK ON BATTLEPLANES.

This device provides for the protection of gasoline tanks by using rubber sheets that will vulcanize to varying degrees of hardness, thus forming a body of rubber which, when applied to the tank, will prevent the rapid loss of gasoline if the tank is punctured. This quality is due to the fact that rubber as described is not only hard to penetrate, but when penetrated by a bullet a very small hole is left and by the use of rubber of varying degrees of hardness and density the hole will close up and prevent the escape of the gasoline in the tank.

I have also provided additional protection against inflammable bullets by the use of asbestos wool or fiber, which is placed outside of the rubber protection, as it seems reasonable that the action of the asbestos on the bullet will be to nullify its action to a very great extent. The rubber will also assist in this action.

It is also my purpose to have the rubber protector vulcanized in such a manner that it will be compressed when it is applied to the tank, as this will assist in the desired action.

PROTECTION OF VESSELS AGAINST DAMAGE BY SHELLS AND TORPEDOES.

If a sheet of rubber of suitable thickness and density was placed between the plates of a vessel at the proper distance above and below the water line, and, if necessary, running all around the hull, it would prevent the shattering of the plates when struck by a shell or torpedo and so prevent the loss of the vessel. It is a well-known fact that rubber will not shatter from the force of explosives, as does iron or steel, and it is this fact that will prevent the loss of the ship when hit by shells or torpedoes.

In the application of this plan rubber sheets of a suitable thickness provided with holes for rivets are placed on the hull of the vessel. Then over the rubber is placed a suitable thickness of steel plates which are then riveted through the holes to the hull. This method of protection can also be applied to any vessel already built. Another method of applying the rubber would be to have the rubber sheets molded with a series of cells, the thickness of these cells being about three inches. They can be applied to the vessel in the same manner as first described. These cells would have a tendency to absorb the shock of a shell or torpedo especially, as it is a fact that air is a very great absorber of shocks. These cells would be filled with air at atmospheric pressure, but when struck by a shell or torpedo would be compressed at the point of contact and absorb the shock.

Sincerely,

WILMER DUNBAR.

Greensburg, Pa.

THE FIRST TUBING MACHINE.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—This is the story of the first tubing machine: One day in August, 1876, a man walked into the office of the late C. B. Dickinson, at the Brooklyn Rubber Works, 349 Adams street, Brooklyn, New York, and asked for a place. He said he had worked for the National Rubber Co., Bristol, Rhode Island. He was hired and after working some weeks he told my father, Andrew E. Cabona, who was superintendent, that he had an idea for a machine that would revolutionize the rubber business. After some talk he disclosed the idea of a tubing machine. Everyone laughed and thought he was crazy, but he kept at it so long that my father looked into the matter and got him to make a rough drawing of the machine. After some hard work the drawing was made and was shown to Mr. Dickinson, who said the man was crazy. Thus the matter was dropped. One day a man by the name of Lafin, who had a place of business on Ann street, New York, and who did work for the firm,

dropped in and was shown the drawings, and was asked his opinion. He examined them very carefully and said that the idea was practical. He was told to go ahead. The result was the first tubing machine in the United States. It was a very crude machine, geared like a mill, so that it was thrown on a shaft by a clutch. The driving wheel weighed about 1½ tons and went very slowly. Six lengths of tubing were run at one time and a solid 3¼-inch cord could be driven out. Now, coming down to the machine shown in THE INDIA RUBBER WORLD January 1, 1919, on page 191, some time after it was running, the late Francis H. Holton, who had been a partner of Mr. Dickinson, and was in business at the foot of Adams street, Brooklyn, secured a set of drawings of the machine and changed it so that only a slight, frail machine was made, run by a belt, as all such machines are today. I recognized it as soon as I saw the picture in your paper. I don't know where the late William Kiel heard of the machine, but I know this, that he never invented the tubing machine. The man who invented the machine was John Prior, the man to whom C. B. Dickinson gave a job. The man who gave the idea never derived a cent from his invention; what he got was a job which he afterward lost through his own fault. A good many men in the rubber business think the idea of the machine was taken from a macaroni press. It was not; it was developed from the machine that makes lead pipe.

Yours truly,

Brooklyn, New York.

E. A. CABONA.

JUDICIAL DECISIONS.

ROSSBACK, ET AL. VS. THE MANSFIELD TIRE & RUBBER CO.—Court of Appeals of New York, November 19, 1918.

The Mansfield Tire & Rubber Co. contracted for the purchase of two lots of rubber, on one of which two tons were delivered and paid for, when the balance of the shipments were deferred at the purchaser's request. No deliveries were made on the second contract, as these shipments were also deferred. Rossback claims that the Mansfield people repudiated the contracts, to which the latter answered that the shipments were deferred by agreement and when they were later demanded, they were refused. The Appellate Division of the Supreme Court decided for the Mansfield people and the Court of Appeals affirmed that decision. (Northeastern Reporter, Volume 121, page 888.)

CUSTOMS APPRAISER'S DECISIONS.

Protest 926,439.—On April 4, 1917, F. W. Myers & Co., acting as agents for the Maxwell Motor Co., made an entry of 250 sets of automobile tires and tubes imported at Port Huron, Michigan. The summary attached to the invoice was O.K'd, as to value, by the appraiser and forwarded to the collector. Four days later the appraiser requested the return of the papers and changed the original summary, which had been permanently attached to the papers, for one prepared by the deputy collector, upon which a notation was made saying that the invoice was incorrect without intent to defraud, and reappraising the value, increasing it 10 per cent. This was forwarded to the collector on June 21. The protests on reappraisal and re-appraisal did not nullify the illegality of the appraiser's changes. The protest was sustained and the duties were payable only on the amount of the original appraisement. (Treasury Decisions, Volume 36, No. 11.)

Protest 851,767, of Pitt & Scott (New York). RUBBER WASHERS.—Rubber Washers used in fitting gage-glasses to steam boilers, classified as manufactures of hard rubber dutiable under

paragraph 369, Tariff Act of 1913, at 25 per cent. ad valorem were held dutiable at 10 per cent. as manufactures of india rubber or gutta percha under paragraph 368, possessing flexibility, resiliency and capable of withstanding great heat. (Treasury Decisions, Volume 36, No. 11.)

Protests 930,688 and 931,161, of William F. Mullen, New York City. GUTTA PERCHA—INDIA RUBBER.—Gums invoiced as gutta hangkang, gutta katiau, gutta doerian, gutta teweh, and gutta siak, classified at 10 per cent. ad valorem under paragraph 385, Tariff Act of 1913, were held free of duty as gutta percha or india rubber under paragraphs 502 and 513. A protest claiming free entry under various paragraphs, but omitting 502, was held sufficient. (Treasury Decisions, Volume 36, No. 14.)

Protest 930,116, of Thomsen & Co., New York City. BASEBALLS, TENNIS BALLS, TOYS.—Baseballs and tennis balls classified as toys at 35 per cent ad valorem, under paragraph 342, are claimed dutiable as manufactures of india rubber at 10 per cent., under paragraph 368, as manufactures of grass straw and weeds at 25 per cent., under paragraph 266, or as manufactures of cotton at 30 per cent. They were found to be of chief value of cotton, used by adults as well as children, and so held dutiable under paragraph 266. (Treasury Decisions, Volume 36, No. 10.)

DECISIONS OF COMMISSIONER OF PATENTS.

EX PARTE AMERICAN RUBBER CO. Decided November 20, 1918. Trade-Marks—"Sealhyde," for carriage cloth—descriptive.

The word "Sealhyde" as applied to a carriage-cloth which is an imitation leather formed of textile treated with waterproof material, held descriptive, and therefore not registerable.

EX PARTE UNITED STATES RUBBER CO. Decided December 9, 1918. Trade-Marks—Government insignia.

The prohibition against the registering of a mark comprising government insignia is not avoided because the letters happen to be part of the initials of the name of the applicant, and a mark consisting of the letters "U S" written on a disk with other relatively insignificant marking, is not registerable.

FEDERAL TRADE COMMISSION DECISION.

FEDERAL TRADE COMMISSION vs. E. P. JONES, S. A. PAUL, IRON-CLAD TIRE CO., INC., QUEEN RUBBER CO., INC., OVERROAD TIRE CO., INC., WORTH-MORE TIRE CO., INC.

The Federal Trade Commission found in its investigation of the affairs of the above corporations that E. P. Jones owns the majority of the stock and has the controlling interest in all of them. S. A. Paul, the other personal defendant, has sold his entire interest and is no longer connected with them. They are all New York corporations and deal in rebuilt and reconstructed automobile tires which are purchased in states other than New York and so are engaged in interstate commerce.

The tires sold by the respondents are rebuilt and reconstructed from partially used and discarded tires and are constructed substantially as follows: the fabric used to a great extent is known as Egyptian or Sea Island, taken only from carefully selected, partially worn, standard make tires. This fabric is carefully examined, repaired, buffed, and cleaned, and is given several coats of high quality vulcanizing cement. To reinforce and strengthen the tire a reliner is then added. The cushion and tread stock consisting of pure rubber, reclaimed rubber, and chemicals in proper proportion are then added, and the tires cured in steam vulcanizers.

The tires thus remade were originally of various makes and brands, the marks of which were effaced and others substituted. The new names have a tendency to mislead the purchaser into believing them to be manufactured from new and unused materials. These tires were advertised so as to guarantee a service of 4,000 miles and that if they failed they would be replaced at one-half the price paid, thus giving the impression that they would last 4,000 miles.

The Commission found that they were violating the Act of Congress of September 26, 1914, giving power to the Federal Trade Commission to regulate unfair competition in interstate commerce. It therefore ordered the respondents to cease circulating advertisements which would tend to create the belief among the consumers that the tires offered for sale are made of new and unused materials, and that the respondents must plainly mark them to show that they are remanufactured tires. (Federal Trade Commission, Docket 243, March 26, 1919.)

PATENTS AND TRADE-MARKS IN THE CZECHO-SLOVAK REPUBLIC.

A law for the protection of patents and trade-marks in the Czech-Slav State was passed in Prague under date of October 28, 1918. By virtue of this law all patents and trade-marks registered in the Austrian Empire will apply to the Czech-Slovak State, but it will be necessary at a later date to proceed and file certified copies of such patents and trade-marks at Prague.

At first the former Austrian laws concerning commercial invention rights (patents, trade-marks, and designs) will remain virtually unchanged. A complete revision of the trade-mark law is being planned and will be effected at a later date. This revision will satisfy all modern demands.

The Czech-Slovak patent office will attend to the official control of the registration of trade-marks and granting of patents and of all matters relating thereto. It will be patterned along the lines of the Vienna patent office and will have departments for applications, complaints, nullifications, etc. As the Czech-Slovak patent office is taking a great many experienced jurists and technical men from the former Imperial patent office at Vienna, it will be in working order from the very beginning.

There will be maintained, together with the patent office, a Czech-Slovak patent court which will take charge of appeals from the nullification department.

The transition decisions will be of special interest and will be substantially as follows:

Patents granted in the past by the Vienna patent office as well as those granted in the future thereby, will not be in force in the Czech-Slovak State.

If a Vienna patent is to be made valid in the Czech-Slovak State, it must be applied for separately at the Czech-Slovak patent office. The application must be accompanied with a certified copy of the Austrian patent and the application will then be regarded as issued by the Czech-Slovak office. The current and following yearly taxes will have to be paid at the Prague office.

Austrian patent applications not yet acted upon by the Vienna office or still pending therein, will probably require a special registration in Prague, the priority date of filing in Austria being granted.

ANNUAL REPORT OF THE KELLY-SPRINGFIELD TIRE CO.

The annual report of the Kelly-Springfield Tire Co., Jersey City, New Jersey, shows that notwithstanding the difficulty of procuring raw materials, labor and transportation, and the curtailed output by governmental regulation, business largely increased during 1918. The net earnings, amounting to \$4,365,227.14, were the greatest in the history of the company, but are subject to heavy income and excess profits taxes. The balance sheet of December 31, 1918, shows a general surplus of \$9,197,858.19.

The outlook for the present year is excellent, the capacity of the various plants is taxed to the limit, and steps are being taken to provide means for increased production.

The Carolina Tire & Accessory Co., Columbia, South Carolina, has increased its capital from \$15,000 to \$50,000, of which \$25,000 is paid in. The company deals in wholesale automotive and shop equipment and no longer handles tires.

NEW TRADE PUBLICATIONS.

THE HANDLING OF COAL AND ASHES IN LARGE MANUFACTURING plants, as well as heavy materials such as cement, sand, ore, etc., is the subject of Book No. 220, published by the Link-Belt Co., Chicago, Illinois, which is devoted to description and illustrations of the Peck carrier in its various modifications for the individual needs of such manufacturing establishments. The book, of nearly 100 pages, shows many diagrams and photographs, and gives the names of plants in which the carrier is installed, among which are several rubber companies and other concerns in allied trades.

THE RAYBESTOS CO., BRIDGEPORT, CONNECTICUT, HAS ISSUED AN 80-PAGE booklet descriptive of Raybestos brake linings and clutch facings, and giving in tabular form the brake and clutch data necessary for supplying the passenger and commercial cars on the American market with these products.

THE EDITOR'S BOOK TABLE

WHAT BRAZIL BUYS AND SELLS. MINISTRY OF AGRICULTURE, Industry, and Commerce, Rio de Janeiro, Brazil. (Paper, large quarto, 134 pages.)

THAT Brazil is eager to foster the growing trade relations with the United States, which have become an important outgrowth of the war, is evinced by this unusual publication in the English language, which has recently been issued for free distribution. Its purpose is to place before American commercial and financial interests the salient facts regarding the foreign trade of Brazil before and since the beginning of the great war.

Statistics of several sorts are given, but especially to indicate the things which Brazil requires for its development, particularly commodities formerly imported from Germany.

A study of the statistics presented discloses the interesting fact that although total exports from Brazil to the United States showed an increase of \$33,845,000 between the years 1913 and 1917; total imports from the United States to Brazil showed an increase of \$57,677,000; and imports of manufactured rubber goods from the United States to Brazil increased to the value of \$932,000, the exports of crude rubber from Brazil to the United States decreased \$452,000 in value, although the quantity was 4,709 metric tons greater in 1917 than in 1913.

HANDBOOK OF CHEMISTRY AND PHYSICS. A READY-REFERENCE Pocket Book of Chemical and Physical Data. Seventh Edition. By Charles D. Hodgman, B. S., assisted by Melville F. Coolbaugh, M. A., and Cornelius F. Senebier, M. A. The Chemical Rubber Co., Cleveland, Ohio, 1919. (Leather covers, 4 1/2 by 6 1/2 inches, 554 pages. Price \$2.50.)

The present edition of this convenient and valuable compilation of data contains about 100 pages more material than the previous edition, largely by the introduction of an entirely new and enlarged table of the physical constants of organic compounds. The list embraces about 2,000 compounds, including many which have only recently become of importance. The data given are classified under the following general topics: Mathematical Tables; General Chemical Tables; Properties of Matter; Heat; Hygrometric and Barometric Tables; Sound; Electricity and Magnetism; Light, Miscellaneous Tables; Definitions and Formulae; Laboratory Receipts; Photographic Formulae; Measures and Units; Wire Tables; Apparatus Lists; Problems.

The whole comprises a very valuable reference work for the laboratory.

STANDARD COTTON MILL PRACTICE AND EQUIPMENT, 1919. The National Association of Cotton Manufacturers, Boston, Massachusetts. (Cloth, octavo, 299 pages.)

This "Cotton Mill Year Book" contains a wealth of information for manufacturers of cotton textiles and the rubber trade in general. Following an introductory article by Arthur Richmond Marsh, editor of "The Economic World," reviewing the American cotton trade during the year 1918, and devoting some

space to the conditions and prospects of the present year, there are nearly sixty pages of statistics regarding raw cotton production, consumption, export, import and prices; mill production statistics, including tables for numbering yarn by weight, breaking weight tables, yarn and cloth output tables, and many others. A classified buyers' index of equipment and supplies lists the latest machinery and equipment for the manufacture of cotton textiles of every sort.

THE OBITUARY RECORD.

A PIONEER IN HARD RUBBER MANUFACTURE.

MYER DITTENHOEFER, one of the pioneers of the hard rubber industry in America and for many years president of the Vulcanized Rubber Co., Morrisville, Pennsylvania, died in his

MYER DITTENHOEFER.

apartment at the San Remo Hotel, New York, April 2, 1919, after an illness of only a week. He was born in New York City over 80 years ago, the son of Isaac and Barbetta D. Dittenhoefer. In the early days of the Civil War he was United States Consul at Mannheim, Germany, in which city he started a hard rubber factory in 1860. On his return from Germany he brought with him William Keil, who was for

many years connected with the American Hard Rubber Co. In the 'sixties, with S. S. Sonneborn as partner, he formed the New York Rubber Comb Co., with a factory in Orange, New Jersey, and subsequently became one of the leading spirits in the Keystone company, manufacturing similar goods. Later he organized the Goodyear Vulcanite Co., with a plant at Morrisville, of which he was at first manager, and later president. This company manufactured a general line of hard-rubber goods, but mainly combs and patented electrical appliances. In 1901 Mr. Dittenhoefer transferred all of his hard-rubber interests to the newly formed Vulcanized Rubber Co., of which he was president, and the late T. E. Studley, treasurer. The factory at Morrisville, built nearly a hundred years previous, even with several additions, proved too small to accommodate the business. A new and modern plant was begun in 1902, and finished in 1904.

The ceremony of laying the corner-stone was notable through the attendance of men prominent in the trade from all parts of the country. Incidentally, it is interesting to recall that, at Mr. Dittenhoefer's request, among the documents sealed up for all time beneath the corner-stone was a copy of THE INDIA RUBBER WORLD.

Mr. Dittenhoefer held the presidency of the company until 1913, retiring then from that office, though he was made chairman of the board of directors, which office he held at the time of his death.

His wife died two years ago, a short time after the couple celebrated their golden wedding. He is survived by a son, Lester F. Dittenhoefer, and three married daughters. The funeral, which was held Friday, April 4, was attended by many connected with the rubber trade, as well as by members of the Masonic fraternity, in which he was prominent.

Annual Report of the United States Rubber Co.

THE twenty-seventh annual report of the United States Rubber Co., presented at the annual meeting April 15, 1919, showed a highly satisfactory year's business, the net sales amounting to \$215,398,425.04, an increase of more than \$39,000,000 over the sales of 1917. The net profits for the year, before deducting income charges, inventory adjustments, and provisions for Federal, Canadian, and British taxes, amounted to \$39,480,631.83. The deduction of the above-named items, \$19,289,534.86, and the charging off of \$4,119,053.41 for interest, left a net profit of \$16,072,041.56 for the year. From this there remained to be deducted \$4,981,501.50 for dividends paid on United States Rubber Co. preferred stocks and to minority stockholders of subsidiary companies, leaving \$11,090,540.06 as the surplus for the year, to which is added the surplus at the beginning of the period, less deductions of \$1,133,695.66, leaving the net surplus on December 31, 1918, \$42,981,747.16.

The financial condition of the company is indicated by the accompanying balance sheet and provides the greater working capital required by constantly expanding business, high cost of materials, and contemplated extensions, particularly in the tire division.

THE CHAIRMAN'S REPORT.

To the Stockholders of the United States Rubber Co.:

Under the by-laws of the company as amended March 19, 1918, the chairman of the board of directors is charged with submitting an annual report to the stockholders. In compliance therewith, your chairman submits the following report for the fiscal year ended December 31, 1918.

The detailed financial statement, as compiled by the comptroller and certified by the public accountants, is appended hereto and made a part hereof. This statement gives a consolidated general balance sheet as of December 31, 1918, and a consolidated income statement for the year ended December 31, 1918, of the United States Rubber Co. and its subsidiaries, after excluding all offsetting accounts between the companies.

BY-LAWS OF THE COMPANY.

The by-laws of the company, as amended at the last stockholders' meeting, provided for the election of a chairman and a vice-chairman. At the December meeting of the board of directors, your former president was elected chairman, Mr. Lester Leland, vice-chairman, and Mr. Charles B. Seger, at the time president of the several companies comprising the Union Pacific Railway System, was elected president. Mr. Seger thereupon resigned as president of the Union Pacific companies, and has since been active in the performance of the duties of president of this company. Mr. Seger supplies a much needed addition to our official staff. He was not a stranger to our company, having been a director and member of our executive committee for nearly two years, and his election to the presidency has been received with universal approval and satisfaction by our entire organization.

VOLUME OF BUSINESS AND PROFITS.

The net sales of the company for the year 1918 were \$215,398,425.04, an increase of more than \$39,000,000 over the sales of the previous year. The income from sales, after deducting cost of manufacture, depreciation, property taxes, selling and general expenses, cash discounts allowed customers for prepayment, and adequate reserve for bad debts, amounted to \$39,480,631.83.

From which there should be deducted income charges, net, including inventory adjustments and provisions for Federal, Canadian and British taxes 19,289,534.86

Thus leaving the net before interest.....\$20,191,096.97

Less interest, net	4,119,053.41
Net profits for the year.....	\$16,072,041.56
Dividends paid on United States Rubber Co. preferred stocks.....	\$4,961,992.00
Dividends paid to minority stockholders of subsidiary companies	19,509.50 4,981,501.50
Leaving as the surplus for the year.....	\$11,090,540.06

GENERAL RUBBER COMPANY DEBENTURES.

In refunding our indebtedness under our first and refunding mortgage, as set forth in the annual report presented March 20, 1917, all outstanding issues were provided for at that time in cash except \$9,000,000 of debentures of the General Rubber Co., which fell due December 1, 1918, and \$2,600,000 of bonds of the Canadian Consolidated Rubber Co., Limited, which will fall due in 1946, for refunding which an equivalent amount of first and refunding mortgage bonds was reserved.

Provision was this year to take up the debentures of the General Rubber Co., when they fell due, through an issue of \$6,000,000 of 7 per cent five-year gold notes of this company, secured by \$9,000,000 of our first and refunding mortgage bonds which were issuable for that purpose. The balance to take up these debentures was provided from our current resources.

GENERAL FINANCIAL CONDITION.

The financial condition of the company is strong, as indicated by the consolidated general balance sheet appended hereto. With the continually expanding business and present high prices of materials, more working capital is required, in addition to which extensions have been planned, especially in the tire division, which will consume a large amount of money.

DIVIDENDS UPON THE COMMON STOCK.

Although the past year's earnings considered by themselves would warrant a dividend upon the common stock, your directors felt that it would not be prudent to pay one on account of the uncertainties which existed in business, and the company's cash position.

INVENTORIES.

Inventories of manufactured goods and materials have been taken on a conservative basis, having in mind the decline in values as a consequence of the closing of the war.

MAINTENANCE.

The plants and properties have been maintained in the highest state of efficiency and adequate charges for depreciation have been made.

EXPORT BUSINESS.

The export sales of the company outside of war orders were maintained during the year, and with the close of the war your directors believe there is a greater opportunity offered in this field than ever before and preparations are being made to materially extend our export business.

OPERATING DIVISIONS.

The operating divisions of the company are now under the direct charge of the president. The president presides at the meetings of the operating council and reports their recommendations to the executive committee, of which body he is also a member. Greater directness and efficiency are thus obtained.

SUMATRA RUBBER PLANTATIONS.

The receipts of rubber from our plantations in Sumatra for 1918 showed a substantial increase over the previous year. We have taken steps for some extension of the planted area there, which, together with the increased age of the trees, should produce for us more and more rubber each year hereafter.

I would mention that there has been considerable damage by water to one of our smaller estates called the "Langkat."

On May 23, 1918, the permanent organization of the United States Rubber Plantations, Inc., referred to in the last annual report, was effected, and took over the management of our Sumatra plantations.

CONCLUSION.

The volume of business of our company so far this year has been somewhat in excess of the same period of last year, and though we look for a falling off in certain lines, especially those where war orders were large, now that we are on a peace basis, the present indications are that our volume for 1919 will be satisfactory.

It gives me pleasure to refer to the continued fidelity and ability shown by the officers, heads of departments, our Far Eastern and foreign staffs, and other employees of the company and its subsidiaries.

Respectfully submitted,

SAMUEL P. COLT, Chairman.

THE COMPTROLLER'S REPORT.

UNITED STATES RUBBER CO. AND SUBSIDIARY COMPANIES.

Consolidated General Balance Sheet, December 31, 1918.

ASSETS.	
Cash	\$12,330,386.76

W. G. PARSONS, Comptroller.	

DIRECTORS.

At the recent annual meeting of the company the following officers were elected:

James S. Alexander, New York City.
 Walter S. Ballou, Providence, Rhode Island.
 James C. Brady, New York City.
 Nicholas F. Brady, New York City.
 Middleton S. Burrill, New York City.
 Samuel P. Colt, Providence, Rhode Island.
 Harry E. Converse, Boston, Massachusetts.
 Sir Mortimer B. Davis, Montreal, Quebec.
 James Deshler, New Brunswick, New Jersey.
 James B. Ford, New York City.
 James Newton Gunn, New York City.
 Francis L. Hine, New York City.
 Ernest Hopkinson, New York City.
 Henry L. Hotchkiss, New Haven, Connecticut.
 William S. Kies, New York City.
 Lester Leland, Boston, Massachusetts.
 Nathaniel Myers, New York City.
 Samuel M. Nicholson, Providence, Rhode Island.
 Raymond B. Price, New York City.
 Homer E. Sawyer, New York City.
 Charles B. Seger, New York City.
 William H. Truesdale, Greenwich, Connecticut.
 Theodore N. Vail, Boston, Massachusetts.
 Elisha S. Williams, New York City.

EXECUTIVE COMMITTEE AND OFFICERS.

EXECUTIVE COMMITTEE.

Samuel P. Colt, Lester Leland, Charles B. Seger, James B. Ford, Walter S. Ballou, Nicholas F. Brady.

OFFICERS.

Except for the elevation of Messrs. Colt and Leland to the offices of chairman and vice-chairman, respectively, and the creation of a tire division under the direction of J. Newton Gunn, last year's officers were reelected as follows: Samuel P. Colt, chairman; Lester Leland, vice-chairman; Charles B. Seger, president; James B. Ford, vice-president; Homer E. Sawyer, vice-president in charge of footwear division; Elisha S. Williams, vice-president in charge of mechanical goods division; J. Newton Gunn, president of United States Tire Co., in charge of tire division; Ernest Hopkinson, vice-president; Samuel Norris, secretary; W. G. Parsons, vice-president and comptroller; H. B. Hubbard and William O. Cutter, assistant comptrollers; W. H. Blackwell, treasurer; John D. Carberry, assistant secretary and assistant treasurer.

OPERATING COUNCIL.

Charles B. Seger, chairman; Homer E. Sawyer, Elisha S. Williams, J. Newton Gunn, Ernest Hopkinson, Theodore Whitteley, and W. G. Parsons.

The Fort Wayne Tire and Rubber Manufacturing Co., Fort Wayne, Indiana, has increased its capital from \$500,000 to \$1,000,000.

FIRST ANNUAL REPORT OF THE REPUBLIC RUBBER CORPORATION.

THE first annual report of the Republic Rubber Corp., New York City, and its subsidiaries, The Republic Rubber Co., Youngstown, Ohio, and the Canton-Blackstone Co., Canton, Ohio, formerly the Knight Tire & Rubber Co., has been issued to stockholders. The condensed balance sheet below covers the year 1918, during which the company was forced to meet not only the unusual conditions prevalent in the industry, but also its own problems of reorganization and re-financing. Under the circumstances the directors regard the net results with satisfaction. All expenses occasioned by the reorganization and additional financing have been fully absorbed and the Federal taxes provided for. All assets of doubtful value have been entirely written off, and the additional working capital needed has been supplied by the sale of second preferred stock. The business of the company is rapidly becoming normal and the directors regard the outlook as excellent.

The condensed balance sheet at the close of business December 31, 1918, follows:

ASSETS.	
CURRENT.	
Cash on hand and in bank.....	\$493,884.96
U. S. Liberty Loan bonds.....	61,670.00
Unpaid stock subscriptions (paid in cash to February 15, 1919, and due April 1, 1919).....	1,500,000.00
Trade acceptances receivable.....	263,057.66
Notes receivable.....	32,278.74
Accounts receivable, after allowance for doubtful accounts, cash discounts, etc., in the amount of \$200,664.75.....	1,747,699.65
Inventory (after certain reserves).....	6,843,245.46
	10,941,236.47
OTHER ASSETS.	
Investment in associated companies.....	375,836.05
Deferred stock subscriptions, payable July 1 and October 1.....	512,780.00
Trade acceptances receivable past due.....	61,902.39
Notes and accounts receivable past due.....	84,743.31
Employer's stock contracts, notes and accounts receivable.....	126,817.49
Miscellaneous Investments.....	8,197.95
	1,170,277.19
PERMANENT.	
Property, plant, and equipment as appraised at reproduction value adjusted to December 31, 1918.....	5,486,902.27
Less: allowance for depreciation and obsolescence.....	879,928.99
Patents and patent rights.....	2.00
DEFERRED.	
Expenses applicable to future operations.....	109,425.29
	\$16,827,914.23
LIABILITIES.	
CURRENT.	
Notes payable; borrowed money.....	\$5,304,750.00
Accounts payable; current purchases, payroll, commissions, etc.....	783,967.63
Accrued taxes and preferred dividends.....	173,634.36
Reserve for contingencies.....	\$6,267,352.01
Other liabilities.....	37,092.51
	27,060.00
NORMAL.	
Capital stock.	
First preferred 7 per cent cumulative, authorized \$10,000,000, issued and held for exchange.....	\$6,767,400.00
Second preferred 8 per cent cumulative convertible, authorized \$2,500,000, subscribed.....	2,100,000.00
Common.	
No par value (authorized 650,000 shares) issued and to be issued 317,721 shares.....	1,634,009.71
Net worth.....	10,501,409.71
	\$16,827,914.23

OFFICERS.

The officers of the company are: Guy E. Norwood, president; L. T. Petersen, vice-president in charge of production; Harvey J. Woodard, vice-president in charge of sales; Mark W. Roe, vice-president in charge of plant; C. F. Garrison, secretary; M. I. Arms, 2nd, treasurer; Arthur L. Irish, assistant secretary; H. J. Stambaugh, assistant treasurer; John T. Harrington, general counsel. The directors are Guy E. Norwood, L. T. Petersen, M. I. Arms, John T. Harrington, Robert Bentley, C. H. Booth, W. M. Coleman, R. E. Cornelius, H. M. Gorlick, Richard Gorlick, R. C. Steese, John Tod.

STATEMENT AND BALANCE SHEET OF THE INTERCONTINENTAL RUBBER CO.

THE directors of the Intercontinental Rubber Co., 15 Exchange Place, Jersey City, New Jersey, have submitted to their stockholders the following balance sheet and statement of profits for the five months ending December 31, 1918, it having been voted by the stockholders at the last annual meeting to change the ending of the company's financial year from July 31 to December 31. The statements have been prepared and certified to by Messrs. Loomis, Saffern & Fernald, chartered public accountants, New York City.

CONDITIONS IN MEXICO.

During the period reflected in these accounts there was no material change in Mexican conditions, although the epidemic of influenza placed an additional handicap on all operations. Production of the Torreon factory was 1,284,503 pounds of rubber (20 per cent moisture basis).

STEAMSHIP INVESTMENTS.

On October 22, 1918, the remaining investment of the company in steamship securities was disposed of for cash, and a substantial portion of the profit earned during the period resulted from this transaction.

AMERICAN CONGO CO. IN AFRICA.

The suspension of hostilities in Europe has not materially affected the company's business. The activities of the American Congo Company in Africa have been reduced to a minimum since the beginning of the European war, and although a partial resumption is being arranged for, the directors do not feel that the outlook is particularly encouraging.

SUMATRA PLANTATIONS.

Development of the Sumatra plantations continues to be highly satisfactory. The demand for crude rubber has been good, although at somewhat reduced price levels.

INVESTMENT SECURITIES.

The item of investment securities shown on the balance sheet represents bonds, short term notes and Liberty Loan Bonds. It was necessary to deduct from income the sum of \$46,526.50 in order to adjust this account to the market quotations of December 31, 1918.

BY ORDER OF THE BOARD OF DIRECTORS,

April 7, 1919.

WILLARD P. SMITH, Secretary.

CONDENSED BALANCE SHEET—DECEMBER 31, 1918.

NEW ARMSTRONG TIRE PLANT.

The Armstrong Rubber Co. has recently completed a modern plant at outfield, New Jersey, for the manufacture of super-size cord and fabric tires and extra heavy tubes. The company has been in business three years, having begun with a small tube plant. The present production is 200 tires and tubes daily, and an increase to 800 daily is anticipated during the year. Arthur J. Peebles, former special representative for The Goodyear Tire & Rubber Co., Akron, Ohio, has recently become general manager. Mr. Peebles was one of the organizers, also former trade

PLANT OF ARMSTRONG RUBBER CO.

secretary and treasurer, of the National Automobile Association, and has a wide acquaintance throughout the tire trade.

NEW INCORPORATIONS.

Allan Tire Case Co., Inc., The, April 1 (New York), \$2,000. G. Stewart, 217 West 83rd street, J. A. and J. Stenlund—both of 2 Rector street—all of New York City. To manufacture auto curtains, etc.

American Tire Distributing Co., The, March 27 (Delaware), \$300,000. G. J. Waters, E. C. Salmon, M. Morris—all of 111 Broadway, New York City. Delaware agents, United States Corporation Co., 311 South State street, Dover, Delaware. To buy, sell, and deal in automobile tires of every kind and description.

Armstrong Tube Sales Agency, Inc., of Delaware, April 10 (Delaware), \$5,000. D. J. Reinhardt, A. C. Taylor, R. H. Morton—all of Wilmington, Delaware. Delaware agent, D. J. Reinhardt, Ford Building, Wilmington, Delaware. To buy, sell, and deal in automobiles and motor vehicles of all descriptions.

Armstrong Tube Sales Agency, Inc., of Maryland, April 10 (Delaware), \$5,000. Business, incorporators, and Delaware agent same as above.

Archer Cord Tire Sales Co., March 28 (Kentucky), \$10,000. E. E. Howard, president; F. Graham, vice-president; A. Delph, treasurer; T. L. Lopp, secretary. Salesroom, 504 South Third street, Louisville, Kentucky. Principal office, 912 Starks Building, Louisville, Kentucky. To distribute Archer cord tires in Kentucky and southern Indiana.

Archer Tire & Rubber Co., February 6 (Illinois), \$4,000. R. L. Watson, R. M. Macush, A. Stober, Old George street, Louisville, Kentucky. To manufacture of every kind, rubber goods and products.

Berman & Brook, Inc., March 17 (New York), \$40,000. S. Berman, M. Block, J. M. Kromann. Principal office, and yards, Inson street, Buffalo, New York. To buy, and sell scrap iron, metals, and rubber.

Briggsmann Tire & Rubber Co., Geo. E. March 16 (New Jersey), \$250,000. G. F. L. and W. S. Bates—both of 51 Grove avenue, Metuchen, New Jersey; G. F. and M. S. Briggsmann—both of 115 Eaton avenue, Meriden, Connecticut. Principal office, 51 Grove avenue, Metuchen, New Jersey. To manufacture, buy, sell, and deal in all goods of which rubber is a component part.

C. J. & Stolar Rubber Co., Inc., The, April 7 (New Jersey), \$200,000. L. E. Clark, Langwood, A. Stolar, Old George street, S. E. Ware, Terrill Road—all of Plainfield, New Jersey. Principal office, 709 Bickman street, Plainfield, New Jersey. Agent in charge, L. P. Clark. To manufacture automobile tubes and all other kinds of rubber automobile accessories, and to do car mobile tire repair work.

Coleman Tire Co., Inc., April 12 (New York), \$5,000. I. D. Coleman, 164 Rosewood Terrace, A. A. and G. J. Batzold, both of 44 Halmeld Place—all of Rochester, New York. To deal in tires.

Dunbar Manufacturing Co., Inc., March 24 (New York), \$100,000. A. H. Dubois, Bradish avenue, Bayside, Long Island; F. M. Dayton, 28 West 23rd street, New York City; H. T. Trevelick, 212 La Fontaine avenue, Bronx—all in New York. To manufacture druggists' sundries, rubber goods, etc.

Eastman Rubber Works, Inc., April 19 (New York), \$200,000. C. L. Warren, J. R. Eastman, both of 213 West 40th street; D. D. Deutsch, 179 Broadway—all of New York City. To conduct a rubber and tire business.

Erie Autumatics Co., The, April 10 (New Jersey), \$5,000. R. P. Ziem, both of 2000 Springfield Road, Red Bank; J. J. and M. B. Kath, both of Newark—both in New Jersey. Principal office, 172 Monmouth street, Red Bank, New Jersey. Agent in charge, R. P. Ziem. To purchase, sell, and repair automobiles, automobile tires and accessories.

Gibney Rubber Co., Inc., March 28 (Delaware), \$3,000,000. T. L. Goulet, H. H. Kutz, M. C. Long—all of 10 Indiana, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To purchase and sell rubber tires, etc.

Gordon Tire Sales Co., of Rochester, Inc., The, April 1 (New York), \$5,000. E. J. and M. E. Edler, both of 20 North Union street, Rochester, New York. To deal in rubber goods, etc.

Great Eastern Tire Corp., April 10 (New York), \$2,000. C. A. Weiden, J. B. Alper, G. A. Dorfman—all of 1877 Broadway, New York City. To manufacture tires.

Great Western Tire Corp., March 10 (New York), \$20,000. J. Jacobs, S. Reichman, S. Loewenthal—all of 1877 Broadway, New York City. To manufacture tires.

Guarantee Vulcanizing & Auto Supply Co., March 14 (New Jersey), \$15,000. J. J. and J. J. Guzman, both of 200 West 11th street, Newark; J. J. Guvelli, 225 Bloomfield avenue, Newark—both in New Jersey. Principal office, 225 Bloomfield avenue, Newark, New Jersey. Agent in charge, C. Camata. To manufacture, buy, sell, vulcanize, and deal in automobile tires and accessories.

Hofmann Rubber Co., March 12 (Illinois), \$30,000. W. P. Kamps, M. J. Roberts, S. Friedlander. Principal office, 2006 West Monroe street, Chicago, Illinois. To buy, sell, manufacture, and deal in rubber tires.

Independent Motor Wheel Co., Inc., April 14 (New York), \$100,000. W. H. Lowy, 404 4th Avenue, 4th Avenue, W. and E. Klingberg, both 1904 Avenue C, Brooklyn—all of New York. To manufacture auto parts, etc.

Indiana Cord Tire Co., March 24 (Indiana), \$100,000. A. A. and H. Peterson, R. W. Thoma—all of 100 South Main street, Evansville, Indiana. To manufacture auto tires, inner tubes and tubes, and accessories.

Johnson Rubber Co., March 17 (New Jersey), \$10,000. H. and G. Johnson, S. Berman—all of Trenton, New Jersey. Principal office, 36 East State street, Trenton, New Jersey. Agent in charge, W. N. Cooper. To make, purchase, and sell rubber goods.

Kud-Tire, Inc., April 2 (Massachusetts), \$90,000. M. M. Graham, 125 Cate street, Dorchester, C. W. Farmer, 25 West Wyoming avenue, Melrose; J. H. Barker, 24 Richmond avenue, Worcester—all in Massachusetts. Principal office, Worcester. To manufacture and deal in automobile accessories.

Manhattan Rim & Tire Corp., April 19 (New York), \$100,000. E. P. Haymond, S. J. and P. P. Randolph, S. J. and P. P. Randolph, both of 220 Broadway, all of New York City. To manufacture auto accessories, etc.

Metro Tire & Repair Co., Inc., March 24 (New York), \$1,000. A. N. and L. Weiss, both of 124 West 63rd street, C. R. Lucke, 2247 Ryer avenue—all of New York City. To conduct tire repair business.

Oval Tire & Rubber Co., Inc., April 9 (New York), \$4,000. J. Jacobs, S. Reichman, W. Loewenthal—all of 1877 Broadway, New York City. To manufacture tires.

Paramount Tire & Rubber Co., March 21 (Delaware), \$100,000. E. D. Benedict, P. Zisk, M. Biedenkopf—all of Chicago, Illinois. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture, purchase, sell, and deal in rubber tires.

Prospect Tire & Rubber Co., March 18 (Delaware), \$500,000. J. T. Barnes, president; H. H. Friedlander, vice-president, both of Westfield, New York; J. L. Rosenblatt, secretary and treasurer, Buffalo, New York. Principal office, 225 Delaware avenue, Buffalo, New York. Factory at Prospect, Chautauque County, New York. To manufacture and deal in automobile tires of every kind for the planting, cultivation, and growing of rubber trees.

Shinix Rubber Process Tire Co., Inc., March 25 (New York), \$5,000. L. E. Swartz, Bloomfield, New Jersey; E. Flander, Corona; S. M. Manson, 353 West 57th street, New York City—all in New York. To manufacture tires, etc.

Savoy Tire Corp., April 11 (Delaware), \$50,000. T. L. Croteau, P. B. Drew, M. M. Ulaney—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture, import, export, and deal in tires.

Seaboard Tire & Rubber Co., The, March 28 (New Jersey), \$30,000. G. J. Waters, E. C. Salmon, M. Morris—all of 15 Exchange Place, Jersey City, New Jersey. Agent in charge, G. W. Flaack. Principal office, 15 Exchange Place, Jersey City, New Jersey. Store at 11 Mechanic street, Red Bank, New Jersey. To buy, sell, import, trade and deal in automobile tires of every kind.

Shinix Rubber Co., Inc., March 28 (New York), \$25,000. A. Hudson, 220 East 72nd street; J. A. O'Brien, 1402 Broadway; E. A. Carbona, 225 Skillman street—all of New York City. To manufacture rubber goods of all kinds.

Spring-Tex Rubber Co., The, March 13 (Ohio), \$50,000. C. N. Lichten, president and treasurer; G. Lichten, sales manager; R. and E. Cohn, dist. agents; H. V. Cieslowski, secretary. Principal office, 100 North Third street, Columbus, Ohio. To manufacture rubber heels and soles.

Superior Tires Corp., The, March 11 (California), \$25,000. J. J. Grant, M. H. Abrams, both of 1000 Broadway, Los Angeles, California. To manufacture automobile tires.

Tee Pee Rubber Co., Inc., April 1 (New York), \$200,000. W. F. Timmer, 501 Riverside Drive, New York City; E. E. Treckwood, both of 236 Tecumseh avenue, Mt. Vernon—all in New York. To manufacture rubber goods.

The Manufacturing Co., February 26 (New Jersey), \$25,000. C. W. Tillou, 134 Washington avenue, Newark; S. E. Tillou, 169 Hcnclowen avenue, E. L. A. Beut, 11 Washington street, both of Belleville—all in New Jersey. Principal office, 134 Washington avenue, Newark, New Jersey. Agent in charge, C. W. Tillou. To manufacture, purchase, and sell all kinds of hard-rubber specialties.

Union Tire & Rubber Co., Inc., March 12 (New York), \$2,500. J. T. and L. T. Chabot, both of 446 Prospect avenue; S. C. Kelly, 346 Franklin street—all of Buffalo, New York. To deal in auto supplies.

Union Tire & Rubber Co., Inc., April 5 (Delaware), \$10,000. W. Mackay, J. H. Jones, J. S. Ogilvie—all of 9 East 40th street, New York City. Principal office with H. F. Gilg, 206 West 11th street, Wilmington, Delaware. To manufacture and deal in rubber goods.

Wagner Tire & Rubber Co., Inc., Fred J., April 4 (New York), \$25,000. H. Ascher, 2581 Sedgwick avenue; E. Landau, 789 West End avenue; R. S. Steiner, 676 Findlay avenue—all of New York City. To manufacture rubber goods.

Warren Tire Stores Co., April 14 (Maine), \$750,000. E. J. Warren, president; H. E. and J. E. Warren, both of Bangor, Maine. To deal in all kinds of automobile supplies.

Zadec Rubber Co., Inc., April 21 (New Jersey), \$2,000. H. C. and G. Zaum, both of 1000 Springfield Road, Red Bank; E. E. Treckwood, both of Prospect street, Long Island City—all in New York. To deal in tires and rubber goods.

News of the American Rubber Industry.

DIVIDENDS.

THE AMERICAN CHICLE CO., New York City, manufacturer of chewing gum, has declared a quarterly dividend of one per cent, payable May 1 on common stock of record April 19, 1919.

The American Winger Co., Woonsocket, Rhode Island, manufacturer of all kinds of wringers, declared its regular quarterly dividend of one and three-quarters per cent, payable April 15 on preferred stock of record March 31.

The Hood Rubber Co., Watertown, Massachusetts, manufacturer of rubber tires and footwear, has declared its regular quarterly dividend of one and three-quarters per cent, payable May 1 to preferred stock of record April 22, 1919.

The Kelly-Springfield Tire Co., New York City, tire manufacturer, has declared quarterly dividends of \$1 cash per share and three per cent in common stock, on its common stock, payable May 1 on stock of record April 15, 1919.

The McGraw Tire & Rubber Co., East Palestine and 1900 Euclid avenue, Cleveland, Ohio, tire manufacturer, declared its quarterly dividend of one and three-quarters per cent on preferred stock, payable April 1 on stock of record March 20, 1919.

The Manufactured Rubber Co., Philadelphia, Pennsylvania, manufacturer of rubber substitute, which resumed paying dividends on its preferred stock last January, recently declared another of one and one-half per cent, payable April 25 on stock of record April 19, 1919.

The Portage Rubber Co., Akron, Ohio, has declared a quarterly dividend of three per cent, payable May 15 on common stock of record May 5, 1919, also a quarterly dividend of one and three-quarters per cent on its preferred stock.

The Sioux City Tire & Manufacturing Co., Sioux City, Iowa, tire manufacturer, has declared cash dividends of eight per cent on preferred stock, payable May 15, and of thirty per cent on common stock, payable July 15, 1919.

The United States Rubber Co., New York City, manufacturer of tires and all kinds of rubber goods, declared quarterly dividends of two per cent and one and one-half per cent, respectively, on its first and second preferred stock, both payable April 30 on stock of record April 15, 1919.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, manufacturer of automotive equipment, has declared a quarterly dividend of one and three-quarters per cent (\$0.87½ per share), payable April 30 on common stock of record April 4, 1919.

LABOR CONDITIONS IN NEW YORK.

Assuming that labor conditions in the rubber and gutta percha factories of the State of New York are fairly indicative of similar conditions throughout the country, the most recent statistics for February, 1919, published by the New York State Industrial Commission are of interest.

These statistics show an increase over the preceding month of 2.6 per cent in the number of workers employed and a decrease of 3.7 per cent in total wages, the latter being due to a reduction in the hours worked per week. As compared with the same month of 1918, there are 4.1 per cent less workers employed, but their total wages represent an increase of 17.7 per cent. Average weekly earnings of all employees in both office and factory are now \$18.61, and have undergone a gradual increase from \$10.66 in 1915. Herein lies the chief cause for the increased cost of manufactured rubber goods.

RUBBER COMPANY EMPLOYEES FORM AN ATHLETIC LEAGUE.

In order to become better acquainted, employees of the different rubber companies in and about New York have formed an athletic association and will give a series of contests in various branches of sport. The organization is known as the Rubber Industries Athletic League and at present includes the following firm members: Ajax Rubber Co., Empire Tire Co., Federal Rubber Co., Firestone Tire & Rubber Co., The Goodyear Tire & Rubber Co., The B. F. Goodrich Rubber Co., Globe Rubber Tire Manufacturing Co., Keystone Tire & Rubber Co., Kelly-Springfield Tire Co., Miller Tire Corp., Pennsylvania Rubber Co., Sterling Tire Corp. and United States Rubber Co. The officers are: President, P. C. Boizenmayer, United States Rubber Co.; vice-president, H. A. Demarest, The B. F. Goodrich Rubber Co.; secretary, J. L. Wood, Ajax Rubber Co., Inc.; treasurer, B. Greene, Sterling Tire Corp.

A baseball schedule has been arranged and the following firm members will have teams in the field: Ajax Rubber Co., Inc., Firestone Tire & Rubber Co., The B. F. Goodrich Rubber Co., The Goodyear Tire & Rubber Co., Globe Rubber Tire Mfg. Co., Kelly-Springfield Tire Co., Sterling Tire Corp., United States Rubber Co. The games will be played on diamonds around New York, and should furnish some lively entertainment, as the rivalry is sure to be keen. Several trophies have been arranged for and will be displayed in the show windows of the interested companies from time to time.

ANNUAL SPRING CROP OF FIBER SOLE BILLS.

Within the last few years several state legislatures have had presented for enactment numerous "pure shoe bills," all of which have failed of passage. A recent bill introduced in the Wisconsin Legislature "relating to the sale of wearing apparel made out of artificial substances, and providing a penalty" was so loosely drawn that the use of fiber soles would be prohibited unless the manufacturers of such soles designate every ingredient entering into the sole, and the exact percentage of such ingredient therein contained. Fines of \$10 to \$1,000, or imprisonment for not more than six months, or both, are named as a penalty.

Luckily the author of the bill, having been shown its absurdity, consented to an indefinite postponement of its consideration, and manufacturers of fiber soles may continue to guard the secrets of their products. Not long ago a similar bill was introduced in the Iowa Legislature.

M. & A. M. A. ENTERTAINS TRADE JOURNALISTS.

Prompted by the desire to know better the trade journal men and others connected with the various trades interested, the directors of the Motor and Accessory Manufacturers' Association gave them an informal dinner on April 18, 1919, at the Transportation Club, New York City, as follows:

"Motor"—E. C. Wright, business manager; Alexander Johnson, editor, "Motor Life"—T. W. Snead, treasurer, and C. B. Ames, business manager, "The India Rubber World"—W. M. Morse, "Class Journal"—David Beccroft, directing editor; W. I. Ralph, vice-president. "Automobile Topics"—Niran Bates Pope, editor. Motor and Accessory Manufacturers' Association—C. E. Thompson, president; C. W. Stiger, A. W. Copland and E. W. Beach, directors; M. E. Heminway, general manager; C. A. Burrell, manager credit department; Sidney S. Meyers, general counsel. Federal Highway Association, Washington, D. C.—S. M. Williams, president.

TRADE NOTES.

The New York Rubber Co., 84 Reade street, New York, has removed its mechanical goods factory from Matteawan to Beacon, New York.

The Belmont Packing & Rubber Co., Philadelphia, Pennsylvania, has removed its New York office and stock room to 99 Chambers street, New York City.

The Burdick Tire and Rubber Co., Noblesville, Indiana, is building a reinforced concrete three-story factory, 100 by 200 feet, and a power plant 100 by 100 feet, in which it will manufacture its shingle-construction patented tire. A temporary plant is being operated until the permanent one is ready for occupancy. The officers of the company are: John P. McKinley, president; A. S. Burdick, vice-president; R. H. Mather, secretary and counsel. The Chicago office is in the Consumers Building.

The Triple Tread Tire Co., a Delaware corporation with its business office at 1442 South Michigan avenue, Chicago, Illinois, has been granted authority to do business in Platteville, Wisconsin, where it has appointed James F. Gibson its agent. H. G. Lund is president of the company.

The Super Tread Tire Co., Cedar and Emerick streets, South Bend, Indiana, manufacturer of tires and repair material, has increased its capital stock from \$5,000 to \$100,000. C. L. Smith is president of the company.

The Washington Rubber Co. of Pennsylvania, Washington, Pennsylvania, manufacturer of tires and inner tubes, has elected the following officers and directors for the current year: J. L. Lockhart, president; Dr. S. L. McCurdy, vice-president; B. F. Mevay, secretary and treasurer; John Warrick, T. W. D. Heiber, and Burt S. Shafer. T. R. McKennan is general manager.

The International India Rubber Corp., manufacturer of "South Bend" tires, South Bend, Indiana, has elected the following officers for the ensuing year: G. W. Odell, president and treasurer; Peter E. Studebaker, vice-president; J. A. Bennett, secretary; directors: C. W. Truxell and J. W. Ridge. The company is to extend the length of its main factory building to 967 feet, in which additional equipment will be installed to increase the output of the plant to double its present volume.

The Rawlings Manufacturing Co., Lucas avenue and 23d street, St. Louis, Missouri, manufacturers of the "Ruko" game balls and other athletic goods, has opened an office at 28 Broadway, New York City, in charge of J. G. Smith. Richard Jackson, Jr., will represent the concern in the West, with headquarters in San Francisco.

The Allen Machine Co., Erie, Pennsylvania, manufacturer of rubber mill machinery, has elected the following officers: E. E. Allen, president; J. A. Himrod, vice-president; A. G. Scheidenhelm, secretary; and P. A. Himrod, treasurer.

T. A. Desmond & Co., 949 Broadway (Flatiron Building), New York City, is a new firm formed by Thomas A. Desmond and Herbert S. DeLanie to deal in crude rubber. Both partners were formerly in the employ of Robinson & Co., New York City, importers of crude rubber.

F. A. Reichard, Inc., and J. W. Coulston & Co., New York City, importers and dealers in rubbermakers' colors and chemicals, have consolidated and will conduct their business, after May 1, 1919, under the name of Reichard-Coulston, Inc., at 303 Fifth avenue. The business management and policy will remain the same. The officers are: J. W. Coulston, president; A. Paluel de Marmon, vice-president; J. W. Bossert, treasurer; and W. I. Coulston, secretary.

The Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, manufacturer of electric controlling devices, has transferred E. C. Cherrington and T. R. Cooley from the sales service department of the Milwaukee office to the Pittsburgh, Pennsylvania, office of the central district, as office manager and engineering correspondent, respectively.

Morgan & Wright, Detroit, Michigan, are building a seven-story warehouse extension, 140 by 170 feet.

The Federal Rubber Co., Cudahy, Wisconsin, has just completed a six-story building 443 by 145 feet, the construction of which was delayed during the war. It is being used for increased production of mechanical rubber goods, including hose, packing, heels and soles, and molded goods.

The Kelly-Springfield Tire Co., New York City, has increased its common stock from \$5,029,900 to \$10,000,000 and decreased its preferred stock from \$3,990,300 to \$3,900,300. Accordingly, 900 shares of the preferred stock have been purchased by the company for its special surplus account and duly cancelled, which out of the increase in common stock a quarterly dividend of three per cent on the common stock, in addition to the cash dividend of \$1 per share, has been declared, beginning May 1, 1919.

The Keystone Tire & Rubber Co., Inc., New York City, has elected the following officers: L. Walter Lissberger, president; Sydney Bernheim, vice-president; Walter Loewenthal, secretary, and Joel Jacobs, treasurer.

The Prospect Tire & Rubber Co., 225 Delaware avenue, Buffalo, New York, a newly incorporated concern for the manufacture of cord tires to be sold direct to the consumer, will locate its factory at Prospect, Chautauqua County, New York. The officers are: James T. Barnes, president; J. H. Prendergrast, vice-president, and J. L. Rosenblatt, secretary and treasurer. The company is capitalized at \$500,000, of which \$300,000 is common stock and the balance preferred.

The Quality Tire & Rubber Co., 1101 Main street, Anderson, Indiana, is installing machinery in the newly completed addition to its factory in which it will start manufacturing automobile tires and tubes about June 1, 1919. C. J. Hodges is general manager.

The Kelly-Springfield Tire Co., New York City, has taken over the business of the Boss Rubber Co. in several western cities, where it will operate Kelly-Springfield branches as follows: 1550 Broadway, Denver, Colorado, H. E. Gabriel, manager; 27 West Fourth South street, Salt Lake City; Utah, George V. Porter, manager, and 120 West Broadway, Butte, Montana, C. D. Cole, manager.

The Fort Wayne Tire and Rubber Manufacturing Co., Fort Wayne, Indiana, has increased its capital from \$500,000 to \$1,000,000.

The Lee Rubber & Tire Corporation, 61 Broadway, New York City, at the annual meeting of the company on March 27, 1919, increased the number of its directors from nine to eleven and elected officers as follows: H. C. Coleman, J. Carl DeLaCour, John M. Dettra (assistant secretary), James A. Fayne, S. B. Fleming, Albert A. Garthwaite (vice-president and treasurer), Walter H. Herrick, Horace C. Jones, Samuel H. Miller, John J. Watson, Jr. (president), and Joseph Wayne, Jr. Henry Hopkins, Jr., is secretary of the company.

The Newman Tire & Rubber Co. has removed its general office and warehouses to 244-246 West 54th street, New York City, and is making this the distributing point for merchandise to its several stores in New York and out of town. Both retail and wholesale business is conducted.

The Quabaug Rubber Co., North Brookfield, Massachusetts, has recently made a number of changes in the personnel of its organization. The officers are: Thomas G. Richards, president and sales manager; C. A. Evans (Merchants National Bank, Worcester), treasurer; directors, in addition to the foregoing—Frank A. Drury (Merchants National Bank, Worcester), Henry Drew (National Union Bank, Boston), Frank Smith (attorney, Worcester), Walter T. Bucklin (Liberty Mutual Insurance Co., Boston), and William Edmunds (investments, Boston). Charles Burgess has resigned from his positions as director, treasurer, and sales manager of the company, as have also Eugene de Rozier as chief chemist and F. W. Tingley as engineer.

The H. H. Robertson Co., First National Bank Building, Pittsburgh, Pennsylvania, dealer in building products, is now supplying Robertson "M. R." (mineral rubber) to the trade in different grades. The company has secured the services of H. B. Pulhar and J. S. Ervin, formerly with the Pioneer Asphalt Co., Lawrenceville, Illinois, to take charge of the production department.

The Inland Rubber Co., La Salle and 27th streets, Chicago, Illinois, expects to complete by the middle of July the two-story extension which it is now building, 87 by 112 feet, at a cost of \$50,000.

The United States Rubber Co. is transferring its store in Burlington, Vermont, from Cherry street to 109 College street where two stores will be occupied.

The Service Tire & Rubber Co. has opened a store at 70 Maine street, Auburn, Maine, under the ownership of Mitchell Zelter and Maurice Leavitt who have recently been discharged from the Navy. This is the only store serving Lewiston and Auburn which makes a specialty of tires of exclusive makes.

The Hohmann-Nelson Co., Eau Claire, Wisconsin, has recently been incorporated to manufacture automatic temperature, pressure and time controllers, also thermometers, recorders, etc., and in several months will be ready for active operations. The officers of the company are: A. B. Hohmann, president; A. J. Nelson, vice-president and secretary; Edward Hutchens, treasurer. These men are well known to rubber manufacturers, having specialized in the development of automatic control as applied to all methods of vulcanization and personally supervised many of the larger installations of such systems.

The Katzenbach & Bullock Co., Inc., 100 William street, New York City, has been appointed sole selling agent for the products of the Nevim Chemical Co., St. Louis, Missouri, manufacturer of high-grade barium products and chemicals for the rubber trade.

The Braender Rubber & Tire Co., Rutherford, New Jersey, will remove its export department from 315 Fourth avenue to 32 Broadway, New York City, on May 1, 1919. It has also appointed the Ryan & Hughes Co., Inc., 1698 Broadway, distributor of Braender tires and tubes in New York City and on Long and Staten Islands.

The Climax Rubber Co., manufacturer of a line of dress shields, sanitary aprons, baby pants, and rubber novelties, has moved to 520 Broadway, New York City.

The plants of the American Rubber Products Co. and the New-castle Rubber Co. have been taken over by a group of Akron and Cleveland rubber manufacturers. Automobile tires are made at the Newcastle plant and the output will be considerably increased. The new company is headed by F. E. Harmon of the Universal Rubber Co., Cleveland, and Fred E. Seiberling, Akron, Ohio.

F. R. Henderson & Co., crude rubber importers, have removed their New York City offices from 82 Beaver street to the Trinity Building, 111 Broadway.

The Gates Rubber Co., Denver, Colorado, is building two new factory units, one of two stories and one of four, and a four-story warehouse.

The Rubber Tire Supply Co., Inc., 420 St. Louis street, Springfield, Missouri, has increased its capital stock from \$10,000 to \$20,000. The officers of the company are: C. E. Randall, president; F. S. Bauersfeld, secretary, treasurer, and manager; J. L. Hines and D. J. Landers, vice-presidents.

The Automatic Safety Tire Valve Corp., 199-203 Eighth street, Long Island City, New York, has opened executive and sales offices at 1765 Broadway, suite 605, New York City. The officers of the company are: G. H. Crossan, president; S. X. Newman, vice-president; H. A. Tremaine, treasurer; and C. R. Tock, secretary.

Albert V. W. Tallman, crude rubber broker, has removed from 54-56 Stone street to 280 Broadway, New York City.

LESTER LELAND.

AN important new office, created at a recent meeting of the directors of the United States Rubber Co., was that of vice-chairman of the Executive Committee. To that office Lester Leland, vice-president of the company was elected. Associated

with the great rubber company in important capacities almost from its inception, Mr. Leland's career affords an interesting study.

He was born in Boston, Massachusetts, July 20, 1864, the son of Lester and Mary (Babcock) Leland. Educated in the public schools of that city, he graduated from the English High School, and after a course at a business college, he entered the office of C. A. Richards, president of the Metropolitan Street Railway, Boston. Some

LESTER LELAND.

years afterward, he was elected treasurer of the Boston Heating Co., and later was appointed superintendent of buildings and purchasing agent of the Metropolitan Telephone Co. of New York City, which position he held until 1893, when he was made assistant treasurer of the Boston Rubber Shoe Co., advancing to the treasurer's position two years later. When this company was purchased by the United States Rubber Co. in 1898, he became identified with the management, serving on the board of directors, and filling the office of vice-president for many years, and assuming his present position and title a month or two ago.

Mr. Leland is a man of many interests. In addition to his connection with the United States Rubber Co. and its subsidiaries, he assists in the management of the American Trust Co., Rubber Mutual Liability Insurance Co., Rubber Manufacturers' Mutual Insurance Co., Industrial Mutual Insurance Co., Cotton and Woolen Manufacturers' Mutual Insurance Co., Arkwright Mutual Fire Insurance Co., all of Boston, Massachusetts; The Atlantic Coast Lumber Corp., and United Timber Co. of New York City, the Oneida Timber Co., Georgetown, and the Pacific & Idaho Northern Railway.

Mr. Leland served several years in the Massachusetts Volunteer Militia, reaching the grade of Captain and Provost Marshal of the Second Brigade. He enlisted in the war with Spain as Second Lieutenant in C Company, Fifth Massachusetts Infantry. His two sons are at present in service, having enlisted in the present war.

Mr. Leland is fond of outdoor sports, his favorite pastimes being riding, tennis, and golf. He is a born organizer and adjuster of industrial difficulties. Quiet, tactful, unassuming, a man of few words, and of keen judgment, he has the confidence and respect of all. In the company with which he has so long been identified, he has done much to bring it to its present condition of greatness and efficiency.

Replete with information for rubber manufacturers—H. C. Pearson's "Crude Rubber and Compounding Ingredients."

CHEMIST AND SALES MANAGER.

LOUIS J. PLUMB, M. A., is well known in every branch of the American rubber trade, through his position as both chemist and manager of sales of a rubber reclaiming company.

LOUIS J. PLUMB, M.A.

Mr. Plumb graduated from Princeton University in 1904, beginning at once his chemical career in the laboratory and dye works of Klipstein & Co., New York. His preference, however, was for the rubber industry, and the following year he became chief chemist of the United States Rubber Reclaiming Co., and established a factory control and research laboratory at their Buffalo plant. Mr. Plumb was awarded his Master's degree from Princeton on the presentation of a thesis on the chemistry of rubber and methods of its analysis. For a number of years the material thus presented was used as a laboratory

text until the appearance of more elaborate works on the subject by other chemists. He is probably the first rubber chemist to establish brands of reclaimed rubber on a purely technical basis, such as standardizing output on guaranteed content of rubber, acetone extract, and physical characteristics, and their technical presentation to the manufacturer.

Mr. Plumb represented his company at the Fourth International Rubber Congress held in London, England, in July, 1914. On that occasion he toured the Scandinavian countries, Holland, Belgium, France, and Germany, in the interest of reclaimed rubber as an important factor in the rubber manufacturing industry. While on this mission he was in Berlin when the world war broke out, and was detained there four weeks during German mobilization and the violation of Belgium.

Mr. Plumb is a member of various business, athletic, social, and scientific bodies. Among the latter are the American Electro-Chemical Society and the American Chemical Society. He is a member of the Executive Committee of the Rubber Section of the latter society and chairman of the Rubber Section's Jar-Ring Committee, which is actively cooperating with the Department of Agriculture on the standardization of jar rings.

DU PONT COMPANY ELECTS OFFICERS AND DIRECTORS.

E. I. du Pont de Nemours & Co., Inc., Wilmington, Delaware, manufacturer of colors and chemicals, Fabrikoid, etc., at its recent annual meeting elected the following officers and directors: Pierre S. du Pont, president; vice-presidents, H. F. Brown, E. G. Buckner, R. R. M. Carpenter, F. L. Connable, William Coyne, Irénée du Pont, Lamme du Pont, H. G. Haskell, J. A. Haskell, Charles L. Patterson, F. W. Pickard, J. J. Raskob, and F. G. Tallman; secretary, Alexis I. du Pont; treasurer, F. D. Brown; assistant treasurers, Charles Copeland, Angus B. Echols, W. F. Raskob, J. K. Rodgers, and William F. Saltmarsh; assistant secretaries, L. R. Beardslee and M. D. Fisher; directors, all of the above and in addition, A. Felix du Pont, Eugene du Pont, Eugene E. du Pont, H. F. du Pont, P. S. du Pont, J. P. Laffey, Charles A. Patterson, H. M. Pierce, and Charles L. Reese.

Since the above elections were made, Pierre S. du Pont has resigned from the presidency of the company and become president of the board of directors. Irénée S. du Pont, chairman of the executive committee, has been made president of the company. These changes became effective May 1, 1919, and are said to have been made because of business conditions following the war.

WESTINGHOUSE DISPOSITION OF BRITISH INTERESTS.

General Guy E. Tripp, chairman of the board of directors of the Westinghouse Electric & Manufacturing Co., New York City and East Pittsburgh, Pennsylvania, has recently returned from a trip abroad, as the result of which an agreement has been reached with important British interests whereby the Westinghouse company sells for cash its British holdings.

This sale is subject to the successful accomplishment of certain legal details in Europe, which may be waived by the company if considered desirable.

The Westinghouse company now plans to enter into a commercial alliance with a view to developing export business. No further details can be announced at the moment, but the plan will be put into execution immediately on the assumption that the British transaction will be consummated on one of the bases indicated.

PERSONAL MENTION.

Thomas R. Burton has been appointed assistant to George S. Shugart, general branch sales manager of the United States Tire Co., with headquarters at 1790 Broadway, New York City.

W. E. Byles, crude rubber broker, has removed from 59 Broad street to 140-142 Pearl street, New York City.

John A. Glaspy, former manager of the Milwaukee, Wisconsin, branch of the Kelly-Springfield Tire Co., has become assistant general sales manager of the International India Rubber Corp., manufacturer of "South Bend" tires, South Bend, Indiana.

L. I. Seaman, 215 West 51st street, New York City, has been designated as the representative of The Canton-Blackstone Co., formerly the Knight Tire & Rubber Co., Youngstown, Ohio, which has been authorized to do business in the State of New York.

J. E. Duffield, formerly general manager and treasurer of the Bailey Non-Stall Differential Corp., has been elected vice-president in charge of the sales division of The Essenkay Products Co., Chicago, Illinois, manufacturer of the "Essenkay" tire filler.

William R. Eales, of The South African Rubber Manufacturing Co., Johannesburg, South Africa, arrived in New York last month on a business visit.

Francis R. Henderson, F. R. Henderson & Co., New York City, returned from London last month.

Charles T. Wilson, Charles T. Wilson Co., Inc., New York City, has gone to England on business.

G. A. Avey, of W. & A. Bates, Limited, Leicester, England, is in this country for a brief visit.

W. M. Doucette has been appointed Eastern district manager of The Mason Tire & Rubber Co., Kent, Ohio, with headquarters at the New York City branch, 235 West 58th street.

J. V. Aguirre is in charge of the export department of The Mason Tire & Rubber Co., Kent, Ohio, at 235 West 58th street, New York City.

C. L. Falkenburg has been appointed representative of the Voorhees Rubber Manufacturing Co., Jersey City, New Jersey, at Jackson, Michigan, in its automobile accessory department, and will cover the States of Michigan, Ohio, Illinois, Indiana, Kentucky, Tennessee, and Alabama.

W. L. Baumbach, formerly operating the Badger Tire Repair Co., distributor of Firestone and Kelly-Springfield tires, in Milwaukee, Wisconsin, has disposed of the business and will represent the International India Rubber Corp., South Bend, Indiana, manufacturer of "South Bend" tires, as manager of its central district.

Edward H. Garcin, president of the Asbestos and Rubber Works of America, New York City, has been elected a director

of the Gotham National Bank, succeeding the late Dr. Thomas Kelly.

Harold H. Henderson, of F. R. Henderson & Co., crude rubber importers, 111 Broadway, New York City, started last month on a combined business and pleasure trip to the Far East.

W. R. Robinson, manager for W. R. Grace & Co., crude rubber importers, in Seattle, Washington, has been elected vice-chairman of the Foreign Trade Bureau of the Seattle Chamber of Commerce and Commercial Club.

R. J. Devereaux is manager of the Bangor, Maine, store of The B. F. Goodrich Co., Akron, Ohio.

A PIONEER IN TIRE REPAIRING.

TO have started business in a one-story shop, and, unaided by a dollar of outside capital, develop a nation-wide business, employing hundreds of skilled workmen, is something of which one may well be proud. This, in brief, is the record of Charles E. Miller, proprietor of the Anderson Rubber Works, Anderson, Indiana, where, in two big factories, he manufactures tire-making machinery, tire-repairing equipment and tires.

Mr. Miller claims to have designed the first tire-repair vulcanizer, and to have done the first repairing job seven years before any other tire vulcanizer appeared on the market. He was born in 1874, in Prairie, Ohio, and with his parents moved to Huntington County, Indiana, where he worked on a farm while acquiring what education the country school afforded. The purchase of a high-wheel bicycle influenced his choice of a vocation, and he secured employment in a bicycle factory at Marion, Indiana. Noticing the great waste in consigning to the junk heap so many burst tires, he conceived the idea of a vulcanizer to repair them. He made patterns, and when the local foundry declared it impossible to make such castings, he made the cores himself, and directed the successful making of the first steam-jacketed tire vulcanizer. Soon he was busy, outside of his factory working hours, repairing bicycle tires for the people in his vicinity. Finally he accumulated \$300 and with this capital he opened a vulcanizing and bicycle shop, a little one-story affair, at Anderson, Indiana.

The business was successful from the start, and with the automobile came the demand for the repair of larger tires for which larger vulcanizers were built. In 1902 when the clincher tire came into use, he designed a sectional vulcanizer for repairing it. In 1911 he invented an adjustable vulcanizer, which permitted adjustment for all sizes of tires. As needs developed, machines and appliances were devised. Inventions and improvements followed fast, for by this time the little repair shop had given place to a big factory where everything needed in the growing business of tire repairing was made and the business of supplying repair shops all over the country was developing. Besides tire repair outfits, he has added the manufacture of vulcanizers for repairing and soling rubber footwear.

Later the manufacture of tires was added, a new system being perfected for making an improved "cog tread" tire, which is neither a wrapped tread, nor a full molded tread, for which a number of advantages are claimed.

Mr. Miller is most democratic as an employer, and is idolized by his employees. He has established an annual profit-sharing

CHARLES E. MILLER.

plan for faithfulness and efficiency in all departments of his factories. He is highly respected in his community, is a member of the Elks, Knights of Pythias, Masonic bodies, Y. M. C. A., Rotary Club, Chamber of Commerce, and the Manufacturers' Association.

FROM WAR SERVICE TO MOTOR ACCESSORIES.

ONE of the live wires in the rubber war work, Montie L. Heminway, has been honored by the appointment as general manager of the Motor and Accessories Manufacturers' Association. A brief outline of his business career is therefore of interest.

Mr. Heminway was born in Somerville, Massachusetts, December 11, 1877, and educated in the Somerville public schools. His early business experience was gained in the shoe industry, first with the Regal Shoe Co., Boston, where he was general office manager and later as sales manager for the Charles A. Easton Co., a well-known shoe manufacturing concern in Brockton, Massachusetts.

M. L. HEMINWAY.

His experience in the rubber business began when he entered the sales department of the Davidson Rubber Co., Charlestown, Massachusetts, of which concern he was sales manager for seven years.

When the War Service Committee of the rubber industry was formed, Mr. Heminway was appointed its secretary, with offices in Washington and New York, and the duties of this important position were filled with ability and credit, until the work of the committee ceased with the signing of the armistice.

At this time L. M. Bradley, the general manager of the Motor and Accessory Manufacturers' Association, was incapacitated by illness, and M. Heminway was called to take the temporary management of that association. Later, Mr. Bradley tendered his resignation and Mr. Heminway was appointed his successor.

Now that the scope of the association has been materially enlarged, the position is assuming an added importance. The association now has a credit department which is pronounced the most complete and satisfactory source of credit information in the motor and accessory industry, and plans are being formulated for further extension of this department, as well as for developing other features of trade association work, in all of which Mr. Heminway's experience and ability will prove of the greatest possible value.

"DOLLAR EXCHANGE."

That the United States has displaced England and all other pre-war creditor countries in supplying long-time money for the financing of industry and transportation was pointed out by D. H. G. Penny, vice-president of the National Bank of Commerce, New York City, in an address on "Dollar Exchange" at the convention of the Association of Reserve City Bankers at New Orleans, March 31, 1919.

Mr. Penny showed that, before the war, the volume of dealing in various kinds of foreign exchanges in Buenos Aires would rank in the following orders: Pounds sterling, reichsmarks, Paris francs, Belgian francs, United States dollars.

He showed that at the present time every bank of consequence in foreign countries has one or more accounts in the United States, whereas before the war many foreign countries had no correspondents at all here. He declares that London's embarrassment is temporary and that Great Britain is still doubtless a creditor nation. He cautions America that we should compete with England by fair methods, never forgetting that "brave old England has borne the heat and burden of the day."

"England has been generous to us in the past, and England deserves well of us to-day," says Mr. Penny. "Civilization has been saved from Germany, but it must now be saved from poverty and economic shipwreck. The whole world looks to America and America will not be found wanting."

A RUBBER ENGINEERING SPECIALIST.

GEORGE W. BURRELL, works manager, who is now also second vice-president of the Wellman-Seaver-Morgan Co., Akron, Ohio, has steadily risen through his 21 years' service with the above named rubber engineering company.

G. W. BURRELL.

Born in 1871, his early education was secured at the public schools of Cleveland, Ohio. Leaving school at the age of 14, he spent the next five years working in machine shops, mastering the mechanical principles of the trade, meanwhile studying at night to prepare for college. In 1891 he entered Ohio State University, taking a three years' course in mechanical engineering.

Thus having fitted himself both in theory and practice, he entered the employ of the above-named company in 1898 as draughtsman. After three years he was appointed inspector, and in the next two years was promoted successively to chief inspector, assistant purchasing agent, assistant secretary, and assistant works manager. For 14 years he has held the last-mentioned position, his duties increasing with the steady growth of the business, and in May, 1917, he was made manager of works, and now has entire charge of the company's works at Akron and Cleveland, Ohio.

FINANCIAL STATEMENT OF PLYMOUTH RUBBER CO.

The condensed balance sheet of the Plymouth Rubber Co., Canton, Massachusetts, shows the following figures for the year ended December 31, 1918:

ASSETS.

Capital assets (at book value):		
Real estate, buildings, machinery, equipment, etc.	\$899,136.80	
Less reserve for depreciation	100,000.00	
Patents and trade marks	\$799,136.80	
	100,000.00	
Total capital assets	\$899,136.80	
Current assets:		
Cash in banks and on hand	105,250.47	
Accounts and notes receivable, after deducting estimated reserves for doubtful items, discounts, etc.	319,298.64	
Inventory of merchandise, goods in process, etc.	673,544.13	
Liberty bonds and war saving stamps	\$98,468.55	
Deduct unpaid installments not due and payments by employees	62,570.35	
Total current assets	\$3,898.20	
Total assets	\$1,133,791.44	
Investment in treasury stock—1,752 shares of the company's common stock at book value	171,800.00	
Sinking fund—cash available for retirement of preferred stock	2,975.31	
Deferred expense for taxes, insurance, interest, experimental work, and advertising	40,719.97	
Total assets	\$2,248,423.52	

LIABILITIES.

	Authorized.	Issued.
Capital stock:		
7% cumulative preferred stock, par value \$100.00	\$500,000.00	\$400,000.00
Common stock, par value \$100.00	1,000,000.00	1,000,000.00
Total capital stock		\$1,400,000.00
Current liabilities:		
Accounts payable	243,511.41	
Notes payable	350,000.00	
Accrued taxes, etc.	9,836.64	
Total current liabilities		\$603,348.05
Sinking fund reserve for preferred stock		6,775.31
Surplus, after providing for dividend on preferred stock		148,200.16
Total liabilities, capital, and surplus		\$2,248,423.52

The accounts of the company were audited by Patterson, Teale & Dennis, Boston, Massachusetts, who certified to the correctness of the above figures. All doubtful items were verified as far as possible through careful estimates, correspondence with banks, consultation with the officials of the company, etc.

WALLACE S. CLARK.

WALLACE S. CLARK was born in Watertown, New York, October 13, 1864. After preparing for college at Hopkins Grammar School, he entered the

W. S. CLARK.

Sheffield Scientific School of Yale University, graduating in 1885. He then went to work for the Edison interests, and has been with them and their successor, the General Electric Co., ever since. He took charge of the wire and cable department of the General Electric Co., Schenectady, New York, in 1892, and at that time became interested in the manufacture of rubber-insulated conductors of electricity. Mr. Clark has recently served as the chairman of the insulated wire and cable division of the War Service Committee of the Rubber Industry of the U. S. A.

STATEMENT OF THE INDIA RUBBER WORLD.

Statement of the ownership, management, etc., required by the Act of Congress of August 24, 1912, of THE INDIA RUBBER WORLD, published monthly at New York, New York, for April 1, 1919.

STATE OF NEW YORK. }
COUNTY OF NEW YORK. } ss.:
Before me, a notary public in and for the State and county aforesaid, personally appeared E. M. Hoag, who, having been duly sworn according to law, deposes and says that she is the business manager of THE INDIA RUBBER WORLD, and that the following is, to the best of her knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher, The India Rubber Publishing Co., 25 West Forty-fifth street, New York City.
Editor, Henry C. Pearson, 83 Agawam Road, Waban, Massachusetts.
Managing Editor, Henry C. Pearson, 83 Agawam Road, Waban, Massachusetts.
Business Manager, E. M. Hoag, 25 West Forty-fifth street, New York City.

2. That the owners are: (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock.) Henry C. Pearson, 83 Agawam Road, Waban, Massachusetts.

3. That the known bondholders, mortgages, and other security holders owning or holding 1 per cent or more of the total amount of stock, mortgages, or other securities are: (If there are none, so state.) None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation by whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by her.

E. M. HOAG, Business Manager.

Sworn to and subscribed before me this 31st day of March, 1919.

[SEAL]

FREDK. SPRENGER.

Notary Public Westchester County,
Certificate filed in New York County.
My commission expires March 30, 1920.

New York County Clerk No. 186. Register's No. 10188.

F. R. HENDERSON & CO. OPEN LONDON HOUSE.

F. R. Henderson & Co., crude rubber importers, New York City and Akron, Ohio, have recently established a London house under the firm name of Henderson, Forbes & Co., Limited, with offices at 11 Hart street, Mark Lane. The associates are David S. Forbes, formerly with Harrison & Crossfields; John R. McIntosh, who was also with the same firm in the Far East; and Hanford M. Henderson from the New York office.

THE RUBBER TRADE IN OHIO.

By Our Special Correspondent.

AKRON rubber manufacturers are giving special attention to the probable ultimate scope of American business in foreign markets. F. E. Titus, recently appointed foreign sales manager of The B. F. Goodrich Rubber Co., believes that whether

F. E. TITUS.

or not the American manufacturer will continue to hold his own and develop business along firm, steady lines in the various foreign markets which have been recently opened to him, will depend largely on the quality of his product and proper methods of economical distribution, as well as the adaptation of his merchandise to the service needs of the countries into which it goes, and the definite policy of standing behind his product.

Mr. Titus brings a wide experience to his new position, having formerly been assistant to First Vice-President H. E. Raymond in handling foreign business, and prior to that successively manager of the branches of the company in Pittsburgh, Pennsylvania, and Buffalo, New York.

AKRON NOTES.

The B. F. Goodrich Rubber Co., Akron, Ohio, reports its classes in tire repairing are larger this year than ever before. Besides the actual experience the student gets at the bench and vulcanizer, lectures on advertising, salesmanship, bookkeeping, business correspondence, etc., as applied to successful garage operation, are also given. The latest tire repair class opened April 28, 1919.

The Firestone Tire & Rubber Co., Firestone Park, Akron, Ohio, is completing its new plant, known as No. 2. During the war it was utilized for balloon manufacture, but will now be devoted to the production of tires and tubes. It is built of brick, concrete, glass, and steel, and is practically fireproof. Electric conveyors eliminate the use of many trucks and unnecessary motion on the part of employees.

The J. Frank Dunbar Co., Inc., 82 Beaver street, New York City, dealer in crude rubber, has opened an office at 610 Flatiron building, Akron, Ohio, in charge of J. Richard Stanley. Mr. Stanley was until recently with Akron office of Pell & Dumont, Inc., crude rubber brokers.

The Akron Equipment Co., Akron, Ohio, manufacturer of rubber tire molds and cores, machinery, dies, etc., is building an addition of brick and steel construction, 60 by 77 feet, of which one-half is an addition to the "heavy shop" where tire vulcanizing presses are made and the other half forms a two-story addition to be used for tire mold and core work and office purposes. The building will be completed about May 1, 1919.

The Akron Rubber Mold & Machine Co., Akron, Ohio, is enlarging its tire repair equipment department in order to take care of increasing business. It has also purchased land and buildings adjoining its property, which it expects to utilize in extending its plant in the near future.

The Firestone Steel Products Co., Firestone Park, Akron, Ohio, has appointed Paul R. Higginbotham, recently a captain in the Ordnance Department, as assistant to J. G. Swain, vice-president and manager of the company.

The Firestone Steel Products Co., Firestone Park, Akron, Ohio, has appointed Lawrence W. Enos, recently a first lieutenant in the Quartermaster's Corps, manufacturer's representative in the Detroit district.

Jones & Kuhle, West Exchange and Water streets, Akron, Ohio, manufacturers of automobile tire molds and cores, special machinery, etc., have incorporated and changed the name of their organization to The Kuhle Machine Co.

The Portage Rubber Co., Akron, Ohio, at its annual meeting held January 14, 1919, elected the following officers: W. W. Wildman, president and general manager; M. S. Long, vice-president; L. E. Larson, secretary-treasurer. The company is now installing a new mill room and expects to increase its tire output 50 per cent by April 15. The company is adding new machinery to its equipment to take care of additional business.

The Portage Rubber Co., Akron, Ohio, has appointed Roscoe M. Gage chief chemist, in charge of its laboratory and development work and fabrics. Mr. Gage was formerly with The Fisk Rubber Co. of New York, Chicopee Falls, Massachusetts, and the New Jersey Car Spring Co., Jersey City, New Jersey, and more recently supervisor of gas-mask manufacture in Akron rubber factories as a first lieutenant in the Chemical Warfare Service.

The General Tire & Rubber Co., Akron, Ohio, has increased the mileage guaranty on its "Jumbo" tire from 5,000 to 7,000 miles. This is a special oversize tire for Fords, Maxwells, Chevrolets, and other light cars using 30 by 3½-inch rims.

W. H. STILLWELL.

W. H. Stillwell, former Akron representative of the Westinghouse & Electric Manufacturing Co., East Pittsburgh, Pennsylvania, has been placed in charge of the newly opened Akron office of the Allen Machine Co., Erie, Pennsylvania, manufacturer of rubber-working machinery.

The Miller Rubber Co., Akron, Ohio, has elected the following officers for the current year: Jacob Pfeiffer, president; C. T. Grant, vice-president; William T. Pfeiffer, secretary and treasurer; J. M. Doran and F. B. Theiss, directors, in addition to the foregoing.

H. Parker Lowell has been appointed editor of "Miller Talk," the house organ of The Miller Rubber Co., Akron, Ohio, which suspended during the war. Mr. Lowell was formerly a member of the copy staff of The B. F. Goodrich Co.

Edward Maurer Co., Inc., New York City, dealer in crude rubber, has opened an office in Akron, Ohio, in the Metropolitan Block, in charge of Adam T. Dealman.

Katzbach & Bullock Co., Inc., New York City, manufacturer, importer, and exporter of chemicals and colors for the rubber and allied trades, has opened an office in the Metropolitan Building, Akron, Ohio, in charge of A. W. P. Barber as manager.

The Amazon Rubber Co., Akron, Ohio, has elected the following officers for the current year: Albert Kroehle, president; J. F. Burger, vice-president; L. J. Schott, treasurer and general manager; L. F. Smith, secretary and factory superintendent.

CLEVELAND NOTES.

The Erie Tire & Rubber Co., Cleveland, Ohio, has bought the plant of the Eagle-Macomber Co. at Sandusky, in which it plans to manufacture cord tires and tubes, under the supervision of H. H. Forrest, its vice-president and general superintendent. The other officers of the company are C. H. Berckamp, president; C. H. Roth, secretary and sales manager; P. F. Wills, treasurer and

general manager, and F. W. Hildebrand, assistant secretary and auditor. The concern was incorporated under the laws of the State of Ohio and is capitalized at \$1,000,000, half common and half preferred stock. The company is building a three-story addition, 60 by 85 feet, to be used for curing rooms. The Osborn Engineering Co., Cleveland, has the contract.

* * *

E. S. Carman, secretary and chief engineer of The Cleveland Osborn Manufacturing Co., Inc., Cleveland, Ohio, sailed for Europe on March 6, 1919, with a party of about forty representatives of the Cleveland Chamber of Commerce. These men will assist foundries in their reconstruction work.

* * *

The McLean Tire and Rubber Co., Cleveland, Ohio, manufacturer of "Champion" tires and tubes, has increased its capital stock from \$300,000 to \$500,000, of which 3,000 shares are common stock and 2,000 shares are preferred. The company is running two shifts of workmen in its plant, producing about 500 tires and 1,200 inner tubes daily.

* * *

The McGraw Tire & Rubber Co., formerly of East Palestine, Ohio, removed its general office on March 1, 1919, to 1900 Euclid avenue, Cleveland, Ohio. The factory remains at East Palestine.

* * *

The Farrel Foundry and Machine Co. has removed its office in Cleveland, Ohio, to 802-3 Sweetland Building.

* * *

The Henderson Tire & Rubber Co., Inc., Bucyrus, Ohio, manufacturer of tires and tubes, states that the loss occasioned by the fire in its plant on April 11, 1919, will exceed \$150,000, but was practically covered by insurance. The company expects to be in partial operation again by May 1 and fully by June 1.

TWO REPUBLIC RUBBER CORPORATION EXECUTIVES.

HARVEY J. WOODWARD, recently elected vice-president in charge of sales of The Republic Rubber Corp., Youngstown, Ohio, brings to his position a selling experience of eighteen years with several large tire companies, notably the Diamond Rubber Co., Akron, Ohio, where he rapidly advanced to high posi-

MARK W. ROE.

HARVEY J. WOODWARD.

tions in the sales department, and was later promoted successively to sales manager of that company's factory branches in Pittsburgh, Pennsylvania, and New York City.

MARK W. ROE, also recently elected a vice-president of the Republic company, has had over thirteen years' engineering experience with some of the largest rubber companies. For many years he was an engineer on tire production for the Dia-

mond Rubber Co., and The B. F. Goodrich Rubber Co., both of Akron, Ohio. During the past two years with the Republic company he has been engineer of rubber goods production, including pneumatic and solid tires, and mechanical rubber goods.

THE BAY STATE HONORS GOODRICH MAN.

THE election of Fred T. Moore as president of the Bay State Automobile Association is a deserved recognition of the services of that gentleman to the association of the board of governors of which he has been a member for five years.

Mr. Moore was born in Worcester, Massachusetts, August 20, 1884, attending the common and high schools in Framingham, and finishing at the Burdett Business College, Boston.

When but a boy young Moore made up his mind to be a sales executive, and prepared himself for such a position by a special course of study. Sixteen years ago he secured the position of stenographer to the manager of the Boston branch of The B. F. Goodrich Co. Beginning thus at the bottom, he rose steadily until, in 1914, he succeeded his principal, and attained the position of manager. He thus has charge in the six New England states of the sales of all the varied products of this great company.

Mr. Moore is a member of the Boston Athletic Association, the Boston City Club, the Rotary Club, and the Woodland Golf Club, his special relaxations being motoring and golf.

Mr. Moore is a member of the Boston Athletic Association, the Boston City Club, the Rotary Club, and the Woodland Golf Club, his special relaxations being motoring and golf.

FRED T. MOORE.

A SMOKELESS SMOKER.

On the evening of Saturday, April 12, 1919, the athletic association of the Miller Rubber Co., Akron, Ohio, held its second "smoker" at the Armory. Primarily, there was no smoking, which omission was amply compensated for by a highly interesting program consisting of vocal and instrumental selections (including several numbers by the Miller Saxophone Sextet) and a number of boxing contests, some of which were fairly fast. The star bout of the evening was between "Jackie" Palmer, a Millerite, and "Red" Schaeffer, who was outclassed from the start. The innovation of the evening was the event between two "African Golfers," whose gloves were smeared with white paste, which ended in both contestants being as "white as they were painted." The affair was a conspicuous success.

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

THE State of Massachusetts still maintains the leading position in the manufacture of rubber boots and shoes, as is shown by the annual report for the year 1917, which has just been published. Nine manufacturing concerns in this line have a total invested capital of \$22,224,512, and their total product was \$42,472,724. The stock and materials used cost \$17,663,113, and their 12,275 employees were paid \$8,904,564. Other manufacturers of rubber goods, represented by 41 concerns with a total capital of \$34,548,936, turned out products worth \$56,903,602.

the materials for which cost \$31,479,517, and the 10,334 employees were paid \$7,970,746.

The sums of these figures give an indication of the extent of the rubber manufacturing industry in the Bay State. Fifty establishments, with an aggregate capital of \$56,773,448, manufactured goods to the value of \$99,376,326. They employed 22,609 persons, to whom they paid \$16,875,310, and consumed material, including rubber, costing \$49,142,630.

A remarkable increase in the number of persons employed in the rubber boot and shoe business is noted. In 1913 there were 4,832 male employees and 3,125 female. In 1917 the figures were 7,155 and 5,120, an increase of 48.1 per cent of male and 63.8 per cent of female workers. An even greater gain is noted in other branches of the rubber industry, for in 1913 there were 4,598 males and 805 females, and the 1917 returns show 7,980 males and 1,397 females, a total increase of 73.6 per cent.

* * *

In the factory of The Fisk Rubber Co. of New York, Chippewa Falls, Mass., an ingenious arrangement of mirrors is used to prevent collisions at angles and crossings of runways and passages. There are several "blind corners" where electric and hand trucks are used, and at each of these a mirror is so arranged that a person approaching the corner can see, reflected in the glass, the other passageway. Collisions are thus prevented. Under the mirror, and on each side, so that one of the two is visible the whole length of the passage, is painted the

BLIND CORNER MIRROR.

danger emblem, adopted about two years ago by the National Safety Council as a universal danger sign.

* * *

M. M. Converse, who returned last month from a trip to Europe, is far from enthusiastic in advising others to spend vacations on the other side of the Atlantic. Mr. Converse did not go across to investigate foreign markets. On the contrary, he sought a complete respite from business. Most of his time over there, however, was spent in collecting autographs of officials on his passport in order to enter and leave the various cities he visited. His visit was unfortunately shortened because of the time necessary to fulfill the requirements imposed on all civilian travelers. Mr. Converse comes back satisfied that the United States is good enough for him, and he is not planning any more European trips in the near future.

* * *

Many members of the rubber footwear trade may remember the late John C. Balderston, of Balderston & Daggett, of this city, the selling agents of the National India Rubber Co., and were also acquainted with his son, Frank Balderston, who for many years had charge of the sales of tennis shoes for the

United States Rubber Co. Some of these may have met Frank's brother, Henry Ware Balderston, generally called "Harry" by his friends, and these will perhaps hear for the first time, from this paragraph, of his sudden death from angina pectoris, at his home in Jamaica Plain, Mass., on April 13, 1919.

As a boy he worked in his father's store, but later entered the cotton goods business, and for the last ten years he was sales agent for New England for the Amoskeag Manufacturing Co., Manchester, New Hampshire. He was 54 years of age. His widow and one daughter survive him.

* * *

Boston's gain is Akron's loss by the transfer of C. B. Linderman from the head office of the Firestone Tire & Rubber Co. to take charge of the Boston branch of that concern. Mr. Linderman has been engaged in advertising and sales department work for several years, and he is being cordially welcomed by the tire fraternity of this city.

* * *

More than 100 members of the sales and executive departments of the Boston branch of the Firestone Tire & Rubber Co., Akron, Ohio, attended a dinner at Hotel Lenox on the evening of April 11, as the close of a two-day conference of New England salesmen. Addresses were made by C. B. Linderman, manager of the Boston branch, and J. E. Mayo, New England district manager. Motion Pictures taken in the Akron factory were shown, and music for dancing was furnished.

* * *

James H. Learned, of the Revere Rubber Co., Boston, whose portrait was shown in the April number of THE INDIA RUBBER WORLD, sailed from New York on the *Aquitania* for Europe April 5. Mr. Learned includes a large part of Europe in his "territory," having "covered" many of the leading cities previous to the great war.

* * *

Many employees of the Hood Rubber Co., Watertown, Massachusetts, who have been discharged from various branches of service, are resuming their former positions. Thus far 26 such men have returned to the tire department and 5 to the calendar room.

The Hood Rubber Co., Watertown, Massachusetts, is building a one-story extension of its warehouse, to cost about \$15,000.

* * *

The Hood Girls War Relief Club, an organization of woman workers at the Hood Rubber Co., Watertown, Mass., gave a very successful minstrel show at Symphony Hall, Boston, April 22, 1919, in which over 150 participated. This club has raised thousands of dollars for war relief work, the proceeds of its annual minstrel show being one of the chief sources of its revenue.

* * *

The Walker Webbing Co. mill in Brockton was originally one story high, measuring 56 by 200 feet. Last year an additional story was built over one-half this area, and now the company is completing two stories by building over the remaining portion. The work will cost about \$6,000, and is expected to be finished sometime this month.

* * *

As a result of the recent Americanization drive conducted by the Boston Rubber Shoe Co., Malden, Massachusetts, 22 employees took out citizenship papers.

* * *

Among the concerns which are welcoming back to their previous positions, or others equally good, the returned soldiers who were formerly in their employ, are the Tyer Rubber Co., Andover, Massachusetts, which has taken back 20 men, and the Carlisle Cord Tire Co., of the same place, which has taken back 8 men.

* * *

J. S. McClurg has become associated with the Carlisle Cord Tire Co., Inc., Andover, Massachusetts, as consulting engineer.

Gifford K. Simonds, general manager of the Simonds Manufacturing Co., Fitchburg, has been added to the board of directors of The First National Bank of Boston.

* * *

Ernest T. Gregory, formerly representative of the American International Corp., and manager of the International Banking Corp., Peking, China, has been elected vice-president of the First National Corp. of Boston. Mr. Gregory at one time was connected with Lee, Higginson & Co., and later was a partner in the firm of Hambleton & Co., Baltimore.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

PRODUCTS of the many Trenton rubber manufacturers, as well as some from other sections of the state, were recently on display in the museum of the New Jersey State House. The exhibition lasted two weeks and was visited by thousands of persons interested in the manufacture of rubber goods. Classes

& Rubber Co., Inc., contributed \$100. The De Laski & Thropp Tire Co. gave \$50, while John A. Lambert, treasurer and general manager of the Acme Rubber Manufacturing Co., and William H. Servis, vice-president of the Hamilton Rubber Manufacturing Co., each gave \$25. The Whitehead Brothers Rubber Co. gave \$25 towards the hero fund being raised in Trenton to entertain homecoming soldiers.

* * *

Four young Trenton men, who are well known in the rubber manufacturing industry, have gone to Mexico City, where they will become associated with the Pelzer Rubber Co. This company is the first to establish an automobile tire plant in that section of Mexico. The men are Daniel Henry, who was formerly employed as a chemist by the United & Globe Rubber Co.; John Simkins, Thomas J. O'Hara and Edward Taylor.

* * *

Weldon Roberts Rubber Co., of 18 Oliver street, Newark, will make alterations to its brick factory, to cost \$7,000.

* * *

The Empire Rubber and Tire Corp. suffered another fire loss recently when flames destroyed more than \$2,000 worth of rubber in the drying plant. The firemen had difficulty in reaching the flames and were compelled to flood the room. The blaze was confined to one structure

* * *

The Page Edwards Tire Corp. has leased for a long term of years the store at 830 Broad street, Newark.

* * *

The Dunbar Manufacturing Co. of New York, capitalized at \$100,000, a reorganization of the Para Rubber Co. whose plant was destroyed by fire in November, 1917, will locate in the Luneppe factory building at South River, this state. The company manufactures rubber gloves and other druggists' sundries. The old Para company employed 100 hands and the new concern will employ a like number. F. M. Dayton, of New Brunswick, and A. H. DuBois, of Bayside, New York, former owners of the Para company, lost \$100,000 when the plant was destroyed by fire and explosion. They hold \$51,000 worth of stock in the new company. The company formerly conducted offices in England, France, and South American countries, and these will be opened again.

* * *

The Goodyear Tire & Rubber Co., Inc., Newark, New Jersey, a branch of the Goodyear company in Akron, Ohio, has leased a building suitable for its purpose and will move into it shortly.

* * *

The engineering department of the Empire Tire and Rubber Corp. enjoyed a get-together dinner recently at Gaertner's cafe for the object of forming an association for the discussion of engineering problems which arise in the plant. Several interesting papers were read, among them being one on the reconstruction period by F. W. Bechtel, toastmaster. M. J. Rich, electrical engineer of the plant, read a paper on "The Direct Motor versus Line-Shaft Drive." Among those present were the following members of the force: Frederick W. Bechtel, M. J. Rich, and Messrs. Graether, Hagadorn, Martin, Smith, Golden, Filipon and Elhret.

* * *

H. B. Niblette has been appointed supervisor of the tire sales division of the Thermoid Rubber Co., Trenton, New Jersey. He was formerly with The B. F. Goodrich Co., Akron, Ohio, and the Quaker City Rubber Co., Quaker City, Philadelphia.

CONNECTICUT NOTES.

The Carlisle Cord Tire Co., Inc., Andover, Massachusetts, has purchased approximately ten acres of land in Stamford, Connecticut, on which it will immediately build a new factory, 150 by

FOOTWEAR IN THE NEW JERSEY RUBBER EXHIBIT. UNITED STATES RUBBER CO. DISPLAY.

from the various schools in this section were brought to see it and had explained to them the way in which the various articles are made. Processes of manufacture were shown as well as the finished product, including tires and inner tubes, hose, boots and shoes, rubberized cloth, mechanical rubber goods, combs, rubber bands, fiber soles and rubber heels, fountain pens, etc.

In one case was shown the process of manufacturing rubber combs as made by the American Hard Rubber Co., Butler, New Jersey. Erasers and rubber bands were shown also, while in another section were the rubber heels and soles made by the Essex Rubber Co., Trenton. Other exhibitors included the Rutherford Rubber Co., Rutherford, "Rubberseal" brushes; Empire Rubber & Tire Co., Trenton, rubber bands; Mercer Rubber Co., Trenton, fruit-jar rings; G. W. Heath Co., Newark, fountain pens; the United States Rubber Co., New Brunswick, boots and shoes; Essex Rubber Co., inner tubes; Thermoid Rubber Co., Trenton, fabric clutch disks; Acme Rubber Manufacturing Co., Trenton, rubber mats; Essex Rubber Co., horse-shoe pads.

The exhibit was of special interest to tire users, as the Ajax, Delion, Acme, Thermoid, Simplex, Empire, and Globe companies exhibited tires and tubes.

An interesting exhibit was that of tire making by the United & Globe company, and of radiator hose by the Thermoid company. Gas masks were shown by the Essex Rubber Co. Supplementing the exhibit were pictures of the work as it is done in the different factories. There were samples of crude, and also washed and dried rubber.

The rubber manufacturing companies of Trenton are always willing to contribute substantially to the various Liberty Loan drives and have given liberally to the various war funds. During the drive for the relief of stricken Poland the Delion Tire

250 feet, of concrete and steel saw-tooth construction, one-story high, to take care of its increasing business.

C. N. Turner has succeeded W. I. Bullard, resigned, as assistant secretary and assistant treasurer of the Goodyear Cotton Mills, Inc., Killingly, Connecticut.

The Foremen's Club, of the Hartford Rubber Works, gave a dinner on Saturday evening, April 12, 1919, to about 200 at the Hotel Garde. The addresses by officers of the company dealt with the outlook for business prosperity following the war.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

WHILE all indications point to a continuation of business activity among the rubber manufactories of Rhode Island during the coming months, there is at present a cessation in the drive that has been experienced for many months previously. During the respite the managements of the various plants are taking advantage of the opportunity of making a general overhauling, renovation and repairing, and are preparing for another period of rushing business, especially among such plants as are making automobile tires and accessories.

Just at present additional orders appear to be slow in coming along, but with the reestablishment of normal trade conditions throughout the country, there is no doubt that the rubber business will enjoy another record-making period. General trade conditions throughout the country appear to be gradually improving. During the past month the Alice and Millville rubber mills of the Woonsocket Rubber Co. have been running five days weekly, being closed all day Saturday.

* * *

It is interesting to note that a canvass that was recently made of the business conditions in 440 large firms of the country that are members of the National Association of Manufacturers indicates that only two districts reported business as very active. These were the Attleboro-Providence district and the Detroit district. Jewelry, musical instruments, rubber and tobacco products, and vehicles, including automobiles, are the only lines of business reporting great business activity.

* * *

The entire plant of the Narragansett Rubber Co., Bristol, including factory buildings, machinery, complete manufacturing equipment and a large tract of land on Wood, Catherine, and Richmond streets, has been sold to the United States Rubber Co. This property has a taxable valuation of \$41,500. It is understood that the main buildings will be used for storage purposes in connection with the National India Rubber Co., doing away with those the company has been using in Providence for that purpose.

This rubber factory has been in existence since 1895, and was started by the late Terance McCarthy, who resided in Bristol all his life. Under his direction the factory grew from a small concern into a large factory which put out daily between 11,000 and 12,000 pairs of arctics and tennis shoes, and employed over 700 hands. When the factory first started it was known as the Byfield Rubber Co.; a few years later it was changed to the Consumers' Rubber Co., and during the last seven or eight years has been known as the Narragansett Rubber Co. Mr. McCarthy was recognized throughout the trade as a thorough rubber man and it is safe to presume that had it not been for his death the factory would have continued doing business under its own name. Practically all of the operatives from this plant have obtained employment either at the National India Rubber Co. or one of the rubber concerns in Providence.

* * *

The Goodyear Raincoat Co., 252 Westminster street, Providence, is owned by Nathan Hyman, Providence, and S. Bornstein, Portland, Maine, according to their statement filed at the City Clerk's office.

The United States Tire Co. has removed its Providence branch from 18 Snow street to the corner of Westminster and Jackson streets, where it will have two of the largest show windows in Providence, one on each street, and about 5,000 square feet of floor space, besides a large basement. Howard E. Crocker is manager.

* * *

In accordance with its policy of bringing the company's service direct to motorists, the Firestone Tire & Rubber Co., Akron, Ohio, has opened a branch at 50 Weybosset street, Providence, in charge of H. J. Aitken, who for the last two years has been attached to the Boston branch of the Firestone company.

* * *

Abraham C. Golden has filed his statement with the City Clerk of Providence that he is the sole owner of The American Tire Co., 131 Fountain street, that city; also of the National Tire Co., at the same address.

* * *

The International Rubber Co.'s plant at West Barrington, where carriage cloth is being manufactured in large quantities, is being operated at night as well as days, due to the unusual rush of orders.

* * *

Business at the factory of the Lynn Rubber Co., in Warren, where rubber heels and soles are manufactured, and which was dull for a while, is beginning to show marked improvement, and orders are increasing.

* * *

The Reliable Vulcanizing Co., 40 Aborn street, Providence, is being conducted by August, Charles and Vincent Gagliano.

PACIFIC COAST NOTES.

By Our Regular Correspondent.

FRANK R. CARROLL, district manager of The B. F. Goodrich Co. in San Francisco, has been chosen to undertake a special mission in the Orient to develop the foreign trade of the Goodrich company. Mr. Carroll is well adapted to this work as he is well acquainted with conditions in the Orient, having been with the first contingent of American troops sent to China during the Boxer rebellion. He was also in the Philippines during the Spanish American war and, later, was engaged in business in China and the Philippines. During his absence the San Francisco business will be in charge of T. Powell.

FRANK R. CARROLL.

* * *

The Tire Service Co., Limited, has been appointed distributor for Southern California, with headquarters in Los Angeles, for the products of the Pennsylvania Rubber Co. H. C. Edelman is manager. Mr. Edelman has been with the Pennsylvania Rubber Co., Omaha, Nebraska, for the past decade.

* * *

B. F. Greenstone of New York City, for the past seven years sales manager for L. Adler Bros. & Co., of Rochester, New York, has been made assistant manager to Mat Shiffner, president of the Tire Co. of California, Los Angeles.

* * *

Howell Tatum, agent for the Fisk tire in Seattle, has gone east to visit the factory and superintendent an advertising campaign to assist the dealers in his territory.

* * *

Allen & Hebard, agents for the Thermoid tire in Portland, Oregon, announce that they have taken over additional territory in southern Washington, a large part of eastern Oregon, and the

district west of Portland to the Coast. They have made considerable additions to their sales force.

E. A. Warner, chief chemist of The Miller Rubber Co., Akron, Ohio, stopped in Los Angeles on his way to the Federated Malay States to get in closer touch with the rubber plantation owners.

LEE E. CLOUGH.

The first of the Mason solid tires to reach California have arrived and have created considerable interest in the trade. Lee Clough, for 13 years connected with the solid tire department of the Firestone Tire & Rubber Co., but for the past year in charge of the tire department of the Mason Tire & Rubber Co., Akron, Ohio, has had charge of their manufacture. The C. Fred Thompson Co. received the shipment.

"The demand for retreaded tires in the East is unlimited," says Ed Harris, secretary of the Tire Construction Co., Olive, at Pico street. "Since the Government boosted this class of work it has created a demand for products which up to eight months ago were practically unknown there."

H. G. ("Ajax") Smith, branch manager of the Ajax Rubber Co., declares that the increase in business since the factory opened its branch at 1237 South Olive street, has been steady and reflects general conditions in Southern California.

James & Thomas have taken over the agency and distribution of the Braender tires and tubes for the whole of this territory.

The Pacific Rubber Co. is Pacific Coast distributor of the "Horseshoe" tires manufactured by the Racine Auto Tire Co., Racine, Wisconsin.

William Wrigley, Jr., of the Wm. Wrigley, Jr., Co., manufacturer of chewing gum, has purchased Catalina Island off the coast of California, near Los Angeles, at a cost of more than \$3,000,000. He will build himself a home there and proposes to make the island the most beautiful and most advertised spot in the United States, intending it for a family pleasure resort rather than a millionaire colony. His plans include the maintenance of the new St. Catherine Hotel, a bungalow colony, sports and fishing facilities, etc. Catalina Island is reached by boat from San Pedro, the harbor for Los Angeles, and has long been an objective point for California tourists.

Tire manufacturers have started in to capture the spring trade of southern California with an energy and determination that has never been known before in the history of the industry in this part of the country. Every big firm in the east is covering the territory with the idea of being in on the ground floor and capturing its share of the business which the end of the war has greatly stimulated. The attraction of all-the-year-round motoring has brought here many of the heads of big eastern firms, and it is believed that not only southern California, but the entire state is to see its greatest year in the history of the automobile industry. Naturally, this creates a large demand for tires and new agencies are daily being announced.

The movement in the legislature for a \$50,000,000 bond issue to be devoted to the improvement of the highways has given an impetus to every branch of the automobile trade. California now possesses excellent highways and this new development will open up thousands of acres in this state.

George Bellis, of The Goodyear Tire & Rubber Co., is introducing the single pneumatic cord truck tire and declares it has many advantages over the old style tube pneumatic. The single pneumatics, he says, are made in the same manner as the cord tires for passenger cars, except that there are more plies of cords, the side walls are sturdier and the tread much thicker. Most of the trucks of the Signal Corps operated during the war, he states, were equipped with the single pneumatic.

Henry E. Durr, president of the Victor Rubber Co., Springfield, Ohio, is in Los Angeles arranging plans for selling the Victor products through the Bershon Tire Co.

Sam S. Cori, factory representative of the Racine Rubber Co., paid a brief visit to the California territory recently, including a visit to San Diego, on which he was accompanied by F. H. Osler of Los Angeles.

Fifty representatives of tire manufacturers and dealers of Seattle recently held their first annual banquet at the Hotel Washington Annex. Addresses were made by W. D. Albright, The B. F. Goodrich Co.; F. E. Winans, United States Rubber Co., and Daniel St. George, The Goodyear Tire & Rubber Co., and G. G. Lemley, of Ballou & Wright, representing the Racine Tire & Rubber Co.

J. D. Hess, Jr., district manager of the Firestone Tire & Rubber Co., Akron, Ohio, was a recent visitor in Portland, Oregon, studying trade conditions. He paid particular attention to the "ship by truck" campaign now being launched by the Firestone company.

The Hippeli Tire Co. has located offices and salesroom in Sacramento for the distribution of Brunswick tires.

O. L. Weaver, secretary of the Star Rubber Co., Akron, Ohio, is making a business trip to the Pacific Coast.

THE GATES CLUB STIMULATES TEAM WORK.

To the Gates Club, Charles G. Gates attributes the successful upbuilding of the Gates Rubber Co., Denver, Colorado, for through it he has achieved coordinated cooperation among the entire executive and operative forces of the company, and given every employe an opportunity to win a voice in the firm's affairs.

The Gates Club is to the company what the Presidents' Cabinet is to the United States Government. It confers on all questions of policy. No new business idea is adopted by the Gates company until it has been thoroughly discussed at the regular semi-monthly meetings of the club. At nearly every session an address is made by a specialist in some line of interest to the rubber manufacturing industry, the cost of these lectures being borne by the company.

Limited to a membership of seventy-five, the Gates Club is a goal coveted by virtually every employe. It is a spur to ambition, "pep," ability, and ideas being the stepping stones to its doorway. The waiting list of eligibles is already considerably beyond the membership limit and growing daily.

The educational features of the club have attracted wide attention. This work is under direction of a committee which issues to club members a weekly bulletin containing market reports, rubber news and special articles. Employes are encouraged to take up business courses, and half of the cost of these studies is paid by the company. More than fifty men are now enrolled in different classes. When an executive position or a place of remunerative attractions is to be filled, it is to the Gates Club that the company turns for recommendations, as one of the duties of the club is to train men for these vacancies.

STRAIGHT FROM GERMANY

An advertisement originated and produced for the Victory Liberty Loan by members of the American Expeditionary Force.

For some of us
the war
will never
be over

MAYBE you'll be going to the country in a few weeks to see the green of the new leaves, and maybe, too, you've got tickets for a corking show tonight, where there will be lights and colors and gay costumes and a happy crowd.

Well — perhaps the war is over for you.

But for some of us —

Can YOU rest or work or play or live until you have finished the work we started—before the light went out?

See it through! It's a big American job. Unless you finish it up in the old American way the battles we fought over here will have been won in vain.

Victory Liberty Loan

GOVERNMENT LOAN ORGANIZATION
Second Federal Reserve District
LIBERTY LOAN COMMITTEE
120 Broadway, New York

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE raw rubber position remains without change, owing to the continuance of the blockade. Customers here know that the stock in the country is equal to nearly a year's consumption and that the East has about 80,000 tons available. It is recognized that the lifting of the blockade—which may be a fact before these lines get into print—will see a jump in rubber prices. Authoritative opinion here, however, does not anticipate a jump to more than three shillings per pound, and it is held, moreover, that it will soon fall again to a lower level. It will be interesting to see how these prognostications pan out.

NATIONAL OR WHITLEY COUNCILS.

Other topics than the price of the raw material have been much to the fore lately; these include the demands of the organized workers, not only in the rubber trade but in almost all occupations and industries, for shorter working hours coupled with no reduction of or an increase in weekly pay. The negotiations which have been going on between masters and men have resulted in an agreement for a week of 47 hours instead of the present 55 hours, and this will shortly come into force. The allocation of the hours over the week is a matter of arrangement for individual firms. In the case of a reclaiming works, where the 47-hour week was adopted in February, the whole of the time was put in the first five days, Saturday being a whole holiday. The decision as to the 47-hour week was reached at a meeting in London of the National Joint Industrial Council of the Rubber Manufacturing Industry in which the employees and other operatives are both represented. This Council is a permanent affair, having as its object "to secure the largest possible measure of joint action between employees and work people for the safeguarding and development of the rubber manufacturing industry as a part of national life, and for the improvement of the condition of all engaged in that industry. The employer's representatives are the following: P. A. Birley, Chas. Macintosh & Co., Limited; H. C. Coles, Wm. Warne & Co., Limited; E. Healey, W. A. Bates, Limited; Sir Chas. Mandelburg, J. Mandelburg & Co., Limited; Stuart A. Russell, Silvertown Co., Limited; J. T. Goudie, chairman, Leyland & Birmingham Rubber Co., Limited; W. G. Wilson, joint secretary, India Rubber Manufacturers' Association; F. C. Baiseley, Dunlop Rubber Co., Limited; F. W. Hinde, Avon India Rubber Co., Limited; Alec Johnston, North British Rubber Co., Limited; R. H. Mallett, The Beldam Tyre Co., Limited; Hon. F. H. Hamilton Smith, The New Liverpool Rubber Co., Limited.

An important effect of these National or Whitley Councils has been to bring together the leading spirits in the same line of business and thus to foster amicable working arrangements tending to the formation of combines or rings. Britain's tendency in this direction was referred to in an editorial in the January issue of *THE INDIA RUBBER WORLD*, and the facts were not overstated. A friend of mine in a rather specialized and restricted business tells me that before the Whitley Councils came into being he knew personally only two out of his twenty-five competitors in Great Britain. Now he knows many of them, and they have formed a combine recently. Although, of course, the main ostensible reason for these trade combines is to further the general interests of the particular trades, the results as far as the consumer is concerned seem to be all in the direction of having to pay more than the mere rise in wages. Then as soon as labor recognizes that profits have increased, a demand is made for increases of pay, and so we go on.

RUBBER GOODS EMBARGO.

I do not propose to deal with the recent ministerial statement with regard to the embargo on manufactured goods, though the

matter is, of course, of great interest to rubber manufacturers on both sides of the Atlantic, though from somewhat diverse standpoints. I may say, however, that the fact of the arrangement having only six months' life has caused it to be somewhat coldly received in business circles generally, the demand being for a definite policy on which to base contracts. Meanwhile, an opportunity has arisen for Canadian rubber footwear to popularize itself in this country, though as the prolonged winter is now about over, it is not to be expected that any great demand will arise.

GOVERNMENT SCIENTIFIC WORK.

Details of scientific work carried out for Government departments in the last four years are now continually being referred to in the press, but so far we have not had anything of the nature or completeness of the article on gas defense apparatus contributed by Major Johnson to the March number of *THE INDIA RUBBER WORLD*. I feel sure that this article will be read with much interest in the rubber trade and would also be of great interest to many in other spheres of employment who are unlikely to come across it.

Among the stocks of chemicals which the Ministry of Munition is disposing of by public tender there is not much of interest to the rubber trade. Sulphur figures to a considerable extent, but it does not follow that it will be disposed of in terms which will enable rubber manufacturers to buy at pre-war prices, as the situation will continue to be dominated by freight costs and facilities from Sicily.

DUNLOP RUBBER COTTON MILLS.

The first rods of a big extension of these mills at Castleton near Manchester were cut early in March by the wives of two of the directors. The object of the extension is to afford a large increase to the productive capacities of the existing mills for the spinning and weaving of tire cloth. The expenditure involved is in the neighborhood of \$7,260,000, and it is estimated that the new mill when completed will raise the number of employees from 800 to 3,000.

THE NORTH BRITISH RUBBER CO., LIMITED.

A meeting of the Edinburgh Section of the Society of Chemical Industry was recently held at this company's works, a thorough inspection of several of the departments being made by the members under the guidance of W. A. Williams, works manager. Great interest was taken in the special laboratory—inspected on a former occasion by the writer—where balloon fabric is tested for its permeability to hydrogen. The failure under examination forms a septum in a gun-metal drum immersed in an electrically treated and controlled thermostat. Hydrogen is maintained at a certain pressure on one side of the fabric and through the other division of the aperture a uniform current of purified air is passed. The hydrogen carried over by the air is, after drying, oxidized by an electrically heated platinum spiral and weighed as water. The capacity of the installation is such that 32 tests can be carried at the same time.

A lecture entitled "The Rubber Industry—Past and Present," was given recently before the Royal Society of Arts, London, by B. D. Porritt, the chief chemist of the North British Rubber Co., Limited, and constituted an interesting and able summary of the development and progress of the industry.

THE MONARCH RUBBER CO., LIMITED.

This company is one of the latest additions to the ranks of pioneering works. The works are in Gleden street, Bradford Road, Manchester. George Spencer, who has been connected with the rubber trade for many years, is the governing director.

The premises are fully equipped to do all classes of proofing for waterproof garments, motor hoods, cart sheets, bench sheeting, hospital sheets, etc., and also telegraph tapes. A large output is already maintained and the company has worked overtime continually since its formation two years ago. The writer understands that a good deal of work has been done for the War Office, but at the present time the whole of the machinery is engaged on civilian work. Arrangements are now completed, it is reported, for removing the business to more commodious premises which will enable the output to be trebled.

CAMPBELL ACHNACH CO., LIMITED.

Another proofing development is the decision of this old established Glasgow firm to make extensive additions to its Thistle rubber mills at Commerce street. This fact, coupled with one or two other similar developments in the country, certainly indicates that the prevalent feeling of three or four months ago that the proofing capacity of the country has been largely overcome as a result of war demands, has been succeeded by more optimistic views of the immediate future.

CABLE MATTERS.

The Telegraph Construction & Maintenance Co., Limited, of London, has paid its customary dividend of 20 per cent for 1918, the year's results being somewhat above the average of the past few years. It is proposed to double the capital by the issue of bonus shares, making it up to £896,400.

The Cable Makers' Association has brought out a new C M A label design. This distinctive label on cables and flexible cords is a guaranty to buyers that they are getting the standard first-quality article.

In the great snowstorm in the north of England last January a very large number of overhead wires were brought down and there was a shortage of labor to make repairs. In some cases the temporary expedient was adopted of using stranded insulated cables suspended from the poles and these are still in use after three months.

The new Transport Bill, to give it its short title, which is now before the House of Commons, will have special interest for cable makers, as it proposes the electrification, on a large scale, of our main line railways. Great though this scheme is, the question of the available supply will not be so acute as in the case of the gutta percha requirement of the new Atlantic cables referred to in the March issue of the INDIA RUBBER WORLD.

DUOPRENE.

With regard to what I said in some recent correspondence about this new hydrochloride of rubber varnish, it should be mentioned that its nonflammability applies to the dried film and not to the solution in which it is sold. The solution medium is pure benzene. I understand that arrangements have been made for an exclusive selling agency in America.

PERSONAL AND TRADE NOTES.

Philip A. Birley, managing director of Chas. Macintosh & Co., Limited, has been elected vice-president of the Manchester Chamber of Commerce and will presumably in due course succeed to the presidency. Since the war the Free Trade directorate of this important chamber has been replaced by men who, in the main, are strongly identified with Protectionist principles and who are representative of a variety of manufacturers, the last president being a shipowner. These facts, it is perhaps advisable to mention, do not mean that the great cotton trade of Manchester is on the decline or that its magnates have revolted from their previous adherence to Free Trade.

The Pomona Rubber Works, Limited, of Hulme, Manchester, have been disposed of as a going concern to Messrs. Lindsay and Williams of London Road, Manchester, and Mr. Shaw, the manager, has entered the service of the latter firm.

Mr. Read, who some time ago sold the Revolite Rubber

Works, Bradford Road, Manchester, has taken premises at Heywood, near Manchester, and is reentering rubber manufacture.

At the beginning of March a party of Canadian officers paid a visit to Manchester and inspected various engineering works. They also visited the works of the Teyell and Eastern Rubber Co., Limited. At a dinner given to them in the Midland Hotel, James Tinto was in the chair and Lieutenant-Colonel Ellis, of the Canadian Engineers, spoke of the business advantages to be derived from personal acquaintance of buyer and seller. He further testified as to the high esteem in which British goods were held in Canada.

BRITISH EMBARGO ON RUBBER GOODS CONTINUES.

The prohibition upon importation of rubber manufactures is still in force in the United Kingdom, but it is understood that the ration previously allowed on the basis of 15 per cent of the 1916 imports is being continued, at least for rubber tires. According to a statement recently made in the British House of Commons, the present restrictions will not be continued beyond September 1, without a complete reconsideration of the whole subject of import restrictions. No promise is implied, however, that the restrictions will be removed by that date.

MANAGING DIRECTOR OF NORTH BRITISH RUBBER CO., LIMITED.

Alexander Johnston, J. P., general manager of the North British Rubber Co., Limited, Edinburgh and London, has been made managing director of the company. He has been, during the last 14 years, secretary, works manager, and general manager, successively, thus filling all of the principal executive positions.

AMERICAN CHAMBER OF COMMERCE HEADQUARTERS IN PARIS.

The American Chamber of Commerce in France has recently removed to new rooms at 32 rue Taibout, Paris. Its membership is now 471, of which 305 are resident, and it is hoped to add some 250 new members this year. The chamber is looking to commercial interests in the United States to avail themselves of its position for fostering their trade in France, also its conveniences afforded to their representatives while in Paris, in return for the support their membership gives.

All American citizens, corporations and associations of good standing, interested in the objects of the chamber, are eligible for active membership. The annual dues of active members, including admission fee, are \$50 for resident members, \$25 for non-resident members. Application blanks and full information may be obtained from the secretary at the above address.

MARSEILLES TO HAVE A RUBBER MARKET.

Until now France has always been content to buy both plantation and wild rubber at London, the world's market. The French Government, desirous of establishing a central market at Marseilles and in compliance with this policy have made arrangements with the Cie. Chargeurs Reunis, for regular voyages between Par  and French ports. The cost of transfer of rubber from Liverpool, amounting to 5 per cent, would then be removed. As a result, the Booth Line has cut freight rates by 20 per cent. ("Wileman's Brazilian Review.")

ITALIAN RUBBER INDUSTRY GROWS.

Pirelli & Co. of Milan have increased their capital by 3,000,000 lire. The Martiny Co. of Twin is about to double its present capital of 6,000,000 lire.

"The India-Rubber Journal" also announces that the newly formed Association of Rubber and Cable Manufacturers is composed of 14 firms, with 20,000 hands. The association's president is Senator J. B. Pirelli, and the vice-presidents are V. Tedeschi, of the Tedeschi Co., Twin, and R. Pola of the Societa Piedmontese Industria Gomma e Affini.

Rubber Planting Notes.

RUBBER EXPORTS FROM THE STRAITS SETTLEMENTS AND FEDERATED MALAY STATES.

IN 1916, the United States took 43,000 tons of crude rubber exported from the Straits Settlements; in 1917, 85,268 tons out of a total of 121,082, and in 1918, 92,454 tons out of a total of 122,004. Japan, which has been steadily increasing her imports of raw rubber, took 7,579 tons in 1918, against 3,190 tons in 1917 and 2,119 tons in 1916.

On the other hand, only 14,583 tons of crude rubber were shipped to the United Kingdom from the Straits Settlements in 1918, compared with 27,812 tons in 1917, 28,808 tons in 1916, and 27,473 tons in 1915.

The value of the rubber exports from the Straits Settlements is given, approximately, at \$94,925,337, and an idea of the falling off in prices of the product is obtained from the statistics of the Federated Malay States, which set out that the value of 78,225 tons exported in 1918 was \$65,867,220, which compared with \$107,166,638 for 79,831 tons in 1917.

The destinations of the year's shipments are given below:

FEDERATED MALAY STATES.			
	December, 1918.	Total for 1918.	Total for 1917.
Straits Settlements	5,830.00	70,609.80	66,772.82
United Kingdom	1,103.66	6,187.51	11,889.05
Europe	29.46	85.44
Ceylon	221.71	699.92
Other countries	130.54	1,120.69	469.58
Totals	7,084.56	78,225.15	79,831.37

STRAITS SETTLEMENTS.			
	December, 1918.	Total for 1918.	Total for 1917.
United Kingdom	2,621.2	14,583.9	27,812.3
United States and Canada	6,390.3	92,454.0	85,268.3
Europe	341.0	5,715.6	4,259.2
Australia	65.4	955.0	193.5
Ceylon	643.6	358.0
Japan	1,667.6	7,579.6	3,190.4
Other countries	25.0	73.2
Totals	10,505.5	122,004.9	121,082.0

The figures for the Straits Settlements include rubber imported into the markets of the Colony from all places, locally produced, and rubber transhipped from the Federated and non-Federated Malay States.

EXPORTS IN FEBRUARY.

A report from Kuala Lumpur states that the export of plantation rubber from the Federated Malay States for the month of February amounted to 10,809 tons. This is the largest amount ever exported in one month, and compares with 6,820 tons and 7,250 tons in the corresponding month of last year and 1917, respectively. The total for two months of the present year is 17,972 tons, compared with 14,408 tons in 1918, and 13,245 tons in 1917. Appended are the statistics for three years:

	1917.	1918.	1919.
January	5,995	7,588	7,163
February	7,250	6,820	10,809
Totals	13,245	14,408	17,972

ARRIVAL OF RUBBER CARGO AT ANTWERP.

A consignment of rubber, the first since the German occupation in 1914, arrived at Antwerp, Belgium, the latter part of March on the S. S. *Albertville*, from the Congo.

TAPPING RESULTS OF PARA RUBBER IN NIGERIA.

According to the trade supplement to the "Nigeria Gazette" of October 31, the *Hevea brasiliensis* now appears to be acclimatized in many parts of southern Nigeria, and its rate of growth compares favorably with that recorded on plantations in the East.

From 300 five-year-old trees growing in the Sapele district, which were tapped by the Agricultural Department in 1911, an average yield of one and one-half pounds of dry rubber was obtained. In the following year, four old trees at Ebrite gave an average yield of seven pounds. From September, 1916, to December, 1917, about one thousand eleven-year-old trees at Agege yielded 4,337 pounds, which was sold locally for £408 15s. 9d.

SUGAR AS A COAGULANT FOR HEVEA LATEX.

Rudolph D. Anstead, Deputy Director of Agriculture, Planting Districts, India, writing in "The Planters' Chronicle" (Bangalore, India), August 10, 1918, page 523, sums up the advantages and disadvantages of sugar as a coagulant for *Hevea* latex as follows:

The great advantage is the cheapness of the material as compared with acetic acid, especially at the present time, while, moreover, it is always available in the country and does not depend upon shipping facilities. The quantity required is very small, 0.1 to 0.2 per cent of sugar calculated on the latex, or one part of sugar to 500 parts of latex.

The disadvantages are that it produces a product which differs slightly in rate of cure from acetic-acid coagulated rubber, necessitating in the case of contracts a warning of the change to buyers. Another objection is that the coagulum is apt to be full of gas bubbles due to the evolution of carbon dioxide during the coagulation process, and sheet rubber showing this defect is regarded with disfavor in the market although the actual quality of the rubber is not affected by the presence of the bubbles. If crepe is being made the bubbles do not matter, but sheet is chiefly made now.

RUBBER TAPPING RESULTS IN UGANDA.

The following table from the "Uganda Official Gazette" of November 15, 1918, shows the results of a year's tapping on four groups of trees, and of nine months on another group in the Botanic Gardens at Entebbe.

The period was an exceptionally dry one, the total rainfall amounting to 50.11 inches during the year of tapping. Series 1, 2, and 4 were tapped for the first time, whilst series 3 and 5 were on renewed bark of four years' growth.

In series 3 the V-cut is the basal cut of the full herring-bone system, which was being practised at the time when the gardens came under the control of the Department of Agriculture, and similarly in series 5, the cuts are the two basal cuts to the left of the full herring-bone system, which had consisted of four, five or six incisions. This previous history of these two groups must be taken into account in reviewing the yields. The disparity in the number of parings per inch is noticeable. In series 5 the taper was clumsy, which accounts for the low average obtained.

The yields have been very uniform throughout, and renewal of bark is good.

Series Number.	Trees in Series.	Date Planted.	Times Tapped.	Averages.				Weight.			
				Girth at 3 Feet When Tapping Began.	Area of Bark Excised.	Parings Per Inch.	Yield Per Tree.	Sheet Rubber.		Scrap Rubber.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED FEBRUARY 11, 1919.

- N^o. 1,293,759. Wind-shield cleaner. C. W. Groot, Rochester, N. Y.
 1,293,898. Resilient wheel. J. Kuehl, Detroit, Mich.
 1,293,893. Split demountable rim for tires. E. Oliver, Daytona, Fla.
 1,294,084. Cushion tire. M. Gomer, Mexico, Mex.
 1,294,105. Rubber glove for insulating and protecting, shaped to fit hand when in position for grasping an object. F. S. Holden, Oakland, Calif.
 1,294,108. Tire with pneumatic tube. T. J. Jameson, Florida, Calif.
 1,294,219. Folding water-bag machine. G. S. Andrus, Akron, O.
 1,294,313. Wheel rim for pneumatic tires. M. Sloper, Develizes, Eng.
 1,294,322. Tire patch. J. T. Swett, Wrens, Ga.
 1,294,350. Pneumatic cord tire. O. Smiley, Indianapolis, Ind.

ISSUED FEBRUARY 18, 1919.

- 1,294,420. Resilient reinforced tire. B. Dahl, Minneapolis, Minn.
 1,294,421. Pneumatic tire. F. S. Dickinson, New York City.
 1,294,464. Box for tire-repair outfit, whose cover is adapted to form press with bottom of box. W. M. Holliday, Penrith, New South Wales, Australia.
 1,294,520. Fountain pen. C. B. Munn and C. H. Marker, Warren, Pa.
 1,294,632. Artificial limb with calf and foot sections having yieldable and inflatable walls. R. B. Dickson, West Point, Miss.
 1,294,649. Hose supporter. S. A. Glum, W. H. Wolpert, and C. J. Hanzel, Antigo, Wis.
 1,294,796. Reinforced rubber tire. H. L. Harding, Loughton, Eng.
 1,295,011. Compression inner tube. N. C. Doss, assignor to The Doss Rubber & Tube Co.—both of Atlanta, Ga.
 1,295,014. Outer cover for pneumatic tires. T. Dussens, assignor of $\frac{1}{2}$ to Rene Hustinx—both of Antwerp, Netherlands.

ISSUED FEBRUARY 25, 1919.

- 1,295,201. Rubber heel cushion. J. Pietruch, Cincinnati, O.
 1,295,266. Reinforced resilient tire. E. E. Bullard, Springfield, Ill.
 1,295,494. Reinforced pneumatic tire. P. L. Hedges, Mattoon, Ill.
 1,295,604. Pneumatic inner tube substitute. D. C. Roberts, Trenton, N. J.
 1,295,627. Rubber grip for bicycle handle-bars, etc. E. J. A. Sommer, Buffalo, N. Y.

REISSUES.

- 14,596. Rubber heel reinforced with embedded metal plate. E. J. Hooper, Stoughton, assignor by mesne assignments to E. W. Cary, Winchester—both in Mass.

ISSUED MARCH 4, 1919.

- 1,295,832. Waterproof container or envelope. P. H. and H. H. Allen, assignors to Bengtson & Co., Inc.—all of St. Louis, Mo.
 1,295,892. Cushion heel. T. Hand, Orlando, Fla.
 1,295,961. Tire patch. G. D. Brillhart, Cuyahoga Falls, O.
 1,295,949. Tire patch. G. B. Wood, assignor of $\frac{1}{2}$ to W. C. Wood—both of Minneapolis, Minn.
 1,296,353. Pouch for tobacco, etc., having side opening with extension for clasp. "A. A. and J. J. Brown, assignors to A. A. Brown & Co., Inc., Springfield, Mass.
 1,296,359. Pneumatic mat. D. W. Brown, Youngstown, O.
 1,296,441. Armored tire. H. H. Stoner, assignor of $\frac{1}{2}$ to W. D. Stoner—both of Springfield, Mass.
 1,296,442. Elastic hose. M. E. Thompson, Newark, assignor of $\frac{1}{2}$ to L. I. Green, East Orange—both in N. J.
 1,296,512. Endless track for tractors, having removable rubber cushions. H. A. Hatfield, London, assignor to H. A. H. Tractors Limited, Birmingham—both in Eng.
 1,296,516. Tire valve. R. H. Henemer, New York City, assignor to A. Schrader's Son, Inc., Brooklyn—both in N. Y.
 1,296,517. Tire valve. R. H. Henemer, New York City, assignor to A. Schrader's Son, Inc., Brooklyn—both in N. Y.
 1,296,539. Auxiliary rim and tire for pneumatic-tired wheels. J. V. Loeffler, Evansville, Ind.

ISSUED MARCH 11, 1919.

- 1,296,668. Life-bomb with inflatable floats. J. Koziol, Des Moines, Ia.
 1,296,694. Hydrometer syringe. R. M. Pierson, Akron, O., assignor to The B. F. Goodrich Co., New York City.
 1,296,763. Sound-transmitting device. C. Cherry, Oakland, Calif.
 1,296,802. Rubber tread and heel for shoes. M. Hirschfeld, New York City.
 1,296,874. Resilient tire. J. Summerson, Emporium, Pa.
 1,296,894. Rubber sole for turn shoes. S. W. Winslow, Jr., Beverly, Mass., assignor by mesne assignments to United Shoe Machinery Corp., Paterson, N. J.
 1,296,915. Submersible toy controlled by rubber bulb. T. Burney, London, Eng.
 1,296,967. Life-saving garment with inflatable bags between layers. A. A. Kehl, assignor of $\frac{1}{2}$ to J. J. Pycha—both of Baltimore, Md.
 1,297,052. Tire with removable rim. N. M. Allan, San Antonio, Tex.
 1,297,061. Vulcanized textile and rubber sole for boots and shoes. G. W. Beldam, Ealing, and A. U. B. Ryall, Brentford—both in Eng.
 1,297,087. Sectional pneumatic tire. C. Chandler, Kingsville, Tex.
 1,297,106. Elastic connection for garment-supporters. W. D. Corder, Philippi, W. Va.
 1,297,207. Nipple for nursing bottles.
 1,297,219. Tire-inflation valve. J. V. Potter, Ardmore, Okla.
 1,297,272. Bunch with elastic scraping band on head. L. B. Strang and C. C. Pollock, Seattle, Wash.
 1,297,278. Armored inner tube. H. N. Wayne, Los Angeles, Calif., assignor to Armored Tire & Rubber Co., Wilmington, Del.
 1,297,279. Inner tube for pneumatic tires. H. N. Wayne, Los Angeles, Calif., assignor to Armored Tire & Rubber Co., Wilmington, Del.

THE DOMINION OF CANADA.

ISSUED DECEMBER 3, 1918.

- 187,740. Rubber tire with transverse elastic webs. J. W. Pepple, San Antonio, Tex., U. S. A.

ISSUED DECEMBER 10, 1918.

- 187,825. Armored pneumatic tire. A. Boerner, Scheveningen, Holland.

ISSUED DECEMBER 17, 1918.

- 187,919. Cushion tire with laminated core of sponge rubber. A. A. Crozier, London, Eng.
 187,920. Cushion tire with laminated core of sponge rubber, made in two sections to accommodate a pneumatic tire. A. A. Crozier, London, Eng.
 187,945. Tire tread. R. A. Palmer, Edmonton, Alta.
 187,948. Spiral process of elastic and non-elastic webbing. P. J. Savage, New York City, U. S. A.

ISSUED DECEMBER 24, 1918.

- 188,025. Fountain pen with presser-bar filling device. H. L. Carman, assignor of F. Riessenberg, both of New York City, U. S. A.
 188,049. Rubber heel with leather-filled central split from inner edge covered by rubber flap. B. Church, Toronto, Ont.

ISSUED MARCH 11, 1919.

- 189,064. Demountable rim for tires. R. McClure, Fort Laramie, Wyo., and H. G. Barnes, Gilman, Mont., assignor of one-half interest—both in U. S. A.

ISSUED MARCH 18, 1919.

- 189,160. Fastener for rubber heels to be cast in the heel. A. E. Taylor, Auckland, N. Z.

ISSUED MARCH 25, 1919.

- 189,263. Fly-awster with cushioning bands. C. S. Hutton, Conyngham, Pa., U. S. A.
 189,297. Belt for garments. L. J. Scheiman, New York City, U. S. A.
 189,315. Nipple for nursing bottle. The Canadian Consolidated Rubber Co., Limited, Montreal, Que., assignor of A. C. Eggers, Brooklyn, N. Y., U. S. A.

ISSUED APRIL 1, 1919.

- 189,345. Hose supported by a rubber band. N. Y., U. S. A.
 189,359. Hard-rubber nipple with screw-threaded metallic coupling. M. V. Crocker, Newton, Mass., U. S. A.
 189,420. Resilient cushioned wheel. J. Stuart, Melbourne, Victoria, Australia.

ISSUED APRIL 8, 1919.

- 189,506. Detachable rubber heel-cover for French heels. E. S. Helwitz, New York City, U. S. A.
 189,529. Pneumatic tire. G. E. Phillips, Sarnia, Ont.

Canadian patents issued between December 31, 1918, and March 11, 1919, were listed in THE INDIA RUBBER WORLD, April 1, 1919.

THE UNITED KINGDOM.

ISSUED MARCH 5, 1919.

- 121,910. Cushioned wheel. W. Freakley, Milton House, Albion street, Hanley, and H. Aynsley, Portland House, Blyth Bridge, Stoke-on-Trent, both in Staffordshire.
 121,976. Rubber pad for crutches. D. J. Moss & Sons, Chapel Field Works, Ardwick, Manchester, and R. C. Armstrong, 11 St. Leonard's Road, Heaton Chapel, Stockport.
 121,988. Rubber-cushioned tread for rubber wheels with removable rubber blocks for use on soft or hard roads. W. L. Bowman, Lydiat Ash, Bromsgrove, Worcestershire.

ISSUED MARCH 12, 1919.

- 122,023. Tube molded from plastic rubber to constitute a single-tube tire. H. B. Wallace, 401 South 7th street, St. Louis, Mo., U. S. A.
 122,032. Collapsible gas-holder for motor vehicles. J. C. Watson, 67 Westbourne Gardens, Hove, Sussex.
 122,059. Protecting cap for toes of shoes when kneeling. I. T. Dowsett, 15 Oval Road, Gravely Hill, Birmingham.
 122,067. Thin rubber sole reinforced with canvas. F. J. Wood, 29 King's street, Bank Parade, Burnley, Lancashire.
 122,089. Packing for stuffing-boxes. W. K. Beldam, 1a New London street, London.

ISSUED MARCH 19, 1919.

- 122,217. Metal-studded tire. A. M. Poynter, 16 Ebury street, London.
 122,301. Demountable rim for tires. J. Renwick, Emmett, Ida., U. S. A.
 122,322. Bottle stopper fitted with rubber plug. O. F. Moss, 29 King's Road, Chelsea, London.
 122,384. Soothing treat filled with sponge rubber. H. S. Briggs, 92 Toorak Road, South Yarra, Victoria, Australia.

ISSUED MARCH 26, 1919.

- 122,410. Corsets with elastic strips. S. J. Newman, New Haven, Conn., U. S. A.
 122,430. Inflatable life-saving suit. T. Bain and L. Morgan, 9 Ravenscourt avenue, Hammersmith, London.
 122,553. Detachable rubber tread bands for tires. J. H. Gill and J. D. Rea, Higher street, Dunedin, N. Z.
 122,578. Resilient inner tube. E. J. Taylor, 9924 102d street, Edmonton, Alta., Can.
 122,620. Surgical appliance. J. E. Larche, Lariboisiere Hospital, rue Ambroise Pare, Paris, France. (Not yet accepted.)

NEW ZEALAND.

ISSUED FEBRUARY 6, 1919.

- 40,996. Resilient tire with core formed of rubber and leather disks threaded on metallic band.

ISSUED FEBRUARY 20, 1919.

- 40,674. Collection device for rubber latex, etc. J. T. Hunter, 157 Featherston street, Wellington, N. Z. (Kapoewas Rubber Co., Limited, 30 Moorgate street, London, Eng., assignor of W. E. Adolph, Kapoewas Rubber Co., Limited, Ponianak, West Borneo.)

ISSUED MARCH 6, 1919.

- 40,886. Pneumatic arm-pit support for crutches. F. A. Pennington, 10 Halsbury Court, Houston (Tex.), Stockport, and T. K. Day, Baskin, Day & Baskin, both in England.

TRADE MARKS.

THE UNITED STATES.

- N**O. 104,645. The words "Stern" and "tube" and rubber-treated rainproof overcoat. United States Rubber Co., New York City.
- 104,384. The words **STERN** used in fancy lettering—inner tubes for pneumatic tires. **Sterns Tire & Tube Co.**, St. Louis, Mo.
- 124,485. Conventional representation of the planet **Saturn** and its rings—rubber and fabric belting. **The Gutta Percha & Rubber Manufacturing Co.**, New York City.
- 107,246. Representation of an animal's skin bearing the word **HIBETEX**—imitation leather. **People's Outfitting Co.**, Detroit, Mich.
- 112,309. Conventional representation of a globe with lines of latitude and longitude—rubber heels. **Frank Wharton, Elyria, O.**
- 112,465. The word **PERFECTION**—pneumatic cord tires. **Perfection Tire & Rubber Co.**, Fort Madison, Ia.
- 108,375. Representation of six-pointed star with diamond superimposed, bearing the word **WELTUM**—imitation leather for making boots and shoes. **Joseph Dejong, London, Eng.**
- 115,743. Representation of four T-squares arranged to form a square with broken sides and the representation of four four-leaved clover-leaves superimposed at the corners, with the words **FOUR SQUARE**, underlined, beneath and between the upper two T-squares—food-jar rubbers. **Friant Bros. Rubber Co.**, Baltimore, Md.
- 114,210. Representation of a double oval with the word **ARISTO** within the inner one and two black dots beneath, between the two ovals—shoes of leather, rubber, and canvas for men and women. **Marshall Field & Co.**, Chicago, Ill.
- 114,252. The word **ECONOMY** decorated with scrolls—boot and shoe tips made of rubber, rubber composition, and fiber. **Emery Heel Sales Co.**, Boston, Mass.
- 114,334. The representation of a flask bearing the words **ARMOS**—resuscitators, mine-rescue apparatus, gas-masks, valves, etc. **The Draeger Oxygen Apparatus Co.**, New York City.
- 114,437. The words **SAMMIES SURE-STICK** in white letters against a black oblong background—tire patches. **Louis H. Scott, Oklahoma, Okla.**
- 114,447. Representation of label bearing the words **OH BOY GUM**—chewing gum. **The Goodyear Gum Co.**, Boston, Mass.
- 114,697. Representation of a brake lining having a longitudinal white stripe and enclosing the words **WHITE STRIPE** in black letters outlined in white—fabric linings for transmissions and brakes. **Advance Automobile Accessories Corp.**, Chicago, Ill.
- 115,002. Representation of a commander's flag bearing the word **FISHING** on the pennant—garters and hose-supporters. **American Textile Products Co.**, Chicago, Ill.

THE DOMINION OF CANADA.

- 24,073. The word **BEAVER**—rubber stamps, erasers, rubber type, etc. **George Bump, Limited, Ottawa, Ont.**
- 24,084. The word **CLIFFER**—tires, tire patches, inner tubes, rubber cements, paint, tape, hose guards and rolls, friction cloth, packings, footwear, belting, hose, horse-shoe pads, sheeting, etc. **Dunlop Tire and Rubber Goods Co., Limited, Toronto, Ont.**
- 24,089. The words **WING FOOT** and the representation of a winged foot—Rubber or composition heels. **The Goodyear Tire & Rubber Co. of Canada, Limited, Toronto, Ont.**
- 24,273. Representation of a circle formed by a rope, enclosing the words **MIXER'S SEA LAND** and the letter **M**—footwear wholly or partially of rubber. **The Miner Rubber Co., Limited, Granby, Que.**
- 24,280. The word **TREO**—corsets, elastic girdles, supporters, etc. **Treo Co., Inc., New York City, U. S. A.**
- 24,281. The word **LUFT**—corsets. **Uplift Corset Co., Toronto, Ont.**
- 24,325. The letters **S. S. S.**—fountain pens. **Asashiro Hosonuma, I. Suehiro-cho, Kanda-ku, Tokio, Japan.**

NEW ZEALAND.

- 14,710. The word **BAKELITE**—condensation products of phenol and formaldehyde. **General Bakelite Co., 2 Rector street, New York City, U. S. A.**

DESIGNS.

THE UNITED STATES.

- N**O. 53,066. Non-skid tire. Patented February 18, 1919. Term 14 years. **E. N. Downes**, assignor to **J. & D. Tire Co.**—both of Charlotte, N. C.

- 53,066. Rubber heel. Patented March 11, 1919. Term 14 years. **I. R. Bailey**, assignor to **The Goodyear Tire & Rubber Co.**—both of Akron, Ohio.
- 53,066. Tire casing. Patented March 11, 1919. Term 14 years. **F. S. Dickinson**, New York City.
- 53,070. Pneumatic tire. Patented March 11, 1919. Term 14 years. **R. T. Griffiths**, assignor to **The Miller Rubber Co.**—both of Akron, O.
- 53,083. Tire. Patented March 11, 1919. Term 14 years. **H. D. Mitchell**, assignor to **Norwalk Tire & Rubber Co.**—both of Norwalk, Conn.
- 53,096. Tire. Patented March 11, 1919. Term 14 years. **G. H. Witsman**, assignor to **The Dayton Rubber Manufacturing Co.**—both of Dayton, O.

A COLLEGE COURSE IN RUBBER TECHNOLOGY.

REALIZING its advantages of location in the greatest rubber manufacturing city of the world, the Municipal University of Akron, Ohio, offers, in connection with its regular courses in chemistry, a course in the chemistry of india rubber, which is designed to prepare young men who have had a preliminary training in chemistry to enter the rubber industry with a theoretical and practical knowledge of chemistry as applied to the manufacture of rubber products.

The course at Akron is an advanced one, the minimum prerequisite requirements being at least three years of college chemistry, including general chemistry, eight credit hours, and six credit hours each of qualitative analysis, quantitative analysis, and organic chemistry. It covers a period of two semesters, starting in September of each year, and the curriculum consists

AKRON MUNICIPAL UNIVERSITY LABORATORY.

of lectures, recitations, laboratory work,* and visits to factories, of which Akron offers plenty, embracing virtually every important line of rubber manufacture.

A general outline of the work follows:

CRUDE RUBBER.—Sources (including discussion of the latex and coagulation), *washing and drying, *analysis, *chemical properties, *physical properties, structure.

COMPOUNDING INGREDIENTS.—Sources and manufacture, *analysis, *use.

VULCANIZING RUBBER.—*Analysis, *physical testing, theory of vulcanization.

RUBBER COMPOUNDING AND VULCANIZING.—Calculating costs and gravities of formulas, *compounding, *vulcanizing, *physical testing.

RUBBER RECLAIMING.—*Methods, *analysis and testing.

BALATA AND GUTTA PERCHA.—Properties and uses.

VISITS TO FACTORIES.—The topics are fully discussed in the lectures, and those indicated by stars are further developed in the laboratories, which are fully equipped to carry on the necessary chemical work and provided with modern apparatus for washing, compounding, vulcanizing, reclaiming, and testing rubber. The student thus acquires knowledge and actual experience in these processes, and in near-by factories becomes familiar with the details of various manufacturing methods impossible to conduct in the laboratory. With preparation in the technology of rubber he is placed in a position to develop into a valuable man in the laboratory, factory or sales force.

The need for such a course is well indicated by the number of situations open to skilled rubber men, while the success of the course is shown by the fact that calls for graduates are received from all parts of the United States, and that these students have been uniformly successful in holding their positions.

THE MARKET FOR COMMERCIAL PAPER.

During April the demand for commercial paper has been rather light, especially in New York City, caused somewhat by the approach to and opening of the Victory Loan campaign, but from out of town the demand has been fair, the best rubber names going at 5½ to 5¾ per cent, and those not so well known at 6 to 6½ per cent.

EXPORTS OF PLANTATION RUBBER FROM THE FAR EAST.

	January, 1919.

STRAITS SETTLEMENTS RUBBER EXPORTS.
An official cablegram from Singapore states that in the month of February 15,661 tons of rubber were exported from the Straits Settlements ports, as compared with 2,334 tons in the corresponding month last year and 6,495 tons in 1917. The total for two months of the present year is 30,065 tons against 6,636 tons in 1918 and 10,057 tons in 1917. Included in last month's exports were transshipments of 1,861 tons. Appended is the comparative table for three years:

	1917.	1918.	1919.
January	3,562	4,302	14,404
February	6,495	2,334	15,661
Totals	10,057	6,636	30,065

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [March 13, 1919]:
The weekly rubber auction opened yesterday rather quietly at about last week's level, but the latter part of the day saw considerably increased competition, there being several buyers in the market for early shipment. On the first day fine pale crepe and ribbed smoked sheet both touched 77 cents, showing an advance of ½ cent on the week. At the continuation of the sale to-day some lively bidding was witnessed, and fine pale crepe advanced to 77½ cents (one fine lot in cases sold for 78 cents) while the same figure was paid for one small lot of prime sheet. Of quality sheet and crepe met with a steady demand at prices about 2 cents up. Clean brown crepes more than maintained their previous value, while dark and bark crepes weakened slightly. The quantity sold was 729 tons, out of 1,210 tons catalogued.

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

THE stagnant condition of the trade in rubber scrap still continues as the result of the depressing influences that have been operative for weeks past. Reclaimers are not buying for lack of orders, as consumers prefer to use crude rubber while the difference in price is so small. The trade, however, evidently believes that the market will soon develop signs of improvement. There is some interest in inner tubes, due to export inquiries. In general, the market is very quiet, in fact, it has been described as not existing.

BOOTS AND SHOES. There has been no demand, and 7½ cents is the delivered price.

INNER TUBES. There has been slight activity in inner tubes. Prices are unchanged at 20 to 24 cents.

MECHANICALS. Very little demand, and prices nominal.

TIRES. The demand is very slight, at about 3½ cents.

NEW YORK QUOTATIONS FOR CARLOAD LOTS DELIVERED.

April 25, 1919.

Prices subject to change without notice.

THE MARKET FOR COTTON AND OTHER FABRICS.
NEW YORK.

AERICAN COTTON. The official figures show a decrease in cotton consumption for March, when 433,000 bales were consumed as compared with 571,000 bales in March, 1918. Both imports and exports for March show an increase, exports being 504,230 bales, as against 311,810 for March, 1918. Imports for March were 15,561 bales, compared with 14,261 bales in 1918.

The spot market has been featureless, and prices have not changed materially. The demand appeared to be for low grades. Middling uplands was quoted 28.60 cents on April 1, and on April 25 the figures were 29.25.

EGYPTIAN COTTON. This season there will be no restriction on the growing of cotton in Egypt, with the full peace time acreage to be planted. Conditions so far have been very satisfactory for the preparation of the crop and the weather has not hindered operations.

The arrival of two cargoes of cotton from Egypt during the month resulted in prices falling below 50 cents.

AMERICAN EGYPTIAN COTTON. The 1919 crop of American Egyptian cotton in the Salt River Valley will be the product of about eighty-three thousand acres of land. The planting of the crop has been completed. The quickest time has been made and the most favorable conditions for five years have prevailed. While the spring was a little late, the rains have not been accompanied by the usual cold weather. A great deal of the cotton is already showing above ground.

This year's crop has all been sold. Quotations were 50 to 52 cents for Yuma and 55 to 57 cents for Pima.

SEA ISLAND COTTON. There has been a fair demand in the northern markets and prices have ranged between 50 and 54 cents, with a difference of about a cent between the various grades.

BURLAP. Market very firm with prospect of higher prices.

SHEETINGS, DUCKS, DRILLS, AND OSNABURGS. Market conditions are much more active and stronger than last month and prices of many coarser fabrics have advanced 5 cents or more a pound.

TIRE FABRICS. Although inquiries received last month indicate greater interest in tire fabrics, the demand has been small. Peelers were steadier and prices unchanged from last month's quotations.

NEW YORK QUOTATIONS.

APRIL 25, 1919.

Prices subject to change without notice.

(Compiled by Davies, Benachi & Co.)

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK.

The markets for the base metals, pig lead and spelter have been characterized the past month by equally quiet and dull conditions. About the middle of the month there was a reduction of one-quarter of a cent per pound in pig lead without appreciably influencing the demand.

ANILINE. There has been a good steady call for aniline throughout the past month at 23 to 24 cents per pound.

DRY COLORS. The prolonged dullness in dry colors shows some indications at present of early improvement, although the demand is still rather quiet.

BARYTES. There have been no price changes for barytes, and sales continue to be light.

BENZOL. The month began with a weak market, which strengthened toward the close, culminating in an active call for the material at firm prices.

CARBON TETRACHLORIDE. The demand has continued weak as through March and the price quiet and unchanged.

LITHOPONE. The price reduction of ½ cent per pound, dating early in the month, stimulated the demand to a very satisfactory condition. The reduced price is 6½ cents.

LITHARGE AND SUBLIMED LEAD.—The market on all lead products has remained dull for the past weeks. Litharge stands at 9¼ to 10 cents, and sublimed lead at 8¼ to 8½ cents.

WHITING.—There has been no change in prices, and none is expected until the cost of ocean freights from England lessens.

ZINC OXIDE. Prices for the second quarter were announced the first of April, and show a marked reduction in most grades. A decided improvement followed on the setting of the new prices and there is now a good demand, particularly in the lead-free grades.

SUBSCRIPTIONS: \$3.00 per year, \$1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, \$3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank draft. Post Office or Express money order on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**RUBBER MANUFACTURERS' OPINIONS.**

THE RESULTS of a canvass of the membership of the National Association of Manufacturers—4,400 large firms engaged in practically every line of industry—with respect to business conditions and probabilities have just been compiled and individual opinions quoted regarding what is needed to promote general prosperity. Five out of 22 principal groups of industries throughout the United States are all that agree that business activity is more than between 25 and 50 per cent of normal. One of these is the rubber industry.

The five divisions of industry reporting a predominant condition of present business prosperity are the jewelry and silverware, musical instruments and vehicle groups (the last mentioned including automobile manufacture), rubber and tobacco. With the exception of these five, the manufacturers in general do not view the trade probabilities for the balance of 1919 as very bright. The views of the rubber manufacturers are here presented. On present trade conditions 19 per cent of rubber men report them poor; 19 per cent report fair; 42 per cent, good; and 20 per cent, excellent. Of the trade prospects for 1919, 5 per cent

of the rubber men report them poor; 15 per cent report fair; 57 per cent, good, and 23 per cent find them excellent.

Conditions of manufactured stocks on hand with retailers (or jobbers) compared with normal pre-war supply:

Rubber and manufacturers report: low, 52 per cent; normal, 32 per cent; and over, 16 per cent.

Are consumers and retailers (or jobbers) buying on any important scale? Rubber manufacturers report: 54 per cent, yes; 46 per cent, no.

Are domestic markets of more immediate attraction than foreign?

Of rubber manufacturers, 76 report that they are, 24 per cent that they are not.

One hundred per cent of rubber manufacturers are recorded as opposed to government ownership of public utilities. On the question of private ownership under government regulation 75 per cent of rubber manufacturers report that they favor it, and 25 per cent are against it.

On the question "Do manufacturers favor legalized (Federal statute) fixed resale prices on trade-marked articles?" 48 per cent of rubber manufacturers favor it and 52 per cent are against it.

On the question of a referendum on the proposed legally vested National Labor Board to adjudicate disputes, 76 per cent of rubber dealers and manufacturers favor it while 24 per cent are against it.

Ninety three per cent of rubber dealers and manufacturers report themselves in favor of the repeal of the La Follette Seamen's Law and 7 per cent are against it.

The question "Should statutory responsibility be imposed on trade unions?" shows that but one per cent of the rubber industry is against it, while 99 per cent declare in favor of it.

THE COMING INDUSTRIAL CONGRESS.

IMMEDIATELY after the return of President Wilson from Paris, an industrial congress to bring about an amicable program between capital, labor and the Government for the readjustment of industry is to be called. About 100 persons will be invited to the conference, which will include some of the biggest employers of labor such as Charles M. Schwab, John D. Rockefeller, Jr., Henry Ford, and J. Ogden Armour, with labor representatives such as Samuel Gompers, W. D. Mahon, John Fitzpatrick, and Austin B. Garretson. Men and women from other walks of life, former President Taft, Justices Brandeis and Holmes, Archbishop Hayes, Professor Ripley of Harvard and others are also expected. Such a conference should be able to do much to improve industrial conditions and agree upon a course which will result in a good accord between labor and capital. It is understood the con-

gress will reaffirm the authority of the War Labor Board as a cooperative tribunal of justice until the conference conclusions are put in effect. The congress may be held in either New York or Chicago and its proceedings will be viewed with the greatest interest, particularly if President Wilson brings back from his extended stay in Europe some timely suggestions regarding the best methods of meeting the changed conditions in the industrial world.

RESULTS OF GOVERNMENT OWNERSHIP.

AUSTRALIA'S experiments with government-owned factories will be regarded with interest in the United States which has a number of government-owned factories of its own. That Mecca of the labor agitator, the Antipodes, which has tried every experiment that offered any novelty savoring of confiscation or paternalism, has of course gone deeply into government ownership and the report of the United States commercial attaché at Melbourne is therefore interesting.

Since 1912, Australia has owned and operated a clothing, cordite, harness and saddlery, woolen fabrics and small arms factories. An acetate of lime plant is being added, which will be subsidiary to the cordite factory. The total output of the factories since their establishment has been \$13,997,225, while the total cost of operating has been \$13,786,075, which includes depreciation of plant and buildings and interest on a capital investment amounting to \$2,392,950. A royal commission which investigated the operation of these factories congratulated the defense department upon the efficiency of their work.

There is, however, another side not generally known. The labor unionists of Australia are distinctly in the saddle, as witness the defeat of conscription during the war. William Hughes, the commonwealth prime minister, has already been repudiated by the labor-union party because he believed in conscription. The Union party is just now frankly syndicalistic and boldly expresses its admiration for the Bolshevistic government of Russia. The one great tenet of this party just now is repudiation of the public debt. Taxation is top-heavy, and the commonwealth Parliament exacts an income tax graduated from \$500 a year up, while the state also exacts 28 cents on every \$4.80 above \$800 a year. All government enterprises are financed with money generally borrowed from Great Britain, sometimes at 5½ per cent interest. The mortgage on the future is growing day by day, and the plan of the Union party to solve it is by repudiation.

Private enterprise in Australia and cooperative citizenship enterprises are practically nil. During the war the laborites deliberately followed a "go slow" policy. The capacity of a man in the shipyards was

98 rivets a day, and the average 73. A machine could set 600, but the employers dared not install them for fear of a strike. Strikes are frequent for every cause and no cause. Of course there is a compulsory arbitration system and the members of the arbitration board are kept working over time. There are hundreds of thousands of acres awaiting development in Australia and but 5,000,000 people. The opportunity for well-directed capital is abundant, but with the present government it is hardly likely to go there. Americans who advocate government ownership and the rule of labor should ponder Australia's plight before urging their own country to embark upon this same calamitous career.

HOMES FOR EMPLOYEES.

"THE NATION is short of homes." "Stimulate the revival of private building." "Start a local 'Own Your Own Home' Campaign."

This is the gist of most timely advice given to the governors and mayors at the recent Washington conference by Ernest T. Trigg, president of the National Federation of Construction Industries, as the most logical and sound way of stimulating business and absorbing labor. The campaign has been promulgated by the United States Department of Labor and it is urged upon manufacturers and the heads of great industrial establishments as a means of hastening the return of normal peace conditions and general prosperity.

It was pointed out that "home owning to-day pays the same ratio of that type of returns that it did before the war, and that every home that is built immediately stimulates business locally, and creates the demand for materials and products in more than a hundred correlated industries." Mr. Trigg's division is prepared to furnish definite plans of organization, suggestions for a publicity campaign, and if occasion demands, send an expert to a community to advise.

Rubber manufacturers have already done much in this line and will doubtless do more.

"WILL WE BOYCOTT GERMANY?" IS ASKED AND answered by magazine writers of many sorts. Actually the answer is, "We have." Not officially, of course, but individually, quietly and determinedly. As a sign of this, note in the erstwhile American-German restaurants, frankfurters are now Liberty sausages; in the department stores rubber toys "Made in Germany" are no longer displayed, but are relegated to the "unsalable" section. This will not continue forever, nor should it; that is up to the Germans themselves. Instead of smug self-satisfaction, continued propaganda, and hypocritical expressions of esteem for us and ours, they should face the music, acknowledge their crimes, repent and make full restitution.

Growing Cotton for Tire Fabrics.

COTTON READY FOR SHIPMENT IN SAN JOAQUIN VALLEY.

ARIZONA'S cotton-planting challenge issued seven years ago when a few far-sighted men started the bolls a-growing, has been echoed by California, where the industry has progressed far beyond the infant stage. The characteristic energy and enterprise of the westerner have overcome all obstacles and the returns have been phenomenal in some cases and gratifying in all.

In the Salt River valley in Arizona 34,000 bales of cotton were produced in 1918, valued at \$12,000,000, while 85,000 acres have been planted for the 1919 crop. Not only are the farmers assured of golden returns for their labors, but the quality of the product is of the very highest. The eastern markets are awakening to the fact that American Egyptian cotton compares favorably with either the genuine Egyptian Sakellarides or Sea Island. It is said that the yield of Sea Island is steadily decreasing, the total amount estimated for this year being but 40,000 bales on an acreage of a quarter of a million. The boll weevil is said to be the chief cause of the falling off.

The cotton planters of Arizona point with pride to the fact that there is a distinct increase in the length of the staple this season as the result of careful seed selection under government inspection. Ninety-eight per cent of the crop grown shows a length of fiber of 1½ inches or better with 81 per cent showing 1-11/16 inches or better. The quality of Arizona Pima cotton has been demonstrated in the manufacture of tire fabrics and a constantly increasing demand is predicted. It is further declared that government tests in the air-

craft program developed the fact that the Pima variety is exceptionally desirable for use in fine fabrics, owing to its comparatively small waste, high quality, uniformity of run and unusual length of fiber. As to the prices brought it is interesting to note that recently an equivalent grade of old-world Egyptian cotton sold at Providence, Rhode Island, at 60 cents.

A little concerning the history of the successful Arizona experiment is worthy of note. Although in the early 'seventies Judge C. H. Gray brought some cotton seed from Georgia and tried it out in Phoenix, where it was regarded as more or less of a curiosity, it was not until 1910 that an actual beginning was made with the Pima variety. This was developed at the experimental farm at Sacaton by the United States Department of Agriculture. This new variety was produced at an average of 1½ inches in staple length, and was raised in commercial quantities in 1912, when some 280 bales were put on the market; in 1913 there were 2,200 bales; in 1914, 6,187 bales; in 1915, 1,095 bales; in 1916, 3,331 bales, and in 1917, 15,966 bales.

The industry is now far past the experimental stage and is progressing toward its flood tide. The Pima variety has now almost entirely superseded the original Yuma. It is carefully segregated throughout its growing and ginning to avoid contamination by inferior grades, thus furnishing pure, select seed, from which the record crop for this year is expected. The war for a time laid a heavy hand on the cotton industry, bringing to the front the inferior grades; this handicap no longer exists and new fields are being planted everywhere.

LONG-STAPLE COTTON FIELD IN SALT RIVER VALLEY.

The average yield of cotton in Arizona has been about half a bale to the acre but some farmers recently have done much better, it is said. It has been demonstrated that new lands are not as good for cotton as the older lands on which there has been

ARIZONA LONG-STAPLE COTTON.

alfalfa or Bermuda. Overirrigation has been responsible for more poor yields than lack of water. Rotation of crops has been found to be efficacious in increasing the yield, preferably every three years, when alfalfa is produced. There have been serious delays in the ginning, caused by lack of machinery, ordered but not received in time. Some of the gins have been doubled in capacity and have been kept working at top speed. The picking for this year was about completed in March, according to the latest figures from Phoenix.

While cotton is most valuable for its use in staple manufactured goods, its utility in by-products is worthy of attention. After having gone through the gin, and a certain percentage has been disposed of for seed and the remainder crushed for oil, its mission in life is by no means ended. From the seed are obtained linters, hulls and the meats or kernels proper. The linter is merely the layer of short lint which thoroughly covers the seed pod. It may be used for upholstery, absorbent cotton, felt, cellulose, twine, gun-cotton, writing paper, varnishes, etc. The hulls are used in bran, fertilizer, fuel, packing material, fiber, stuffing for horse collars, bases for explosives and pressed paper products.

The usefulness of the meats or kernels of the cotton seed naturally exceeds that of the linters and the hulls. Two products are made from the kernels, cake or meal and crude oil. The first product finds its usefulness in dyestuffs, fertilizers, flours and in an unusually well-balanced feed for cattle and other stock. The crude oil goes through several refining processes, yielding oils of various qualities, many of which are useful as foods. The so-called foots, produced from the crude oil, are used in washing powders, soaps, glycerine, candle pitch, composition roofing, linoleums, insulating material, oilcloth, waterproofing, artificial leather and phonograph records.

California claims to be far ahead of Arizona in acreage and general expectations. It is declared that the following figures show what is to be expected from California: Imperial valley, 142,000 acres; San Joaquin valley, 35,000 acres; Palo Verde valley, 23,000 acres; Bard district, 1,000 acres; miscellaneous areas, 1,000 acres. The farmers of the San Joaquin valley are especially enthusiastic over the outlook this year and are planning to increase their acreage greatly. There is some conflict of opinion in this district as to the best varieties to plant, it is said. Efforts to exclude by legislation all varieties of cotton except Pima or Yuma Egyptian strains have not been entirely successful. Some growers who preferred the short staple have made a successful effort to have their way. It is said the first experiment in raising cotton in the San Joaquin was made 35 years ago. There was a considerable acreage also in the early 'eighties when a large force of men was employed to gather it. A strike over some minor matter took place, and the superintendent, a man of choleric disposition, rather than yield or compromise with the strikers, set the field on fire, thus ending for the time being what might have developed into a big industry.

Favorable factors in prognosticating returns from cotton raising this year are: (1) decrease in cotton production as a whole, both in the United States and elsewhere in the last few years; (2) increase in the number of cotton spindles in the United States and England; (3) new uses for cotton and cottonseed products.

Limiting factors in normal cotton consumption are (1) time needed to restore the wrecked mills of Belgium and France, and to reorganize the cotton-spinning industries of Germany and Austria; and (2) time for the impoverished peoples of Europe to recover their normal buying power. Prices, because of the fact that cotton is a basic commodity, probably will not be lowered appreciably except in proportion to labor and living costs.

The estimate of the Department of Agriculture is a carry-over of 3,000,000 bales, about as much as there was last year. The growers express the greatest faith in the recuperative powers of mankind and declare that the world will actually need more than the United States will have to sell this year.

PIMA COTTON IN ARIZONA.

Edward F. Parker, vice-president of the Southwest Cotton Co., Phoenix, Arizona, states that there will be about 350,000 acres under cultivation in the Salt River valley this year. Of this total about 80,000 acres will be in Pima cotton, some 10,000 acres belonging to the Southwest company.

It has been found impractical to grow this grade of cotton on all of the irrigated land of this valley because some of the land is not suited to the crop. In order to compete successfully with Egypt and other sources of cotton of similar quality, it is desirable to rotate with alfalfa and keep the land in the best possible condition so that it will yield to maximum capacity. It costs no more, and often less, to grow a large crop on a small acreage than to grow a small crop on a large acreage. The real profit is in the yield which is in excess of the average.

Mr. Parker has recently been made president of the Salt River Valley Hotel Co., Phoenix, Arizona, which is planning the erection of a handsome tourist hotel to be called "The Arizona." Associated with him in the enterprise are a number of important business men in Phoenix.

REDMANOL.

Redmanol is a synthetic resin or amber made of phenol and anhydrous hexamethylene-tetramine, possessing unusually high dielectric strength, exceptional heat-resisting qualities, brilliancy and luster, and great chemical inertness. With the proper fillers it withstands a temperature of 500 degrees F. in the air, and 650 degrees F. in live steam or boiling oil, without changing its shape or characteristics of chemical inertness. It may be used in making the type of articles known as condensation products.

Echoes of The Great War.

EXCISE TAXES ON RUBBER GOODS.

UNDER the last War Revenue Act passed by Congress and approved February 24, 1919, the following excise taxes on rubber manufacturers are now in effect. They apply to articles sold or leased by the manufacturer, producer or importer, the tax specified being a percentage of the price for which so sold or leased:

Automobile trucks and automobile wagons (including tires, inner tubes, parts and accessories therefor, sold on or in connection therewith or with the sale thereof), 3 per centum.

Other automobiles and motorcycles (including tires, inner tubes, parts, and accessories therefor, sold on or in connection therewith or with the sale thereof), except tractors, 5 per centum.

Tires, inner tubes, parts or accessories, for any of the articles enumerated above, sold to any person other than a manufacturer or producer of any of the articles enumerated above, 5 per centum.

Baseball protectors, foot-balls, tennis, golf and lacrosse balls, 10 per centum.

Chewing gum, 3 per centum.

THE VICTORY LIBERTY LOAN.

According to the final official figures, subscriptions to the Victory Liberty Loan amounted to \$5,249,908,000, an oversubscription of \$749,908,300, or 16.66 per cent over the quota of \$4,500,000,000. The work lagged somewhat during the early days of the drive, but there was never any real doubt that the American people would respond generously to "finish the job right." Up to the last day only 85.54 per cent of the total had been tabulated, yet the last-day avalanche from coast to coast swept the country over the top, with colors flying, and Treasury officials had prophesied that the final figures would go very close to \$6,000,000,000. Only \$4,500,000,000 will be accepted, however. New York district totaled \$1,762,684,900, exceeding by \$112,684,900 the estimate of the managers that it would exceed its quota by \$200,000,000, and most of the other great cities of the country went over the top.

THE DRIVE IN GREATER NEW YORK.

Committees representing the various branches of the rubber industry in Greater New York solicited the trade with thoroughness and enthusiasm, and a total of \$5, 911,500 was subscribed by the various divisions of the Central Committee as follows:

Crude rubber.	\$1,171,600
Tires	2,188,650
Boots and shoes	734,100
Medical rubber goods..	101,700
Mechanical rubber goods	1,161,050
Reclaimed rubber	55,000
Hard rubber.	354,700
Publicity	11,200
Brooklyn direct	133,550
	\$5,911,550

The Crude Rubber and Publicity Divisions are to be especially congratulated for the fact that they went over the top by about 65 and 60 per cent, respectively.

THE RESULT IN MASSACHUSETTS.

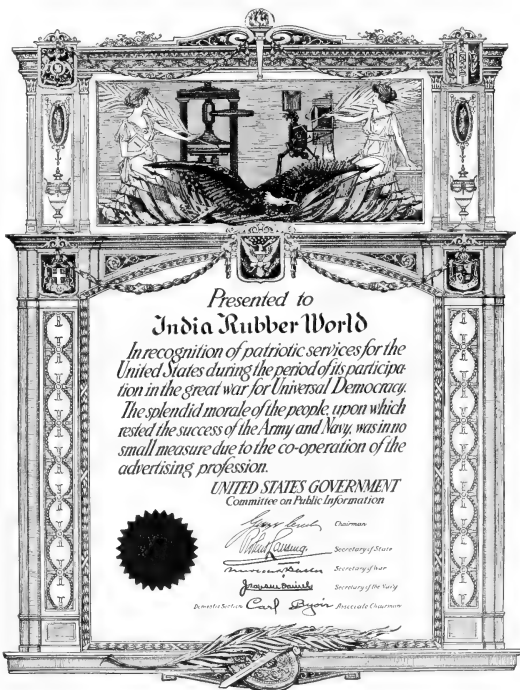

In Massachusetts 65 rubber firms and their employees subscribed \$2,648,075 and returns have not yet been received from many important concerns. Most of the larger companies reached their quota and some exceeded it.

The enthusiasm of the employees of The Fisk Rubber Co., Chicopee Falls, was particularly notable.

In twelve hours they had exceeded their quota, total subscriptions at the end of the first day being \$300,000. At the close of the fifth day the final total of \$450,350 had been reached, making \$1,569,250 subscribed in the five loans.

The Boston Federal Reserve District went over the top in the Victory Liberty Loan drive by more than fifty millions of dollars. Subscriptions to the Fifth Loan amounted to \$425,159,950, an oversubscription of \$50,159,950, or 13.38 per cent over the quota of \$375,000,000. The Boston district finished third, New York being first and Chicago second. The estimated number of subscribers for Boston was 817,822.

A list of subscriptions by firms, including all from whom returns have been received, follows:

GOVERNMENTAL APPRECIATION.

FIFTH LIBERTY LOAN SUBSCRIPTIONS OF THE RUBBER INDUSTRY OF MASSACHUSETTS. EMPLOYEES AND COMPANY SUBSCRIPTIONS COMBINED.

Acheson Process Co.	\$1,250	Converse Rubber Shoe Co.	48,100	Lowell Insulated Wire Co.	20,300

RECONSTRUCTION INFORMATION.

The United States Council of National Defense has placed at the command of the business world the information contained in the voluminous collection of data brought together, classified, indexed and partly digested by the Reconstruction Research Division. It also offers the services of the division in the procurement of such special information as may be desired and which may aid in the reorganization of industry and the resumption of trade, or which in any other manner may promote progress in reconstruction.

It will chart all information received from state, county and community organizations, keeping a digest of state reconstruction news. It has access to every important report of foreign reconstruction activity, proposed or accomplished. Having at its disposal reports from all war administration boards, bureaus and commissions, it can supply valuable information as to do-

mestic price data and production estimates, wage data, labor supply reports, foreign prospects, credit outlook, and price tendencies which will be invaluable to the manufacturer and business man. A vast amount of material from clipping agencies having a bearing upon any phase of reconstruction is instantly available, classified, indexed, and ready for reference.

In thus proposing to extend its service the council opens to the business public probably the largest and most complete assembly of up-to-the-minute reconstruction information in existence. Inquiries may be made by written communication, by telephone, or by personal representative. Requests should be addressed to the Reconstruction Research Division, Council of National Defense, 18th and D streets, N. W., Washington, D. C.

LOUIS BIRKENSTEIN IN CHARGE OF SURPLUS WAR PROPERTY.

Announcement has been made by the War Department of the promotion of Louis Birkenstein to the position of Chief of the Surplus Property Division, Office of the Director of Storage. Before the war, Mr. Birkenstein was head of S. Birkenstein & Sons, scrap rubber dealers, Chicago and New York. On proffering his services to the Government, he was appointed head of the Waste Materials Branch of the Salvage Division of the Quartermaster's Department, where he has acted as civilian expert and won the esteem of his associates through his ability, integrity, and patriotism. His new duty will be to dispose of the surplus of various articles acquired by the War Department.

BRITISH IMPORT RESTRICTIONS MODIFIED.

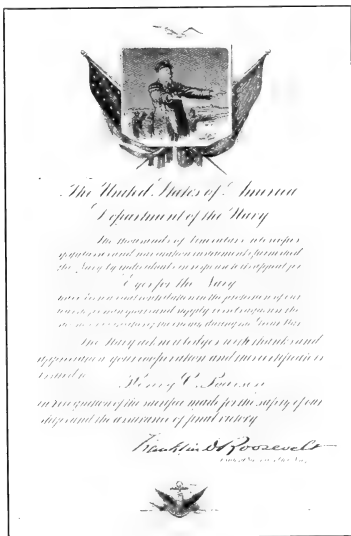

All restrictions upon the importation of rubber manufacture other than tires, except boots and shoes and stationers' sundries, have been removed, and these may now be imported freely under general license. Rubber tires and boots and shoes are now admitted under license up to 50 per cent of the 1913 imports. No rations have been set for stationers' sundries.

TESTING MATERIALS MEETING.

The American Society for Testing Materials will hold its annual meeting at the Hotel Traymore, Atlantic City, New Jersey, from June 24 to June 27. The sixth session, to be held June 26, will include the report of Committee D-11 on "Rubber Products," E. A. Barrier, chairman; "Steam Hose for Car Heating," H. J. Force, report of Committee D-13 on "Textile Materials," G. B. Haven, chairman, and report of Committee E-1, on "Methods of Testing," G. Lanza, chairman.

WATERPROOFED APPAREL IN GREAT BRITAIN.

Statistics for the six years 1913 to 1918, inclusive, show a large decrease in Great Britain's imports of waterproofed apparel during the last year. The figures are the following: 1913—\$31,544; 1914—\$41,151; 1915—\$26,162; 1916—\$46,319; 1917—\$44,027; 1918—\$10,763.

FOR SUPPLYING "EYES FOR THE NAVY."

An Investigation of German Ravages in Rubber Factories of Belgium and Northern France During the Great War.

Special Correspondence.

THE will to conquer new markets by force played a rôle in Germany's aggression that is daily being put in a clearer light by substantial documents. In February, 1916, the German staff instituted a detailed and thorough study of the French and Belgian industries in the occupied districts. It was a very close inventory of more than 5,000 factories, for which were employed 200 experts specially recalled from the front for the purpose, out of the ranks of the combatant army.

What thought moved the German Staff to undertake and bring to a successful issue this comprehensive task? Was it a question of drawing up a list of the resources which, in case of a prolongation of the struggle, the supplies and the industries of the occupied regions would still be able to furnish? The date at which this work was executed, the certainty of victory that inspired the Hun High Command at the time, exclude this hypothesis. The end pursued was quite different, and if the facts of the case are examined with any logic, the aim will immediately stand revealed with startling clearness.

Starting with the principle that a thorough knowledge of the industrial and economic conditions of the occupied territory was necessary in influential circles in the German Empire, an attempt was made in this study to furnish a description as complete as possible; this has been gathered from statements made and information gained on the spot. This work covers the most important industrial branches, from a technical as well as from an economic point of view. It describes the conditions under which the various industries exist; it exposes their relations with Germany and with the markets of the world; it gives, furthermore, a summary of the repercussions that will probably result for Germany from the destruction of certain branches of these industries.

All things duly considered, this formidable survey had no other end to serve. Each of its chapters is devoted to one of the industries of the invaded countries, and each industry there is examined from the following triple point of view:

- 1—Its position at the time of the invasion.
- 2—Its position resulting from the damage sustained, at the time of the investigation.
- 3—The profit that the German industry could derive from its disappearance and from the destruction of its factories.

The damage found by the experts of the great German Staff are divided into two classes and placed under the following headings:

- 1—Damages caused directly by the operations of war.
- 2—Damages resulting from the proceedings of the German authorities.

This statement, which in reality constitutes an avowal signed

by the hand of the thieves themselves, is limited to the zone occupied by the German armies and was effected in February, 1916; consequently, it does not relate the total damage sustained by the French establishments, for the victory of the Marne had already forced the enemy to retreat.

Now, immediately behind the French front there was a whole series of flourishing industrial towns before the war, whose factories must now be considered as having been absolutely destroyed. Such is the case of Rheims, Armentières, Béthune, Lunéville, Verdun, Dunkirk, and many other points. This reservation has, moreover, been well made, "for in order to estimate the whole damage," adds the German document above considered, "the data of this inquiry should be amplified by figures which it will not be possible to fix

until after the end of the campaign." Thus from each page of this "confidential" work, truly stupefying in its cynicism, glares the constant concern to destroy methodically and deliberately every industry capable of competing in the slightest degree with the German industry; and the conviction proudly proclaimed of thus aiding in the development and prosperity of Germany is displayed on each page.

In a chapter devoted to coal mines, for instance, the authors of the "confidential" report estimate the losses that France will suffer, at 13 million tons for the first year and 10 million tons for the succeeding years, since Lens, Liévin and Meurchain had been rendered inexploitable. "When they shall have been put in good condition again," says the German document, "the coke ovens of the Lens company will for years be obliged to import their supply of coals for coke, since there will be no bituminous coal from their own mines, because of the destruction of the works and the flooding of the mine." The establishments thus attacked comprise 554 ovens with an annual production of 620,000 tons of coke.

The weaving industry, which in many respects is so intimately related to the rubber

industry, has not been spared, either. Still quoting from the admission of the German experts, it will take two years to restore the 1,900 weaving establishments of Lomme, Haubourdin, Comines, Wervick, Perrenchies, Deulemont, Provins, and one year for 1,400 others. And the German investigators dwell on this situation, showing all the benefit that the German industry will derive therefrom. "In order to be able to take advantage," says their report, "of the terrible blow sustained by the industries in the occupied regions, it is of particular interest to Germany to set her intact mills working as soon as possible, immediately after the war is ended. An outlet of enormous importance is certain to open for them in France!"

"As for the rubber industry," finally says the report, "it will

PLANT OF ENGLEBERT & CIE.

OSCAR ENGLEBERT.

certainly take some years after the war to procure the necessary rolling-mills, calenders, and special machines and tools, and the despoiled factories will certainly lose many of their customers. Let us know how to profit by this circumstance."

The avowal is significant, and this document, fallen into French hands at the time of the defeat of the Germans, and brought before the Allied Council by the French Minister of Finance, M. Klotz, shows, without further discussion, that one of the principal objects of the German campaign was nothing but the destruction of French and Belgian industry, to the advantage of German industry. This is just what the French Prime Minister, M. Clémenceau, crushingly summed up when he said during an interview accorded the American press: "that the war launched by Germany and brought by her into the invaded territories, in the pillage and destruction, was a thorough and well-calculated conspiracy with the view of exterminating France industrially and commercially as well as militarily."

This inventory ordered by the German Staff at the moment when cannon thundered at Verdun is, as we said before, incomplete, since, for two years more, the invader was at liberty to complete his work, methodically dismantling what the hazards of the bombardments had spared in the occupied towns. Nevertheless, it was as well to quote from it, for the cynical admissions which are displayed in it constitute the very best preface it would be possible to find for the investigation with which THE INDIA RUBBER WORLD has entrusted us regarding the ravages committed by the German armies in the rubber factories of the occupied regions.

BELGIUM.

Before the war, Belgium represented a double interest, as far as rubber was concerned: it was both an importer of the crude article and a rubber manufacturing center.

The Belgian port of Antwerp was the place of discharge for huge cargoes of crude rubber, the wild grades of which came from the Congo, while the plantation varieties were shipped from the Netherlands East Indies or the Federated Malay States, where the Belgian capitalists had very large interests. For these two kinds of merchandise, the market of Antwerp was of the utmost importance and ranked immediately after that of London.

This facility in the matter of obtaining supplies of the raw material, combined with the cheapness of fuel and the abundance of labor, caused the erection on Belgian territory of numerous establishments where practically all articles of rubber were manufactured, from tires to surgical supplies.

In Antwerp there was a very powerful group of importers, most of them quite well-known in the United States, for instance: Grisar & Co., Bungé & Co., Osterrieth & Co., L. & W. Van der Velde, G. & C. Kreglinger, who in 1913 had received about 8,000 tons of rubber coming from Africa and chiefly from the Congo, 3,000 tons arriving from the plantations of Ceylon, 1,000 tons from the Straits Settlements, shipments from Borneo, the Ivory Coast, and from Dahomey; in short, about 15,000 tons of rubber, of which a certain quantity was reexported to France, Germany, the United States, and above all to Russia. A considerable part, 4,000 to 5,000 tons, however, remained in the country to be converted into manufactured products. For a population of 7,500,000 souls, this proportion was large, for France with 40,000,000 inhabitants did not consume more than 16,000 tons of rubber, and England, not more than 20,000 tons. This, therefore, shows the industrial activity of the country.

EDOUARD BUNGÉ.

Under such circumstances, it is easily understood that at the time of the German invasion, which came about as suddenly as it was unexpected, the stocks of crude rubber lying at the docks of Antwerp must have been considerable and may have run into several thousands of tons. Thanks to the speedy and efficient measures taken by the owners, the greater part of this merchandise was removed to England and escaped seizure by the enemy.

According to information which the Grisar company of Antwerp has kindly furnished, when the Germans occupied the great Flemish port, only 632 tons of crude rubber were captured, for which, however, they paid with worthless requisition tickets. This represents a dead loss of about 30 million francs to the Belgian importers. A portion of this material was forwarded to Germany, where the Continentale undertook to use it, and the rest was sent to Brussels, where General von Bissing ordered a military factory to be installed in the Jenatzky-Leleuz works, for the purpose of manufacturing tires and tubes to supply the automobile service of the campaigning armies.

For the reasons previously mentioned, the Belgian rubber industry in 1914 had attained a very high degree of prosperity. This industry was created in 1852 when Gustave Luyck built his works at Molenbeek-Saint-Jean, just outside of Brussels. Soon after, in 1859, an American, J. G. Stickney, one-time partner of Samuel Colt, uncle of Colonel Samuel P. Colt, of the United States Rubber Co., established himself at Menin, and applied to the treatment of rubber the new processes of vulcanization that Goodyear had just discovered. The increasing popularity of the bicycle and the development of the automobile afterward led to the manufacture of various products in which rubber was used in a number of ways.

Finally Belgium, like Goodrich, produced "Everything in Rubber."

Next to the house of Englebert & Co., which is one of the largest European firms, were the works of the Cie. Coloniale du Caoutchouc, Ghent; the Société pour le Commerce et l'Industrie du Caoutchouc, Alost and Brussels; Ghysel & Co., L e m b e c q; Hannot at Selesin; Defauw Frères and Latour, Capelle et Goethals, Menin; Jenatzky - Leleuz, Brussels. At Brussels, too, were established the Manufactures des Câbles Electriques et de Caoutchouc and finally, there was the factory of the Société des Câbles Electriques, at Huisynghem.

Among the concerns of minor importance may be noted Michel-Jackson, Menin; La Manufacture Belge de Caoutchouc, d'Amiante; the Société Anversoise, Antwerp; the Société Anonyme de Caoutchouc and the Cie. Générale pour la Fabrication du Caoutchouc, Brussels; Finet Ducobu, Boussu-les-Mons; Gevaert et Fils, Deynze, and Lechat, at Ghent.

In consequence of the German occupation, all these factories, with one single exception, are in such a plight that it is absolutely impossible for them to work, and thousands of laborers formerly employed are out of work and penniless. Those factories that were near the firing line, like the factory at Alost and the two establishments at Menin, no longer exist. They

MAJOR LEON OSTERRIETH.

have been completely destroyed by the bombardments and not a stone has been left standing. As for the others, even if the main walls still stand, the reserves of raw material, the stocks of manufactured goods, and every bit of machinery have been methodically removed by the Germans. Mills, calendars, mixers, tables, presses, vulcanizers, molds, mechanical and electric motors, generators, were first concentrated at Brussels, and finally taken to Germany, to be distributed among the manufacturers beyond the Rhine. Except the works of Jenatzky-Leleuz, which by special favor have been spared, nothing to-day remains of the other establishments but the four walls.

"Alas!" said Oscar Englebert during an interview, "the Boches have occupied our factories since the beginning of the war, and God knows how we have had to suffer from this occupation! At the outset, when they considered themselves victorious and expected to annex Belgium, their depredations were slight. They contented themselves with occupying the buildings, organizing a storehouse for tires, installing photographic workshops of the army, and creating barracks for transient soldiers, where sometimes as many as 2,000 men were lodged. During this relatively quiet period, the General Staff was content with ordering the removal from our works of all the stocks of pneumatic and solid tires, as well as tubes. After the repulse on the Marne and the halt on the Yser, all the raw materials were requisitioned, from rubber to sulphur, from the reclaimed rubber and factices to the talc, from the fabrics to the steel wires. Then came the turn of the heavy machinery; mills and calendars, steam boilers and kettles, all were shipped to Germany. To remove these enormous pieces of machinery, the walls had to be broken, the foundations had to be dynamited, so that the factories are at present in a state of complete devastation."

The proprietors were not to be spared a single annoyance. The head of the concern, Oscar Englebert, was brought before the Prussian court martial on the charge of having concealed a part of his stocks and thereby disobeyed the orders of the Kommandatur, and it was due only to his rights as Consul of Spain, at Liège, that he escaped deportation to North Germany. Despite these experiences, M. Englebert has lost none of his energy, and is actively engaged in restoring his factory, which he hopes to be able to put in working condition within a few months.

The same condition is found at the Colonial Rubber Co., Ghent, which used to manufacture tires. The buildings are left standing, but the stocks and machines have disappeared.

Of the factories of the Société pour le Commerce et l'Industrie du Caoutchouc, the one at Alost no longer exists; the other, at Brussels, has been deprived of its heavy machinery and all its belting. The smaller pieces, the tools and molds, have been broken up and sent away to be melted.

The conduct of the Germans with regard to the works of Ghysel & Co., at Lembeek, was singular. During the period in which they believed that they were victorious, they enlarged the works and considerably developed the manufacture of tires; but as soon as the tide of war began to turn against them, they hastened to remove all the machinery and implements, leaving nothing but the buildings.

The structures belonging to the two factories of the Cables Electriques at Brussels and at Huysinghem are intact also, but all supplies and the stocks of copper wire have been removed and a great part of the apparatus has been broken up and sent away to be melted.

In the midst of all this devastation, the buildings of the Jenatzky-Leleuz works at Brussels alone have been left with their machinery intact.

A very rough estimate places the total damage caused to the Belgian rubber industry by the occupation, the requisitions, and the thefts by the German army, at one hundred million francs. Should not the Huns reimburse this amount?

URGENT NEED OF RAW MATERIALS AND EQUIPMENT FOR THE RESUMPTION OF INDUSTRY IN BELGIUM.

The urgent need of raw materials and equipment in reestablishing Belgian industries is emphasized in a report by Trade Commissioner Harry T. Collins, Brussels, Belgium. The estimate given in the following abstract is based on the requirements for the first three months of resumption of industry, covering the principal articles of rubber or containing rubber. Materials which are undoubtedly being obtained in Belgium have been omitted.

Cool mine:		
Rubber for joints.....	metric tons	15
Waste for packing.....		15
Insulated wire.....	meters	240,000
Mining cables.....		100,000
Rubber belting.....		18,500
Glass industry:		
Rubber belting.....	meters	425
Sheet rubber.....	square meters	540
Rubber check valves.....	number	448
Textile industries:		
Rubber rollers.....	metric tons	3,160
Paper industry:		
Rubber cloths for machines.....	number	14
Rubber guide belts.....	meters	70
Rubber belts.....	metric tons	15,000
Rubber blocks.....	metric tons	6
Rubber sheets.....		6

AVIATOR'S WIRELESS-TELEPHONE APPARATUS.

Some weeks ago the Secretary of the Navy conversed with an aviator in flight, 150 miles distant from the Secretary's desk. This broke all former records, which were from 40 to 50 miles.

(C) Underwood & Underwood, N. Y.

SECTION OF TRANSMITTER, SHOWING RUBBER PARTS.

A sectional view of the instrument employed by the aviator shows it to contain a hard-rubber mouth-piece, an internal soft-rubber diaphragm to exclude dust and water from the transmitting mechanism, and soft-

TELEPHONE HEAD-PIECE.

rubber cushions bearing against the face of the aviator who wears the instrument held in place by elastic straps, as shown in the picture. By means of a device of this sort, Lieutenant Herbert E. Metcalf delivered President Wilson's cable address 3,000 feet in the air.

SULPHUR PRODUCTION TO INCREASE.

The Texas Gulf Sulphur Co. has opened two new sulphur wells at Gulf, Matagorda County, Texas, and is developing very large deposits of sulphur similar to those already operated in Louisiana and Texas. Over 1,000 tons are now being received daily. This makes three sulphur companies producing from the Gulf region: the Union Sulphur Co., which is the original and which developed the Frasche process; the Freeport Sulphur Co., which has been in successful operation for several years, and the Gulf company, which has just come into operation.

PHILIPPINE IMPORTS OF RUBBER GOODS.

Imports of rubber and rubber goods into the Philippine Islands during 1918 are given in recently published statistics as follows: rubber and manufactured rubber goods, excepting tires, \$581,559; automobiles and parts, including tires, \$3,262,832.50. Attention is directed to this evidence of the buying power of the people of the Philippines, numbering about 10,000,000.

The Goodyear Rubber Plantation.

WHEN The Goodyear Tire & Rubber Co. determined not long ago, to organize a plantation for the production of a large part of the rubber they require in their Akron factories, they sought one of the best locations to be found in the Far East and found it in the northerly part of the island of Sumatra. This extensive island lies parallel to the Malay peninsula, a short distance to the westward. Sumatra belongs to Holland and contains large areas specially suited for the growth of the *Hevea* or Pará rubber tree.

AN IDEAL LOCATION.

The new Goodyear enterprise is located near the region of volcanic mountains about one-half hour's ride by motor car from the town of Siantar, the center of the tea district of the northern section of Sumatra. Here a vast plantation is in process of formation, embracing 20,000 acres of jungle land. Between 8,000 and 10,000 acres have already been planted with rubber trees.

The soil is plentifully supplied with such mineral salts as sulphates and phosphates of alumina, iron, lime, magnesia, potash and soda, as well as carbonate of lime. It is probable that no better rubber-growing land is anywhere to be found. The site chosen lays at an altitude of from 300 to 500 feet and the land is gently undulated and well supplied with streams.

AMERICAN MANAGEMENT AND EQUIPMENT.

On this estate from 7,000 to 8,000 laborers are employed. Some of these are imported from Java, some from China, and others from India. There is a small proportion of native Sumatrans among the number.

Practically only American-made machinery and tools are employed in preparing the land and operating the plantation, such, for example, as engines, tractors, stump pullers, automobile trucks, picks and other hand tools.

The army of coolies is supervised by a competent staff of overseers, planters, and engineers.

LABOR AND SANITARY CONDITIONS SAFEGUARDED.

The general manager of the Goodyear plantation, in speaking of this company's accomplishment, gives the following outline of the work involved. The plantation is divided into six divisions, each approximating 3,000 acres and under a separate manager. About 3,000 acres of jungle in the 20,000 of the plantation

close to Belawan, its port of shipment, and in its various appointments is practically independent of the outside world. There is a plantation hospital with 400 beds and the best medical attention is thus made available for the needs of the plantation workers. Sanitary conditions are being steadily improved.

CLEARING THE JUNGLE.

The plantation area was overgrown with the densest jungle anywhere to be found and many of the trees were enormous.

In the process of cleaning the jungle for planting, axemen fell the trees and are followed by Chinese plank sawyers who save all the lumber possible for use in constructing the coolie quarters. It requires the labor of 1,300 coolies for two months to fell the timber on 3,000 acres.

CLEARING AND PLOWING BY STEAM TRACTORS.

After removal of the underbrush and timber the stumps are removed by special pullers and tractors. No explosives are used in the work. After clearing, the land is plowed by a big steam tractor, to the depth of about 20 inches. The effectiveness of plowing by tractor is shown by the fact that by this means twenty acres can be plowed in a day, while 250 coolies can plow

THE BEGINNING OF ROAD BUILDING.

but three acres in the same time. About 100 trees are planted to the acre and the entire tract is kept free of weeds. The labor of felling and uprooting the jungle trees and cleaning away the underbrush preparatory to planting represents only a part of the work of establishing a plantation.

ONE HUNDRED AND TWENTY-FIVE MILES OF GOOD ROADS.

Good roads must be built that all parts of the plantation may be reached easily and quickly. Building and maintaining highways must be a constant development and already 125 miles of substantial roadway has been built on the new plantation. The whole scheme is a huge engineering proposition terminating in extensive factory and shipping facilities to handle the latex and prepare the rubber.

THE ENTERPRISE OF GOODYEAR.

The development of this newest all-American rubber plantation is of much interest to the rubber industry all over the world. The Goodyear company has so often accomplished comparably big things that a twenty-thousand acre rubber plantation at the Antipodes seems quite fitting to go with the Goodyear scheme in general. It is interesting, however, to conjecture not only what

AN ASSISTANT'S BUNGALOW.

estate are reserved for the natives. The laborers are accorded the very best treatment. Labor troubles are entirely eliminated and the coolies are thoroughly contented.

The plantation is distant 75 miles from Medan, which is very

the conservative fathers of the industry of a couple of generations ago would have thought of this development, but how they would have regarded the huge Goodyear cotton acreage in Ari-

A MATURE AREA.

zona with its twenty or more gins; the Goodyear cotton-duck mills in Connecticut, and the Goodyear factories in Canada; Belike, they would gravely disapprove them all as things that broke trade precedents and overturned existing conventions. Were these respected worthies alive to-day they would certainly marvel and ultimately approve these daring projects of the "Napoleon of the rubber trade."

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(710.) A manufacturer requests the addresses of makers of gummed tape for sticking tire wrappings.

(711.) An inquiry has been received for the addresses of manufacturers of paint such as is used on rubber toys, balls, etc., and which will not crack.

(712.) A correspondent desires the addresses of manufacturers of tissue-paper transfers for marking inner tubes.

(713.) A correspondent wishes to get in touch with manufacturers of valves suitable for small air seat cushions.

(714.) An inquiry has been received for the addresses of manufacturers of machinery for making rubber stamps.

(715.) A reader requests the addresses of manufacturers of collapsible tubes for rubber cement.

(716.) A manufacturer requests data concerning the use of creosote solution in improving the quality of washed brown crepe.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce or its district or cooperative officers. Request for each should be on a separate sheet, and state number.

(29,079.) A firm in Spain desires to purchase automobile truck tires. Quotations f. o. b. New York, cash against documents. Correspondence in Spanish.

(29,120.) A commercial agent in France desires agency for

sale of druggists' sundries. Correspondence may be in English.

(29,122.) A man in Denmark desires agency for sale of elastic, garters, dress shields, etc.

(29,142.) A Norwegian firm desires to purchase and an agency for sale of rubber and rubber goods. Payment through New York bank, preferably cash against documents at destination.

(29,149.) A Norwegian manufacturing firm desires to purchase rubber goods, fingers, gloves, footwear, etc. Payment through New York bank.

(29,153.) American firm with Italian branch and planning other European offices, desires agencies for insulated wire and cables, rubber goods, and all machinery and materials for their manufacture.

(29,156.) A Norwegian firm desires to purchase and an agency for sale of rubber goods, rubber shoes, etc. Cash against documents, destination or New York.

(29,157.) A Norwegian firm desires to purchase and an agency for sale of belting, rubber, rubber goods, etc. Credit through local New York banks.

(29,161.) A man in Norway desires to purchase and an agency for sale of rubber and rubber goods. Cash against documents.

(29,162.) Representative of Danish firm now in America desires to purchase and an agency for sale of rubber garments. Correspondence may be in English.

(29,168.) Norwegian firm desires to purchase and an agency for sale of rubber and rubber goods. Cash against documents, New York or destination.

(29,194.) An American firm with Danish branch office desires agencies for sale of rubber goods, wearing apparel, etc. Opportunity offered for display of goods in Denmark.

(29,219.) A man in Switzerland desires to represent first-class American firms to sell pneumatic and truck tires. Correspondence may be in English.

(29,249.) An Italian desires agency in Italy for sale of shoes and rubber goods. Correspondence in Italian.

(29,272.) Three firms in Belgium desire to communicate with makers of solid and pneumatic tires.

(29,274.) Belgian firms desire agencies for balata belting.

(29,284.) A Swedish firm desires to purchase and an agency for fountain pens. Quote f.o.b. New York.

(29,312.) A Norwegian firm desires to buy and an agency for sale of rubbers, rubber heels, etc. Cash against documents at New York or destination of goods. Quote f.o.b. New York.

(29,362.) Exclusive agency desired for sale of rubber goods at wholesale by man in this country expecting to establish offices in Paris and Brussels.

(29,366.) A Belgian firm desires to communicate with makers of balata belting.

(29,372.) Belgian firms desire to purchase machinery belting.

(29,378.) Man in South Africa desires to purchase golf balls, etc. Submit catalogs and prices. Payment through an export house.

HOW TO TAG A TIRE.

When the average man tags a tire he ties it so the tag hangs on the outer rim. The most natural way to move a tire is to roll it, whereby the tag is often damaged or torn from the tire. The right way is to tie the tag so that it hangs on the inside. Then another tag should be securely fastened to the inside of the tire.

AVOILAS COMPOUND IS A NEW VEGETABLE OIL LUBRICANT AND softener having a melting point of 90 degrees F. It is said to offset the tendency of free sulphur coming to the surface and to render easily removable from the molds all classes of molded goods.

Giant Tires for Handley-Page Airplanes.

PROBABLY the largest pneumatic tires made for any purpose are those with which the famous Handley-Page airplanes of the British Government are being equipped. They are Palmer Cord Aero Tyres 1500 by 300 mm. (59 x 11.8 inches), or approximately five feet in diameter and one foot in cross-section, and greatly exceed all regulation pneumatic-tire sizes for either airplanes or motor trucks.

The 1918 S. A. E. specifications for United States Government airplane landing wheels specify four sizes, the largest of which is 800 by 150 mm. (32 by 6 inches), the others being 750 by 125 mm. (30 by 5 inches), 700 by 100 mm. (28 by 4 inches), and 700 by 75 mm. (28 by 3 inches). It was anticipated, however, that larger sizes would probably be required and added to the list. The specifications call for tires of the clincher type,

smooth tread, constructed of two or more cord plies of long-staple cotton, so arranged that an equal number of plies run in each diagonal direction across the tire, each ply being separated from the adjoining ply by rubber compound. Even the giant cord pneumatics now being turned out by American manufacturers are dwarfed beside these Palmer airplane tires, the largest pneumatic truck tire regularly on the market being 48 by 12 inches, and other sizes being 42 by 9, 40 by 8, 38 by 7, and 36 by 6.

That these giant tires are needed becomes evident on considering the size and weight of the Handley-Page airplane. Its wing span is 126 feet, the width of the span is 12 feet, and the length of the fuselage is 65 feet. Equipped with a 350-h.-p. Rolls-Royce engine and known as the "Berlin Bomber," it weighs 15 tons fully loaded, over 5 tons of which is useful load.

This type of machine represents the maximum achievement in heavier-than-air flying during the war, and now promises to be used extensively in commercial aviation, as it is able to carry, for example, a five-ton load of passengers, mail, or merchandise in a non-stop flight equivalent to the distance between Boston and St. Louis, in twelve hours. It will be recalled that one of these great airplanes flew from Ipswich, England, to India, a distance of 5,800 miles, last winter and covered 700 miles of the distance over the Mediterranean, which was a record flight for a land machine flying over water. It is also one of these machines which recently arrived in Newfoundland, and with which a transatlantic flight will be attempted sometime during the month of June.

As compared with the airplane tires of former years these latest and largest tires represent a startling development. In the early days of aviation all sorts of makeshifts were resorted to. Bicycle and motorcycle tires of fabric construction were first employed on some of the pioneer machines, but they proved costly and uncertain. Later, as larger and heavier machines were constructed to carry more passengers and heavier loads,

some builders even went so far as to use full-size automobile tires. The latter answered so far as reducing the shock of landing was concerned, but were far too heavy and offered too much wind resistance.

The development of special tires to fit the peculiar requirements of aviation began about 1910. It was soon discovered that great resiliency is a very important factor and that a live, springy tire not only helps to absorb the shock of landing but actually aids the machine to get off the ground at the beginning of a flight. The need of security against punctures and blowouts was also appreciated. As the superior resiliency of cord tires for motoring had become recognized and the success achieved by this type of tires in automobile track races had demonstrated their dependability, experiments were made with

cord tires in aviation, with the result that cord tires for airplanes have been refined to a point of efficiency equal to that of cord tires for gasoline and electric automobiles.

The Palmer was probably the first tire of cord construction to be used for aviation purposes in England, and it has ever since held a prominent place among airplane tires. Invented by an American, John F. Palmer, of Chicago, in 1893, this parallel-thread fabric construction was first used in racing tires on bicycles and later modified and first applied to the manufacture of automobile tires in 1900. In its latter form it was known as the Palmer cord

to distinguish it from the lighter Palmer bicycle tire. It consisted of two layers of parallel-lying cords crossing each other at such an angle that they were tangent to the rim and nearly in the line of strain which falls upon all equally. Each cord consisted of several threads carefully rubbered and flattened.

More recently, as the disadvantages in using round cord were recognized, a new type of ribbon of flat cord approximately one-half inch wide was developed. These inextensible flat strips can be placed on the tire core at a true tangent to the rim, that is, at right angles to the spokes of the wheel. This position gives the most efficient power transmission from the rim to the tread for the reason that force is best transmitted in straight lines.

In America The B. F. Goodrich Co. in 1910 introduced as a regular product an airplane tire which in construction was a modification of the Palmer bicycle tire. It was smaller than a bicycle tire in diameter, but of larger cross section, being 20 by 2 and 20 by 2½ inches. About the same time the Continental Rubber Works was making airplane tires in these same sizes and also 20 by 3 inches. The Pennsylvania, Goodyear, and Hartford companies were offering airplane tires 20 by 4, 26 by 2½, 28 by 2½, 28 by 3 and 28 by 3½ inches and weighing 6½ to 8¾ pounds each, the former company featuring leather as well as rubber treads. Two of the 20 by 4 tires were said to be capable of carrying a 1,000 to 1,200-pound flyer.

(C) Underwood & Underwood, N. Y.

TIRE EQUIPMENT OF THE "BERLIN BOMBER."

Tires combining extreme lightness with toughness and resiliency had thus been the early desideratum, but, with heavier and more powerful machines, maximum cushioning ability to resist the lateral thrusts that occur when an airplane side-swipes the earth in landing, became fully as important as light weight, so that large cross-section was essential. As early as 1909 Palmer cords had been made up to 7-inch cross-section, and in 1915 a new Goodyear airplane cord tire was brought out in America to meet this need. It was a 26 by 4 clincher with a carcass consisting of four to six-cord fabric layers. Since that time developments have been rapid, owing to the impetus of war, and various companies have been producing airplane tires of ever larger diameter and cross-section as the needs of the Government have advanced.

It is a far cry from the frail airplane wheels and small tires of 1910 to these giant wheels and Palmer cords with their canvas shields to prevent wind resistance to the turning of the wheel as a result of cross drafts through the spokes, but as the development of aviation has been phenomenal and revolutionary, so also has been the achievement in tire building. Indeed, the latter has been a big factor in making the former possible. But for cord-tire construction, the airplane might not be what it is to-day, and it is a matter worthy of more than passing mention that the Palmer tire, the pioneer in its class, still heads the list of progress.

PNEUMATIC TIRES ON TRUCKS.

FOR vehicles up to 1,500 pounds capacity, inclusive, pneumatic tires should be used except under very rare conditions. Vehicles of 2,000 to 3,000 pounds capacity are being rapidly changed to pneumatic equipment in the large majority of cases, due to the development of the cord tire. A considerable percentage of 2 to 2½-ton vehicles will probably be placed on pneumatic equipment when the subject has been more clearly demonstrated and design changes which may be found necessary have been made.

A limiting factor to the preceding statements is to be found in the character of roads on which pneumatic equipment is operated, and the freedom of the roads from litter of scrap-metal, glass, etc.

The modern cord tire is excellent for operation on almost every kind of road. The structural strength of these tires renders them less susceptible to injury from stone bruises, etc., when operated on rough roads, if the proper inflation pressures are used, than the fabric type. The types of tread which have been developed are of great assistance in snow and mud and on wet surfaces. In consequence, with these advantages, it is safe to say that the pneumatic tire will compare favorably with the solid tire under almost every condition of road.

ADVANTAGES OF PNEUMATIC TIRES.

The claims of advantage may be listed as follows: (1) reduction in mechanical repairs; (2) increase in permissible speed; (3) decrease in gasoline consumption; (4) decrease in oil consumption; (5) less fatigue for men; (6) lessened depreciation of roads; (7) greater tractive ability.

OBJECTIONS TO PNEUMATIC TIRES.

The objections to pneumatic tires are not so numerous, but need careful consideration lest the prospective buyer be carried away with the idea that their use offers a solution for all troubles, and involves no special problems needing attention. The objections are: (1) high initial cost compared with solid tires; (2) the need of carrying emergency equipment; (3) the difficulty attendant on making road changes due to weight and high inflation pressures required; (4) reduction of the high-gear ability and limitation of the total ability due to larger diameter

of wheels; (5) limitations imposed on the size of brakes, due to the small size of wheels.

The larger sections used in these tires, together with the space taken up by the demountable rim, leave a very small wheel diameter, and this imposes severe limitations on the size of brake

From "The Journal of the S. A. E."

12-INCH CORD TRUCK TIRE ON REAR OF TRAILER.

equipment and decreases the ability of the brakes at the same time. This is very important because the greater speeds put considerably heavier duty on the braking systems.

The heavy duty pneumatic tire, particularly in the larger sizes, has come into prominence in the last few years when engineers were so completely occupied as to leave little time for the thorough investigation of the subject to determine what effect their use would have on future design. That there will be need of a considerable change in design with respect to some particulars seems very evident.

The increase in speed carries with it a demand for more efficient brake equipment. Inasmuch as air pressure will be needed to inflate the tires, calling for an efficient air compressor, it may be found feasible to add the other elements necessary to provide for the use of air brakes.

PRACTICAL TEST.

A leading American tire manufacturing company is manufacturing a cord construction pneumatic tire of the straight-side type which has proved a successful commercial proposition.

A fleet of five-ton trucks last year made a successful trip from Boston to San Francisco on 40 by 8-inch front and 44 by 10-inch rear pneumatic tires. This trip was made in 257 hours and 10 minutes running time at an average of slightly over 14 miles per hour, a full load being carried all the way. The trucks at the end of the trip were in excellent condition and the whole performance was rendered possible by reason of freedom from vibration troubles resulting from the cushioning qualities of the big pneumatic tires.

GENERAL ELECTRIC CO. ELECTS DIRECTORS.

The General Electric Co., Schenectady, New York, at its meeting held May 13, 1919, elected the following directors: Gordon Abbott, Oliver Ames, George F. Baker, Jr., Anson W. Burchard, C. A. Coffin, George P. Gardner, Henry L. Higginson, Robert Treat Paine, 2d, Marsden J. Perry, Seward Prosser, E. W. Rice, Jr., Charles Steele, Philip Stockton, and B. E. Sunny.

¹Abstract from a paper by B. B. Bachman, published in "The Journal of the Society of Automotive Engineers," April, 1919, pages 298-302.

Developments in Rubberized Unwoven Fabrics.

By Roland B. Respass

WOVEN FABRICS and fibrous materials enter very largely into rubber manufacture, for strengthening or "filling" rubber goods. Fibers have been used as a filler by mixing with rubber and sheeting out of the compound or forming it in molds. Where it is desired that the fibers be of the form to give considerable added strength to the rubber products woven cloth is usually employed. Unwoven fabrics give as great

FROM COTTON BATTING TO ARTIFICIAL LEATHER.

or greater strength than woven goods, and may be used in rubber manufacture more cheaply than woven goods, and are therefore, not only of interest as offering possibilities in improving the product but in cost reduction as well.

The writer experimented to produce an unwoven fabric to be used in making automobile tires. His first attempts were along lines disclosed as far back as 1867 in a patent issued to Charles Saffray, M. D., who used a cotton batting which he saturated with a binding agent, using wire mesh to hold the fiber sheet when dipped in a thin liquid solution, after which it was pressed to take out the excess solution, and dried and sheeted, to be used as a leather substitute. Investigation of the patent records did not disclose a practical method of manufacture, and the writer started out to devise and develop such methods.

In his early experiments he succeeded in making a strong sheet resembling split leather, which was capable of being coated and embossed to simulate leather, but this sheet was no more successful than the experiments of a number of others, and it was decided that such fabric would not be suitable for automobile tires because it would stretch like leather, and the tire probably would not hold its shape.

Experiments with cords and threads were then begun and later the fiber sheet was combined with the cords and threads. During the course of these experiments results were produced which appeared adaptable to many uses in the rubber trade, but the conditions resulting from the war presented a serious handicap due to the difficulty in gaining assistance from those who were engaged in government work. After two years of con-

weight desired. The fiber then passes to a saturating machine where a heavy rubber solution is pressed into the fibers to saturate or coat each individual fiber, after which it goes to a dryer where the solvent is evaporated, and then it is passed between heavy pressure rolls and pressed into a firm sheet resembling split leather, the entire process occupying not over twenty minutes—from cotton to "leather."

This leather is then ready to be coated with rubber surface dressing after which it may be embossed to design and vulcanized; or, if the leather dressing is to be of cellulose or similar dressing, the sheet is vulcanized and then coated, after which it may be embossed to any design required. The leather may be made any weight or width and any length in which the rolls may be handled. Its strength can be varied as may be required, and some samples produced have tested up to 6,250 pounds to the square inch, giving nearly double the strength of standard belt leather. For greater strength there are other processes, including strings or cords placed in the direction of greatest strain, which will produce belting having a tensile strength up to 10,000 pounds.

The peculiarity of this leather when examined closely is that it does not look like rubber at all, but resembles genuine leather. It is difficult to decide that rubber actually enters into its composition. The stronger sheet has the appearance of raw-

RUBBER SHOE LACES MADE FROM COTTON FIBER.

hide and the other sheets look like split leather. By use of a sizing on the surface of the cotton sheets before saturation, a product almost identical with the hair side of genuine leather is produced. It may be finished with ordinary shoe polish or dressing and resembles and has the feel of kid leather. Any kind of dressing that is used in finishing leather or artificial leather may be used. It may be finished by hand as hides are finished, and give the same rich appearance, or it may be finished by machinery as artificial leather is produced. The samples finished in black or colored patent leather feel and look like the genuine article. There seems to be a perfect affinity, in this process, between the cotton and the rubber and between the rubber and the cellulose or oil dressings.

The field for use of this leather alone seems very great, but the leather in sheet form seems only the beginning of its possibilities. After the sheet rolls are prepared and before they are vulcanized, the material may be cut to forms and molded or laminated and thereafter vulcanized to retain its form. This quality opens a wide field for development in the manufacture of power and transmission belts which may be made with or without the thread or cord reinforcement; also shoe counters and slippers vulcanized in one piece may be produced and such slippers may be sterilized, subjected to any reasonable heat or boiled without injury. Hospital blankets may be made without the cold, clammy feel of rubber blankets and yet having their waterproof qualities. Also boxes, cases, suitcases, bags and hundreds of small formed articles for which leather has been heretofore used exclusively, may be produced rapidly and cheaply.

RUBBER TAPES OR BELTING, OF COTTON FIBER.

stant work, the writer is now able to present a brief outline of what he has accomplished and covered by his patents and applications for patents.

The production of leather substitute, for instance, has been worked out to the point that the cotton from the bale, or cotton linters, old rags, old jute bags, etc., are put in a picking machine that picks apart the fibers, which are then fed to a carding or garnett machine and formed into fiber batting of any width or

The same principle applies to the production of narrow belts and straps, cordage, shoe laces, etc. The cordage may be used in weaving or braiding fire-hose coverings which will not be subjected to mildew and water rot. The processes also cover new methods of making shoe soles, one of cotton or other vegetable fibers and the other utilizing waste leather and reconstructing it to give as good wear as real leather. In fact there seems hardly a product into which leather or woven fabrics enter which may not find use for these new processes.

The above relates only to unwoven fabric which contains no twisted threads or cords nor woven goods. The processes covering the use of cords and threads cannot be explained in detail at this time, but it may be said that it is possible to place cords or threads in any predetermined design combined with the fiber sheets or without the fiber sheets and at less cost than woven goods can be produced. In this process the rubberizing

ARTIFICIAL LEATHER BACKED WITH UNWOVEN FABRIC.

is not considered in comparison, inasmuch as all such fabric must be rubberized and the same methods now in use are employed.

Consideration of the known weaknesses of woven fabric, especially with regard to the bending strain when it is brought under tensile strain, seem to make an unwoven fabric, which may be used in the same manner as woven fabric, especially desirable. Moreover, the use of straight cord or thread in a square yard of fabric would allow the employment of approximately 25 per cent additional threads in each direction as compared with woven goods in which the thread or cords must bend to one-half circle every other thread. The fact that any strain on straight cords must be entirely tensile on each thread and will not have the bending strain that occurs in woven fabrics should be in favor of the straight-line thread or cord fabric.

These processes also cover a matted thread or cord unwoven fabric in which no straight lines appear but which is entirely made up of overlapping curves in predetermined matted design and the fabric may be made to be used in the construction of a tire, the exact width required for each size, without cutting at angles, lengthwise of the fabric, and such fabric may be made rapidly and economically in any tire factory with very little additional cost in equipment. This construction gives extraordinary strength and resiliency and may be produced for less than the cost at which woven goods can be made and sold.

Another process covers a fabric of entirely new construction, unlike any fabric now known, and which will make a super-tire. Threads or cords are employed and the fabric may be made in any rubber factory by the addition of inexpensive machinery.

All the processes require very few special machines, and such as may be required are simple adaptations of machinery now in use for other purposes.

Matters of this kind which may become important to the entire industry are of general interest as affording great possibilities through future development. It is of interest to know that the

inventor intends offering his processes to the trade under royalty, as he does not contemplate engaging in manufacturing the products.

USEFUL HINTS FOR THE RUBBER LABORATORY.

By D. Repony.

ACETONE. Directly after acetone has been received it should be redistilled and afterwards kept in a tin can or dark-colored bottle, otherwise it becomes oxidized when exposed to the light and will leave residue upon evaporation, which will give false results by acetone extraction.

EVAPORATING GASOLINE. As directed by the Underwriters' specifications for gasoline hose, the gasoline from hose immersion should be evaporated to dryness, which is difficult, due to the high boiling series. This is, however, easily accomplished by blowing compressed air over the gasoline surface. Should the volatilization required be greatly accelerated, introduce at a convenient place in the rubber tubing a piece of metal piping and heat this portion with a gas burner. The heated air volatilizes the gasoline rapidly.

RUBBER SAMPLES. The rubber sample for alcoholic potash extraction should be ground to small particles. When the sample is cut by scissors the large pieces require long boiling for complete extraction, and this is especially the case in such rubber compounds as contain but a low percentage of fatty substitute.

SCORCHED RUBBER. Rubber scorched during mixing or calendering can be recognized upon immersing in gasoline, where it will swell considerably, but will not paste in uniform colloidal cement.

THE BEST SOLVENT. Boiling kerosene is by far the most practicable and cheapest solvent for vulcanized rubber.

CLEANING FLASKS. Flasks after acetone extraction are easily cleaned by first pouring in a few drops of benzol and afterwards a few cubic centimeters of crude nitric acid. Heat the charge on steam bath and then wash it out with water.

DISTINGUISHING RUBBER FROM BALATA. To distinguish with accuracy whether the belting in question is rubber or balata, immerse one ply in chloroform. Balata will paste in solution, and float on the surface, while rubber will swell considerably but will not paste in solution.

PAINT FOR HOODS. Metal or wooden hoods, or exhaust pipes which come in contact with acid fumes, are best preserved by being occasionally painted by asphalt benzol solution.

ANALYTICAL BALANCES. The vibration of a building, influencing the proper action of an analytical balance is avoided by placing a glass plate on sponge rubber legs. The glass plate should be considerably longer so that the legs of the balance rest about 5 inches from the sponge rubber legs toward the center.

TACKY RUBBER. To prevent tacky rubber from sticking to the extraction thimble, remove the wet sample directly after the acetone extraction, and dry it on a weighed watch glass.

CARBON DISULPHIDE. Carbon disulphide employed for quantitative extraction, should be freshly redistilled and the extraction should be performed by night, if possible.

CASTOR OIL. Castor oil, comparative with all other oils, has a very slight effect upon rubber, therefore it is best employed as a lubricant for such parts as are in connection with rubber.

LABORATORY TUBING. The most durable rubber tubing for laboratory use is of a rubber compound that contains a high percentage of paraffin and asphalt with the lowest possible content of free sulphur.

"THE POWER A MAN PUTS INTO SAVING MEASURES THE POWER of the man in everything he undertakes."—(Frank A. Vanderlip.) Buy W. S. S.

THE EDITOR'S BOOK TABLE.

CEYLON AGRICULTURAL SOCIETY YEAR BOOK, 1918-1920. Compiled by C. F. H. A. S. Ceylon Agricultural Society, Colombo, Ceylon. (Cloth, 16mo, 149 pages.)

THE latest edition of this well-known handbook has undergone considerable revision and contains much fresh matter pertaining to tropical agriculture of every sort as practiced in the Middle East, greater attention being given to crop notes than hitherto. The details of each culture are succinctly presented, and there is much tabular matter of a miscellaneous character for ready reference. A four-page article by Mr. Kelway Bamber, M. R. A. C., is devoted to the essentials of planting and the preparation of rubber.

PRACTICAL EXPORTING. BY B. OLNEY HOUGH. The Johnston Export Publishing Co., New York City. (Cloth, octavo, \$29 pages. Price, \$5.)

Many books devoted to export business have been published of late, yet this volume by the editor of the "American Exporter" remains the standard work on the subject. Written by one who has for many years been intimately identified with this subject, and who has had personal experience in foreign markets, it now appears in a third revised edition more comprehensive than ever. The altered conditions brought about by the war are given due consideration, and firm executives engaged or about to engage in export business, will find the book replete with helpful suggestions, important information and authoritative data. Some idea of its scope may be had from the fifteen chapter titles which follow: Ways and Means; Some Mistaken Impressions; Markets for American Goods; The Export Department; Foreign Trade Correspondence; Traveling Salesmen Abroad; Advertising to Get Export Trade; Export Commission Houses; Local Foreign Sales Agents, Distributors and Branch Offices; The Export Order; Preparing Shipments; Making the Shipment; Marine Insurance; Financing Foreign Business; Credits, Acceptances and Collections.

A unique and particularly valuable feature consists of specimen blank forms as used by leading American export houses, railroads, steamship companies, bankers and consular offices properly filled out and bound into the book. These include form letters, export orders, sales contracts, export and consular invoices, bills of lading, permits, receipts, declarations, certificates, insurance policies, letters of credit, guarantees, drafts, acceptances and many other documents used in commercial relations with foreign buyers.

NEW TRADE PUBLICATIONS.

THE L. J. MUTTY Co., BOSTON, MASSACHUSETTS, IS REMINDING its patrons, old and prospective, of "Driedek" and other fabric products by sending them a handsome little stamp book and calendar bound in red leather, for vest pocket use.

* * *

THE MORSE CHAIN Co., ITHACA, NEW YORK, HAS REPRINTED IN pamphlet form an article on "Chain Drives" written by J. S. White and published in the 1919 "Yearbook of the National Association of Cotton Manufacturers." The article is devoted to an exposition of the advantages of chain driving rather than to exploit any particular make or type of power chain, but the company considers that the circulation of this article with its many excellent half-tone illustrations, must redound to the advantage of the makers of the Morse rocker-joint chain for power transmission purposes.

* * *

A STRIKING BIT OF TRADE LITERATURE, WHICH TELLS ITS STORY graphically, is entitled "Sixty Seconds and Out." It is published by the Foamite Firefoam Co., New York City, and shows, in a series of photographs, the efficacy of the company's product in extinguishing fires almost instantaneously. The pictures are so

convincing that but little else is necessary to convey the story the company wishes to tell. The book is handsomely printed, and is one of the best examples of convincing advertising coming to this office.

* * *

UNDER THE TITLE "MAGNESIA PRODUCTS FOR THE RUBBER Trade," the General Magnesite and Magnesia Co., Philadelphia, Pennsylvania, has issued a very neat and complete booklet of 29 pages, treating of the properties of magnesia compounds, and their use in rubber compounding. Valuable data are given on their accelerating and chemical effects; also on their physical effects. Comparisons with German magnesias, with other minerals, and with organic accelerators are shown in a series of interesting curves. There is also given a number of formulas for the use of magnesia in typical rubber mixings.

* * *

ROGERS-PYATT SHELLAC Co., CRUDE RUBBER DEPARTMENT, New York City, has sent to the trade a novel blotter-chart printed in three colors and showing price fluctuations of the three standard grades of crude rubber for a period of years.

* * *

THE PORTABLE MACHINERY Co., PASSAIC, NEW JERSEY, IS circulating a well-arranged and attractive "broadside" sheet under the title "Over 1000 Scoop Conveyors." It tells by description, testimonials, and fine half-tone pictures, the advantages of the scoop conveyor manufactured by this concern, and shows its effectiveness in handling, at any desired angle, such raw materials as are used in manufacturing plants of different kinds, as well as coal, coke and ashes. Several rubber manufacturers are mentioned among the users of the device.

* * *

THE NATIONAL STANDARD TRUCK COST SYSTEM, ISSUED BY THE Truck Owners' Conference, Inc., 327 South La Salle street, Chicago, is now in use for checking the operation of over 18,700 trucks. It has been found that where supposedly accurate truck costs were kept there was a variation of 65 per cent in keeping the depreciation or sinking fund record, 21 per cent in handling maintenance changes and 13 per cent in keeping tire costs.

* * *

CALDWELL & Co. AND THE CALDWELL SHIPPING Co., WITH offices in New York City and seven other leading ports of the country, are mailing on request a 24-page pamphlet on "How to Ship for Export," which will be of practical value to all rubber firms engaging in foreign business. Ocean rates and space, railroad permits, lighterage, demurrage, trucking, warehousing and bills of lading receive particular attention, and important special facts are given regarding most foreign countries and principal ports.

"Railroad Freight Rates" is a 12-page pamphlet issued by the same companies, that contains the freight rates from various producing points on representative commodities moving for export. Pneumatic and solid tires, inner tubes, and air brake materials are the rubber goods mentioned.

* * *

"COMMERCE MONTHLY" IS THE NAME OF A WELL-EDITED and nicely printed 32-page magazine which made its initial appearance dated May, 1919. It is published by the National Bank of Commerce in New York, "to serve as a medium through which the experience and investigations that have proved useful to this bank in the fields of industry, commerce and finance may be shared with its friends." The current issue contains nine features devoted to timely topics of much importance to American industry in home and foreign markets. One of these consists of a table of wholesale prices of representative commodities for the past seven years. All quotations are from recognized trade sources, the rubber prices being from THE INDIA RUBBER WORLD. Altogether it is a publication that will be read with interest and benefit by executives in every business.

What the Rubber Chemists Are Doing.

EFFECT OF CERTAIN ACCELERATORS UPON THE PROPERTIES OF VULCANIZED RUBBER.

At the meeting of the New Jersey Chemical Society in Newark, January 13, 1919, a paper on the "Effect of Certain Accelerators Upon the Properties of Vulcanized Rubber," by George D. Kratz and A. H. Flower, was read by the former. The main features of this paper and the authors' conclusions are given in the following extended quotations:

INFLUENCE OF ACCELERATORS.

The results recorded were obtained in the course of several investigations to determine the relative activity of certain inorganic and organic accelerators, and the permissibility in the use of the sulphur coefficient in evaluating samples of vulcanized rubber known to contain accelerators. This has consisted of: (a) a comparison of the relative effects of heavy calcined magnesia and an (unidentified) organic accelerator in a mixture containing only rubber and sulphur, and (b) a comparison of the effect of larger amounts of heavy calcined magnesia, light magnesia and lime in a mixture which contained an excess of zinc oxide.

Irrespective of the effect of accelerators upon the physical properties of the vulcanized mixture, possibly the advantage most often claimed for the organic variety in preference to inorganic substances is that in accelerating vulcanization, the former are much more active than the latter and can be used in small amounts to replace much larger quantities of litharge, magnesia or lime.

These investigations have not included a comparison of the relative effects of magnesia and *p*-nitroso-dimethyl-aniline. The organic accelerator which we employed in place of the latter substance was found to be far more active, when used in small amount, than were similar quantities of magnesia. Likewise, the physical properties of the mixtures which contained the organic accelerator were shown to be superior to those obtained with similar amounts of magnesia.

When the load required to effect a given extension is taken as a measure of the physical properties, we have found a marked decrease in the extension of the vulcanized mixture to be true for small amounts of magnesia; certain organic accelerators, however, were found to increase the extension. Under these circumstances, entirely erroneous results were obtained when two series of mixtures, one of which contained small amounts of magnesia and the other similar amounts of a strong accelerator, were tested by this method. Comparisons made on the basis of the loads required to effect a given extension are less reliable than those obtained by comparing the tensile strength and percentage elongation at break. In this instance the sulphur coefficient may be said to afford a fair index of the state of cure as measured by the physical properties of mixtures known to contain small amounts of either inorganic or organic accelerators.

This statement, however, was not found to be of general application, and certainly is not true for mixtures which contain larger amounts of inorganic accelerators in the presence of an excess of zinc oxide. We find that large amounts of zinc oxide effect a slight and limited increase in the rate of vulcanization (sulphur coefficient).

Contrary to what might be expected, we have found that mixtures which contained fairly large quantities of both magnesia and zinc oxide, when vulcanized to maximum physical properties, had lower sulphur coefficients than a control mixture which was vulcanized to the same degree without the assistance of an accelerator. The substitution of lime for magnesia in such a mixture, however, was found to produce quite a different effect. With lime, after an initial decrease in the sulphur coefficient, the latter value was found to respond to a further increase in the amount of the accelerator. This difference in the action of the two substances would indicate that their function in the mixture is not identical.

Our results with heavy mineralized mixtures have shown that such mixtures are not only subject to misinterpretation, but the constituents of the mixtures tend to obscure or mask the individual properties of the rubber used.

INDICATION OF SULPHUR COEFFICIENT.

Fundamentally, the purpose of any ordinary vulcanization is to obtain the maximum physical properties which the mixture will retain unimpaired over the longest period of time under the conditions to which it will be subjected. This physical condition

may be largely independent of the sulphur coefficient, particularly if the mixture has been vulcanized with the assistance of an accelerator. Generally speaking, we have found that the sulphur coefficient does not afford a reliable indication of the physical properties of a vulcanized rubber mixture or that it can be taken as a measure of the state of cure except possibly in the case of mixtures which consist of rubber and sulphur only. We agree with Stevens, however, that for *Hevea* rubber practically all mixtures with a sulphur coefficient in excess of 3.2 will be subject to rapid deterioration.

In a former paper¹ we have given the limits for the vulcanization coefficient of *Hevea* rubber at 1.7 to 2.8. Under standardized conditions, the higher figure has been found to be consistently approximated by mixtures vulcanized without the aid of an accelerator, or with the assistance of one which is only mildly active. The lower figure has been found to apply for mixtures vulcanized with the assistance of even small amounts of powerful organic accelerators or larger amounts of magnesia. The anomaly found to exist between the action of magnesia and lime, however, indicates that a certain amount of reservation should be made in interpreting the coefficients of mixtures which contain either of these substances.

In view of our results as a whole, while we agree with Stevens that the sulphur coefficient is most important as an indication of the ultimate stability of the product, in general practice it should be considered as an indication only. Even in the case of mixtures composed solely of rubber and sulphur, we have found it dangerous to evaluate between them on the strength of their sulphur coefficients alone, unless the past histories of the samples in question are definitely known. As stated by Stevens, the true value of a product, as expressed by its state of cure, is obtained from physical and chemical tests only when they have been made after a definite period of aging conducted under carefully standardized conditions.

EXPERIMENTAL RESULTS.

TABLE I.

Accelerator Used.	Per Cent Accelerator.	Sulphur Co-efficient.	Load in lb. per Sq. Mm. Extended 1 to 9.	Tensile Strength per Sq. Mm. (at Break).	Per Cent Elongation at Break.
Heavy calcined magnesia.	0.00	0.684	163	181	962

	1.25	3.004	642	1223	1087

In the case of mixtures vulcanized with the assistance of "Accelerator A" it is evident from the figures obtained for the percentage elongation at break that this property increased proportionately with the tensile strength; with magnesia, on the contrary, tensile strength was increased at the expense of elongation.

This difference in the effect produced in the percentage elongation by small amounts of accelerators prohibits the use of the load required to effect a given extension as a measure of the physical properties of the two series of mixtures. As the percentage elongation of a mixture is increased by the action of an organic accelerator or otherwise, unless this is accompanied by a corresponding and uniform increase in the tensile strength, a given extension will be effected by a lesser load than would normally be required. This was roughly found to be true with "Accelerator A." On the other hand, when the tensile strength is increased at the expense of elongation, as was found to be the case with magnesia, it will require an excessive load to effect the same extension. This decrease in the percentage elongation of mixtures which contained small amounts of magnesia was so marked that, with one per cent of this substance, an extension

¹"Journal of Industrial and Engineering Chemistry," 11, 1919, page 30.

*These samples were pinched through by the clamps of the testing machine before a point of rupture or break, was reached. Consequently, the results for tensile strength and elongation at break are low.

of 1 to 9 was produced only by a load just short of that required to produce rupture or break.

	15	40	1,512	750

In the second experiment where much larger amounts of inorganic accelerators were employed, it was desired that the effect of the accelerator as a filler should be minimized to the greatest possible extent. This was accomplished by employing mixtures which contained zinc oxide in such an excess that from 5 to 15 per cent of an inorganic accelerator could be included in the mixture, by replacement of a similar volume of zinc oxide, without decreasing the effect, or function, of the latter substance (Table II). The sulphur content of the various mixtures was also cut down from 11 to 5 per cent, calculated upon the rubber. In this instance, and unlike the preceding experiments, the mixtures were vulcanized to maximum physical properties and their respective sulphur coefficients determined at this point. Portions of each of the mixtures were vulcanized in a platen press at 50 pounds steam pressure (298 degrees F.) over a wide range of times and the correct cure determined as the point of coincident maximum tensile strength and percentage elongation (technical cure). The sulphur coefficient of each mixture when vulcanized to this degree was then determined (Column 6, Table III).

The results obtained show that, for all three accelerators used, the best physical properties were obtained with about ten per cent of each in the mixture. The effects produced by light magnesias, heavy calcined magnesias, and lime ranked in the order named. These differences, however, were small enough to be accounted for in the value of each of these substances as a filling material. However, it is evident that the value of these accelerators as filling materials is of limited extent, because, when present in larger amount (15 per cent), in each case the vulcanized mixtures showed inferior physical properties (Columns 4 and 5, Table III). Moreover, the sulphur coefficients of the various mixtures were found not to reflect, or be a measure of, their physical properties. With both varieties of magnesias, the mixtures which contained 10 per cent of these substances were found to have lower sulphur coefficients than the mixtures which contained but 5 per cent, and the latter had lower coefficients than the control which was vulcanized without the assistance of an accelerator. On the other hand, the results obtained with lime were remarkable in that with 5 per cent of this substance, a much lower sulphur coefficient was obtained than in the case of the control, while with 10 per cent, contrary to the results obtained with magnesias, the sulphur coefficient was increased almost to that of the control.

In explanation of the results with magnesias, we have consistently found that mixtures vulcanized quickly to maximum physical properties with the assistance of accelerators invariably show lower sulphur coefficients than similar mixtures also vulcanized to maximum physical properties, but without the assistance of an accelerator. Frequently, much higher physical values are developed by those mixtures which contain accelerators. The same is true in lesser extent when a short period of vulcanization is effected by the use of higher temperatures. It is at least

indicated that the time required to effect the cure of a given mixture is reflected both in its sulphur coefficient and physical properties.

CONCLUSIONS.

The physical properties of vulcanized rubber mixtures are more fully expressed in terms of the tensile strength and elongation at break than by the load required to effect an extension of 1 to 9.

When used in small amount magnesias is less active in accelerating vulcanization than certain organic accelerators, and it does not impart to the mixtures the physical improvement characteristic of the latter substances.

With mixtures which contain even small amounts of either inorganic or organic accelerators, no direct relationship exists between the sulphur coefficient and the state of cure as measured by the physical properties of the mixture.

When mixtures are vulcanized quickly, with the assistance of inorganic accelerators, the correct state of cure, as reflected by their physical properties, is obtained at abnormally low sulphur coefficients.

COLLOIDS AND RUBBER.

At a recent meeting of the Society of Chemical Industry at the University of Birmingham, Dr. D. T. Twiss spoke on the properties of the colloidal state as exhibited by rubber. The following outline is condensed from the report published by "The India-Rubber Journal," January 4, 1919, page 6.

Rubber is so completely and typically colloidal that it is difficult to decide what details should be selected in order to give briefly a general indication of its colloidal character.

Natural rubber made its first appearance in a condition which might be described as doubly colloidal. Rubber latex is a milky fluid containing minute globules of a colloid, probably rubber itself in a state of colloidal suspension in an aqueous fluid or serum. These rubber globules are microscopic in size and show a distinct Brownian movement. Rubber latex is a negative suspensoid and the precipitation of rubber from *Hevea* latex exhibits analogies to the precipitation of such substances as clay or arsenious sulphide from colloidal aqueous suspension. The precipitation of negative suspensoids such as these is greatly accelerated by the addition of acids. Most of the rubber produced to-day is separated from its latex by the addition of small quantities of acetic acid.

Alkalies increase the stability of negative suspensoids, including rubber latex. Also the presence of an additional colloidal or emulsoid substance can increase the stability of the suspensoid.

Masticated raw rubber immersed in a solvent slowly absorbs the latter and swells enormously, finally yielding a colloidal solution of high viscosity. Some solvents, such as carbon disulphide, chloroform and benzene, yield almost transparent clear solutions, while others such as shale naphtha, petroleum ether and ordinary ether, yield solutions of milky appearance. Although rubber latex is closely comparable with the ordinary suspensoid colloids, rubber itself is an emulsoid. Emulsoids are, as a rule, more viscous than suspensoids, and the proportion of dispersed substance to medium is often higher.

Raw rubber may be considered as a fairly extreme case in which the rubber hydrocarbon is in a fine state of dispersion throughout a medium, probably consisting in part of the protein matter from the latex. As rubber freed from protein matter still retains its typical consistency, the emulsoid state must be attributed mainly to the presence of rubber in at least two forms of different molecular weight, or of different molecular condition, the rubber thus supplying not only its disperse phase, but also its own dispersion medium. Other peculiarities in the behavior of rubber confirm this lack of uniformity.

One of the greatest obstacles in the way of the production of synthetic rubber is the colloidal nature of the material. The problem is not merely to produce a substance of known molecular weight and structure, because the required material is of undetermined molecular magnitude and less desirable in a pure condition than when containing so-called impurities.

CHEMICAL PATENTS. THE UNITED STATES.

PUNCTURE-HEALING COMPOSITION. A puncture-healing compound including beeswax 1 ounce, paraffine 2 ounces, rosin $2\frac{1}{2}$ ounces, linseed oil $\frac{1}{2}$ -ounce, ground cork 2 ounces, and disintegrated asbestos 2 ounces. (Marie R. Weaver and Hermann Clemens, assignors of one-half to Otto Weydemeyer—all of El Paso, Texas. United States patent No. 1,299,273.)

THE DOMINION OF CANADA.

RUBBER SUBSTITUTE. Process and product for a rubber-like substance comprising a mixture of fixed oil, sulphur, and zinc oxide, substantially free from air and moisture, having been subjected to heat, pressure and agitation until the nascent period of the elements reacting has ceased. (Harry H. Hazeltine and Morton Gregory, both of Tacoma, Washington, U. S. A. Canadian patent No. 189,232.)

RUBBER VULCANIZATION. An accelerator for the vulcanization of rubber and similar materials, consisting of a solution of sodium or potassium in aniline or of potassium in diaphenylamine or toluidine. (The Dunlop Rubber Co., Limited, Westminster, London, assignee of Douglass Frank Twiss, Sutton, Coldfield, Warwick—both in England. Canadian patent No. 190,042.)

PROCESS AND PRODUCT OF VULCANIZING RUBBER.—A PROCESS FOR treating rubber or similar material which comprises subjecting the rubber to a vulcanizing agent comprising a nitro-derivative of anthracene (beta-dinitroanthraquinone.) (The Canadian Consolidated Rubber Co., Limited, Montreal, Que., assignee of W. A. Gibbons, Flushing, N. Y., U. S. A. Canadian patent No. 190,352.)

RUBBER COMPOSITION. A mixture of 60 parts of rubber, 14 parts of golden antimony sulphide, and 16 parts of asbestos or mica is used for electric insulation of cables and wires, for packing glands, etc. (F. H. Bloomfield, 76 St. John's Park, Blackheath, London, British patent No. 122,310.)

THE UNITED KINGDOM.

PACKING. Joint-making rings are composed of a corrugated metal core covered with asbestos, india rubber, etc., which may be secured by vulcanization and a wrapping material, and in some cases coated with graphite. (S. A. Copeland, 24 Essex Gardens, and C. G. Alexander, 125 Rectory Road, both of Gateshead, and J. Taylor, Dunford & Co., 12 Dean street, Newcastle-on-Tyne—both in England. British patent No. 122,724.)

PLASTIC COMPOSITION. A composition resembling rubber is obtained by heating fish scrap or fish oil with sulphur, afterwards heating the product under pressure. The mixture is heated first to 175 degrees C. Afterward the temperature is raised to 220 degrees C. over a period of one to two hours. The plastic mass so obtained is mixed with more sulphur, lead oxide is added to accelerate the reaction, and the whole heated at 155 degrees C. under pressure of 20 to 40 pounds per square inch for $\frac{1}{2}$ to 1 hour. The product may be used as rubber substitute or may be compounded with rubber. (M. Gregory, 2113 North Anderson street, Tacoma, Washington, U. S. A. British patent No. 123,114.)

PLASTIC COMPOSITION. Waste cork sawdust and pieces of cork, with or without refuse of tan or wood fiber, are made into a composition by addition of a mixture of alum, crude shellac, gum arabic, gutta percha, carbon bisulphide and methylated spirits. A specified composition is: alum, 4 ounces; carbon bisulphide, 1 pint; crude shellac, 8 ounces; gutta percha, 8 ounces; methylated spirits, 1 pint, combined with a proportion of the specified fibrous material. (E. Wood, 7 Sunny Terrace, Granville Road, Weymouth, Dorsetshire. British patent No. 123,285.)

IMPREGNATED TEXTILE BELTING. Textile belting is impregnated with linseed oil, asphalt, balata, etc., freed from hygroscopic substances and dried by a continuous operation. The belts are

dried by heating under reduced pressure. The solvent is passed with the steam into a condenser and recovered. (E. C. R. Marks, 57 Lincoln's Inn Fields, London. British patent No. 123,502.)

LABORATORY APPARATUS. CONVENIENT WALL CLAMP.

A VERY useful wall clamp adapted for supporting such objects as maps, charts, drawings, blue-prints, fabrics, writing pads, etc., on a wall surface is shown in the annexed cut and called a "Kling-Klamp." It consists of a reversible cam to accommodate either thick or thin objects, which grips the object in proportion to its weight. The range of usefulness of this simple and inexpensive device is practically unlimited. It will be particularly appreciated by the works chemist in his office, laboratory and testing rooms. (Standard Scientific Co., 70 Fifth avenue, New York City.)

KLING-KLAMP.

DISTILLATION ADAPTER.

The accompanying cut illustrates the H-J distillation adapter which presents certain distinct practical advantages worthy of note. It can be readily attached to any ordinary flask, thereby adapting it for all purposes of distillation. This combination practically replaces the usual form of one-piece distillation flask. It is connected to the flask through a rubber or cork stopper, forming a tight but non-rigid joint, thus greatly lessening the liability to injury when used.

H-J DISTILLATION ADAPTER.

The separability of the adapter and flask presents several distinct points of value and convenience, for example: flasks may be easily removed for refilling without disturbing other connections. In case of breakage of flask or adapter the cost of replacing that part is less than the cost of a new distillation flask. When not in use the adapter may be removed to a suitable place without fear of injury. These features are certain to make this adapter popular in laboratories where distillation flasks are much in use. (Standard Scientific Co., 70 Fifth Avenue, New York City.)

AUTOMATIC SIPHON.

STANSIPHON.

A series of practical automatic siphons covering the usual laboratory and factory requirements has been perfected as shown in the cut. These siphons are made in glass, hard rubber, and a variety of metals, according to the liquid to be used. The various models are classified as automatic or self-starting; bulb pressure attachment; bulb lift and gravity pressure, and piston pressure. (Standard Scientific Co., 70 Fifth Avenue, New York City.)

CANADIAN INSTITUTE OF CHEMISTRY.

The Canadian Institute of Chemistry was organized with 28 members at the Canadian Chemists' Convention held in Montreal, Quebec, May 17, 1919. Three classes of membership are provided for. At the first session Dr. W. L. Goodwin, of the Kingston School of Mines, presided. Among the Montreal industrial plants visited by the members of the Institute was that of the Canadian Consolidated Rubber Co., Limited.

New Machines and Appliances.

THE "AKRON" FRICTION CLUTCH.

WHILE the principle of this clutch is not new, it is of interest to the rubber trade, due to the refinements of design and construction necessary to meet the demands of a reliable power-transmitting device. Its simplicity and durability make it of special advantage for rubber machinery, and particularly so when used on tire-building machines.

There is only one point to adjust, and the adjusting screw is always accessible. The clutch can be quickly adjusted to slip, when a given load is exceeded, thereby avoiding wrecking other

FRICTION CLUTCH FOR TIRE-BUILDING MACHINES.

parts of the power transmission. It takes hold slowly, reduces shock, and consequently lengthens the life of the machinery. The pulley is not a part of the clutch and is easily interchangeable. The friction parts are all of metal and run in oil; consequently, the wear on these parts is reduced to a minimum. As all working parts are enclosed in a metal case, and there are no toggle arms, levers, or other traps to fan the air and endanger operatives, it can be run at high speed with perfect safety. Made in all sizes from $\frac{3}{4}$ -h. p. at 100 r. p. m., and up. (The Williams Foundry & Machine Co., Akron, Ohio.)

THE PFAUDLER UTILITY POT.

For small-scale manufacture and laboratory practice, rubber chemists will be interested in the acid-resisting glass-enameled utility pot shown in the illustration. The vessel is made with an outer jacket and its inside dimensions are: diameter 18 inches; depth 25 inches; capacity 26 gallons. It is convenient to handle, easily moved, may be raised, or lowered in temperature, and is very effective in resisting acids or alkalis. (The Pfaudler Co., Rochester, New York.)

PFAUDLER UTILITY POT.

TASGON AND TAR-GON.

Two new specialties that are recommended to car-users are Tasgon and Tar-gon. Fittings that are rusted, corroded, or otherwise stuck fast may be easily removed after applying a few drops of the former. The latter removes tar, asphalt, grease and stains from automobile bodies, mud-guards, and tires. (Polygon Products Co., 141 Milk street, Boston, Massachusetts.)

STEEL TABLES AND DRY COMPOUND BINS.

The progressive rubber manufacturer will be interested in the line of steel factory equipment here illustrated. It comprises tables, compound bins, and other factory furniture. The first cost of such equipment is practically the final cost. There is little depreciation and low insurance rate.

The dry compound bins, built in double compartment units, meet in every way the most stringent requirements for dry compound storage. Each compartment has its own cover for the protection of the contents by excluding accidental impurities.

The all-steel tables are perfectly adapted for holding warm or soft batches for cooling or keeping free from damage by contact with splinters of wood,

DRY COMPOUND BIN.

COOLING TABLE.

which are an annoying cause of trouble wherever wooden equipment is used in a rubber mill. (Charles W. Carll's Sons, Trenton, New Jersey.)

KREMER TIRE-BUILDING MACHINE.

This machine is especially designed with the view of reproducing all the essential features employed in producing a hand-made tire in a machine-made product, advantages that will be

KREMER'S TIRE BUILDER.

readily appreciated by any one familiar with the art of machine tire construction. A fabric tension device is employed that will insure uniform stretch to all the different plies of fabric alike, the desired percentage of stretch being determined at will by the operator.

The core-supporting arm rotates on its axis, whereby the core can be made to assume either a vertical or a horizontal position without affecting the rotation of the core. This feature greatly facilitates the setting of the beads, as with its arrangement the bead-setting rings are entirely eliminated.

In this machine a single spinning head is employed which stitches down the fabric in a manner similar to that of the hand-

made tire, with the result that there is no distortion of the fabric at the points where the fabric is overlapped or spliced. This difficulty frequently occurs when both sides of the carcass are spun down at the same time and in the same direction from the median line of the core.

Briefly, the operation of the machine is as follows. After the fabric has been fed to the core, the latter is rotated forward at a fast speed and the spinner held against that side of the fabric in which the warp threads extend diagonally rearward, relative to the direction of movement of the core. When one side of the fabric has been spun down, thus maintaining the proper position and tension of the warp threads, the core is stopped, the treadle depressed to unlock the core-holding arm, which is then rotated to bring the opposite side of the core into position to be engaged by the spinner. The lever handle is then operated so as to reverse the rotation of the core, and the remaining side of the fabric is thus spun down in the proper way, to preserve or produce the necessary tension on the warp threads. (F. W. Kremer, Rutherford, New Jersey.)

NON-EXPLOSIVE SAFETY CEMENT CANS.

Rubber cement is used to join together the seams of rubber footwear, clothing, hot-water bags and toys, and in the manufacture of tires, tubes, and many other rubber articles. The

SAFETY BENCH CAN.

The fumes of the solvents used in the manufacture of cements contaminate the air to the injury of the workers, and often result in serious explosions, unless carefully guarded.

As examples of what has been accomplished to overcome these difficulties, three types of safety bench cans for rubber cement or gasoline are presented in the accompanying illustrations. The bench can with a removable cover is provided with a float valve which rests on the gasoline or rubber cement and allows the operator to use a light brush where a small quantity is desired. When the float is pressed down slightly the liquid is automatically forced up through the fine screen and flows back through the screen when the pressure is released. There is no danger from explosion in a can of this construction, which has the additional feature of economy in the use of gasoline. This type of can may be used for any volatile liquid in rubber mills or repair shops.

UPRIGHT AND HORIZONTAL TYPES.

The two smaller cuts illustrating, respectively, the upright and horizontal types of rubber cement pots constructed after the fashion of drinking vessels for poultry, permit only a small quantity of cement or gasoline to stand in the brush receptacle, thus minimizing the escape of fumes into the atmosphere. (McNutt Can Sales Co., Inc., 254 Church street, New York City.)

A NEW METHOD OF EXTINGUISHING FIRES.

When fires occur in chemicals, acids, or oils, they are usually marked by extremely high temperatures; so high, in fact, that water, even where it can be made to stay on the surface of the

fire, is unable to extinguish it by cooling, as it is immediately vaporized by the heat and the vapor blown away by the wind or sucked away by the draft of the fire itself. But in most cases the water, being heavier than the liquid, sinks to

FIREFOAM ENGINE.

HAND EXTINGUISHER.

the bottom, where it can do no good. In fact, it usually does harm, as it spreads the burning liquids over a larger area.

The method here described utilizes the well-known smothering ability of carbonic-acid gas. But in this method the gas is not left free to be blown away, but is held on the surface of the burning substance in the form of very minute bubbles in which the carbonic-acid gas is confined. This mass is said to be an almost perfect non-conductor of heat. It is lighter than liquids and, consequently, floats on them. If spread entirely over the surface it must cut off the supply of oxygen completely and quickly smother the blaze. When applied to solid substances it coats the surface and kills the fire by preventing air from reaching it. (Foamite Firefoam Co., 200 Fifth avenue, New York City.)

PORTABLE AIR COMPRESSORS FOR TIRES.

This new outfit consists of a one-half horse-power electric air compressor, having a capacity of two cubic feet of free air per minute, together with a cylindrical pressed steel reservoir, 14 inches

PORTABLE AIR PUMP.

by 30 inches, mounted on three wheels and provided with a handle, so that the whole can be wheeled about as circumstances require. The reservoir holds sufficient air at one filling to inflate five average tires from flat to full pressure or ten tires from 40 to 80 pounds. The outfit is complete with switch, electric cable, attachment plug, pressure gage, safety valve, 25 feet of hose, tire connector, and all necessary piping and wiring. The motor operates on alternating current of 60 cycles or less and direct current. The motor, gear train and compressor are enclosed in one housing. The motor and compressor are cooled by forced circulation of air through this common housing, and the motor, gears and compressor, including cylinder walls and piston, are grease-lubricated. (Black & Decker Manufacturing Co., Baltimore, Maryland.)

MACHINERY PATENTS.

COMPRESSED ASBESTOS SHEET PACKING.

DUE to the elimination of German competition, the manufacture of asbestos sheet packing of the Klingerite type is becoming an important division of rubber goods manufacture.

The process here illustrated relates to the continuous manufacture of joint-making material and consists in applying to one or both faces a surfacing material of finer quality or of different color.

The material A, formed from a plastic composition of rubber and asbestos compressed and dried in any manner, such as between endless bands B as described in British patent No. 121,772, receives surfacing material from a hopper *c* on one or both faces and passes to calendering rolls E which may be heated to drive off solvent.

MACHINE FOR MAKING ASBESTOS PACKING.

From the calender, the sheet passes between presser rollers and is wound up on the roller A shown at the right of the illustration. (Potter's Asbestos Co. and A. E. Stafford, Rochdale, Lancashire, England. British patent No. 121,904.)

CHICLE GUM-STRAINING MACHINE.

In the operation of this machine the melted chicle containing the foreign matter flows in a continuous viscous stream from the chute down onto the surface of the rotating cylinder and is carried thereby under the rubber roller, the pressure of which squeezes the gum through the screen and perforations into the interior of the cylinder.

CHICLE STRAINER.

From the interior of the cylinder the gum is gathered by a spiral scraper and caused to flow out of the open end of the cylinder through a hole in the plate, to the discharge spout.

The cylinder and scraper are heated to the required degree to facilitate this flow of the gum without heating it too hot. The impurities in the gum are not forced through the screen into

the cylinder, but are picked up by the comparatively cold and more sticky yielding surface of the rubber roller and carried thereby until they are collected from the surface of the roller by the scraper at the top. (Karl E. Feiler, assignor of one-ninth to himself, two-ninths to William A. Lorenz, both of Hartford, Connecticut; and six-ninths to Beechum Packing Co., Canajoharie, New York. United States patent No. 1,296,112. See United States patent No. 1,296,096.)

MACHINE FOR MAKING RUBBER STOCK.

Rubber stock may be built up of laminated strips, and entrapped fluids removed by this process. The machine illustrated is designed to produce solid tire stock, and comprises an ordinary tubing machine A provided with a laminating die B through which the separated strips are forced and conveyed between compression rollers C and D.

SOLID-TIRE-STOCK MACHINE.

Pressure being applied to the mass in the tubes

when the strips are extruded through the die into a region of lower pressure, the gases are excluded. Furthermore, as the strips pass between the compression rollers, any remaining gas-pockets are broken and all hollows are flattened out so that the stock leaves the rolls free of pockets and entrapped fluids.

(Thomas P. Little, assignor to The Fisk Rubber Co., both of Chicopee Falls, Massachusetts. United States patent No. 1,297,482.)

MAKING GOLF BALLS.

This patent relates to apparatus for molding elastic material and particularly golf or like balls of the form described in British patent specification No. 120,658. The mold sections 7, 8, 13, 14 are provided with tapering radial pins 9 .. 14 which

GOLF-BALL MOLD

converge to a common center and are symmetrically disposed. Some of the pins may be long enough to support a hard core (1) to be embedded in the material (2) of the ball. In the construction shown, the mold consists of four sections, two (13, 14) of which form the equatorial part of the ball. When molded, the material is drawn off the pins, and the ball is completed as described in the above-mentioned specification. The mold may be used for a rubber composition, which is vulcanized therein, or for a composition which can be poured into the mold and allowed to set. (W. J. Mellersh-Jackson, 28 Southampton Buildings, London. [Revere Rubber Co., 59 Reade street, New York City.] British patent No. 121,239.)

New Goods and Specialties.

A TOY MONOPLANE THAT SOARS.

THE interest in airplanes has stimulated the production of toys for the youngsters that shall have some of the characteristics of the real airplane. The one shown in the accompanying illustration, called the "Joy-Toy Soaring Monoplane," will ascend straight into the air for more than 100 feet and spiral back to the feet of the sender. It has wings of tough paper supported by light metal stays on hardwood doweling, and these wings fold up like a fan. A light spring holds them in position when spread. A strong sling or catapult has a broad rubber band with a ring for attaching to the monoplane, and the height to which the plane ascends depends on the power given it by the force exerted on this sling. The small sketches show the means of attaching the

THE JOY-TOY SOARING MONOPLANE.

sling and the position in which the monoplane is held when sending it into the air. The air resistance holds the wings closed until the plane has reached the top of its flight, when they automatically spread open. The direction of the toy can be regulated by adjusting the rudder, which is detachable. (The Evanston Supply Co., 118 North La Salle street, Chicago, Ill.)

A WORK-SHOE WITH RUBBER SOLE.

The tremendous increase in the cost of footwear has opened the way for the popularization of a work-shoe that can be marketed at a reasonable price, and that will give good value for the money paid. A shoe which answers the requirements is illustrated here in so graphic a manner as to require but little further description.

It has an upper of heavy brown canvas, with a lining of lighter duck, a sole of tough rubber, a fiber counter and insole, and a resilient box-toe. The rubber heel is of pneumatic construction, with several specially constructed chambers which draw in and eject air at every step, thus being lighter and more

THE HOOD "WORKSHOE."

resilient than the ordinary rubber heel. The shoe is made on the Munson last, the shape approved by the Government for its

Army shoes, in regular lace, blucher, and scout patterns, for men, boys and youths, women, misses, and children. It is in all a most desirable shoe for the purposes intended. (Hood Rubber Co., Watertown, Massachusetts.)

AN AUTOMATIC INFLATING VALVE.

A new valve for use in garages and service stations is covered with rubber to protect it from injury and at the same time prevent it from scratching or injuring the body of the automobile near which it may be used when inflating tires. An automatic feature guards against the escape of compressed air, if for any reason the supply is not cut off when the use of the valve has ceased. This valve is made in four sizes from 5/16-inch to 3/4-inch, and a patent has been applied for on the device. (A. Schrader's Son, Inc., 783-803 Atlantic avenue, Brooklyn, New York.)

"SCHRADER UNIVERSAL INFLATING VALVE."

DETACHABLE RUBBER HEEL.

A cushion rubber heel made in two layers or lifts, on the principle of the mortise-and-tenon joint, is shown in the accompanying sketch. One of the layers is permanently attached to the heel of the shoe, and the other, being detachable, is easily replaceable when worn. The two rubber parts may be made of two grades of rubber if desired, the upper one receiving less wear than the tread member. The inventor who has patented the idea calls attention to the possibility of utilizing it in applying a rubber facing to the sole or a portion of the sole of a shoe. (Walter H. Clarke, Akron, Ohio.)

CLARKE RUBBER HEEL.

A WESTERN NON-SKID TIRE.

The tire shown herewith uses a double diamond tread to produce its non-skid feature. This tire is of the clincher type and is a new brand being manufactured by a western concern. It is called the "South Bend" tire. (International India Rubber Corp., South Bend, Indiana.)

A SPONGE-RUBBER TIRE FILLER.

A new substitute for the customary pneumatic tube in automobile tires is made of sponge rubber produced by a special process which toughens it to withstand hard wear. The "Rubber Ace," as it is called, is manufactured in different sizes to fit various tires. It is claimed for this tire filler that it will not harden or crumble and will retain its resiliency, while it is not affected by natural heat or cold. The manufacturer guarantees its invention for one year. (Lafayette Rubber Co., 6100 South La Salle street, Chicago, Illinois.)

"RUBBER ACE" TIRE FILLER.

A RUBBER-LINED CASE FOR BOTTLES.

Those who are constantly traveling and require a water-proof case for bottles should be interested in the one illustrated here. It is made in two styles, one of black patent leather and the

other of tan pig goat-skin, lined with a checked water-proofed fabric. The bottles which come with the case are of glass in nickel holders with a removable cap. (Mark Cross, 404 Fifth avenue, New York City.)

RUBBER-LINED BOTTLE-CASE.

ber, and vulcanized under pressure sufficiently heavy to unite the plies and make the belt impervious to moisture. This type

"TEST SPECIAL" RUBBER BELTING.

A new kind of belting for machinery is made of specially woven cotton duck, thoroughly impregnated with rub-

ber, and vulcanized under pressure sufficiently heavy to unite the plies and make the belt impervious to moisture. This type of belt is also non-stretching, an important feature. (New York Belting & Packing Co., New York City.)

NOVEL HOT-WATER BOTTLE THAT FOLDS.

The needs of the traveler are the incentive that spurs many inventors to new efforts. The latest item of this sort is a folding hot-water bottle with syringe attached, the bottle, tubing, and pipe being made in one piece. The tubing is of soft rubber, and is of the rapid-flow type. The pipe is of semi-hard rubber. (G. S. Andrus, Akron, Ohio.)

FOLDING HOT-WATER BOTTLE AND SYRINGE.

REGENT KEDS—A NEW LINE OF SUMMER FOOTWEAR.

A new line of "Keds" called the "Regent" has recently appeared, designated as of higher grade than the ordinary rubber-soled canvas footwear and priced accordingly. The models are made of white Sea Island duck and have white rubber soles.

prevent the foot from coming in close contact with the latter. The sole is vulcanized to the upper by the pressure-cure process. Half Louis heel pump and 9-inch Bal, rubber lifts on heels; 8-inch Bal, misses' pump, and men's Bal and Oxford, rubber heels.

WOMEN'S 8-INCH BAL.

MISSSES' PUMP.

INFANT'S OXFORD.

MEN'S OXFORD.

INFANT'S BOOT.

WOMEN'S 9-INCH BAL.

MEN'S BAL.

The heel varieties are made with a combination steel and fiber shank to support the arch of the foot, and there is a ground cork filling between the fiber insole and the rubber outsole to

The line includes a number of models not shown above, including Oxfords and Bals for men and women and an infant's ankle-strap pump. (The United States Rubber Co., New York City.)

A "MINNOW" BAIT FOR BASS.

For deep-water fishing, especially for bass in mid-summer, in northern lakes, a new "plug" has been devised which sinks and dives and has an active swimming or wiggling movement, en-

THE HEDDON "DEEP-O-DIVER" BAIT.

hanced by a rubber "pork rind" attachment. This bait has a double-hook equipment, weighs only 2/3-ounce, and is 2 1/2 inches long. It is made in four color combinations, one being a red-scale finish. (James Heddon's Sons, Dowagiac, Michigan.)

A NEW SWIMMING GLOVE.

A swimming glove intended to prevent the entrance of water between the glove and the hands of the swimmer, has its outer edge provided with a continuous web formed with a flange which connects, by means of ribs, with the fingers. When the fingers of the hand are spread, the spaces between act like the web of a duck's foot to resist the water and thus offer an effectual means of making progress.

The glove is formed of elastic material, preferably rubber, and the wrist portion has a rubber band at its outer end to prevent the entrance of water. When the fingers are brought together, the resistance to the water is very slight during the return swimming stroke. The glove is easily adjusted. (John W. Eckman, Decatur, Illinois.)

ECKMAN SWIMMING-GLOVE.

VACUUM CLEANER WITH RUBBER BELT.

An electrically driven vacuum cleaner is pictured here, having a 3/4-inch round driving belt of rubber and rubber-tired wheels at front and back. The belt drives the spiral brush direct from a simple and durable large carrier wheel. This brush is divided and by its wide opening, the end vents, and the large center vent, it is possible to clean dust from base-board cracks and pick up pieces of strong and larger articles of rubbish without the inconvenience of getting them wound around the brush. The brush itself is adjustable to suit the special requirements of the surface to be cleaned. This adjustment is facilitated by the special attachments which come with the cleaner.

This motor has a tri-plever, foot-operated, for starting and stopping. All of the electrical connections are contained in the motor housing and the handle is of non-shock-enamelled wood. This handle can be adjusted and fastened at any desired angle. (The Wise-McClung Manufacturing Co., New Philadelphia, Ohio.)

"AMERICA" CLEANER.

AN ADJUSTABLE CRAVAT.

Dealers in men's furnishings will be interested in a new type of cravat called the "Tieze." The particular feature is the substitution of a strip of elastic webbing for the narrow strip of material which passes around the back of the collar. When a cravat having this elastic insert is put in position to be tied, the elastic permits it to be drawn down and knotted with ease. It can then be released and will adjust itself snugly. Another specialty of novel interest made by the same company is

"TIEZE" CRAVAT.

A WEIGHTED RUBBER SOLE.

One of the disadvantages of the life-saving suits of the modern type is that the heavy metal soles of the feet have no resiliency and possess a tendency to bend beneath the weight of the wearer if he happens to step on some hard object, such as a stone under water.

To overcome this handicap a new sole has been devised, made of rubber heavily compounded with litharge. The inner side is of fabric, like the interior of a rubber boot. This is known as the "High Gravity Sole." The "Dread-naught" safety suit described in our issue of October 1, 1918, is said to be equipped with these weighted rubber soles.

The "High Gravity Sole" and the "Tieze" cravat are the product of the same inventor. (Bull's Eye Rubber Co., 131-135 Harris avenue, Long Island City, New York.)

A TRUCK TIRE THAT WITHSTANDS STRAIN.

A truck tire is represented in the accompanying illustration which is made with base, sub-base, and tread fused in one piece by a special process. The channel lips of the base are shorter than in some types of solid tires, but it is claimed by the manufacturer that the bond between the rubber and the steel rim is so strong that a laboratory test in which 100 tons hydraulic pressure were exerted against the unsupported tire-walls failed to dislodge the tread. At the same time, although the tire was much distorted during the test, it regained its normal size and shape when the pressure was removed. (The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio.)

MCGRAW SOLID TIRE.

BLACK AND WHITE IN COMBINATION.

Nearly all the rubber footwear manufacturers are now producing lines of white rubber, which seem to have caught the fancy of the public. The various standard styles and shapes are being duplicated in white.

A decided novelty in this line, however, is the "Lytton," a lumberman's shoe with white rubber upper, heel, and sole, and black leather top and white celluloid eyelets. The upper and top are attached by four rows of stitching, and the whole forms an article which commends itself by its novelty and attractiveness. (The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada.)

"LYTTON" LUMBERMAN'S SHOE.

Activities of The Rubber Association of America, Inc.

MEETING OF THE BOARD OF DIRECTORS.

THE QUARTERLY MEETING of the Board of Directors was held at the Union League Club, New York City, May 9, 1919, with the following attendance:

Homér E. Sawyer, president. Directors: Harry T. Dunn, Seneca G. Lewis, John Morgan, John A. Lambert, William J. Kelly, John S. Lowman, Charles J. Davol, C. W. McLaughlin, G. W. Henne. Former presidents: Henry C. Pearson, Frederic C. Hood, George B. Hodgman. Secretary, H. S. Vorhis. Also by special invitation, Colonel H. Stuart Hotchkiss.

It was voted to purchase \$10,000 of Victory Loan notes and to appropriate \$5,000 toward supporting the work of the National Industrial Board, of which the Association is a member.

The following firm and associate members were elected:

FIRM MEMBERS AND REPRESENTATIVES.

The Archer Cord Tire & Rubber Co., W. F. Bigelow, Minneapolis, Minnesota.

Curtis Tire & Rubber Co., Curtis R. Gray, Muskegon, Michigan. Lincoln Highway Tire Co., M. S. Ackles, Fulton, Illinois. Monarch Rubber Co., G. F. Kline, Canton, Ohio (factory at Hartsville, Ohio).

Semple Rubber Co., C. H. Semple, Trenton, New Jersey. Standard Tire Co., R. J. Firestone, or T. A. Palmer, Wilmoughby, Ohio.

ASSOCIATE MEMBERS.

W. A. Eden, Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada.

The associate membership of E. O. Cummings was transferred to firm membership in the name of W. H. Cummings and Sons, 60 Harrison street, New York City.

ASSOCIATION REPRESENTED AT CHAMBER OF COMMERCE MEETING.

The seventh annual meeting of the Chamber of Commerce of the United States of America held at St. Louis, April 28 to May 1, 1919, brought together 2,500 business leaders from all parts of the country and was one of the most important gatherings of this nature ever held. Among other resolutions, the following that is of particular interest was adopted:

NO. 11—HIGHWAYS.

That highways are an integral part of our nation's system of transportation has been emphasized by the war, and an enormous development is at hand, so important as to require a comprehensive national policy, under which federal appropriations for highways will be applied to national needs for interstate commerce, agriculture, postal delivery, common defense and general welfare.

Frank A. Seiberling is chairman of the Highways Committee, which has given this question extended study. Mr. Seiberling and Secretary Vorhis were delegated to represent the rubber industry.

NEW CLASSIFICATION OF RUBBER EXPORTS AND IMPORTS.

That the industry may be better informed concerning rubber exports and imports, the Bureau of Foreign and Domestic Commerce has adopted the following classification schedules for use in the monthly summaries published by the Department of Commerce:

EXPORT SCHEDULE.

40. RUBBER AND RELATED GUMS AND MANUFACTURES OF.

Code No.	CLASS AND COMMODITY.
4011.	401. Rubber, reclaimed, scrap and old, fit only for manufacture.
4012.	Reclaimed.
4013.	Scrap and old.
4031.	403. Boots and Shoes.
4032.	Boots.
4033.	Shoes and overshoes.
4039.	Canvas shoes with rubber soles and all other rubber shoes, n.e.s.

404. Drugists' sundries and medical and surgical goods. (This will include: air goods, including bed pans, beds, cushions for invalids, operating cushions, life preservers and pillows, water bottles and bags, fountain and bulb syringes, sets and atomizers, sheets and sheeting, including hospital sheeting, blankets, pillow cases, bandages, aprons, basins, bath tubs; miscellaneous goods and catheters, finger-cuts, surgeons' gloves, pouches, sponges, stoppers, tourniquets, tubes, tubing, urinals.)

405. Hard rubber goods, including electrical supplies, combs, etc.

4051. Battery jars and other battery jars.

4052. Electrical supplies and other than battery jars.

4053. Combs and other hair goods.

4059. All other (sheet, moldings, pipe stems, rods and tubes).

4061. Pneumatic casings for automobiles.

4062. Pneumatic casings, all other (bicycle, motorcycle and aeroplane).

4064. Pneumatic tubes for automobiles.

4065. Pneumatic tubes, all other (bicycle, motorcycle, airplane).

4067. Solid tires—automobile and motor truck tires.

4068. Solid tires—all other.

407. Waterproof cloth and clothing (rubberized).

4071. Waterproof cloth, including carriage cloth and auto topping (rubberized).

4072. Waterproofed wearing apparel (rubberized).

(For waterproof clothing not rubberized, see "Textiles" 20, 21, 26, 27.)

409. Other manufacturers of rubber.

4091. Belting, including transmission, conveyor and elevator belting of rubber or balata.

4092. Hose, including braided, molded, cotton rubber-lined, wire wound, air-brake, fire, garden, submarine, vacuum, steam, suction, water, car-heating, and lining or cotton jacket for cotton rubber-lined hose.

4093. Packing.

4094. Soles and heels.

4095. Rubber thread.

4099. All other rubber goods (including brake linings, buffers, cord, friction tape, gaskets and washers, gasket tubing, splicing compound, mats, matting, mold work, roll covering, rubber springs, tubing, valves, cables, vent, insulating compounds, etc.).

IMPORT SCHEDULE.

40. RUBBER AND RELATED GUMS AND MANUFACTURES OF.

Code No. CLASS AND COMMODITY.

4001. Rubber, crude or unmanufactured.

4010. Rubber, crude, wild.

4012. Rubber, crude, plantation.

4013. Guayule.

4014. Jelutong.

4015. Rubber, reclaimed and scrap, fit only for remanufacture.

4016. Reclaimed.

4017. Scrap and old.

4020. Balata.

4021. Chicle.

4022. Crude.

4023. Refined.

(For chewing gum—see confectionery.)

4024. Gutta percha.

4025. Gutta siak.

4026. Other guttas.

4027. Boots and shoes (includes boots, shoes and overshoes, and canvas shoes with rubber soles).

4028. Drugists' sundries and medical and surgical goods.

(This will include: air goods, including bed pans, beds, cushions for invalids, operating cushions, life preservers and pillows; water bottles and bags, fountain and bulb syringes, sets and atomizers; sheetings, including hospital sheetings, blankets, pillow cases, bandages, aprons, basins, bath tubs; miscellaneous goods and catheters, finger-cuts, surgeons' gloves, pouches, sponges, stoppers, tourniquets, tubes, tubing and urinals.)

4029. Hard rubber goods, including electrical supplies, combs and other hair goods, sheet moldings, pipe stems, rods and tubes.

4030. Tires and tire tubes.

4031. Waterproof cloth and clothing (rubberized).

4032. Waterproof cloth, including carriage cloth and auto topping (rubberized).

4033. Composed of cotton or other vegetable fiber of which cotton is the material of chief value.

4034. Composed of silk, etc.

4035. Composed of wool or mohair, etc.

4036. Composed of cotton or other vegetable fiber, or of which cotton is the material of chief value.

4037. Composed of silk, etc.

4038. Composed of wool or mohair, etc.

4039. Composed of linen, ramie, or ramie.

4040. Other manufacturers of rubber.

4041. Belting, including transmission, conveyor and elevator belting containing rubber or balata.

4042. Hose, including braided, molded, cotton rubber-lined, wire-wound, air-brake, fire, garden, pneumatic, submarine, vacuum, steam, suction, water, car-heating, and lining or cotton jacket for cotton rubber-lined hose.

4043. Packing.

4044. Soles and heels.

4045. Rubber thread.

40990.

All other rubber goods (including brake linings, buffers, cord, friction tape, gaskets and washers, gasket tubing, splicing compound, mats, matting, mold work, roll covering, rubber springs, tubing, valves, cables, cement, insulating compounds, etc.).
(For Insulating Wire—see "Wire.")

OUTING DATE CHANGED.

The Outing Committee announces that in order to secure the desired accommodations the annual outing will be held on June 24, 1919, instead of June 17, as previously announced. The place will be the Seaview Golf Club, at Absecon, adjoining Atlantic City, New Jersey.

The Outing Committee is extremely fortunate in securing one of the finest and best equipped clubs in the country for the outing, and in a location that will be central for the entire membership.

OTHER MANUFACTURERS AGREE TO CRUDE RUBBER CHARGE.

The following manufacturers have signed the agreement to pay the Rubber Association 3 cents per 100 pounds on all crude rubber purchased by them:

Cortland Tire & Rubber Co.	Pioneer Rubber Mills.
Dreyfus Co., L. A.	Polson Rubber Co., The
Burack Co., The	Schacht Rubber Manufacturing Co.
Eureka Rubber Manufacturing Co., Inc.	Zee-Zee Rubber Co.

OVERLAND FREIGHT RATES REDUCED.

George F. Hichborn, chairman of the Traffic Committee, announces that transcontinental rates from the Pacific coast on carloads of crude rubber have been reduced to \$1 per hundredweight and to \$2.25 per hundredweight in less than carloads, these rates effective May 29, 1919.

EXECUTIVE COMMITTEE OF TIRE DIVISIONS DISCUSS EXCISE TAXES.

A joint meeting of the Executive Committees of the Pneumatic and Solid Tire Manufacturers' Divisions was held May 14, 1919, at 52 Vanderbilt Avenue, New York City, A. G. Partridge presiding. The following were present:

George M. Stadelman, chairman, Pneumatic Tire Manufacturers' Division; A. G. Partridge, chairman Solid Tire Manufacturers' Division; H. C. Miller, Joseph C. Weston, W. W. Duncan, Maurice Switzer, T. S. Lindsey, A. H. Peterson, Horace De Lissier, R. T. Griffiths, Seneca G. Lewis, John A. Kearns, J. E. Baum, and H. S. Vorhis, secretary; by special invitation, M. L. Hemmingsway and W. C. Arthur.

The following members of the Special Committee on the Excise Tax on Tires and Tire Accessories were present: F. C. Van Cleef, Bernard M. Robinson, Kennedy M. Thompson, C. L. Landon, and J. C. Weston.

Important matters relating to the excise taxes on tires and accessories were discussed and definite action taken toward modifying certain features.

It was voted that the Excise Tax Committee be increased from seven to twelve members and that the following companies be invited to name representatives: Ajax Rubber Co., Inc., Hood Rubber Co., Lee Tire & Rubber Co., Empire Rubber & Tire Corp., General Tire & Rubber Co.

Horace DeLissier was appointed a member of the Executive Committee of the Pneumatic Tire Manufacturers' Division, succeeding H. L. McClaren, resigned.

The next meeting of the Pneumatic Tire Manufacturers' Division and the Solid Tire Manufacturers' Division will be held at the Hotel Chalfonte, Atlantic City, New Jersey, June 23, 1919, at 2:30 p. m.

COMMENT ON TREASURY REGULATIONS RELATING TO EXCISE TAXES ON TIRE AND TIRE ACCESSORIES.

May 14, 1919.

To firm members of The Rubber Association of America:

The special committee appointed in the matter of the Federal excise tax on the sales of tires, inner tubes, parts and accessories, submits the following comment with reference to Regulations 47 approved under date of May 1, 1919, by the Treasury Department, a copy of which regulations

is sent you by this mail. Of these regulations the following articles affect particularly the manufacturer of automobile tires, inner tubes, parts and accessories, and should be carefully studied by every such manufacturer:

ARTICLES 1-16, INCLUSIVE. ARTICLES 34-55, INCLUSIVE.

Certain of these articles seem to require special comment or explanation, since they appear to be in either real or apparent conflict with a portion of the contents of the letter of March 11, 1919, issued by The Rubber Association. Treasury Department Regulations 47, taken in connection with the contents of this letter, should be considered as superseding and replacing the letter of March 11, 1919.

I. BASIS OF TAX.

ARTICLES 3, 4 AND 31 OF REGULATIONS 47.

It is recommended that the tax be billed as a separate item and not included in the price of the article. Articles 3 and 4 of Regulations 47 stipulate the method to be followed in determining the basis on which the tax is to be computed. As stated in article 34, the tax on sales at wholesale is based on the actual price for which the article is sold, and on sales at retail is based on the average price at which the manufacturer sold the same article at wholesale during the preceding month. No cash discounts can be deducted in computing the price on which the tax is payable.

The law requires that as to wholesale sales, taxes shall be collected on the actual amount of the sale price. Many manufacturers have two or more wholesale prices, as for instance manufacturers who sell at one price to jobbers and distributors, and at another price to retail dealers. Thus if a manufacturer sells a given tire for \$50 to a jobber, the tax would be \$2.50, but if the same tire were sold to a dealer for \$60, the tax would be \$3. Thus, this same tire from this same manufacturer would, if sold through the dealer at \$60, get to the consumer with \$3 tax, but if sold at \$50 through the jobber, it would get to the consumer with a \$2 tax. The many disadvantages to the manufacturer of such a course and the obvious unfairness to the dealer are quite apparent.

Therefore, in order that the tax paid by the consumer on products of rubber manufacturers may be uniform in each case, regardless of whether the goods are distributed by a manufacturer direct to a dealer or through the intermediate channel of a jobber or distributor, it is suggested that all products of rubber manufacturers sold to the wholesale trade be sold on the same price base and that in the case of jobbers or distributors to whom extra discounts are allowed in fact not as discounts on the sale price of the article, but as reimbursement for storage, delivery and other services rendered in behalf of the manufacturer, such extra discounts be regarded as a commission or service payment to the jobber, and that they be paid by the issuing of a credit memorandum to the jobber, or by any other suitable method which will make the extra discount transaction with the jobber or distributor one separate from the sale of the article.

Commissions to agents and other expenses of sale are not deductible from the price. If articles are sold at the factory and the freight charges from the factory to the point of delivery are paid by the buyer as a specific item, or if they are sold delivered at a sum less freight charges to be paid by the purchaser, such charges need not be included as part of the price of the goods; but if the manufacturer sells goods at a delivered price and himself pays the freight, he is not entitled to make any deduction on account of the inclusion in the price of freight charges. If the price of an article is increased to cover the tax, the tax is on such increased price.

II. ADJUSTMENTS, REPLACEMENTS AND EXCHANGES.

Where adjustments, exchanges or replacements of tires and tubes are made by the manufacturer thereof with others than the manufacturers, producers or importers of the automotive vehicles enumerated in the Section 900, Subdivision 1 and 2 (except where the goods were not originally tax-paid—see second paragraph below), the tax charged the customer should be computed on the exact amount, if any, paid by the customer for the tires and tubes delivered by the manufacturer in making the adjustment, exchange or replacement. Thus, where a customer returns for adjustment a \$50 tire and the manufacturer gives the customer a \$50 tire, allowing \$25 for the old tire, and receives from the customer a differential of \$25 for the new tire given in adjustment, the tax charged to the customer should be \$1.25 or 5 per cent of the \$25 (the amount paid by the customer).

In opposition to the former verbal ruling of which you were advised on page 6 of the letter of March 11, 1919, the Treasury Department has now ruled that where tires and tubes, on which at the time of the original sale the tax was not paid, are adjusted, exchanged, or replaced, the tax to be then paid shall be based on the full price of the tire or tube delivered in the adjustment, exchange or replacement. Thus, if a \$50 tire sold prior to February 25, 1919, were presented for adjustment in March, 1919, and replaced by a \$50 tire for which the manufacturer received \$25, a tax of \$2.50 (i. e., 5 per cent of \$50 instead of 5 per cent of \$25, the price received) must be paid to the Government.

It appears to this committee quite impracticable and impossible for tire manufacturers to determine whether or not tires and tubes returned for adjustment were or were not tax-paid at the time of their original sale

by the manufacturer. Hence, this committee is taking immediate steps to effect if possible a return by the Treasury Department to its original ruling, under which the tax returnable on all adjustments, exchanges or replacements, regardless of whether the original sale was made before or after February 25, 1919, shall be based on the exact amount, if any, paid to the manufacturer by the customer for the article given in adjustment, replacement or exchange.

III. TAXABLE PURCHASES BY TIRE AND TUBE MANUFACTURERS.

ARTICLES 6 AND 7 OF REGULATIONS 47.

Although as pointed out in paragraph VI hereof, the sale of tires, tubes, and accessories to automotive vehicle manufacturers is tax-exempt, it is not true that this exemption applies to cases where taxable parts or accessories are sold by the manufacturer of such parts or accessories to the manufacturers of tires and tubes, or accessories.

Thus where the tire or tube manufacturer buys articles such as rims, tires, pumps, etc. (i. e., articles which are, at the time of purchase, in such condition as to be usable for the performance of their intended functions), a tax must be originally paid to the Government by the manufacturer of the part or accessory. If in such a case the tire or tube manufacturer both (a) reimburses the part or accessory manufacturer for this tax, and (b) resells the part or accessory as a component part of an article which he manufactures, the tire or tube manufacturer may claim credit from the Government for the amount of such tax so reimbursed. The tire or tube manufacturer must, however, return to the Government an amount of tax based on the price for which he subsequently sells the taxable article of his manufacture of which said part or accessory has become a component part.

The taking of credit by the tire or tube manufacturer for the tax for which he reimburses the manufacturer of the part or accessory will be allowed only if the tire or tube manufacturer keeps such records and evidence as will clearly establish his right to this exemption.

SPECIAL NOTE: Since under Article 6 of the regulations 47, a purchaser of such parts or accessories cannot make claim to the Government for credit unless he knows the amount of such tax and unless he actually did pay as a tax the amount claimed, it will therefore be observed that the purchaser should request the manufacturers who furnish him with such parts or accessories to bill the tax as a separate item. Likewise billings covering the sale of cement, gum, etc., to accessory kit assemblers and other customers of like character should show the tax as a separate item.

ACCESSORY KIT ASSEMBLERS.

The principle laid down by the Treasury Department thus affecting tire and tube manufacturers likewise applies to those concerns which purchase their gums, cement and fabrics from rubber manufacturers and merely place an assortment of these materials in a kit for sale to the consumer. Thus, it appears that rubber manufacturers when selling cement, fabrics, gums, etc., to a customer who assembles these materials in a kit, should charge the customer a tax. This customer may, as above indicated, subsequently obtain from the Government a credit for the tax so paid to the rubber manufacturer.

IV. SALES TO THE GOVERNMENT, ETC.

ARTICLE 10 OF REGULATIONS 47.

Articles enumerated in Section 900, Sub-divisions 1, 2 and 3, when sold by the manufacturer thereof to state, city, county, or municipal governments, are exempted from tax. Where such articles are thus sold by any one other than the manufacturer thereof, the sale is taxable. The Treasury Department in Regulations 47 departs from the previous ruling given the committee and holds that sales to the United States Government are taxable.

V. ULTIMATE USE AS AFFECTING TAXABILITY.

ARTICLES 11, 12, AND 13 OF REGULATIONS 47.

The sale of an article by the manufacturer thereof may be taxable even though the article is not eventually used as a part or accessory for any of the articles enumerated in Section 900, sub-divisions 1 and 2. For instance the new regulations provide (see Article 16) that where tires are sold for use on trailers such tires are tax-exempt. This does not mean, however, where the tires reach the trailer owner through an intermediary, such as a dealer, that the original sale of such tires by the manufacturer is exempt.

Hence the present ruling is in direct contradiction to the principle recited in the latter part of page two and the first part of page three of the letter of March 11. Where tires are sold to a dealer and the dealer subsequently sells the tires to a trailer owner, the manufacturer cannot employ the new ruling and obtain credit for the tax on such tires should he refund it to the dealer.

VI. SALES TO MANUFACTURERS.

ARTICLE 14 OF REGULATIONS 47.

Article 14 makes it perfectly clear that all sales of tires, tubes, parts or accessories to manufacturers are not necessarily exempt from tax. The exemption applies only where the articles sold are for use, and are so used, by the manufacturer in the manufacture or production of new cars or for free replacement by him under contract of guaranty. Sales to the manufacturer for any other use are taxable. It is suggested that the certificate referred to in this article be worded as follows:

Referring to the Federal Excise Tax Law it is hereby certified that the articles covered by this order or contract of sale are to be used by the undersigned exclusively in the manufacture or production of new cars.

(Signature of Purchaser.)

SUPPLEMENTAL COMMENT ON EXCISE TAXES.

May 20, 1919.

To firm members of The Rubber Association of America:

In accordance with the intention expressed in our circular letter of May 14, the special committee appointed in the matter of the Federal excise tax secured a hearing before the Commissioner of Internal Revenue and other officials of the Department, on Thursday, May 15. Doubtful questions affecting the rubber industry were presented as formal inquiries to the Commissioner, and as a result of the conference the committee gathered some impressions relative to possible future changes in the regulations which it is deemed advisable to pass on to members of the Association with the full understanding, however, that there is no authoritative basis for procedure in respect to the tax other than the law itself or the rulings of the Department as set forth in Regulations 47.

The committee's interpretation of Regulations 47 as set forth in the letter of May 14 seems to be correct, and there is no reason to believe that these interpretations will be modified except as subsequent regulations or Treasury Decisions may furnish a basis for a modification. The committee were led to make these interpretations on the ground that, as these possible modifications are given for the information of members of the Association, referring in each case to the title number under which the subject in question was treated in the letter of May 14.

I. BASIS OF TAX.

The committee presented to the Department the impracticability of basing retail sales upon the average wholesale price of the month immediately preceding. The Department has under consideration changing the regulations so as to make the basis of the tax in retail sales the average price at which the manufacturer sold the same article at wholesale during the second month preceding the month during which the retail sale was made. If this modification is made, retail sales in May, for instance, will be based upon the average wholesale price for March.

II. ADJUSTMENTS, REPLACEMENTS AND EXCHANGES.

The committee strongly pressed the justice and advisability of a return to the informal ruling on this subject given to the committee in March, 1919, and set forth in the letter of March 11, under which the tax in the case of adjustments, replacements and exchanges was to have been based upon the actual price, if any, paid to the manufacturer for the new tire or inner tube delivered in the transaction of adjustment, replacement or exchange. It will be noted that such a modification of Article 5 of Regulations 47 would be important as affecting adjustments, replacements, or exchanges of tires and tubes sold prior to February 25, and therefore, tax-free. The Department took the matter under advisement.

III. TAXABLE PURCHASES BY TIRE AND TUBE MANUFACTURERS.

The committee was given to understand that a supplemental regulation or Treasury Decision was in contemplation by the Department, modifying the provisions of Articles 6 and 7 of Regulations 47. It seems probable that a supplemental regulation will provide that manufacturers of tires, tubes and accessories may purchase tax free, for use in the manufacture of their products, articles otherwise taxable, and that such purchasers will be required at stated intervals to furnish a report as to the disposition of articles so purchased. On the basis of this report, the tax will be payable on articles so purchased and not used by the purchaser in the manufacture of his products. Such a ruling would probably place the manufacturer of tires, tubes and accessories in the same position as car manufacturers with reference to tax-exempt purchases and procedure to secure the tax exemption.

IV. SALES TO THE GOVERNMENT.

It was not indicated that any change would be made in the regulations with reference to sales to the Government.

V. ULTIMATE USE AS AFFECTING TAXABILITY.

There is no reason to believe that a modification will be made in the regulations affecting the interpretation under this title in the letter of May 14. The committee, however, pressed the point that where sales direct by a manufacturer were non-taxable, the same should be true of sales of the same articles through an intermediary, such as a dealer or jobber. The suggestion was taken under advisement but little hope was given for anticipating a change in the regulations.

VI. SALES TO MANUFACTURERS.

The certificate suggested under Title VI of the letter of May 14 was informally approved by the Department. As indicated under Title III above, a supplemental ruling is probable, providing that where an order or contract of sale is covered by this certificate, the sale shall be tax-free, and further providing for a report by the purchaser at stated intervals relative to his use of the articles purchased tax-free. A tax will be levied upon such articles as are shown by this report to have been used by the purchaser other than in the production of articles of his manufacture.

It appears that the Government will take the position that any sales taxable under the law, made from February 25 to May 1, the date of the

issuance of Regulations 47, will be taxable in accordance with the provisions of Regulations 47.

A form of "Proof of Exportation" to meet the provisions of Article 43 of Regulations 47 was submitted by the committee. This form will be compared by the Department with suggested forms submitted by Exporters' Associations and others and an approved form will be adopted and issued.

The committee cannot emphasize too strongly the fact that the Internal Revenue Department refuses to be committed by any informal opinions given in conference, and this special report of the committee is made only for the purpose of giving all members of the Association the benefit of information in the possession of the committee. While the report may serve to prepare the members of the Association for possible supplemental rulings, no member should, without fully realizing the risk, proceed in regard to the excise tax upon any other basis than is found in the law itself or in Regulations 47 as they now stand. Regulations 47 in their present form furnish the only authoritative interpretation of the law as far as the Treasury Department is concerned, and no alteration is authoritative unless made by a formal written Treasury Decision.

The committee will supplement its reports to the Association as the occasion may demand.

ASSOCIATION NOTES.

The Druggists' Sundries Division will meet on June 10 and 11 at the Yale Club, New York City.

W. J. Kelly, chairman of the Special Liberty Loan Committee, volunteered to solicit subscriptions from the rubber trade for the Salvation Army drive of last month. While no specific sum was allotted, the rubber industry responded generously.

A COURSE FOR RUBBER FACTORY FOREMEN.

The Mechanical Rubber Co., Chicago, Illinois, is conducting a three-month course in production methods, for the benefit of rubber factory foremen. This course is under the direction of the Business Training Corporation of New York, and is edited by John E. Calder, M. E. There are six text-books and a series of six lectures delivered at intervals. The course is intended to give each foreman new ideas and advanced instruction as to the best and most efficient manner of handling his daily production problems.

TESTING OF TEXTILE MATERIALS.

THE METHODS for examining and testing fibers and textile fabrics as conducted at the Bureau of Standards, are given under the above title in Circular of the Bureau of Standards No. 41 (third edition), from which the following abstracts are taken:

TENSILE STRENGTH AND LOAD-STRETCH RELATIONS.

These determinations are made by tests upon single strands or upon skeins. The instruments employed in these tests are of the dead-weight type, and stress is uniformly applied by motor or by water pressure. All tests are performed under standard atmospheric conditions, the yarn or tissue being wound at least three times around a $\frac{3}{4}$ -inch drum securely held at each end. The testing length between center of drums is six inches and the pulling jaws travel at the rate of 12 inches per minute.

DRY WEIGHT.

Bone-dry weighings are made in the oven illus-

OVEN FOR DRYING TEST SPECIMENS.

OVEN FOR MAKING DRY WEIGHINGS.

trated. A motor-driven fan circulates the atmosphere in the oven to insure uniformity of heat. The sample to be weighed is placed in one of ten small baskets carried by a chain. This chain may be turned by a wheel outside the oven, bringing each basket successively into such position that it may be transferred to a hook suspended from one end of the balance by means of another hook operated from the outside of the drying-oven.

FABRICS.

Some of the determinations made upon fabrics are: weight, tensile strength and load-relations, percentage of fiber composition, thread count, yarn number or size, folding endurance, etc.

FOLDING ENDURANCE.

Some materials are subjected in actual use to considerable folding. In such cases, folding endurance tests will show to what extent they may be expected to resist deterioration from this cause.

The folding test is made upon a specially constructed machine which registers the number of alternate folds the specimen endures before breaking under a given constant tension. The determination is made in the standard atmosphere upon a test strip 15 mm. (19/32-inch) wide and 95 mm. (3 $\frac{3}{4}$ inches) long. The number of double folds made before rupture occurs is reported. By a double

MACHINE FOR TESTING FOLDING ENDURANCE.

fold is meant that the sample is folded flat upon itself, then opened and folded at the same point upon itself in the reverse direction. A constant tension of 1,000 grams (35 ounces avoirdupois) is applied during the folding operation and the double folds are made at a rate of 200 per minute.

WASTE MATERIAL DEALERS MOVE TO NEW YORK.

About June 1, 1919, the headquarters of the National Association of Waste Material Dealers, formerly at 185 Summer street, Boston, Massachusetts, will be established in a suite of offices on the eleventh floor of the Times Building, Times Square, New York City. The formal opening, with a reception for members will take place on Monday, June 16, which is the day preceding the regular quarterly association meeting.

Charles M. Haskins, the secretary, has severed his connection with the "Commercial Bulletin," and will henceforth devote his entire time to the association. Plans are under way looking to the establishment of a mercantile credit service which will be of great service to members.

BUY WAR SAVINGS STAMPS—BUILD FOR AMERICAN PROSPERITY and your own success.

S. A. E. Adopts Standards Recommended by Tire and Rim Division.

At the annual meeting of the Society of Automobile Engineers, held February 5, 1919, recommendations of the Tire and Rim Division of the Standards Committee were approved for final presentation to the voting members of the society. The following S. A. E. Standards were adopted by the letter ballot which closed April 5.

SOLID TIRE SECTIONS.

Solid Tire Widths, Inches.	Minimum Total Sectional Area of Rubber, Square Inches.
4	9.75
5	12.5
6	15.25
7	18.0
8	20.75
10	26.25
12	31.75
14	37.25

The above table is in complete accord with the schedule worked out and adopted by the Solid Tire Division, War Service Committee of the Rubber Industry of the U. S. A. These areas include the hard and soft rubber used in solid tires.

INDUSTRIAL TRUCK TIRES.

Tire Dimensions.		Wheel Dimensions.	
Nominal Diameter, Inches.	Sectional Widths, Inches.	Wheel Diameter, Inches.	Width of Felloes, Inches.
16	3 1/2	6	2 3/4
16	3 1/2	12	2 3/4
16	3 1/2	12	4 1/4
16	3 1/2	16	4 1/4
20	3 1/2	20	2 3/4
24	3 1/2	24	2 3/4
28	3 1/2	24	2 3/4

Wheel diameters shall be 4 inches less than the nominal tire diameters. The height of the finished tire is to be 2 inches for all sizes. The width of the wheel felloe is to be in accordance with the present S. A. E. standard truck tire practice and the rim diameter tolerances will be plus .005, minus zero. This will make all the former or present S. A. E. standards for industrial truck tire sizes null and void.

BASE BANDS FOR SOLID TIRES.

Base Band Size.	Limits of B.	Curvatures.					
3 1/2	A. 4 1/4	B. 1 1/32	C. 11/32	D. 18	E. 0.191	F. 3 7/16	G. 3 9/16
4	4 13/16	1 1/32	3/8	26	0.196	3 59/64	4 1/16
5	5 27/32	1 1/32	7/16	26	0.189	4 59/64	5 1/16
6	6 27/32	1 1/32	7/16	32	0.185	5 59/64	6 1/16
7	7 27/32	1 1/32	7/16	36	0.192	6 59/64	7 1/16
8	8 7/8	1 1/32	7/16	40	0.196	7 27/32	8
10	10 7/8	1 1/32	7/16	50	0.196	9 27/32	10
12	12 7/8	1 1/32	7/16	60	0.197	11 27/32	12
14	14 7/8	1 1/32	7/16	70	0.197	13 27/32	14

The above dimensions conform to the recommended series of solid tire sizes and are in accordance with the base bands recommended and adopted by the War Service Committee of the Rubber Industry of the U. S. A. The recommended bands

as the same general dimensions apply to bands with either facing.

BASE BANDS FOR INDUSTRIAL TRUCK WHEELS.

The sections of tires and base bands as recommended for solid tires for trucks will also apply to industrial truck wheels, and the recommended S. A. E. standard 3 1/2 and 5-inch pressed-on channel sections shown in the accompanying drawing is adopted for industrial truck wheels.

EDGES OF FELLOE BANDS.

The present specification as revised at the June meeting in Dayton to 3/16-inch radius on the inside edges and 1/16-inch radius on the outside edges of bands, is a specification to which it is practically impossible to get the mills to roll steel; therefore, the edges of felloe bands has been changed to 3/32-inch radius for all edges.

EDGES OF FELLOE BANDS.

ALLOWABLE TOLERANCES FOR FELLOE BANDS.

The tolerances given on page 8a, S. A. E. Handbook, Volume I, are used for the inspection of not only steel bands on wood wheels but also for steel wheels. The wording at the bottom of page 8a is changed to read, "Band circumference after application to wood wheels and circumferences of steel wheels."

On account of the difficulty of inspecting circumferences with a tape to the present close tolerances, "Band circumferences before application" is changed to prevailing commercial tolerances of plus 1/32 minus 1/16-inch.

WOOD FELLOE DIMENSIONS—PNEUMATIC TIRE RIMS.

At the June, 1918, meeting of the Society wood felloe dimensions were adopted for only the 6, 7 and 8-inch rims. To complete this specification for 3 1/2, 4 and 4 1/2-inch rims, the following dimensions are adopted:

Nominal Tire and Rim Size	Width.	Depth.
3 1/2	1 1/4	1 1/4
4	1 1/4	1 1/4
4 1/2	1 1/4	1 1/4
6	1 1/4	1 1/4
7	1 1/4	1 1/4
8	1 1/4	1 1/4

These felloe band dimensions conform with those adopted by the Automotive Wood Wheel Manufacturers' Association.

S. A. E. TIRE AND RIM DIVISION.

The Tire and Rim Division of the 1919 Standards Committee has been assigned the following subjects:

Airplane Landing Wheels, Carrying Capacity of Solid Tires, Pneumatic Tire Sections, Pneumatic Tires for Passenger Cars and Commercial Vehicles, Rim Dimensions—Cast Steel Wheels, Rubber Tires for Tractors, S. A. E. Deflection and Set Tests for Rims, Section Dimensions of Solid Tire Single and Dual Wheels with reference to thickness of permanent metal felloe band; Solid Tire and Wheel Diameters, Wheel Circumferences; Solid Tire Sizes and Wood Spokes, Passenger Cars.

BASE BANDS FOR SOLID TIRES.

relate to corrugated mill sections and it is optional with tire manufacturers to use either mill corrugated or dovetail facings,

*Width of felloes for rims with special sections.

*Width of felloes for demountable rims on cold-rolled bands.

The personnel of the Tire and Rim Division and the assignments to the different subdivisions are as follows:

CHAIRMAN.

Charles B. Whittlesey.

PNEUMATIC TIRES FOR PASSENGER CARS.

W. H. Allen, C. I. Bradley, Burgess Darrow, E. C. Hulse, William McMahon, J. C. Tuttle.

PNEUMATIC TIRES FOR COMMERCIAL VEHICLES.

W. H. Allen, C. I. Bradley, J. E. Hale, E. C. Hulse, William McMahon, J. C. Tuttle.

PNEUMATIC TIRES FOR AIRPLANES.

W. H. Allen, W. M. Britton, Burgess Darrow, C. I. Bradley, William McMahon, J. C. Tuttle.

SOLID TIRES.

W. H. Allen, C. I. Bradley, W. M. Britton, Lawrence R. Davis, Hugo Hoffstaeter, J. E. Hale, A. Hargraves.

PNEUMATIC TIRE RIMS.

W. H. Allen, W. N. Booth, C. C. Carlton, Burgess Darrow, Lewis Fine, C. N. McFarland, William McMahon, A. W. Richards, J. G. Swain, J. H. Wagenhorst.

SOLID TIRE BANDS AND RIMS.

W. H. Allen, W. N. Booth, C. C. Carlton, Lawrence R. Davis, Lewis Fine, J. E. Hale, A. Hargraves, C. N. McFarland, O. W. Mott, G. S. Porter, A. W. Richards.

S. A. E. SUMMER MEETING.

Plans are rapidly being completed for holding the summer meeting of the Society of Automotive Engineers at Ottawa Beach, Michigan, from June 23 to 27, inclusive. The place chosen affords ideal facilities for a meeting combining professional sessions with social features and recreation, and present indications forecast a well-attended and very interesting meeting. The papers and discussions will cover all important automotive subjects, particularly the passenger car of the future, farm tractors, and aeronautics. Representative exhibits of automotive apparatus may be arranged.

The recreation features include outdoor sports and athletic contests of varied character, many of the events being open to both men and women. There will be dancing every evening, a grand ball on the evening of June 26, and special entertainments for the ladies.

Reservations for the meeting may be made through the office of the society at 29 West 39th street, New York City.

KLUCINE.

The pseudo-scientific term "Klucine," based on the inventors' names, is the trade designation of a peculiar oil product. It is depolymerized China wood oil. In its commercial preparation it consists of a clear, dark amber-colored solution in gasoline. In this form it may be applied to fabrics and metallic surfaces, depositing a tough, elastic coating after 24 hours' drying. The Klucine solution may be used pure or in combination with pigments as a paint vehicle for the weather protection of any surface. Owing to its thinness, the film deposited by the solution has about double the covering capacity of ordinary painting materials.

Chemically, Klucine film is inert and when dry is insoluble in its original solvent. It is very flexible under all conditions of temperature, non-porous and tough. As applied to fabrics it penetrates the fibres and bridges the intervals of the woven structure, rendering the fabric both air and moisture proof. As a compounding ingredient it is said to add appreciably to the tensile strength of vulcanized rubber mixings. Pure rubber articles such as thread, elastic bands, and soft rubber goods generally, are preserved from deterioration by oxidation, it is said, by the application of a light coating of Klucine solution.

JUDICIAL DECISIONS.

FLIGEL, ET AL. vs. SEARS, ROEBUCK & Co.—Circuit Court of Appeals, Second Circuit, November 13, 1918.

Patent No. 1,099,031 for a waterproof garment including a cape and hood, the hood having a section capable of conversion either as a vizor or a military collar. This is known to the trade as the Billie Burke Brand.

Sears, Roebuck & Co. do not manufacture but sell the alleged infringing article. When the case came up in the District Court the court decided that there was no invention or infringement but the Court of Appeals held that there was invention but that the article sold did not infringe since the band on the article sold by Sears, Roebuck & Co. was simply a military collar and did not have any other function than decoration and was not capable of being used as a vizor as in the patented article. (Federal Reporter, Volume 254, page 698.)

DECISIONS OF COMMISSIONER OF PATENTS.

EX PARTE ROBERT E. MILLER, INC. Decided March 14, 1919.

The term "U-Put-On" as a trade-mark for rubber heels with an open casing attached, so that it may be applied by slipping the casing over the flared heel of a woman's shoe, held not registrable as a trade mark, since it is descriptive of the goods with which it is used. This decision was given by Assistant Commissioner Clay in affirming the ruling of the Examiner. (Official Gazette, March 15, 1919, page 733.)

CUSTOMS APPRAISER'S DECISIONS.

Protest 931,148, of George Borgfeldt & Co. (New York). RUBBER NIPPLES—Rubber nipples classified as toys at 35 per cent ad valorem under paragraph 342, Tariff Act of 1913, are claimed to be rubber nipples dutiable as druggists' sundries at 15 per cent under paragraph 368. (Treasury Decisions, Volume 36, No. 18.)

Protests 930,720, etc., of Pitt & Scott (New York). INDIA RUBBER MANUFACTURES—Merchandise classified as a manufacture of hard rubber at 25 per cent ad valorem under paragraph 369, Tariff Act of 1913, is claimed dutiable as a manufacture of india rubber or gutta percha at ten per cent under paragraph 368. (Treasury Decisions, Volume 36, No. 18.)

CONCERNING TRADE-MARKS.

A booklet of interest to every manufacturer and particularly to those in the rubber trade has been issued by William E. Richards, an attorney of New York, which contains a digest of the most useful information pertaining to trade-marks, handled in such a way as to be most readily comprehensible to all. The contents are in brief form and compiled so that all the facts necessary to the selection and registration of a trade-mark for a new line of goods can be obtained in a half-hour's time. Mr. Richards' booklet is divided into sections concerning "Digest of United States Law and Practice," "Digest of Practice in Foreign Countries," "Piracy of Trade-Marks Abroad," "Schedule of United States Charges," and "Schedule of Foreign Registration Charges." Mr. Richards states that the purpose of his book is to "present in concise form for ready reference the features most necessary to be available to lawyers and manufacturers to enable them to understand readily the leading points of law and practice on this important subject matter, and to take the necessary steps to secure protection for this class of property."

Nothing can be more important to the manufacturer of a new line of goods than the selection of a proper trade-mark and it may mean thousands of dollars to him eventually. In this regard Mr. Richards' brief advice on this subject cannot be improved upon.

First. It will be obvious that the most desirable and effective marks are those that are (a) simple in design; (b) easy to understand and remember; (c) attractive in appearance; and, (d) if the marks is an arbitrary word, easy to speak, spell, and attractive in sound.

The Honorable Augustus O. Bourn.

SCIENCE, politics, literature and rubber manufacture, while not closely correlated, are all more or less combined in the subject of this sketch, who is one of the oldest active members of the industry to-day. As a founder of two rubber manufacturing concerns and an investigator of rubber chemistry and vulcanization, he is prominent in the industry. As Governor of his state and as Consul-General at Rome, he was prominent in politics, while his literary work, mainly published for private distribution, serves to show another aspect of this versatile man.

Augustus Osborn Bourn was born October 1, 1834, at Providence, Rhode Island, and was educated at the public schools and Brown University in that city. After graduation he entered the employ of his father's firm, Bourn & Brown, later Bourn, Brown & Chaffee, manufacturers of rubber shoes, of which firm, after the death of his father, he became a member. In 1861 this firm was incorporated as the Providence Rubber Co. and seven years later was merged with the National Rubber Co. Mr. Bourn retained his connection with this company until 1887 or 1888, when he retired from business and joined his family in Europe.

Returning to this country in 1893, he established a rubber factory at Providence the next year, carrying on the business as the Bourn Rubber Co., and manufacturing footwear under the "Providence" and "Union" brands. When this business was incorporated in 1902, he continued to be president and manager. Meanwhile the plant has steadily grown till it now covers an entire city block in Providence.

About 15 years ago the Bourn Rubber Co. commenced the manufacture of insulated wire, and the business so increased in volume as to compel the erection, in 1918, of a separate factory for this branch of its business. No man in the rubber business has had a wider experience than ex-Governor Bourn. He is acquainted with every detail of the manufacture, as well as with the general management, of the business. He introduced many new styles and originated numerous innovations while with the National Rubber Co., among them being "snow excluders," fusion linings for boots and lumbermen's goods and button gaiters. He also manufactured the style now known as "Alaskas" several years before any other company produced this class of footwear.

As an investigator, his experiments in vulcanizing began in 1903, and were reported in an address at the Rubber Conference in New York in 1912, receiving the marked attention of all practical rubber men and chemists. He showed that the rate of vulcanization was doubled for every 11 degrees F. and that the same compound which vulcanized in 14 hours at a temperature of 194 degrees F. could be similarly vulcanized in 15 seconds in a heat of 327 degrees F.

He has written several treatises on astro-physical subjects, which, however, he declines to have published, having written them solely to occupy his spare moments. Some years ago he published, for private distribution, a small volume of memorial addresses of prominent public men delivered in Rhode Island

and elsewhere, and he is now preparing for publication a large number of speeches delivered between 1876 and 1888, which exemplify the political conditions and thoughts of that period.

In politics, Mr. Bourn has played a prominent part. He was a member of the Rhode Island Senate from 1876 to 1883 and from 1886 to 1888. For six years from 1877 he was chairman of the Finance Committee and member of the Judiciary Committee. He was the author of the "Bourn Amendment" to the Constitution of Rhode Island, extending to foreign-born citizens the same rights of franchise enjoyed by the native-born. In 1883 he was elected Governor by the Republicans, and re-elected in 1884, receiving all but 13 votes of the total of nearly 16,000 votes cast. During his term in this office, at the time of the settlement of the international differences growing out of the New Orleans riots, he was in 1889 appointed Consul-General

of the United States for Italy and was stationed at Rome. For a period he was both Consul-General and in charge of the Legation.

In his younger days he served with the Providence Horse Guards, rising from private to the rank of Lieutenant-Colonel of the First Battalion of Cavalry.

He moved from Providence to Bristol, Rhode Island, in 1873, and his residence, "Seven Oaks," is one of the most attractive in that city, the garden running down to the waters of Narragansett Bay. He is very fond of flowers and this garden is one of his hobbies; having been arranged by himself, it is now cultivated in accordance with his directions.

Ex-Governor Bourn is a busy, as well as a business, man, leaving Bristol at 10 a. m. and returning at 7:05 p. m. At noon it is his custom to lunch at the University Club, at Providence, with a number of congenial men, all graduates of Brown

University, including editors, educators, jurists and manufacturers prominent in the professions and leading industries.

Ex-Governor Bourn is an ex-officio member of the board of directors and Executive Committee of The Rubber Association of America, and was the second president of the New England Rubber Club, the predecessor of the above-named association.

INTERESTING LETTERS FOR OUR READERS ARMENIAN BOLE.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—Can you give me any information as to what bole Armenia may be? Furthermore, is it used in rubber compounding?

Bole Armenia, or more correctly Armenian bole, is a bright red, friable clayey earth found in Tuscany and in Armenia. Chemically it is clay or hydrous aluminum silicate, known in its purest forms as kaolin and fuller's earth. Its color is due to the presence of iron oxide.

Armenian bole is used to color or adulterate various substances, notably tooth powders, and was formerly used in certain horse medicines as an absorbent and astringent. Very little attention has been paid to it in rubber manufacture, although it is said that 10 per cent added to Pará rubber has been employed in making inner tube patches.—THE EDITOR.

News of the American Rubber Industry.

A RUBBER TECHNOLOGIST.

THERE are few men with scientific training who have had such a wide experience in rubber chemistry as Dr. Albert A. Somerville, who is now associated with the R. T. Vanderbilt Co., 50 East 42nd street, New York, dealer in rubber chemicals and ingredients.

Dr. Somerville studied and taught at DePauw and Cornell Universities, specializing in sciences and engineering. Summers he worked at Franklin Institute and at the Bureau of Standards in Washington. In 1912 he took charge of the physical testing laboratory of the India Rubber Co., New Brunswick, New Jersey, where guayule was one of the chief materials handled. The next year he was taken into the development department of the United States Rubber Co., and for five years supervised the experimental and development work at its laboratory in New York City, mainly on mechanical goods, but to some extent on tires and footwear. A year ago he was appointed technical assistant to the general manager of all the factories of the United States Rubber System.

During the war he represented the company on the War Service Committee, and he was the company's representative as a member of the American Society for Testing Materials, in the rubber section of which he has been especially active. He is also a member of the American Physical Society and of Masonic organizations.

Dr. Somerville therefore brings to his new position a wide, practical, and scientific knowledge of many lines of rubber manufacture, which will make him a valuable man, not only to the company, but also to its customers.

(C) Underwood & Underwood, N. Y.
DR. ALBERT A. SOMERVILLE.

DIVIDENDS.

The Ajax Rubber Co., Inc., New York City, manufacturer of tires and inner tubes, has declared its quarterly dividend of \$1.50 per share, payable June 15, on stock of record May 31, 1919.

The Converse Rubber Shoe Co., Malden, Massachusetts, manufacturer of rubber footwear, has declared its semi-annual dividend of three and one-half per cent on preferred stock, payable June 1 on stock of record May 24, 1919.

The B. F. Goodrich Co., Akron, Ohio, manufacturer of tires, balloon fabric, and other rubber goods, has declared its quarterly dividend of one and three-quarters per cent on preferred stock, payable July 1, 1919.

The India Tire & Rubber Co., Akron and Mogadore, Ohio, tire manufacturer, has declared a quarterly dividend of two per cent, payable July 1 on common stock; also one of one and three-quarters per cent on preferred stock, payable at the same time.

The Mason Tire & Rubber Co., Kent, Ohio, manufacturer of tires, declared a dividend of two per cent, payable May 20 on preferred stock of record January 31, 1919. A further dividend of ten per cent has been declared, payable July 15 on common stock of record June 10, 1919.

The New Jersey Zinc Co., New York City, manufacturer of zinc products, declared a quarterly dividend of four per cent, payable April 30 on stock of record May 10, 1919.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, manufacturer of tires and other rubber goods, has declared quarterly dividends of one and one-half per cent on common shares, and one and three-quarters per cent on preferred shares, payable June 30 on stock of record June 15, 1919.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, manufacturer of automotive machinery, electric control devices, etc., has declared quarterly dividends of two per cent, payable July 15 and 31, respectively, on preferred and common stock of record June 30, 1919.

CHANGES IN PERSONNEL OF THE NEW JERSEY ZINC CO., INC.

The New Jersey Zinc Co., Inc., 160 Front street, New York City, and its branch, the Mineral Point Zinc Co., 1111 Marquette Building, Chicago, Illinois, announce the following recent changes in organization: E. V. Peters, general sales manager, succeeding H. G. Clopper, resigned, New York; Bushnell Bigelow, manager of Eastern sales, New York; R. M. Neumann, manager of Western sales, Chicago; W. P. Hardenbergh, Jr., manager of export sales, New York; J. Matthias, Jr., assistant sales manager, Chicago; Walter I. Hess, assistant sales manager, New York; F. C. Fuller, assistant sales manager, New York; and R. L. Cathcart, assistant sales manager, Pittsburgh, Pennsylvania.

THE UNITED STATES RUBBER PLANTATIONS, INC.

The organization meeting of the United States Rubber Plantations, Inc., was held Tuesday, May 20, 1919, and the following directors and officers were elected:

BOARD OF DIRECTORS.

H. Stuart Hotchkiss, Samuel P. Colt, Lester Leland, Charles B. Seger, Nicholas F. Brady, Edgar B. Davis, Ernest Hopkinson, W. J. Gallagher, Walter B. Mahony, Homer E. Sawyer, J. Newton Gunn, John W. Bicknell, L. D. Tompkins, W. H. Blackwell, and W. F. Bass.

EXECUTIVE COMMITTEE.

H. Stuart Hotchkiss, Samuel P. Colt, Lester Leland, Charles B. Seger, Walter B. Mahony, John W. Bicknell, and L. D. Tompkins.

OFFICERS.

Samuel P. Colt, chairman; Lester Leland, vice-chairman; H. Stuart Hotchkiss, president; W. J. Gallagher, vice-president; W. S. Gordon, vice-president; John W. Bicknell, vice-president, treasurer, and assistant secretary; L. D. Tompkins, vice-president and secretary; T. H. Lee, assistant treasurer; Walter B. Mahony, counsel for the company.

The United States Rubber Plantations, Inc., holds all the United States Rubber Co.'s plantations in Sumatra. The authorized capital is \$40,000,000 preferred and \$60,000,000 common, of which \$10,000,000 preferred and \$20,000,000 common has been issued. Extensions to the vast estates are contemplated in the near future.

PERFECTION MAKES KEYSTONE BRAND OF TIRES.

Since the publication of the many conflicting reports concerning the output of the Perfection Tire & Rubber Co., Fort Madison, Iowa, the following facts have been ascertained. The Perfection company makes under a cost-plus agreement with the Keystone Tire & Rubber Co., New York City, tires branded with the Keystone name and design. This does not affect the output of Perfection tires which are being marketed through the company's regular channels. In addition, the Nemours Trading Corp., New York City, has the exclusive export sales representation for the Perfection tire.

EDWARD V. PETERS, GENERAL SALES MANAGER.

EDWARD V. PETERS, the newly appointed general sales manager of the New Jersey Zinc Co., New York City, though born in St. Louis, Missouri, in 1881, is virtually a New Yorker, having moved East with his family and finished his education at Greenville Academy, Greenville, New York. His first business experience was in the electrical department of the Manhattan railway system, and within a year he was placed in charge of electrical purchases. In 1903 he organized a purchasing department for J. G. White & Co., engineers and contractors, New York City, where he remained in charge until August, 1906, when he accepted a position in the purchasing department of the New Jersey Zinc Co., soon rising to assistant purchasing agent. In 1913 he was made purchasing agent, thereafter becoming assistant sales manager, and, a few weeks ago, succeeded H. G. Clopper, resigned, as general sales manager.

During the war the New Jersey Zinc Co. was active in serving the Government and also the allied nations, and much of Mr. Peters' time was spent in connection with this work.

Mr. Peters is a man of excellent business judgment, a great believer in cooperation and organization, and has been a potent force in upbuilding the units of the sales staff of the company into an energetic selling organization. He is fond of sports, and in his younger days played baseball and tennis. In the last few years he has confined his recreation mainly to golf and motoring. He is president of the Flushing Country Club, Flushing, Long Island, New York.

EDWARD V. PETERS.

CLOPPER GOES TO EAGLE-PICHER CO.

HERBERT G. CLOPPER, for thirty years connected with the zinc industry, and identified with the New Jersey Zinc Co. since its formation in 1897, has resigned as general sales manager of that company to accept the position of vice-president of the Eagle-Picher Lead Co., Chicago, Illinois, corrodors and manufacturers of lead products.

HERBERT G. CLOPPER.

Mr. Clopper was born in Camden, New Jersey, August 12, 1873, and was educated in the public schools of that city. In his sixteenth year he entered the employ of the Lehigh Zinc & Iron Co., Philadelphia, Pennsylvania, as office boy. Eight years later, when the New Jersey Zinc Co. was formed he was made assistant bookkeeper. In May, 1899, he became a clerk in the purchasing department, and steadily advancing, he was appointed purchasing agent five years later. He made a thorough study of purchasing systems of industrial corporations, and in 1912, when a general purchasing department was established, with branches in different sections of the country, he was selected as head, with the title of general purchasing agent, in which position

he was enabled to create one of the largest and most efficient purchasing organizations in the country. In June, 1913, on the retirement of W. W. Melvin, who for nearly half a century had been with the company, and for much of this time its sales manager. Mr. Clopper was appointed to this important position, and although this change from purchasing to selling required a complete reversal of point of view, his success in the new position is a matter of record, and the Eagle-Picher Lead Co. is to be congratulated upon securing his services.

PERSONAL MENTION.

G. H. Hamilton, formerly special representative of The Federal Rubber Co. of Illinois, Cudahy, Wisconsin, has been appointed export manager, with offices at 38-40 West 62d street, New York City.

G. R. Lundane has been placed in charge of the newly established New York City office of The Black & Decker Manufacturing Co., Baltimore, Maryland, manufacturer of portable electric tools, compressors, and special machinery, with headquarters at Room 2920, Equitable building. Mr. Lundane will include the State of Connecticut in his territory as well as New York City and the surrounding territory. The Black & Decker company have branches in Philadelphia, Atlanta, San Francisco, Chicago, Detroit, Columbus (Ohio), Buffalo and Boston, as well as foreign connections in England, France, Norway, Sweden and Japan.

G. R. LUNDANE.

Arthur J. Peebles has been appointed general sales manager of The Armstrong Rubber Co., Inc., 2 West 61st street, New York City.

J. S. McClurg has been elected to the board of directors of The Carlisle Cord Tire Co., Inc., New York City and Andover, Massachusetts.

Martin K. Whalen, formerly special representative of the Century-Plainfield Tire Co., Plainfield, New Jersey, has been appointed manager of the southern district of the International India Rubber Corp., South Bend, Indiana.

C. G. Hill, who for two years was assistant manager of the record department of The Rubber Association of America, and later in charge of the Association's Pacific Coast office, is now with Charles T. Wilson Co., Inc., New York City, crude rubber importers.

Frank Waldo, of the firm of E. M. & F. Waldo, New York City, dealers in colors and compounding ingredients for the rubber trade, recently returned from Europe where he has been military attaché at The Hague.

W. J. Cromie, formerly with the Belmont Packing & Rubber Co., 139 North 2d street, Philadelphia, Pennsylvania, has become associated with the Gustin-Bacon Manufacturing Co., 1021 Filbert street, in the same city. This concern manufactures mechanical rubber goods, belting, packing, hose, etc.

F. K. Starbird has been appointed northwestern district manager for the Firestone Tire & Rubber Co., Akron, Ohio, and will cover Minneapolis, Great Falls, Minot, Fargo and Des Moines branches.

THE GILLETTE RUBBER CO., EAU CLAIRE, WISCONSIN, HAS TAKEN over the plant and business of the Eau Claire Manufacturing Co. for manufacturing machinery and equipment for the tire trade. A new machine shop has been built and the company is producing a bead-making machine of its own design, as well as tire-building and portable tire stands, tire cores and molds, and other specialties.

TRADE NOTES.

The Pennsylvania Rubber Co., Jeanette, Pennsylvania, has established a branch office at Jacksonville, Florida, on the corner of Forsythe and Clay streets, in the heart of the automobile district. Captain J. L. Branan, recently returned from service in France, is in charge.

The Newman Tire & Rubber Co., Inc., 244 West 54th street, New York, has increased its capital from \$5,000 to \$200,000. It has added three additional stores to its chain and greatly increased its jobbing business.

The Pearson Products Co., New York City, has recently been incorporated for the purpose of selling certain patented articles and products. Herbert P. Pearson, the incorporator, was formerly with the Cravenette Co.

The Black Hawk Tire & Rubber Co., Hippee Building, Des Moines, Iowa, is building the first unit of its new factory on East 20th street, between Capitol avenue and Walnut street, along the right of way of the Chicago-Great Western, Chicago-Rock Island, and Interurban railway tracks. This unit will be two and one-half stories high, with basement, 216 by 73 feet. The officers of the company are: William Moran, president; John F. Griffin, vice-president; E. A. Lewis, secretary; and J. J. O'Malley.

The Mason Tire & Rubber Co., Kent, Ohio, has bought the three-story building at 233 West 58th street, New York City, where it will make extensive alterations. A large stock of solid and pneumatic tires will be carried in the new quarters, which will be in charge of W. M. Doucette, eastern district manager of the company.

The Miller Rubber Co., Akron, Ohio, has established branches at Charlotte, North Carolina; Memphis, Tennessee; and Cedar Rapids, Iowa, each fully equipped with a complete stock of tires, tubes, accessories, and repair materials.

The Harmon Rubber & Manufacturing Co., Inc., 1211 Harmon place, Minneapolis, Minnesota, has prepared plans for a two-story plant, 40 by 160 feet, to be located in the Midway District, between Minneapolis and St. Paul, for the purpose of manufacturing inner tubes. This company is a reorganization of the Harmon Tire & Repair Co. of Minneapolis, and it manufactures high-grade inner tubes and rubber goods. It will sell to jobbers in the Northwest. The officers are: J. F. Brown, president; W. F. Rickley, vice-president and general manager; and J. E. Johnson, secretary and treasurer.

The Century Rubber Works, Chicago, Illinois, on April 26, suffered by a fire on its premises on Rawson street at Elston avenue. The loss was covered by insurance and the company is again operating at full capacity. Plans are also being drawn for a new plant to be erected at an early date. E. B. Tozier is general manager.

The Carlisle Cord Tire Co., Inc., New York City and Andover, Massachusetts, at its special meeting of stockholders held May 3, 1919, voted to increase its authorized capital stock from \$500,000 par value preferred and 10,000 shares of common stock, with no par value, to \$1,000,000 par value preferred stock and 25,000 shares of common stock with no par value.

The Archer Tire & Rubber Co., Inc., Minneapolis, Minnesota, has elected the following officers: W. F. Bigelow, president; William A. Beiter, vice-president; and M. A. Hessian, secretary and treasurer.

The Carlisle Tire & Rubber Co., Carlisle, Pennsylvania, has completed a new factory addition, doubling its facilities. It also expects to build another addition of reinforced concrete, steel and glass, three stories high, 300 feet by 190. It intends to begin manufacturing automobile tire casings before the spring.

The C. A. Shaler Co., Waupun, Wisconsin, manufacturer of vulcanizing apparatus and tools, is building a three-story warehouse, 42 by 90 feet, and when that is completed will build an additional factory building of twice that size.

The Hodgman Rubber Co., Tuckahoe, New York, is building a one-story, reinforced concrete structure, 70 by 134 feet, so constructed that four additional stories can be added later. This building is to be used as an additional calendar room.

The American Rubber Co. of Chicago, Chicago, Illinois, has increased its authorized capital stock from \$95,000 to \$1,000,000.

The Johnstone Tire & Rubber Co., People's Gas Building, Chicago, Illinois, has elected the following officers: E. C. Walton, president; B. R. Blackwelder, vice-president; C. W. Mussey, secretary and treasurer; A. P. Eves, consulting rubber chemist and engineer. Mr. Eves was four years with the Kelly-Springfield Tire Co., four with the Firestone Tire & Rubber Co., and eight with The Goodyear Tire & Rubber Co.

The Rubber Trade Association of New York has removed its offices to 44 Broad street, Room 824, New York City.

The General Asbestos & Rubber Co. has removed from 106 West Lake street to 14 North Franklin street, Chicago, Illinois.

The American Eagle Rubber Cement Co. has removed its general offices and factory from 59 East 43d street to 3026-3030 South La Salle street, Chicago, Illinois.

The American Zinc, Lead & Smelting Co., St. Louis, Missouri, has appointed the American Zinc Sales Co., its representative, at 1415 Conway Building, Chicago, Illinois. A. C. Eide is in charge as manager.

The Hill Pump Valve Co., Archer avenue, Canal and 23d streets, Chicago, Illinois, is building a modern plant to be equipped with electric furnaces and the latest automatic machinery. The building will be one story high and contain about 50,000 square feet of floor space. It is located on the company's recently acquired property at the southeast corner of Belmont and Knox avenues, which fronts 213 feet on the former and 964 on the latter.

A. Daigler & Co., 54 West Kinzie street, Chicago, Illinois, dealers and importers in chemicals, oils, and fillers for the rubber trade, whose factory was damaged by fire a short time ago, report that their building has been remodeled and that they are in position to handle all orders.

Nulsen, Klein & Krause Manufacturing Co., Levee and Sidney streets, St. Louis, Missouri, dealers in barytes, whiting, and other ingredients used in rubber compounding, has changed its firm name to Nulsen Corporation.

The Stanley Insulating Co., Inc., 43 Exchange place, New York City, and Great Barrington, Massachusetts, manufacturer of the "Ferrosil" rubber-finished vacuum bottle, is a Maine corporation and has been authorized to do business in the State of New York. W. S. Hood is the New York representative and the officers of the concern are: Otis A. Glazebrook, Jr., president; Horace W. Davis, vice-president; William S. Hood, assistant secretary and treasurer; and R. G. Williams, assistant treasurer.

The Parker Pen Co., Janesville, Wisconsin, manufacturer of the "Lucky Curve" fountain pen, will erect a four-story office and factory building, with basement and sub-basement, of reinforced cement and brick veneer, at the corner of Court and South Division streets, to cost \$125,000.

The Essenkay Products Co., Chicago, Illinois, manufacturer of the "Essenkay" tire filler, has elected the following officers: F. D. Mayer, president and treasurer; R. Peiser, G. Weir and J. E. Duffield, vice-presidents; and W. B. Russell, secretary.

The W. A. Sheaffer Pen Co., Fort Madison, Iowa, manufacturer of the "Sheaffer" fountain pen, has been authorized to do business in New York State, and A. L. Kugel has been designated representative and manager of its New York City office, at 440 Canal street. The company also has offices in Chicago and San Francisco. The officers are: W. A. Sheaffer, president; B. T. Coulson, vice-president; J. C. Brewster, treasurer; and W. A. Scherf, secretary.

Foreign Trade

CANADIAN CONSOLIDATED RUBBER CO. REPORT
AND ELECTION.

At an adjourned meeting of the shareholders of the Canadian Consolidated Rubber Co., held at Montreal, Canada, April 22, President Rieder read the report of the directors, which was, in part, as follows:

"Sales for 1918 were the largest in the history of your company, \$18,785,640.28, being an increase of 15.08 per cent. over 1917. Of this, \$793,403.28 was made for war purposes. Export trade suffered slight reduction due to shipping embargoes. During the year the selling prices on most lines moved upwards, resulting in an average increase of only 9 per cent. over last year. Sales in all departments as well as in all territories in Canada show increases over 1917."

Mr. Rieder announced his withdrawal from the presidency and the board of the company, and a resolution expressing appreciation of the services which he had rendered to the company was passed unanimously.

The following directors were elected for the ensuing year: Charles B. Seger, president, United States Rubber Co.; Sir Mortimer B. Davis, president, Imperial Tobacco Co. of Canada; Colonel Samuel P. Colt, chairman United States Rubber Co.; V. E. Mitchell, K. C.; E. W. Nesbitt, M. P.; W. A. Eden; R. E. Jamieson; J. B. Waddell; R. C. Colt; A. D. Thornton; H. Wellein; and Messrs. H. E. Sawyer, J. N. Gunn, E. S. Williams and Ernest Hopkinson, vice-presidents of the United States Rubber Co.

At a meeting of the board of directors, held immediately after the annual meeting, Charles B. Seger was elected president and W. A. Eden and Victor E. Mitchell, K. C., vice-presidents. Walter Binmore was appointed secretary, H. P. Nellis, assistant secretary, Hugh Wellein, treasurer, and J. P. B. Daigneau, assistant treasurer.

The statement of the company, and its constituent companies, excluding all offsetting accounts between the companies, as of December 31, 1918, is here given.

CHARLES B. SEGER.

President Canadian Consolidated Rubber Co., Limited.

FREDERICK W. DUNBAR, CRUDE RUBBER
IMPORTER.

EARLY this year, when it was announced that Frederick W. Dunbar had resigned his position as manager of the New York office of Alden's Successors, Limited, of London, England, there was some curiosity in the trade as to his future plans, for it was scarcely conceivable that a man so thoroughly versed in the crude rubber trade could contemplate abandoning it for any other line of business. The question is now settled by the announcement of the new crude rubber importing house of F. W. Dunbar & Co., 280 Broadway, New York City.

Mr. Dunbar's experience dates back to the middle 'nineties, when he was manager at Pará for Adelbert H. Alden, which house was the branch in that city of the New York Commercial Co., at that time the heaviest rubber importing concern in the United States. Later he was made vice-president of the last-named company, with offices in New York City. In 1914, when the concern was reorganized as Alden's Successors, Limited, of London, England, Mr. Dunbar was appointed American agent, attorney-in-fact, and manager of the New York City office of the company, which position, as stated above, he resigned at the close of the year 1918. His many friends in the trade wish him the highest success in his new business.

FREDERICK W. DUNBAR.

CANADIAN BANK BRANCHING OUT ABROAD.

The Royal Bank of Canada, New York City, which already has direct representation in Cuba, is planning to open branches at Rio de Janeiro, Brazil; Buenos Aires, Argentina; and Montevideo, Uruguay. A Parisian branch is also contemplated, and a new branch has just been established at Fort de France, Martinique.

THE PREMIER RUBBER CO., GUELPH, ONTARIO, HAS CHANGED ITS name to The Northern Rubber Co., Limited. Plans have been practically completed for building a four-story factory, 200 by 80 feet, for the manufacture of rubber footwear exclusively. This is the factory which it was recently announced would be built by The F. E. Partridge Rubber Co., Limited.

THE RUBBER TRADE IN OHIO.

By Our Regular Correspondent.

The rubber companies of Akron helped the Fourth Federal District go over the top in the recent drive for the Victory Liberty Loan, in their usual enthusiastic style.

The B. F. Goodrich Co. opened its campaign with a Victory Loan dinner, at which the now famous poem "In Flanders Fields" was recited. L. M. Barton, chairman of the campaign, presided, and outlined the Goodrich schedule. When informed that each rubber company would be allowed a week to make up its quota, the Goodrich officials declared that two days were enough for them. Over 1,400 new employees had purchased \$100,000 of bonds before the drive began.

The American Rubber & Tire Co. subscribed its entire quota on the first day of the drive, totaling 30 per cent more than in the previous drive.

Firestone Tire & Rubber Co. made use of its band in raising its quota, totaling over a millions dollars, in a three-day campaign.

The Miller Rubber Co. started its campaign with a series of short speeches, which were enthusiastically received.

The Goodyear Tire & Rubber Co., through officers and employees, subscribed \$2,000,000. 19 departments raising from \$10,000 to \$50,000 apiece.

AKRON NOTES.

The Firestone Tire & Rubber Co., Akron, is planning to develop an athletic field for the benefit of its employes, to be located in Firestone Park, but it is not expected that the plans can be carried out this summer.

* * *

The India Tire & Rubber Co., Akron and Mogadore, has increased its capital from \$500,000 to \$1,500,000.

* * *

The General Tire & Rubber Co., Akron, is to build an addition to its plant in the near future.

* * *

The Dri-Cure Retreading Co., 405 East Market street, Akron, has been formed by H. B. Houghton, Jr., E. M. Harbin and M. L. Cope, three former employes of The B. F. Goodrich Co. It will distribute the product of the Western Vulcanizer Co., Chicago, in its territory, which includes Indiana, Michigan, Pennsylvania, and New York, as well as Ohio.

* * *

The National Aniline & Chemical Co., Inc., New York City, manufacturer of chemicals for the rubber trade, has opened a branch office in the People's Savings & Trust Building, Akron, in charge of H. H. Replogle.

* * *

The Biggs Boiler Works Co., Akron, Ohio, manufacturer of vulcanizers, et cetera, has purchased the equipment for the new addition to its plant.

* * *

Alexander Adamson, head of the Adamson Machine Co., Akron, and Mrs. Adamson, have donated funds for the purchase of a site for a girl's training school and dormitory at Laoag, Philippine Islands, where their daughter, Miss Vera Adamson, is a missionary.

* * *

Arnold H. Smith, until recently assistant chemist in the Bureau of Standards, Washington, D. C., has resigned to accept a position as research chemist with The Goodyear Tire & Rubber Co., Akron. Mr. Smith is secretary of the Rubber Division of the American Chemical Society.

F. A. Seiberling, president of The Goodyear Tire & Rubber Co., Akron, Ohio, was unanimously reelected president of the Lincoln Highway Association at its annual election.

In the recent balloon race from the naval air station at Wingfoot Lake, Akron, on Saturday, May 10, 1919, the S-20, known as the "City of Akron," was entered by John R. Gammer inventor of many models for rubber machinery, the Gammer balloon valve, etc. The S-20 landed near Clayton, Delaware.

CLEVELAND NOTES.

The Union Tire & Rubber Co. has purchased a factory site on the Nickel Plate Railroad, near Chardon Road, Cleveland, where it will build in the near future. R. J. Birch, Hippodrome building, Cleveland, will be general manager.

* * *

The Osborn Engineering Co., Cleveland, reports great activity among rubber companies, which are increasing their factory space or building new plants to take care of additional business.

* * *

The Jackson Tire & Rubber Co., Cleveland, has increased its capital from \$10,000 to \$20,000.

* * *

A. G. Spalding & Bros., New York City, dealers in sporting goods, have removed their Cleveland store to the Statler Hotel Building.

* * *

Charles R. Sargent & Co., Engineers Building, Cleveland, has been formed by Charles R. Sargent, recently general manager of Stresen-Reuter & Hancock, Inc. The new company has bought the Cleveland end of the business of Stresen-Reuter & Hancock, Inc., in chemicals, oils and colors, and has taken over the employes of the Cleveland branch.

MISCELLANEOUS OHIO NOTES.

The Faultless Rubber Co., Ashland, Ohio, is enlarging its plant to take care of increasing business.

* * *

The Rubber Products Co., Barberton, Ohio, is building an addition to its plant, 60 by 100 feet, besides several smaller structures and an office building.

* * *

The Mason Tire & Rubber Co., Kent, Ohio, has recently awarded a contract for an addition to its plant.

* * *

The Pearce Tire & Rubber Co., Ashtabula, Ohio, called a special meeting of its stockholders in April to increase its

PLANT OF PEARCE TIRE & RUBBER CO.

capital stock from \$1,000,000 to care for the many improvements it is planning. Two new buildings are soon to be erected, a warehouse and a two-story office building, and a 66-inch calender and two extra mills are to be installed in the present main building, together with three additional

vulcanizers. The officers of the company are: A. M. Pearce, president and general manager; Charles L. Foster, vice-president; M. H. Sullivan, assistant general manager, and W. E. Wilkins, secretary.

The Toledo Auto Fabrics Co., Toledo, Ohio, has increased its capital from \$150,000 to \$225,000.

The Tubeless Tire and Rubber Co., Millersburg, Ohio, has elected the following officers: W. A. Miller, president; G. B. Helmuth, vice-president; O. J. Hicks, second vice-president, and G. A. Jordan, secretary-treasurer.

The Security Tire & Rubber Co., Wellington, Ohio, manufacturer of the "Security" no-air tube, elected the following directors and officers at its annual meeting: Edwin L. Camp, president; R. B. McNerny, vice-president; George J. Quay, secretary and general manager; S. Sudro, William H. Hill, Harry Gresham and W. W. Parker. The company is now in its third year of operation, having been incorporated in Delaware, in 1916, with a capitalization of \$1,000,000.

The Monarch Rubber Co., Carrollton, Ohio, recently bought the plant of the BeSaw Tire & Rubber Co., at Hartville, including real estate and materials on hand, at an approximate cost of \$200,000. The plant has been remodeled and new machinery installed. Additional building equipment is planned to increase the capacity of the plant.

The BeSaw company has no connection with the Monarch concern and will continue to operate its present plant at Ardmore, Oklahoma.

The Lancaster Tire and Rubber Co., Columbus, Ohio, has increased its capital from \$500,000 to \$800,000, of which \$200,000 is original preferred and \$600,000 common stock.

The Mansfield Tire & Rubber Co., Mansfield, Ohio, has approved plans for the construction of an addition to its present plant, to be of steel, brick and glass, four stories high. Additional ground has been purchased north of the present plant, making a total holding of nine acres.

The Fidelity Tire & Rubber Co., Massillon, Ohio, has leased the plant of the Kendall Tire & Rubber Co. in that place and will manufacture Ford-size tires.

The Erie Tire & Rubber Co., Sandusky, Ohio, is having plans prepared for an addition to its factory.

The Henderson Tire & Rubber Co., Inc., Bucyrus, Ohio, has increased its capital from \$200,000 to \$350,000.

NEW MAXOTIRE FACTORY.

The K & W Rubber Co., Ashland, Ohio, one of the pioneer manufacturers of tire reinforcements, has purchased more than ten acres of land along the Big Four tracks in Delaware, Ohio,

FACTORY OF K & W RUBBER CO.

and erected a modern factory for the manufacture of the "Maxotire," a successful inside tire. The accompanying photograph shows the new building, which is devoted exclusively to the making of tire reinforcements. The company has moved its general offices and equipment into the new quarters, and machinery is rapidly being installed with which to run all kinds of rubber stock needed.

JOHN MORGAN, MCGRAW'S VICE-PRESIDENT.

JOHN MORGAN, who was elected a director of The Rubber Association of America at the annual meeting, was born in London, England, in 1880. Educated privately, he was later graduated from the City of London College with honors and completed his education by travel in the different countries of Europe.

JOHN MORGAN.

He became secretary to a leading member of the European Diplomatic Corps, with headquarters in Paris, France, during which association extensive travels throughout Europe enabled him to make a very broad study of the customs and languages of the European nations.

Coming to America in 1905, he became interested in the importation of high-grade foreign automobiles, and perceiving the possibilities of the American automobile industry, he was instrumental in introducing the Kempshall tire into America in 1906. This connection led to his association with The McGraw Tire & Rubber Co., East Palestine and Cleveland, Ohio, with whom he has spent his time exclusively for the past ten years. He was elected treasurer of the company in 1913, and vice-president the following year, which office he now holds. Mr. Morgan has interests also in large textile industries and the manufacture of electrical appliances.

A SPECIALIST IN RUBBER CHEMICALS.

RALPH L. FULLER, of Ralph L. Fuller & Co., Inc., Cleveland, Ohio, is well known throughout the rubber and chemical trades of the United States and Canada.

His introduction to chemicals dates back to the summer of 1880, when he took temporary work with the well-known wholesale drug house of Strong, Cobb & Co., Cleveland, continuing to do so each vacation for five years. In this way, he became familiar with the various chemicals and at the same time acquiring a knowledge of chemistry in school and subsequently at college.

RALPH L. FULLER.

Having finished his college course he returned to Messrs. Strong, Cobb & Co., and was assigned to the order department, then to the position of keeping costs, and finally he was given a permanent position in the sales department. Later he with others formed the Cleveland Commercial Co., of which he was secretary. The success of this business was such that it became necessary to increase the organization and in 1892, the Harshaw, Fuller & Goodwin Co. was organized and succeeded the Cleveland Commercial Co.

Soon after the present war started, it occurred to Mr. Fuller that with the advent of a large number of new manufacturing concerns, particularly of chemicals, a further change in business methods could be adopted to the advantage of manufacturers and consumers of those products, and accordingly, with some of his associates he organized Ralph L. Fuller & Co., Inc., to act

as purchasing and sales agents for various manufacturers and jobbers interested in the purchases and sales of chemicals, oils, pigments, etc. His judgment in this respect has been justified, for the history of Ralph L. Fuller & Co., Inc., seems to indicate that where the finished products of one manufacturer are so frequently the raw materials of another, the bringing together of the two producing firms and production through a common handling agency is mutually advantageous.

Mr. Fuller has a wide acquaintanceship, and hosts of friends. He is a director of the Guardian Savings & Trust Co. of Cleveland, and also the Cleveland National Bank. He is an ex-president of the Cleveland Chamber of Commerce.

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

ABOUT the first of last month, it was reported that Lockwood, Greene & Co., had purchased the Roxbury Carpet Co., which purchase included the plant and business of the Boston Belting Corp. Investigation confirmed the sale of the carpet company but that neither the Boston Belting Corp. as such, nor its stock held by the carpet company had been included in the transaction, being still held largely by the Simpson Estate, from which the carpet company was purchased some time ago by Willett, Sears & Co., for a cash payment, it is said, of \$700,000, and notes for a like amount.

Mr. Willett later purchased the Boston Belting Co., buying up the stock by paying therefor a sum in cash and an amount of preferred stock in a new corporation named the Boston Belting Corporation. He sold to the Roxbury Carpet Co. the common stock of the belting corporation for \$500,000, which money went to pay the above-mentioned cash payments to the belting company's stockholders. It is now understood that the present holders of the majority of the belting corporation stock are anxious to sell the plant and business.

Among the assets of the Boston Belting Corp. is a large block of stock of the Plymouth Rubber Co., which is valued around \$50,000, though its face value is somewhat higher. Another possible asset of large value is the water-power privilege which the old company has held for many years, and which, by the terms of its contract, may be bought by the city of Boston within a few years for such sum as may be estimated to be its value at that time.

Another possible asset is a claim of \$350,000 against the Industrial Service and Equipment Co., against which a petition in bankruptcy has been filed by the belting corporation and two other concerns formerly controlled by Willett, Sears & Co. The Industrial Service and Equipment Co. was also a Willett-Sears concern, which was placed in the hands of receivers, in equity, last February. It is understood that the dividends on the preferred stock of the Boston Belting Corp., so far, have been paid from the earnings, as they became due and that the corporation is continuing business as heretofore and pushing for foreign trade, with encouraging results.

The Needham Tire Co., Charles River, Massachusetts, is building a one-story addition to give it 13,000 square feet of additional space for operating purposes. The company is also building a 150-foot smoke-stack to replace its present chimney. An additional 250-horse power boiler and other equipment for making tires are being installed, as well as nine more presses for making fiber soles and rubber heels.

Everlastik, Inc., manufacturer of elastic webbing, dedicated its new Victory Mill at Chelsea, a suburb of Boston, on April 30, by appropriate addresses, dancing, and refreshments. When the armistice was signed, work was begun on this mill, and in the succeeding five months there has risen a handsome three-story factory of modern mill construction. It will be equipped with

warping and winding machinery, as well as looms for making elastic and non-elastic webs, automobile brake linings, etc. The street floor on the Webster avenue side will contain the offices and the machine shop. All the machinery will be driven by individual electric motors, and, of course, the mill will be lighted by electricity. Special attention has been paid to arrangements for the comfort of the employees.

According to the fourth annual report of the Forsyth Dental Infirmary, that institution continues its philanthropic work among the poor children of Boston, having treated over 25,000 cases during the year 1918, and starting that number of children in the proper way to preserve their teeth. The enforced closing of the institution for some weeks because of the influenza epidemic, and the reducing of the permanent staff because of the call to service in the Army Dental Corps reduced somewhat the number of cases treated. Forsythe Day, the anniversary of the presentation of the loving cup to the surviving founder, Thomas A. Forsyth, for many years connected with the Boston Belting Corp., was celebrated by special clinics which brought together several hundred New England dentists.

At the annual meeting of the Crocker Rubber Co., held at Brockton, Massachusetts, May 14, 1919, the following officers were elected: president, O. W. Holmes, Brockton; treasurer, H. J. Callahan, Salem—both in Massachusetts, and secretary, M. R. Henry, Providence, Rhode Island. This company specializes in rubber boots of all kinds and has been located in Brockton since 1904. It is one of the eleven stores of the Crocker System. O. W. Holmes has been with the Crocker Rubber Co. for twelve years. Besides his duties as president he will act as manager. Mr. Callahan, the treasurer, holds a like office with the Salem Rubber Co., of which Mr. Henry is secretary.

The Davidson Rubber Co., Charlestown, has sold to A. Francis Harrington the stock, tools, and machinery of the Sterling Fountain Pen Co., which has been run as a subsidiary of the Davidson Rubber Co. for the past eighteen years. Mr. Harrington, a Boston lawyer, at this writing is sole owner of the pen business, but he proposes to form a stock company, under the name of the Sterling Fountain Pen Co., which will continue the business, with factory and office at 15 Brattle Square, Boston.

The Berkshire Rubber Co., Pittsfield, Massachusetts, controls or owns The Berkshire Rubber Co. of New York, Inc., The Hoosac Auto Supply Co., North Adams, Massachusetts, and the newly incorporated Holcomb Rubber Co., 713 Albany avenue, Hartford, Connecticut. The officers of the Berkshire company are: Richard Prosser, president, New York; Albert Wurts, treasurer; Frank Prosser, secretary, New York.

A most effective instance of window advertising of automobile tires was the display staged by the Boston branch of The Miller Rubber Co., Akron, Ohio. The tires were shown in the window of a leading florist's store and the combination of tires, ribbons, flowers and greenery, backed by a landscape which blended with the foreground, was very effective. The name of the tires was just conspicuous enough to advertise them effectively without detracting from the beauty of the display.

James H. Learned, of the United States Rubber Co., who went to Europe in April on business connected with the rubber thread department, returned the middle of last month. He visited England and France, and, like most Americans now going across, spent a considerable portion of his time ashore in attending to his passport requirements. He experienced the same difficulties as others in regard to traveling and hotel accommodations, but found his customers ready to do business, and reports the outlook for future orders most encouraging.

APPLETON: "ANCIENT AND HONORABLE."

CAPTAIN FRANCIS HAWKES APPLETON, veteran in military affairs and in reclaiming, was born in Jersey City, New Jersey, August, 4, 1853. He attended the public schools of that city,

FRANCIS H. APPLETON.

finishing his education at Pennington Academy, Pennington, New Jersey, and after some years in a wholesale grocery house, he entered the employ of the Murphy Varnish Co., Newark, New Jersey, as bookkeeper. After two years in this position he became traveling salesman for the same concern, and during the next seven years sold varnishes in practically every state in the Union. The succeeding six years found him managing the Boston branch of the Murphy company, a branch which he established.

In 1898, Mr. Appleton established a rubber reclaiming factory at Franklin, Massachusetts, and in 1902 he took in his son and namesake as partner, the firm being F. H. Appleton & Son. This concern was afterwards incorporated and has ever since been a prominent factor in the reclaiming industry.

In military and Masonic affairs, Mr. Appleton has been very prominent. He is a veteran of the Seventh Regiment, New York's crack militia regiment, and when he located in Boston he joined the Ancient and Honorable Artillery. He was one of a committee of three who went to England to present to King George V. a certificate of honorary membership in this famous Boston organization. Two years later he was chosen captain at the "drum-head election" held on Boston Common, and in July, at the head of 100 men, sailed on a peaceful invasion of England to hobnob with the parent organization in London, and to dine with the King and other dignitaries.

Mr. Appleton was a charter member of the Rubber Reclaimers Club, being temporary president during the formation of that trade body, and for several years was treasurer. When the club became the Reclaimers' Division of The Rubber Association of America, he was elected chairman, a position he now holds. He is also one of the original members of the New England Shoe and Leather Club.

Mr. Appleton is a 32nd-degree Mason, and is Chief Rabbi of Aleppo Temple, Ancient Arabic Order of the Mystic Shrine. He is also a member of the Algonquin, Boston Athletic, City, Commonwealth, Country, and Point Shirley clubs.

PACIFIC COAST NOTES.

THE one topic of conversation among the tire and rubber firms is the sudden reduction in tire prices, which came like a bombshell on automobile row. The announcement of the United States Rubber Co. of a 15 per cent reduction was followed immediately by that of other companies, and the buying public immediately sat up and began to take notice. The report to the effect that this reduction was likely to be followed by another, put a stop to tire buying for the time being, except in emergency cases, and branch managers of the high-grade tire companies professed to be at sea as to the present, although all looked for a further reduction.

Meanwhile the companies selling "seconds" and the rebuilding and retreading firms were panic-stricken, realizing there would not be a great demand for their products when users could buy "firsts" for a little more than "seconds" and rebuilds. It is ex-

pected that automobile owners will stock up for the summer and fall, as this is the first reduction from the prevailing war prices. There are more automobiles in this part of the state than in all the rest of California and the owners will not be slow to take advantage of the opportunity given them to make a legitimate saving.

One of the large rubber companies states that the reduction is not likely to affect other lines of rubber goods, such as clothing and footwear, and that prices on these may go higher. Automobile owners are asking whether price reduction will extend to other automobile products.

R. H. Keaton, president of the Keaton Tire & Rubber Co., Akron, Ohio, stopped over in Los Angeles for a few hours, on his way East to attend the opening of a Keaton headquarters in Chicago, Illinois. The Los Angeles branch, now located at 437-39 West Pico street, will be enlarged.

"Our rim business is growing so that we find it necessary to establish a central handling and shipping point in the East," said Mr. Keaton. "We have decided to open a Chicago branch that will enable us to handle our steel shipments better, as well as the 'East of the Rockies' demand for our tires. Our factory output is the only thing that is keeping us back, as we are unable at present to supply the demand."

E. R. Baker, sales manager, Western Auto Supply Agency, Los Angeles, is handling a device manufactured in that city for carrying a spare tire, which is particularly adapted to the Ford car that comes from the factory with no such appliance. Many Ford users carry their extra tires strapped on the running board or hanging from the side, an expensive way to carry a spare tire which may injure the carcass, to say nothing of the question of appearance.

The Oldfield Tire Co. has removed its Los Angeles offices to its tire warehouse at 228 Los Angeles street. The new offices and warehouses are large enough to hold nine carloads, or over \$300,000 worth, of Oldfield tires and tubes. The Oldfield retail store and vulcanizing shop on Hope street has been sold to Hewitt & Kinslow, experienced tiremen who will continue the repairing and retreading business.

Max Shiffner of the Tire Company of California, Los Angeles, reports the sale of twice as many tires for the month of April as in any previous month in its history.

F. C. Milhoff, general sales manager, Miller Rubber Co., Akron, Ohio, who recently spent a few days in Los Angeles, predicts an unprecedented sale of tires during the next few months and declares that millions of dollars of back orders must shortly be filled.

Thomas L. Rich, agent for Thermoid tires, spent several days on an extended trip through the northern part of his district, and reports a general feeling of optimism in the rubber trade.

C. Fred Thompson has returned to Los Angeles from a trip among Mason tire dealers throughout Southern California, and reports an increased use of Masons through the desert and mountain country of his district.

The steady development of the cotton-growing industry in Arizona and the Imperial Valley has at last resulted in the announcement that a Boston textile firm will construct a cotton mill in the Los Angeles-Long Beach Harbor district with spindles sufficient to employ 1,000 workers. It is said an option has been acquired on 20 acres of land and that \$3,000,000 will be invested in the project which includes the building of a colony of homes for the accommodation of the workers.

That the project will be greeted as a boon by the cotton growers of the Southwest goes without saying. It is the belief in industrial circles of Los Angeles that cotton raised and baled in Arizona and the Imperial Valley will eventually find its way to the mills of the Orient. It is pointed out that California has every element to make the manufacture of textiles and fabrics profitable, cheap electrical power, abundant labor, the raw product within easy haul, and climatic conditions that manufacturers have come to understand as a compelling economic factor in both mill construction and factory production.

With the growth of the tire manufacturing business in the West, the establishment of a textile factory here seems to be dictated by wisdom and confidence in the future.

The Bowers Rubber Works, which began business in San Francisco in 1888, has changed its name to the Pioneer Rubber Mills. Its factory is at Pittsburg, Contra Costa County, California, on the Sacramento River, and its general offices are at 68 Sacramento street, San Francisco, while it maintains factory sales offices in Los Angeles, Portland (Oregon), Tacoma and Seattle, Salt Lake City and Denver. The company manufactures "Skookum" piston-rod packing, "Copper Queen" belting and "Victor" fire hose. George N. Towne is vice-president and general manager and D. D. Tripp is vice-president in charge of sales. Mr. Towne visited New York City last month.

The Savage Tire Corp., San Diego, California, manufacturer of "Savage" tires and "Grafitite" tubes, has made the following promotions and appointments: J. E. Shaw, from assistant sales manager to sales manager; L. S. Chamberlain, assistant sales manager; H. E. Gressler to succeed Mr. Chamberlain as manager of San Diego branch; A. E. Kelley transferred as branch manager from Seattle to San Francisco; J. C. Magly to succeed Mr. Kelley at Seattle.

The Western Rubber Co., 1143 Dock street, Tacoma, Washington, which for nearly two years has been conducting a tire-rebuilding business, is now planning the erection of a \$300,000 unit of its future plant. Elmer Dover is president. He is at present on a business trip East in connection with the new factory. The company uses among other things a special composition of which one of the principal ingredients is fish scrap. Several chemical patents have been issued on this composition.

An important branch managers' conference was recently concluded in Los Angeles by H. S. Firestone, president of the Firestone Tire & Rubber Co., Akron, Ohio, and district manager J. D. Hess, Jr., from the Akron factory. Mr. Hess will spend the greater part of his time here watching the trade conditions of the Pacific Coast branch territories.

One hundred high-grade rubber tires a day are now being turned out by the Hendrie Rubber Co., Los Angeles, which has again opened its plant at Torrance after a period of inactivity caused by closing down on account of the war. Plans are being made to more than double its capacity and a much larger force of men will be put to work in the next month or two. The company has a large and commodious building with all modern appliances and has laid in a big stock of rubber and fabrics preparatory to starting active work.

Thomas L. Rich, for years one of the best known tire dealers of Los Angeles, has been chosen as the Southern California distributor of Thermoid casings and tubes.

Hawley, King & Co., Los Angeles, have been appointed distributors in California, Arizona, and Nevada for the Globe

tire. Reeve Gartzmann, general manager of Hawley, King & Co., will supervise the tire department, and H. H. Anderson, formerly of the Firestone organization, is sales manager. A. T. Smith, former manager of the Los Angeles branch and later Pacific Coast manager of the Firestone company, is western manager of the Globe Rubber Tire Manufacturing Co. The Globe company announces that in addition to its fabric and cord tires it will soon manufacture a solid tire as well.

The Pacific Rubber Co., Los Angeles, has arranged for storehouse facilities for "Horseshoe" tires in San Francisco to facilitate their distribution in the northern part of the state, according to Roy R. Meads, president and general manager of the concern, who has returned from an extended business trip through that section.

A big shipment of reconstructed tires for Japan has just been made up by the Tire Construction Co. of Los Angeles. "This shows what a tremendous export we may expect in the future," says Edward Harris of that company. "We on the Coast come in contact with the buyers from the Hawaiian Islands, Japan and China, who come here for the latest information on vulcanization methods and repairing."

F. C. Morrison of the Miller Tire Sales Co. reports eighteen new agencies recently installed in this territory, the latest being that of Goodell & Mead at Pasadena.

Steward Slosson has been appointed Pacific Coast representative of The Rubber Products Co., Barborton, Ohio, manufacturer of tires and mechanical rubber goods, and will take charge of the company's business in "Stronghold" tires.

W. H. Gilbert, treasurer of the Pacific Coast division of the United States Rubber Co., San Francisco, according to his usual custom, is spending a portion of the early summer resting in Los Angeles.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

THE Trenton rubber manufacturers are proud of the fact that they went over the top in subscribing for the Fifth Liberty Loan. Their subscriptions amounted to nearly half a million dollars, or to be exact, \$423,350. The list follows:

Ajax Rubber Co., Inc.	100,000
Joseph Stokes Rubber Co.	100,000
Empire Rubber & Tire Corp.	80,000
Thermoid Rubber Co.	40,000
United & Globe Rubber Co.	30,000
Hene Rubber Co.	17,500
DeLion Tire & Rubber Co.	15,650
Essex Rubber Co.	9,600
Whitehead Brothers Rubber Co.	8,500
Woven Steel Hose & Rubber Co.	5,950
Simple Rubber Co.	5,800
Globe Rubber Tire Manufacturing Co.	5,300
Mercer Rubber Co.	5,000
	\$423,350

The United & Globe Rubber Co. will erect a brick addition to the plant on Frazer street, Trenton.

Horace B. Tobin, secretary and treasurer of the United & Globe Rubber Co., Trenton, and who is also president of the Trenton Club, recently entertained the members of that organization at the Country Club at Spring Lake, New Jersey.

The Atlas Tire & Rubber Co., Trenton, has begun work on its new \$250,000 plant on Enterprise avenue. Work will be rushed to completion and machinery installed as soon as possible. The company will manufacture automobile tires and tubes, and employ about 200 persons at the start. One

of the structures will be 90 by 360 feet; another, the engine and boiler room, will be 82 by 92 feet. There will be an 800-foot siding. Henry A. Ludeke is president of the Atlas company; Ira Worthington, vice-president, and R. Unkles, secretary.

* * *

At the annual meeting of the Globe Rubber Tire Manufacturing Co., Trenton, New Jersey, Joseph B. Linerd was reelected president. He is said to be the youngest president

of any such important enterprise in this country. Young as he is, however, he has had a good business experience. Previous to his connection with the Globe company, he held various responsible positions with the Goodyear Tire & Rubber Co., Akron, Ohio, and later became sales manager of the Ajax Rubber Co., Inc., Trenton, New Jersey. In 1916, he reorganized the Globe Rubber Tire Manufacturing Co. and served first as its general sales manager, later being chosen president, to which office he has just been reelected.

JOSEPH B. LINERD.

Solomon J. Lewis, representing the Sturdy Tire & Rubber Co., of Trenton, recently returned from Havana, Cuba, where he closed a \$300,000 contract with the Caribbean Agencies.

* * *

The Eureka Tire Co., 26 West State street, Trenton, New Jersey, whose plant is on Whitehead's Road, has filed a certificate of dissolution in the office of the Secretary of State, as agreed upon by the stockholders.

* * *

The New Jersey Car Spring & Rubber Co., Inc., Jersey City, New Jersey, has elected the following officers and directors: G. W. Stephens, president; F. H. Smith, vice-president and general manager; E. E. Dearth, secretary; Charles Hoffman and Jesse E. La Dow, counsel; directors—John J. Fields, F. H. Smith, E. E. Dearth, Jesse E. La Dow, Charles Hoffman, G. W. Stephens and P. H. Ober.

* * *

William J. B. Stokes, head of the Thermoid, Stokes and Home Rubber companies, Trenton, who was chairman of the Fifth Liberty Loan Committee, will shortly entertain those who aided him in the work.

* * *

Alfred Whitehead, secretary of Whitehead Brothers Rubber Co., Trenton, was chairman of the rubber manufacturers' division of the Salvation Army drive.

* * *

The storehouse of the Empire Rubber & Tire Corp., Trenton, was badly damaged by fire on May 19, the principal loss being caused by water from the sprinkling system.

* * *

Samuel E. Lavery, formerly manager of the Allentown, Pennsylvania, branch of the United Tire Co., has purchased a building on West End avenue, Trenton, and will conduct a plant there.

* * *

Harry L. Midler, formerly owner of the Midler Auto Supply Co., Trenton, has been held in the Federal Court on a charge of perjury in bankruptcy proceedings. He was held in \$1,000 bail. A petition in bankruptcy against the Midler

company was filed by the Pennsylvania Rubber Co. early in 1918.

* * *

The plant formerly occupied by George F. Lufberry, Jr., Meadow Lane, Elizabeth, New Jersey, has been sold to the Lowenstein Radio Co., of Newark. The transaction involves nine acres of land and twelve buildings.

* * *

The Victory Tire & Rubber Co., 385 East 149th street, New York City, has plans for the erection of a tire plant on Railroad avenue, Asbury Park. The building will be two stories high, 75 by 165 feet, and will cost \$125,000.

* * *

Elgin L. McBurney, receiver of the Indian Tire & Rubber Co., New Brunswick, has made application to the Court of Chancery for permission to borrow \$5,000 on a receiver's certificate. An order to show cause why the court should not allow this and order the business to continue for the disposal of the property of the corporation has been obtained by some of the stockholders. It is alleged that the assets of the company total \$107,115, and its liabilities \$65,000.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

WHILE the several plants manufacturing rubber goods in Rhode Island have many orders on their books, they also have more or less stock on hand and are playing somewhat of a waiting game. Advantage is being taken of this to make repairs, renovations, improvements, and additions as well as complete accounts of stock of every description which have not been taken as thoroughly as usual for the past two years or more because of the drive under war conditions.

In common with other industries the rubber manufacturers are finding much difficulty in securing experienced help to fill numerous places that are vacant. Several hundred employees left the several plants to go into the service of the country, either as volunteers or draftees, and it is expected that with their return they would seek their former positions. This has not proved to be the case, however. While a few have applied for and resumed their former employment, a large majority do not desire to resume indoor work, and so are seeking for something to do outside.

* * *

The efforts to take Rhode Island over the top in the Fifth Liberty loan by the subscription for a quota of \$37,000,000 of Victory Notes gave all industrial interests considerable activity. Early in the campaign the announcement was made from New York that the United States Rubber Co. had subscribed for \$2,500,000 of the bonds, of which \$1,500,000 was to be credited to the various States where the company had plants. Later it was announced that of this sum \$500,000 had been credited to Rhode Island. In the distribution Providence, where the Revere Rubber and Mechanical Fabric Companies are located, received credit for \$200,000, while Woonsocket with the Woonsocket Rubber Co.; and Bristol with the National India Rubber Co., each received credit for \$150,000.

* * *

Edward P. Gwillam, of Newark, N. J., appeared before Judge Arthur L. Brown in the United States District Court this city, about the first of the month and pleaded not guilty of conspiring to bribe a United States official. He was released when \$1,500 bail was furnished. Mr. Gwillam is general manager of the Newark Raincoat Co., whose local representative, Samuel Levison, was arrested here last summer on charges of attempting to bribe a United States officer in connection with a raid that was made. Mr. Levison informed the Government officials here that Mr. Gwillam conspired with him in the bribing.

The shoe division of the National India Rubber Co.'s factory at Bristol, was closed on Friday, May 16, for two weeks, resuming Monday, June 2. The announcement was made by the management that the shut-down of the two sections of the division was to curtail production and for general repairs. During the period of the shut-down the company continued to make samples and small productions of particular grades of shoes.

The Revere Rubber Co. of the United States Rubber System, has just added another plot of land to its holdings on Valley and Eagle streets, Providence. It is located at the northeast corner of the two thoroughfares and contains 3,506 square feet. It is a valuable acquisition as it completes the holdings of the concern on that block.

The Davol Rubber Co. of Providence, has just received a large contract to furnish ice bags to the Medical and Hospital Supplies Division, Office of the Director of Purchase and Storage, at Washington.

CONNECTICUT NOTES.

The Raybestos Co., Bridgeport, Connecticut, manufacturer of brake linings and clutch facings, is building a one-story brick and steel addition to its factory, 160 by 170 feet, to cost approximately \$75,000.

The Goodyear Rubber Co., Middletown, Connecticut, is expending about \$10,000 in enlarging its cutting room.

The New Haven Sherardizing Co., New Haven, Connecticut, has increased its capital from \$30,000 to \$50,000.

NEMOURS TRADING CORP. OPENING FOREIGN OFFICES.

The Nemours Trading Corp., 151 Fifth avenue, New York City, recently incorporated to do a general export business, in addition to its branch offices in the principal foreign cities, has opened a house in Mexico City and will open others in Johannesburg, South Africa, and Melbourne, Australia, early in the autumn. W. P. Berrien, export sales manager, was for eight years connected with the Firestone Tire & Rubber Co. Among other products the Nemours corporation will specialize in Perfection tires, made by the Perfection Tire and Rubber Co., Fort Madison, Iowa.

WHAT GOOD BRAKE LININGS SHOULD DO.

The accompanying chart, published by the Thermoid Rubber Co., Trenton, New Jersey, and showing the distance within which it should be possible to stop an automobile traveling at various speeds when equipped with suitable brake linings, is of interest to associations, railroads, and motorists in general. It was prepared to show in a graphic manner how directly the safety of the car and the security of all who ride depend upon the brake linings, and also to provide a fair and reliable test which every motorist can easily make with his own car.

A RUBBER RESEARCH SPECIALIST.

AMONG AMERICAN RUBBER CHEMISTS the name of George D. Kratz is recognized as that of a rubber research chemist of ability. Following his graduation from Cornell University in 1912 with the degree of Bachelor

GEORGE D. KRATZ.

of Chemistry, Mr. Kratz began his professional career with the former Diamond Rubber Co. in his native city of Akron, Ohio, continuing as one of the laboratory staff of The B. F. Goodrich Co., after the absorption of the former concern by the latter. In 1914 he became chemist of the Norwalk Tire & Rubber Co., Norwalk, Connecticut, three years later assuming the duties of chief chemist of the Falls Rubber Co., Cuyahoga Falls, Ohio, which position he holds at the present time.

In research work Mr. Kratz has been associated with Dr. David Spence and in collaboration with him has had published many articles on chemical research. He has contributed frequently to the "Journal of Physical Chemistry," the "India Rubber Review," and THE INDIA RUBBER WORLD.

He is a member of the American Chemical Society, The New Jersey Chemical Society, the University Club of Akron, and the Cornell University Club, New York City.

THE OBITUARY RECORD.

A RUBBER MAN OF THE THIRD GENERATION.

JOHN V. ALDEN died at Buffalo, Wyoming, May 12, in his 31st year. He was the only son of Adelbert H. Alden and grandson of the late George A. Alden, the well-known rubber merchants, and at one time was president of the Seamless Rubber Co., New Haven, Connecticut. His health failing, he went west some years ago, and it was thought he was recovering. He came East to welcome his father on the latter's return from abroad a short time ago, but death took him soon after his return to Wyoming.

A PROMINENT FABRIC COMMISSION MERCHANT.

Augustus D. Juilliard, senior member of A. D. Juilliard & Co., New York City, manufacturers and distributors of cotton fabrics for the rubber goods manufacturing trade, died at his home in that city, April 25, 1919, after a brief illness.

He was the son of Jean Nicholas Juilliard, a native of Burgundy, France, who came to America in the early forties. Born in Canton, Ohio, seventy years ago, Augustus D. Juilliard early identified himself with the textile commission business. In 1873 he was appointed receiver for Hoyt, Sprague & Co., at that time the largest commission house in New York City, and soon after organized his own company. During the presidential campaign of 1896 he became prominent as a strong protectionist and a friend and ardent supporter of McKinley. Later he became prominent in connection with banking, trust and insurance interests, and was a liberal patron in musical, artistic, scientific and educational movements. He organized the American Protective Tariff League, and maintained its high protective principles in all legislation regarding the textile industry.

Mr. Juilliard was a member of the Metropolitan, Union League, Tuxedo, City, Republican, Merchants, and the New York Athletic Clubs, the Ohio Society of New York, and the Huguenot Society of America.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE only feature of new interest in the present low-level price of rubber is the attention being given to finding some new uses for it. The Rubber Growers' Association is moving in the matter, but the prize scheme it is said to be preparing has not yet seen the light. It seems obvious that something besides rubber pavements will be required to absorb rubber to the extent desired, and the position as regards the price of finished articles is not the same as it was when the rubber pavement was being advocated some years ago as a panacea for increased output. The new expenses associated with labor have to be considered, and it may be that they will press more heavily upon rubber as a pavement material than upon its present competitors.

In contrast to what has occurred in some industries, demobilized rubber workers are being regularly reinstated in their old jobs, the positions being vacated by the women workers who had occupied them. A point which came up at a recent general meeting of the Whitley Council was in regard to the propriety or expediency of replacing women by temporary men until the original holder of the position was available. A prominent rubber manufacturer, who said that he was reducing the woman staff regularly in favor of returned men, agreed with Mr. Duke, the rubber workers' secretary, that it was not advisable to dismiss women in favor of temporary men. Among those who are drawing the much-talked-of out-of-work donations are a good many rubber workers, mostly from the proofing side. These do not come from works generally, as some firms have not dismissed any hands. The fact is at this time of general upset that some firms are busier than others. Although the war rush has, of course, subsided, Government peace orders are coming forward as usual and these are naturally on a larger scale than they used to be. Under present conditions some firms have much of their work on hand, while others may have little or none, hence the effect on the labor required at different works.

NEW WORKS.

Now that the government restrictions on the issue of capital for new ventures have been removed, as far as Great Britain is concerned, we may expect to see some schemes put before the public. A recent one is the offer of £200,000 8 per cent cumulative participating preference shares in Fuller's United Electric Works, Limited. Part of the works which are at Chadwell Heath, Essex, were started during the war for the manufacture *inter alia* of ebonite, insulated electric cables and carbon black, and seem to have made very good progress, being helped naturally by the scarcity of ebonite and gas black. The fact that the four companies which are now merged into one earned 30 per cent upon their capital in 1918 must of course be looked upon by investors in the light of war demands and prices and the absence of difficulties of foreign competition. The names of the companies now merged are: John C. Fuller & Son, Limited (founded in 1875 at Bow, London); the Fuller Accumulative Co., Limited; Fuller's Wire & Cable Co., Limited, and Fuller's Carbon & Electrical Co., Limited.

EFFECT OF REDUCED HOURS ON OUTPUT.

In view of the reduced number of hours now in force in rubber factories, I asked a manufacturer the other day if it was his experience that there was no falling off. His answer was that the general results are much the same, mainly because better time is now being kept by hands who persistently lost time in the past by not turning up regularly before breakfast. With respect, however, to the regular and steady workers the output certainly shows a diminution. The claim that the output will

be the same with a reduction in hours of work has really been negated by the workers in their demand for a 10 per cent advance on piece-work rates. This has been granted locally in several cases by virtue of a special clause in the Whitley Council regulations. The 47-hour week is now uniformly adopted throughout the rubber trade, and it has this good effect, that one manufacturer knows that another cannot gain an advantage over him by working a longer week, as was the case in the past. Although manufacturers now have to spend a good deal of time attending meetings and seeing to a new class of correspondence, the general opinion seems to be that it is worth it if the dislocation of business caused by strikes is done away with.

An important part of Mr. Porritt's recent lecture on rubber at the Royal Society of Arts dealt with the new problems of labor in the factory. Cheap labor, he said, is now a memory of the past and manual operations will have to be performed more efficiently or supplanted by mechanical processes if the new conditions are not to be reflected in unduly increased costs of production. While unnecessary labor will have to be eliminated, that which is essential should be made more efficient.

SOCIETY OF CHEMICAL INDUSTRY.

I referred recently to the somewhat belated report of the Society of Chemical Industry for 1917, and now have a word to say regarding that for 1918, which has appeared more promptly. The chapter on india rubber is written by Dr. Twiss of the Dunlop Rubber Co., Limited, instead of by Dr. H. P. Stevens, who wrote the two preceding ones, a change of authorship having been made in several of the subjects in order to get new points of view. Despite the change from a consulting chemist to a works chemist, with a naturally wider purview of "applied chemistry," there is no extensive lifting of the veil on matters intimately concerned with rubber manufacture, a remark which applies equally to many other subjects treated of in the volume. We have, however, a useful and succinct summary of matters of technical importance of special interest to those who have omitted to read their trade journals carefully throughout the period under review.

With regard to the published list of accelerators for vulcanization, Dr. Twiss points out that its length is apt to be misleading because in some cases the same chemical substance appears several times under different trade names. He makes the important observation that very little definite information is available as to the influence of accelerators on the aging of vulcanized rubber, and still less as to the possible influence of the proportion of free sulphur on the activity of the accelerator. Speaking of reclaimed rubber, he says there is a tendency towards open acknowledgment that the essential effect is purely a thermal one and that the various chemical operations used in conjunction with heat are unnecessary. The main objection to a more general acknowledgment of this lies, I think, in the fact that it knocks the bottom out of a good many patents. The 1918 patent of the Dunlop Rubber Co., Limited, and D. F. Twiss depends on thermal treatment with avoidance of oxidation effects and not on any specific chemical reaction. Perhaps some pronouncement on this important matter will come from America, the home of reclaiming. The paragraph on analysis is somewhat thin, touching as it does on only one topic—the extraction of rubber with acetone. Reference is made to the fact that when the resin contents of a rubber is known and is non-variable the free sulphur in an acetone extract is obtained by simple subtraction instead of a tedious estimation. I imagine that this procedure is by no means a novel one, though, of course, it has

its strict limitations in practice. Attention is drawn in a paragraph on raw rubber to the fact that although most of the moisture which may be retained in rubber is expelled in mastication, the whole of the natural moisture in plantation rubber is not removed and that the 0.2 or 0.3 per cent which is retained is liable to cause porosity unless the surrounding pressure in vulcanization is maintained greater than the vapor pressure of the dissolved water.

HENLEY'S TELEGRAPH WORKS, LIMITED.

The net profit of this old-established business, now in its forty-first year, was £148,054 for 1918, against £162,867 in 1917, and the dividend is 15 per cent against 25 per cent. It should be noted, however, that a year ago the capital was raised from £200,000 to £400,000 by the capitalizing of £200,000 from the reserve fund, the shareholders receiving bonus shares. The motor tire business, which was started a few years ago, was transferred to a new company on August 1 last and this has naturally affected the net balance. In the accounts provision has been made for special depreciation on machinery bought for war purposes, which it is stated will now be useless or of problematical value.

MISCELLANEOUS FOREIGN NOTES.

DEMAND FOR RUBBER FOOTWEAR IN SCOTLAND.

THE "Weekly Bulletin of the Canadian Department of Trade and Commerce" reports an active demand in Scotland for ordinary galoshes and storm galoshes of broad-toed shapes, hip boots and top boots, gray canvas gymnasium shoes, and light sand shoes. There is little call for the strap-sandal or low-cut rubbers, for pointed shapes, or for white or brown goods.

RECLAIMED RUBBER FROM ITALY.

During 1917 there was exported from Turin to the United States reclaimed rubber to the amount of 543,429 pounds, value \$130,154, as against 72,211 pounds in 1916, value \$101,532.

RELATIVE IMPORTANCE OF FRENCH FAIRS.

The leading three French fairs being held this spring have three distinct aims, though each is naturally local and national in character to a certain extent. The Lyons Fair, held March 1-15, 1919, is chiefly international, purposing to substitute the Leipzig Fair; the Paris Fair, held April 25-May 10, 1919, is principally national; and the Bordeaux Fair, to be held May 31-June 15, 1919, is chiefly colonial. This feature of the Bordeaux Fair is natural when it is remembered that approximately one-third of the merchandise bought for and imported into the French colonies, as well as of the products exported from those same colonies, is handled by Bordeaux firms and shipped via Bordeaux.

RUBBER IMPORTED INTO DENMARK.

Figures for the month of December, 1918, and for the year 1918, show that during those respective periods Denmark imported crude and manufactured rubber as follows:

	Kilos.	
	December, 1918.	Year 1918.
Crude rubber	900	5,900
Tires and other rubber goods	23,400	61,400
Totals, imports	24,300	67,300

THE SCANIA FAIR AT MALMO, SWEDEN.

The Scania Fair, to be held at Malmö, Sweden, June 30-July 6, 1919, is primarily a manufacturers' exhibit, its object being to bring together the producer and consumer. The exhibits will be divided into thirteen groups, of which group 8 comprises rubber and leather goods, and group 13, known as the technical department, will cover inventions, patents, mate-

rials, etc., to be used in the manufacture of other goods. This fair is open only to Swedish industry, but many Danish and German interests will be represented through Swedish agents, and some American houses likewise. There is considerable demand in southern Sweden for rubber goods, belting, and other products.

MARKET FOR RUBBER GOODS IN SWEDEN.

The Swedish Consulate at Göteborg calls attention to the demand in Sweden for inner tubes and tractor tires; belting of all kinds; rubber goods; and waterproofed coats. Catalogs in quadruplicate are desired.

A GERMAN PLAN TO SAVE RUBBER.

An interesting device of the Germans to secure something of the resiliency afforded by a rubber tire with the minimum amount of rubber is shown in the accompanying illustration.

This wheel is of a type much used by the Germans during the war to economize in the use of rubber. The rim is of steel and the pads between the rim and the felloe are made of rubber. The picture is from a United States official photograph taken at Speicher, Germany.

RUBBER-PADDED STEEL WHEEL.

TIRE MANUFACTURE AND MARKET IN GERMANY.

A Swiss consular report of conditions in Germany at the present time remarks that the scarcity of cotton in Germany will make it impossible to manufacture pneumatic tires for some time. It is expected that large amounts of crude rubber stored in neutral countries will be released with the signing of the peace treaty. Solid rubber tires will then be manufactured.

The synthetic rubber so much vaunted proved during the war to be useful chiefly for insulating purposes in the construction of submarines, torpedo boats, electrical engines, etc., but it failed to relieve or in any way affect the tire situation. This was due to its lack of resiliency and durability and also to the high cost of production.

It is believed that Germany will offer a good field for American automobiles, trucks, and tires, as the number of prospective buyers is constantly increasing.

It is pointed out that the customary appointment of a foreign importer as agent or sole agent on condition that he buy outright or guarantee to sell a certain number of cars or tires yearly will not result in the establishment of a permanent market. This is due to the fact that the foreign importer is generally unfamiliar with the car or tires, and has no further interest in them or the satisfaction of the buyer, once the goods are sold.

The only means of creating a lasting market is that of establishing an American agency in the prospective foreign territory. Great care should be given to the selection and location of a principal office and sub-agencies, etc.; also, to selecting salesmen of experience in the automobile and tire business, familiar with the country, people, language, methods of procedure, and organization of the German automobile industry.

The Rubber Trade in Japan.

By a Special Correspondent.

THE great impetus given to the Japanese rubber industry by the war is reflected in the rapidly increasing crude rubber imports. As shown by the accompanying official statistics, the 1918 imports represent an increase of 7,966,517 pounds, value \$1,909,006, over the 1917 imports; 9,729,520 pounds, value \$2,761,114, over the 1916 imports and 12,457,352 pounds, value \$4,758,321, over the 1915 imports. The rates of increase for the several years were, in quantity, 95 per cent. in 1918, 132 per cent. in 1917, and 302 per cent. in 1916; in value, 42 per cent. in 1918, 76 per cent. in 1917, and 236 per cent. in 1916.

These imports do not indicate the actual demand of the rubber industry, however. Contrary to the previous custom of buying crude rubber in the various eastern markets as needed, Japanese firms have taken advantage of the low ruling prices and accumulated considerable stocks in anticipation of a rise under improved peace-time conditions. Japan now has her own crude rubber quotations, and at times prices have been more favorable than those ruling at Singapore for the same grades.

Japan's rubber commerce has grown remarkably of late.

IMPORTS OF CRUDE RUBBER.

	1917—	Value.	1918—	Value.
Pounds.		Pounds.		
From British India	1,616,131	\$988,285	526,168	\$234,207
Straits Settlements	6,185,569	3,141,527	15,248,181	\$938,066
Dutch East Indies	78,000	44,500	374,716	73,775
Great Britain	347,326	266,845	148,652	126,281
United States	123,301	101,211	94,465	51,160
Other countries	43,849	21,745	68,720	20,630
Totals	8,394,385	\$4,565,113	16,360,902	\$6,474,119

The Japanese rubber manufacturing industry has so expanded in recent years that exports of rubber goods now greatly exceed imports. Insulated wire, tires, toys, and balloons are the lines which have been developed chiefly, so that the imports of rubber manufactures shown by the accompanying statistics consist chiefly of other goods not yet produced in Japan at all, or not in sufficient quantity to meet home demands.

IMPORTS OF RUBBER MANUFACTURES.

	1917—	Value.	1918—	Value.
Pounds.		Pounds.		
Reclaimed and unvulcanized rubber	136,165	\$20,623	47,290	\$6,676
Latex rubber	19,953	49,457	332-4	\$4,007
Soft rubber—				
Rods and cords	84,610	12,727	149,865	106,858
Tubes, sheets and rubbers	250,012	86,648	344,252	144,709
Threads, strips, bands, rings and washers	44,786	62,914	108,886	121,651
Other soft goods	106,288	57,641	173,394	66,423
Other rubber goods	49,140	27,680	33,677	31,074
Bicycle tires	2,736	2,673	424	560
Insulated wire—				
Submarine cables				3,325
Other armored cables	11,312	1,492	10,005	3,821
Other wires	45,845	23,963	58,717	53,108
Woven belts and hose	213,836	157,639	381,020	198,843
Waterproof sheeting	14,184	12,957	8,969	6,764
Elastic webbing		50,642		79,798
Insulating tape	35,910	13,169	24,566	11,923
Totals		\$610,276		\$887,650
Scrap rubber		137,657		86,254

In addition to the above imports of rubber goods for 1917 and 1918, automobiles and parts, including tires, were imported to the value of \$3,830,906 in 1918 against \$1,984,457 in 1917.

In 1912, rubber goods imports reached their highest mark, but with the growth of the Japanese manufacturing industry, and on account of shipping difficulties, these imports have decreased. A customs tariff of 20 to 40 per cent. ad valorem will not tend to increase the volume of these imports under peace conditions.

Excellent automobile and motorcycle tires are now made by the

Japanese in Japan and bicycle tires also. In 1918, automobiles were imported largely in the form of parts and assembled in Japan. They will be in large demand in the near future, having been recognized as a necessity rather than a luxury, as they were formerly regarded in Japan.

There were also exported 2,651 jinrikishas (\$71,133) in 1918, against 6,854 (\$144,752) in 1917; also 7,408 bicycles and parts (exclusive of rubber tires) to the value of \$2,161,334 in 1918, against \$352 valued at \$1,219,409

in 1917. Jinrikishas for China, Hongkong, Straits Settlements and British India show a gradual decrease figure, as they were exported as parts, not as completed vehicles, in order to avoid payment of import duties and to reduce the cargo charges. The increased use of automobiles is also affecting the sale of jinrikishas.

EXPORTS OF RUBBER GOODS.

	1917—	Value.	1918—	Value.
Pounds.		Pounds.		
Insulated wire	4,061,544	\$1,559,456	12,742,382	\$4,162,167
Rubber tires	901,633	2,021,815	3,261,324	2,253,469
Rubber toys and balloons		114,210		383,270
Other rubber manufactures		307,715		612,600
Totals		\$4,002,596		\$7,411,506

Owing to the shipping difficulties of Japanese rubber goods exports have increased year by year until the Japanese rubber manufacturing industry has become large enough to supply the lack of European and American goods in China, Manchuria, Malaya, British India, Oceania and Australia.

There is a difference of opinion as to the effect of peace on this foreign trade. Some believe that with better shipping conditions, European and American goods will be pushed into these Far East markets to the detriment of Japanese business; others, that the proximity of these markets to Japan and the lower wage scale in Japan place her in an advantageous position to continue and develop this business. The prohibition of imports of Japanese rubber toys by both the United States and Great Britain, which became effective in April of this year, has been a hard blow to Japanese rubber manufacturers, many of whom specialized in balls, dolls and balloons.

NEW ASSOCIATIONS.

Several new trade associations have been formed that are identified with the rubber industry in various ways. Some three hundred makers of toys of rubber, wood, cotton, cloth, paper, celluloid and metal in Tokio have organized the Tokio

MARCHO-HI RUBBER WORKS, TOKIO, JAPAN.

Export Toy Makers' Association. In the department of rubber toys, The Mitatsuchi Rubber Manufacturing Co., The Nippon Rubber Co., Limited, and S. Yamada, director of the "Gomusekai" ("Rubber World") were elected to the council. The office is at Sakuragicho, Shitaya, Tokio.

Rubber manufacturers by hot vulcanization methods in Osaka-Fu and Hyogo-Ken (Kobe district) have organized the Osaka-Kobe Rubber Industry Association. The directors are The Kakuichi Rubber Co., The Chugai Rubber Co., Limited, Teikoku (Imperial) Rubber Manufacturing Co., Limited, Settsu Rubber Co., Limited, Naigai Rubber Co., and Hanshin Rubber Works. The office is at 190, Kita-3 chome, Kamifukushima, Osaka.

Rubber goods traders in Osaka have organized the Osaka Rubber Association. The office is at 190, Kita-3 chome, Kamifukushima, Osaka, the same address as that of the Osaka-Kobe Rubber Industry Association.

Rubber traders in Kyushu have organized the Kyushu Rubber Association, at 43, Shimonishimachi, Fukuoka City. Kyushu is an island to the southwest of Nippon and about the area of Belgium.

About three hundred rubber manufacturers, dealers, crude rubber brokers and scrap rubber dealers in Tokio have organized the Tokio Rubber Association with headquarters at Hamacho, Nihonbashi, Tokio.

Manufacturers in Shibuya, Tokio, have organized the Shibuya Rubber Association with an office at 1309 Shimoshibuya, Tokio.

MARKET PRICES.

Owing to the war, the prices of compounding ingredients have risen from 20 to 200 per cent, while the prices of rubber goods generally have also risen 20 per cent. Since the beginning of this year, the price of naphtha has gradually risen to three-fold in April, and manufacturers of waterproof cloths, nipples, balloons, etc., were obliged to raise their prices from 20 to 35 per cent.

EXHIBITIONS.

The Electric Exhibition was held from March 20 to May 10, and insulated electric wires and cables, insulating tapes, ebonite and rubber goods were exhibited by the Mitatsuchi Rubber Manufacturing Co. (Tokio), The Nippon Rubber Co., Limited (Tokio), Fujikura Electric Wire Co., Limited (Tokio), Nippon Electric Wire and Cable Works, Limited (Tokio), Yokohama Electric Wire Works, Limited (Yokohama), Tsuda Electric Wire Works (Kyoto), Sumitomo Electric Wire Works, Limited (Osaka).

In April, the Chemical Industry Exhibition was held in Osaka and rubber goods were exhibited by rubber traders and manufacturers in Osaka and Kobe.

NEW JAPANESE INCORPORATIONS.

Sumatora Rubber Plantation Co., Limited. Capital, \$1,000,000, one-fourth paid in. Plantation, 5,000 acres; office, 23 Satsumahori-Hirashinocho, Osaka.

Takushoku Rubber Co., Ltd. Capital, \$250,000, one-fourth paid in. Office, 18 Kamiya-cho, Shiba, Tokio.

The Fuji Trading Co., Limited, to trade in crude rubber. Office, 3 chome, Sanjitenkhor, Kyobashi, Tokio.

The Taiyo (Sun) Rubber Co. (Ltd.), originally established on a small scale under the style of The Taiyo (Sun) Rubber Works, has increased its capital to \$250,000 and incorporated as a stock company. Office, Oshimamachi, Tokio.

Masuda Co., Limited. Capital, \$1,000,000. Office, 68-9, 4 chome, Honcho, Yokohama. To engage in general trading, especially in crude rubber. Branch offices in Tokio, Osaka, Kobe, Nagoya, etc., in Japan, and in London (England), Melbourne and Sidney (Australia), Shanghai, Dairen, Tientsin, Hankao (China), Calcutta and Singapore.

Nichinan Rubber Co., Limited. To plant in Johore. Capital, \$100,000, two-fifths paid in. Office, 44 Samoncho, Yotsuya, Tokio.

Shino Rubber Co., Limited. Capital, \$750,000. To plant in Johore. Office, 5 Nishikonyacho, Kyobashi, Tokio.

Borneo Rubber Co., Limited. To plant in Borneo. Capital, \$1,000,000, one-fourth paid in. Office, No. 18, 1, 1 chome, Yurakucho, Tokio.

Chugai Rubber Co., Limited. Capital, \$75,000. To manufacture rubber goods. Purchased The Alenken Rubber Works, situated at Toyosakimachi, Osaka.

Takasago Industry Co., Limited, was established with a capital of \$125,000, one-fourth paid in, purchasing The Taiheiyō Rubber Co., Limited, Tokio, to manufacture rubber goods and electric batteries.

Keihoku Rubber Works. Capital \$10,000. Purchased The Eastern Rubber Co., Tabata, Tokio. To make rubber toys, etc. Johore Rubber Co., Limited. Capital, \$125,000. Purchased T. Okabe's plantation in Johore. Office, 4 Maruyacho, Kyobashi, Tokio.

Fuji Rubber Manufacturing Co., Limited. Capital, \$1,000,000, one-fourth paid in. Office, Oi-machi, Tokio, to manufacture patent rubber spoppers and tires in which rubber sponge stock replaces the inner tube.

Sakura Rubber Co., Limited. Capital, \$250,000. Office, No. 10 Gofukucho, Tokio. To manufacture rubber goods.

Takasago Rubber Co., Limited. Capital increased to \$90,000. Products, rubber balls, tubing, etc. Office and works, Zoshigaya, Tokio.

Nankoku Rubber Co., Limited. Capital, \$50,000, one-fourth paid in. Baron H. Shimazu is president.

Nan-a Co., Limited. Capital, \$500,000. Amalgamated with the Malay Rubber Plantation Co., Limited. Capital, \$250,000, both being Japanese rubber plantation companies in Malaya.

Victor Rubber Co., Limited. Capital, \$30,000, one-fourth paid in. To make air pillows, ice bags, etc. Office, 187 Tsunohazu, Yodobashi, Tokio.

Tokio Belt Co., Limited. Capital, \$150,000, one-fourth paid in. Office, 101 Taniyama, Asaki, Tokio. To manufacture rubber belting and other rubber goods.

Hanto Rubber Co., Limited. To plant rubber in the Malay Peninsula. In August it was dissolved because of the law prohibiting the sale to foreigners of land in Malaya. The remaining business is to be settled by the liquidator of the company in Kobe.

Nitto Rubber Co., Limited. Capital, \$250,000, one-fourth paid in. Office, Makino, Nagoya, to make rubber tires.

Yachiyo Rubber Co., Limited. Capital, \$125,000. Purchased Hanokhu Rubber Co., Osaka, to manufacture rubber goods. Office, 1, Yurakucho, Kyobashi, Tokio.

HEVEA RUBBER IN FORMOSA.

Experience indicates that *Hevea* trees are more successfully grown in Formosa than *Manihot* trees. On the Murai plantation *Manihot* was first tried, and camphor trees were planted in alternation to provide a shield from the wind. Hurricanes are of annual occurrence, and despite the interplanting, the *Manihot* trees were greatly damaged. *Hevea* was then tried with better success, but they require seven years to attain the tapping age as against five years in Malaya.

FREIGHT ON RUBBER FROM JAVA TO AMERICAN PORTS.

A considerable decrease in freight rates from Batavia to San Francisco has recently taken place, said to be due to Japanese competition. A comparison of the figures shows the amount is almost 25 per cent.

Rubber	Unit	San Francisco		New York	
		Jan. 1, 1918	Jan. 1, 1919	Jan. 1, 1918	Jan. 1, 1919
	40 cubic feet	\$62.71	\$36.18	Unit	'Cubic meter ¹
					\$55.88

¹A cubic meter is 35.3 cubic feet.

Balata and Rubber Enterprises in the Guianas.

Special Correspondence.

A NEW BALATA ENTERPRISE.

SOME changes for the better have taken place in the balata industry in Surinam during the year. Several valuable concessions have exchanged hands and are now held by the Consolidated Rubber and Balata Estates, Limited, a British Guiana concern. The Consolidated is to operate this new enter-

EXPANSE OF STILL WATER, UPPER MARONI.

prise on a gigantic scale; every available part of the acquired lands that has the "goods" will be exploited, the object being to take out the balata as soon as possible. In other words, the company intends to rush matters.

This will mean thousands of dollars to the local trade; the laborers must be fed, and provisions purchased in the local market. When the men return to town and receive their wages it is all spent in the street, and the stores will derive all the benefit from this new source of revenue. It is said the purchase price paid to the sellers was \$30,000 cash, and this amount is considered, by people who know, as being very reasonable. The concessions are situated in the Nickerie district of the colony and are well known to be rich in wood and easily reached from New Town, the starting point.

PRODUCTION IN 1918.

On the whole, 1918 was a prosperous year for the industry, and all the concerns operating made more or less satisfactory returns on the capital invested. The Balata Company Surinam, for instance, cleaned up a big crop which realized high prices. The firm of A. F. C. Curiel, operating with United States capital, did well; in fact, they all made money, while the smaller undertakings have also no cause to grumble.

The total production for 1918 was 663,930 kilograms of which were exported as follows: To United States, kilos, 26,891; Great Britain, 24,385; sold to the Consolidated in British Guiana, 573,746; total exported, 625,022.

Balata undertakings in Dutch Guiana have always proved veritable gold mines to those companies operating with experienced bleeders and with good administrative head men who studied the conditions before starting in. A short sketch of what is most required to make the venture a success will, therefore, be interesting.

HOW CONCESSIONS ARE SUCCESSFULLY OPERATED.

The land which is granted by the Government must be paid for in advance. Charts are necessary to indicate the position

of the land; these also must be paid for in advance. Then comes the prospecting party which consists, generally, of 20 men and a foreman, to each of whom is advanced a sum of money. Provisions and implements are purchased to feed and keep the men busy at prospecting for three months. Boats are either built or hired to convey the party to the fields. If the lands are situated on the Maroni, the transportation of men and provisions costs much higher than in any other district, owing to the rapid state of this river which entails hiring Indians or lush negroes to take the party over the falls. This means of transport generally costs \$10 per man and the same sum for every hundred kilos of freight. Each boat can carry no more than five men and five hundred kilos of freight, which also includes the baggage of the laborer.

When the party reaches the spot where operations for prospecting are to take place, the men are sent out in every direction; lines or paths are cut through the forests by means of the cutlass and every tree encountered is marked and noted down so that the foreman at the end of the prospecting term can tell more or less the number of trees to each hectare of land. With this knowledge at its disposal the company, before exploiting or bleeding operations begin, will know exactly what the production will be at the end of a season, conditions, of course, being normal. In this way, therefore, it can be plainly seen that one can tell more or less what to expect from a concession of 40,000 hectares with, say, 20 trees to the hectare.

BALATA INVESTMENTS ARE SOUND.

Dutch Guiana balata investments are sound ones and many have reaped fortunes from this source. In the Nickerie district, for example, there are two full-blooded negroes who, ten years ago, were ordinary bleeders. To-day they are well-to-do men, being worth, individually, about \$200,000 cash, owning landed property valued at \$150,000. These two men are the exception, for the general run of the balata men are "wasters" and drunkards, with never a cent to show after being a week in town.

According to the new balata laws, which came into force not very long ago, only men with some capital will be granted lands by the Government, for the reason that the responsibility is great. For instance, in the case of a company operating a concession with, say, 500 laborers, the Government must be satisfied that after the contract time of these men has expired, their wages will be paid in full the day after their arrival in the city from the concession. In the past, several poor men were made victims by dishonest and unprincipled employers; all this, however, is past and the new laws protect both employer and employee.

THE INDUSTRY IN FRENCH GUIANA.

In French Guiana the industry is prospering. A syndicate at the head of which is M. Galmot, well known in United States society and a popular Paris journalist, is doing wonders on the Maroni. This concern has employed an able balata foreman, John Moses, for years in the employ of the Balata Company Surinam, where he made good. Mr. Moses is placed in charge of the syndicate's affairs and has men and means at his disposal to run the enterprise according to his own judgment. Several hundred bleeders are scattered all over the different concessions on the Maroni and its tributaries and have, up to the date of writing, made ample use of their time by producing a tremendous quantity of gum which, when prepared for market, will amount to several hundred thousand kilograms. French Guiana will, in a comparatively short time, become a rival to both

British and Dutch Guiana. The forests are practically virgin and the fields of operation extensive.

THRIVING HEVEA PLANTATIONS.

Cultivated *Hevea brasiliensis* in Dutch Guiana compares favorably with rubber estates in the East, says a Dutch official who arrived recently from Java and was impressed with the robust and healthy condition of the trees in this country. Hardly any tapping operations have taken place during the last three years owing to the war and the restrictions on the export of rubber. In June last year, however, one estate, as an experiment, put on a gang of Javanese bleeders for a few months, and the results were so satisfactory that the owners have now decided to tap the trees regularly in future. This experimental tapping produced 1,718 kilograms of biscuit of the finest quality.

It is expected that all the rubber-producing plantations will begin operations this year, and if weather conditions are satisfactory the production will startle the rubber producers of the East. It must not be forgotten that only yesterday the colony began to talk rubber and is therefore young in the business in comparison with other countries. The colony is to be congratulated on its soil and climate; they are ideal for the industry and if the price of rubber remains stable there will still be good money to be made by rubber planters in this part of the world.

There are fully a million trees of tappable size in Surinam that have never been touched by the knife; they are just "fat" with latex, and are fine specimens of *Hevea brasiliensis*. It is a pleasure to visit some of the estates and see these valuable productions of nature. A fact which should be recorded is that for the last eighteen months the leaf disease has not been seen in the country; it is entirely eradicated and it is anticipated that, through measures adopted by the Agricultural Department, the disease will never make its appearance again.

In conclusion, Dutch Guiana would make an ideal spot for Americans, it is so well situated; the climate is charming, the resources so numerous, the chances for money-making so certain, that it would be a pity to allow such a country to go to ruin when the United States has the millions to make it one

TRAIL THROUGH THE BUSH TO BALATA CONCESSION.

of the most prosperous countries in South America. Why doesn't Uncle Sam make a bid for it? Holland undoubtedly realizes the desirability of a transfer to the United States of her West Indian possessions at this time, especially when she contemplates the expense she is called upon to meet each year for their up-keep. To quote the words of Dr. Schick in "Onz Land":

"America can better develop the resources of the West Indies than the Netherlands, and when people begin to talk of how many millions they will ask, they are on their way to acceptance of the proposition."

MISCELLANEOUS FOREIGN NOTES.

BALATA AND RUBBER EXPORTS FROM BRITISH GUIANA.

THE amount of balata and rubber exported from British Guiana to England and the United States during the ten months ended October 31, 1918, as compared with the corresponding ten months of 1917, is as follows:

	1917.	1918.
Balata pounds	1,015,474	575,081
Rubber	12,113	19,173

The production of balata decreased because the dry season set in earlier than usual, stopping the flow of latex. At the same time, the stocks on hand at the end of October were not above normal for that season of the year.

RUBBER IN DUTCH GUIANA.

Rubber production in Dutch Guiana decreased about 50 per cent in 1917, owing to plant diseases and lack of the right kind of labor, but ruling prices were high. In 1916, 23,861 pounds were sold for \$23,861; in 1917, 9,354 pounds produced \$5,102.

Balata production increased 261,201 pounds in 1917, 1,952,643 pounds being produced as against 1,692,442 in 1916. Prices varied during the year, changing on the London market from 70 to 95 cents per kilo and in New York from 72 to 95 cents.

RUBBER MANUFACTURES IN PERU.

Imports of rubber manufactures increased notably during 1917, notwithstanding the difficulties of shipment. The amount imported in 1917 was valued at \$1,002,288. In 1916 the imports amounted to \$107,817.

Export figures, however, show a decrease of approximately 25 per cent, doubtlessly due to inadequate shipping facilities. Crude rubber exports during 1917 were valued at \$2,812,640, as against \$3,391,459 in 1917.

BRITISH SOUTH AFRICAN IMPORTS AND EXPORTS, 1916-1917.

Statistics covering the imports and exports of British South Africa show the following comparison:

IMPORTS.			
	1916.	1917.	
India rubber, including tires.....	\$2,531,286	\$2,805,099	
Machinery, bands and belting.....	86,155	88,696	
Conveying hose	401,311	288,122	
Totals	\$3,796,752	\$3,981,917	
EXPORTS.			
Rubber goods and gutta percha:			
To United Kingdom.....		\$1,365,553	
United States		738,944	
Italy		281,683	
Total		\$2,586,180	

Since the entry of the United States into the war, no discrimination has been made against American goods, although there is naturally some preference for products of British manufacture in some quarters. Most important importers, however, handle American products. Rubber tires are also imported from Japan.

RUBBER EXPORTERS IN BATAVIA.

The Bureau of Foreign and Domestic Commerce can supply a list of exporters of rubber at Batavia if reference is made to file number 9546.

RUBBER IMPORTED INTO AUSTRALIA AND SOUTH AUSTRALIA.

Import figures for Australia and South Australia show that Australia imported rubber goods during the year 1917-1918 amounting to \$5,370,085, a slight gain over the figures for 1916-1917, \$5,274,921. During the year 1916-1917, South Australia imported rubber and rubber goods to the value of \$286,413.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED MARCH 18, 1919.

- N**O. 1,297,316. Demountable rim for tires. J. A. Berland, St. Paul, Minn.
- 1,297,338. Demountable rim for tires. G. B. Filmer, Moose Jaw, Saskatchewan, Canada.
- 1,297,405. Armored inner tube. H. H. Schuster, Chicago, Ill.
- 1,297,462. Fountain pen. J. F. Siegienski, Thorp, Wis.
- 1,297,648. Swimming device. R. N. Bressler, New York City.
- 1,297,694. Squirrel roller. L. Kindling, Milwaukee, Wis.
- 1,297,725. Quick detachable dust-cap for tire valves. M. F. Patton, Tuscaloosa, Ala., assignor to A. Schrader's Son, Inc., Brooklyn, N. Y.
- 1,297,824. Cap for valves. H. Fuchs, St. Louis, Mo.
- 1,297,834. Composition rubber sole for boots and shoes. J. E. Grosjean, Lima, assignor by direct and mesne assignments of $\frac{1}{4}$ to L. F. Montgomery, Fort Recovery, and $\frac{1}{4}$ to F. L. Maire, Lima—all in Ohio.
- 1,297,902. Resilient tire. N. C. Pellissier, Scammon, assignor of $\frac{1}{2}$ to A. Luckey, Columbus—both in Kansas.
- 1,297,922. Arch support for shoes. C. L. Skinner and P. A. Tucker, Chicago, Ill.

ISSUED MARCH 25, 1919.

- 1,298,050. Demountable rim for tires. O. J. Jobski, assignor to The Standard Parts Co.—both of Cleveland, O.
- 1,298,089. Overshoe with rubber sole, etc. M. L. Paterson, Wilmette, Ill., assignor to Converse Rubber Shoe Co., Malden, Mass.
- 1,298,104. Rubber-heel lift with sockets for inserting means of attaching to shoes. G. Schrade, New York City.
- 1,298,117. Metallic packing containing cubical particles of rubber composition. J. G. Sirock, Pittsburgh, Pa. (Original application divided.)
- 1,298,139. Double suction cup. C. M. Wolcott, New York City, assignor of $\frac{1}{4}$ to S. and L. Myerberg, Baltimore, Md.
- 1,298,213. Tire casing. G. E. Hottenstein, Miami, Ariz.
- 1,298,226. Fountain pen having two ink reservoirs, joints, etc. E. Gessmann, Union Hill, N. J.
- 1,298,335. Brake lining. C. H. Gunn, Sacramento, Calif.
- 1,298,404. Gas-mask respirator. H. Romanoff, New York City.
- 1,298,423. Gaiter-drying device with elastic strap. E. M. Trinks, Pittsburgh, Pa.
- 1,298,551. Rubber-shoe sole with tread and shank portions. F. A. Nolan, St. Paul, Minn.
- 1,298,581. Reliner for pneumatic tires. H. W. Shaar, Monroe, Wash.

ISSUED APRIL 1, 1919.

- 1,298,633. Combination shaving set having brush embedded in hard rubber. S. Alland, Boston, Mass.
- 1,298,639. Eraser with brush attachment. J. Auld, Chicago, Ill.
- 1,298,660. Resilient wheel. A. Cardoso, Milan, Italy.
- 1,298,661. Tire casing and method of manufacture. A. L. Case, Plainfield, N. J.
- 1,298,670. Chewing gum containing caffeine to produce bracing effect of coffee. S. W. Cramer, Charlotte, N. C.
- 1,298,673. Dental plate having suction-cup attachment. C. De-Felice, New York City.
- 1,298,713. Crutch having pneumatic cushion between tip and foot. G. Hipwood, Boston, Mass.
- 1,298,715. Armored pneumatic tire. A. Cruzan, Lawrence, Kans.
- 1,298,945. Inner tube for tires. H. M. Henning, Hindley, Calif.
- 1,299,005. Tire shoe for pneumatic tires. H. E. Motl, Houston, Tex.
- 1,299,037. Resilient heel with pneumatic cushion. A. L. Runyan, Omaha, Neb.
- 1,299,075. Gas mask. P. Wasylowich, Chelsea, Mass.
- 1,299,092. Rubber hand-hall having 14 faces to cause rebound in unexpected direction. J. Abrahamson, Asbury Park, N. J.
- 1,299,112. Tread for pneumatic tires. T. Bradshaw, Oakland, Calif.
- 1,299,167. Pneumatic tire having cord element between casing and air tube. J. R. Gammett, Akron, O., assignor to The B. F. Goodrich Co., New York City.
- 1,299,253. Screw-clamp for tires. J. A. and E. E. Sowell, Sacramento, Calif.
- 1,299,305. Tire casing with side flaps and tread member laced together. W. G. Deane, Niagara Falls, N. Y.
- 1,299,352. Demountable wheel rim for tires. L. F. Jordan, Portland, Me.

ISSUED APRIL 8, 1919.

- 1,299,450. Demountable rim for tires. H. I. Foster, assignor to Hydraulic Pressed Steel Co.—both of Cleveland, O.
- 1,299,451. Demountable rim for tires. H. I. Foster, assignor to Hydraulic Pressed Steel Co.—both of Cleveland, O.
- 1,299,472. Demountable rim for tires. E. C. Horni, Dayton, O.
- 1,299,541. Demountable clutch-rim for tires. E. K. Baker, assignor to Universal Rim Co.—both of Chicago, Ill.
- 1,299,576. Stylographic pen. C. N. Hosinger, Jersey City, N. J.
- 1,299,642. Fountain pen. W. A. Welty and H. P. Ravn, Waterloo, Ia.

- 1,299,650. Sole and heel for shoes, composed of wood blocks and fibrous material embedded in a rubber matrix.
- 1,299,722. Cushion wheel. M. T. Haulter, Shippensburg, Pa.
- 1,299,836. Fountain pen. B. R. Jolly, Raleigh, N. C.

- 150,066. Armored pneumatic tire. C. W. Bain and R. I. Brown, assignees of J. interest—both of High Point, N. C., U. S. A.

ISSUED MAY 6, 1919.

- 150,094. Pneumatic pad for arch supports. T. Coffey, Tulsa, Okla., U. S. A.
- 150,115. Toy ball having a whistle and rattle, the representation of a face on its surface, the semi-spherical covers, each having a portion at its center vulcanized. C. O. Griffin, Newbern, N. C., U. S. A.
- 150,127. Tire valve. W. C. Huntson, Providence, R. I., U. S. A.
- 150,134. Pneumatic insole for shoes. M. Korbel, South Bethlehem, Pa., U. S. A.
- 150,161. Syringe. J. P. Richards, Toronto, Ont.
- 150,191. Inner tube for tires. The Crown Perfection Tube Co., New York City, assignee of J. J. Voorhees, Jersey City, N. J.—both in U. S. A.
- 150,192. Battery jar of vulcanized rubber. The Canadian Consolidated Rubber Co., Limited, Montreal, Que., assignee of H. Weida, Highland Park, N. J., U. S. A.
- 150,205. Dust cap for valves. A. Schrader's Son, Inc., New York City, assignee of W. B. Burke, Cleveland, O.—both in U. S. A.
- 150,215. Spring wheel with solid rubber tire. E. E. McNeely and H. Gordon, assignee of J. interest—both of Waldron, Ind., U. S. A.
- 150,222. Artificial foot with rubber cushioning pads. C. B. Winn, Buffalo, N. Y., U. S. A.

ISSUED MAY 13, 1919.

- 190,231. Tire valve. M. C. Schweinert, West Hoboken, and H. P. Kraft, Ridgeport, both in New Jersey, U. S. A.
- 190,238. Tire filler composed of small particles of rubber, cement, gasoline, and kerosene, molded and subjected to pressure. E. F. Aycock, Midlothian, Tex., U. S. A.
- 190,288. Tire rim. S. P. Michael, Frankfort, Ind., U. S. A.
- 190,333. Pneumatic tire. O. Zancan, New York City, U. S. A.

THE UNITED KINGDOM.

ISSUED APRIL 2, 1919.

- 122,694. Collapsible crutch with rubber ferrule. R. T. Kelly, The Nook, Walton Park, Liverpool.
- 122,777. Drinking cup for vacuum flasks, with rubber band. F. Price, Meate Road, Athlone, Ireland.
- 122,806. Mattress with inflatable sections. F. W. Brampton, Steel Stampings, Limited, Cookey, near Kidderminster, Worcester-shire.
- 122,904. Solid rubber tire with side recesses. Dunlop Rubber Co., 14 Regent street, Westminster, and C. Macbeth, Dunlop Rubber Co., Para Mills, Aston, Birmingham.

ISSUED APRIL 9, 1919.

- 123,011. Knife for tapping rubber trees. T. W. Newey, 9 St. Mary's Row, Birmingham.
- 123,142. Resilient wheel. A. W. Benjamin, Yarker, Ont., Canada.
- 123,143. Multi-core electric cable. A. W. Downton, Lesney View, Erith, Kent.

ISSUED APRIL 16, 1919.

- 123,166. Sock having layer of paper, powdered cork, sawdust, etc., covered with layers of waterproofed fabric whose rubberized surface is inside or outside, according to whether the socks are to be worn by persons with cold or hot feet. S. Abraham, 16 Marshall Place, Chesham Hill, Manchester.
- 123,174. Pneumatic or inflated disc-wheels with or without streamline shield, for deadening shock of airplane landing. Dunlop Rubber Co. and W. H. Paul, Para Mills, Aston Cross, Birmingham.

- 123,221. Protector for soothing teats or nipples for nursing bottles. E. C. B. Marks, 57 Lincoln's Inn Fields, London.
- 123,239. Elastic tabs for suspenders. C. G. Hall, 13 Fosters Gardens, Haslemere, Surrey.
- 123,284. Rubber blocks for wheel tires. E. W. Edwards, Akron, O., U. S. A.
- 123,291. Detachable rim or double rim for tires. T. J. Hobson, 17 Chain Walk, Aston, Birmingham.
- 123,358. Rubber pads with removable metal studs, for adapting tractor wheels for use on hard roads or soft land. W. L. Bodman, Lydiate Ash, Bromsgrove, Worcestershire.
- 123,382. Life-saving garment with inflatable pouch. J. S. Drew, 49th Australian Camp, Stockbridge, Hampshire.

ISSUED APRIL 24, 1919.

- 123,487. Protector for boots and shoes, consisting of a revoluble rubber pad backed with canvas and having an embedded plate for the securing screw. C. N. Chamberlain, Chowpatty, Bombay, India.

ISSUED APRIL 30, 1919.

- 123,608. Rubber-coated vulcanized fiber sheets for use instead of metal plates for bolting, pressing, etc., or for the construction of vessels or utensils ordinarily made of tin. A. D. Spicer and J. Spicer & Sons, 50 Upper Thames street, London.
- 123,745. Breast pump. O. O. R. Schwaetky, 157 Terrace avenue, Hasbrouck Heights, N. J., U. S. A. (Not yet accepted.)
- 123,789. Foundation band for solid rubber tire, having inner edge formed with grooves to reduce the weight. Dunlop Rubber Co., 14 Regent street, Westminster, and H. C. Young, The Grove, Chester Road, Erdington, Birmingham.

TRADE MARKS.

THE UNITED STATES.

- N^O. 106,818. The word BELMATE—machinery composition packing. The Belmad Packing & Rubber Co., Limited, London, England.

CHART SHOWING FLUCTUATIONS OF THE LONDON CRUDE RUBBER MARKET FOR THE YEARS 1911 TO 1918, INCLUSIVE.

Review of the Crude Rubber Market.

NEW YORK.

DURING the past month the prevailing tone in the crude rubber market has been one of dullness, the price for plantations has been remarkably steady. Early in the month the spot plantations were depressed owing to oversupply. The prices were firm, however, due to advices from London and the Far East where the markets were higher.

About the middle of the month there was a decline of about one cent per pound on first latex, followed by a tendency to advance, owing to a demand for future deliveries.

The month closed dull with quotations nominal.

PLANTATIONS. May 3, first latex crepe, spot 47 cents; May arrivals, 48 cents; July to September arrivals, 48 cents; July to December arrivals, 48 cents; January to December, 1920, 51 cents. On May 23 the prices were: first latex crepe, spot, 46½ cents; July to September arrivals, 47 cents; July to December arrivals, 47½-48 cents. January to December, 1920, 49 cents.

May 3, spot ribs, 46 cents; May arrivals, 46 cents; July to September arrivals, 47 cents; July to December arrivals, 47 cents; January to December, 1920, 50 cents. On May 23, spot ribs were 45½ cents; July-September, 47 cents; July-December, 46½-47 cents, and 1920 futures, 50 cents.

May 3, Amber gristly crepe was quoted at 41 to 44 cents for nearby and 43 cents for July to December arrivals. On May 23 this grade was quoted, spot 41-44 cents; July to December arrivals 44 cents; 1920 futures 44 cents.

May 3, No. 1 roll brown crepe, spot, 34 cents; nearby, 31 cents; July to December arrivals, 30 cents; May 23, No. 1 roll brown crepe, spot, was 32-34 cents; July to December arrivals, 32 cents.

PARAS. Spot prices on May 3 were: Upriver fine, 56½ cents; islands fine, 47 cents; upriver coarse, 35 cents; islands coarse, 21 cents; Cameté coarse, 23 cents; May 23, spot prices were: Upriver fine, 56 cents; upriver coarse, 34 cents; islands fine, 47 cents; islands coarse, 34 cents; Cameté coarse, 22½ cents.

RECLAIMED RUBBER.

The market for reclaimed rubbers of every grade has remained dull for the past two months. Consumers continue to purchase only for immediate needs and special requirements.

Present prices at which scrap rubber is held by dealers practically forbid its conversion by reclaimers into products that can compete with crude rubber. Thus a situation is created disadvantageous to the trade on all sides which ultimately probably will be relieved by mutual concessions.

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report (April 10, 1919): Influenced by early shipping opportunities for America, the weekly rubber auction opened yesterday with a strong demand for all grades, which was continued throughout the sale. Prices, although showing considerable advances on the week, are generally below the level of business reported prior to the opening of the auction. The demand for fine pale crepe was a feature of the market, and this grade sold up to 79 cents, an advance of 2 cents on the previous week. Fine ribbed smoked sheet opened at 77½ cents and firmed up to 78½ cents (one small lot sold for 79 cents) on the second day, showing an advance of 1 cent. Off quality crepe and sheet found ready buyers at a few cents up. Darker grades crepe were steady round about previous values, while dark and barky grades recorded a further advance.

The quantity on offer was unusually small, the total catalog being only 971 tons, of which 621 tons changed hands.

The following is the course of values:

	In Singapore per pound	Sterling Equivalent per pound in London.
Sheet, fine ribbed smoked	76c	28½c
Sheet, good ribbed smoked	70c	25½c
Sheet, plain, unsmoked	60c	22c
Crepe, fine pale	77c	28c
Crepe, good pale	71½c	26½c
Crepe, fine brown	64c	23c
Crepe, fine brown	64c	23c
Crepe, good brown	54c	20c
Crepe, dark	35c	12½c
Crepe, bark	21½c	8c
Scrap, virgin and pressed	21½c	8c
Scrap, bark	35c	12½c

(Quoted in S. S. Currency.)

RUBBER EXPORTS FROM THE FEDERATED MALAY STATES.

A report from Kuala Lumpur states that the export of rubber from the Federated Malay States in the month of March amounted to 10,679 tons, which compares with 10,809 tons in February and 7,709 tons in the corresponding month last year. The total exports for the first four months of the year is 50,273 tons, as against 15,494 tons last year and 18,356 tons in 1917. Appendix 1 shows the comparative statistics for three years.

Appendix 2 shows the comparative statistics for three years:

	1917.	1918.	1919.
January	5,995	7,388	7,163
February	7,250	6,820	10,809
March	7,088	7,709	10,679
TOTALS	20,333	22,117	28,651

STRAITS SETTLEMENTS RUBBER EXPORTS.

A report from Singapore states that the export of cultivated rubber from Straits Settlements in the month of March amounted to 20,908 tons, the highest on record for one month—compared with 15,661 tons in February and 8,555 tons in the corresponding month last year. The total export for the first four months of the year is 50,273 tons, as against 15,494 tons last year and 18,356 tons in 1917. Appendix 1 shows the comparative statistics for three years.

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

The anticipations of the dealers, noted a month ago, that the scrap rubber trade would soon develop signs of improvement, have not been realized. Conditions are practically stagnant as regards the demand for scrap by the reclaimers, who decline to buy except for actual needs and are not paying the prices demanded except for shoes. The dullness of crude rubber apparently has more influence on the scrap market than has the supply of scrap. Some dealers are turning to the business of selecting repairable tires for selling to tire rebuilding plants and pulling tire fabric for the repair trade.

BOOTS AND SHOES. The movement has been very slow. Prices have held firm.

INNER TUBES. The market has been practically inactive.

MECHANICALS. Very little demand. Prices nominal.

TIRES. The demand is very slight, at about 4 cents.

QUOTATIONS FOR CARLOAD LOTS DELIVERED.

MAY 24, 1919.

Prices subject to change without notice.

THE MARKET FOR COTTON AND OTHER FABRICS.
NEW YORK.

THE American staple market has been quite active and prices have advanced, due to a general demand both here and abroad. On April 17, middling spot was 28.65 cents and July deliveries, 25.80 cents. May 20, the spot quotation was 31.75 cents and July deliveries, 29.68 cents. These figures show an approximate advance in future cotton of \$20 a bale.

Tentative estimates point to a reduction of 11.2 per cent in this year's cotton acreage. Rains and cool weather have prevented planting and plowing, and labor is scarce, hence the season is about 10 days late. The prospects, however, are better than a year ago and unless heavy replanting becomes necessary, a good yield seems assured.

Egyptian prices are unchanged. It is reported that the Cotton Control Commission in Egypt will go out of existence on July 31. It is also understood that trading in Egyptian futures will be resumed in Liverpool beginning June 2. Present quotations are 50 cents c. i. f. Boston for a medium grade of Sakel and 45 cents c. i. f. Boston for a medium grade of uppers.

SEA ISLAND COTTON.—John Malloch & Co. report a better demand during the month and prices have advanced. Prices are very strong, 57 cents being quoted for average extra choice. There is not a great deal of desirable cotton left in the South and such as there is appears to be in very strong hands. The outlook for the present crop as regards acreage is a little better than was anticipated a month ago and should everything go well

the crop would make about 50,000 rather than 30,000, which was the earliest estimate. However, to offset the increased acreage, there are reports of weevil which is very unusual at this early stage of the crop. If these reports are true, it is doubtful if 50,000 bales or anywhere near it can be made.

COTTON FABRICS.—The general demand has been good in all lines and prices have been substantially advanced. The mills are confronted with increasing cost of raw materials and labor is high and scarce, all of which accounts for the inclination on the part of cotton goods manufacturers to withdraw from the market.

NEW YORK QUOTATIONS.

THE MARKET FOR CHEMICALS AND COMPOUND INGREDIENTS.

NEW YORK.

THE MARKETS for the base metals, pig lead and spelter, have been very dull for the most part during the past month. A considerable decline in values took place in both pig lead and spelter, the prices regaining firmness and an upward tendency toward the middle of May.

ANILINE. There was a good volume of trade early in the month followed by lessened demand and a tendency to lower the price, which reached 21 cents per gallon.

DRY COLORS. The market for dry colors remains dull and prices unchanged. Manufacturers are optimistic, however, looking for improved demand.

BARYTES. The demand showed some improvement followed by steady domestic and good export demand. The price remained practically fixed.

BENZOL. The demand throughout the past month has been good at about 22 cents per gallon.

CARBON TETRACHLORIDE. The demand has been small and prices weak, falling to 12 cents per pound.

LITHOPONE. The month's business has been satisfactory with continuing good demand. The price holding steady at 6½ cents for carload lots.

LITHARGE AND SUBLIMED LEAD. There has been no change in prices, and none is anticipated till the usual mid-year revision.

WHITING. There has been a good demand, with no scarcity of material, at a steady price level.

ZINC OXIDE. The demand has been active the entire month. Prices remain unchanged and are likely to remain so until the end of the quarter.

NEW YORK QUOTATIONS.

MAY 24, 1919.

Prices subject to change without notice.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**TRADE ASSOCIATIONS AND COMPETITION.**

THE BUSINESS MAN patiently and patriotically submitted throughout the war while the conduct of his business was taken from him through government control of raw materials, fuel, transportation, distribution, prices and capital. The war is ended and business and industry need free rein, not gradually but immediately.

Franklin D. Jones, counsellor-at-law at Washington, points out in an address to the American Academy of Political and Social Science of Philadelphia, that it is vitally to the interest of industry that competition, free, fair and unrestricted, be reestablished. "Just as the trade associations, through their war service committees," he says, "rendered invaluable service to the Government and their industries during the period of government control, so now they can become a great and constructive factor in the maintenance of competition."

He points out that one of the great faults of the trade association in the past was that it concerned itself largely with control of prices, curtailment of pro-

duction and division of territory, but that its action too often was dictated by desperation of its members over conditions which threatened the ruin of the industry. Mr. Jones declares it is beyond dispute that American industry must now direct its efforts toward securing the greatest possible efficiency in production and distribution because considerations of world competition as well as domestic conditions demand it.

The facing of mass competition in foreign trade, the fight of industrial interests of one nation against another must be met. Against these Mr. Jones insists that American industry must present a united front and that an association of associations in the United States such as the Hansabund of Germany and the Union of the Metallurgical and Mining Industries of France should be considered. "A similar organization in America founded on right principles and having behind it the unlimited resources and resourcefulness of American industries could become a great constructive force in national and international affairs," he says in conclusion. "In the absence of international regulation of international trade, it is a national necessity."

TO PROTECT AMERICAN RIGHTS IN MEXICO.

BECAUSE of the chaotic conditions that have existed in Mexico during the past eight years with such disastrous effect upon lives and property in that country, there has been organized in the United States the National Association for the Protection of American Rights in Mexico, with headquarters in New York City. Its purposes are to make a coordinated effort to prevent repetition of the gross injustices that have been committed in that country, and to assist in removing the causes of friction between the United States and Mexico.

Further development of Mexico's resources, with increased revenue to the Government, reestablishment of its credit, employment for its people, and an assured food supply are largely dependent upon the continued help of American capital and enterprise, neither of which will be available for this purpose until there is an effective, practical and friendly recognition by the Mexican Government of its obligation to protect American and other foreign rights.

To this end the Association will keep accurate records of conditions in Mexico, will collect data regarding foreign industries there and keep informed concerning all decrees, laws, and regulations affecting American rights, in order to be prepared at all times to take and prosecute vigorously such legitimate steps as may be necessary for their protection. A study of the situation from the historical, legal, and economic standpoints will also be made in order to furnish accurate information to the United States Government and to American industry.

Nation-wide membership is essential and hundreds of leading firms from coast to coast, including several rub-

ber companies, have joined. Active membership includes corporations, associations, partnerships or individuals who have active or inactive property or business interests in Mexico. All others in sympathy with the purposes of the association are eligible as associate members.

WORKS COMMITTEES AND THE LIKE.

THAT there is a revolution on in the labor world none will deny. That it is likely to be a peaceful one, at least in America, is also more than probable. The fact that except for strikes, warranted and otherwise, labor is getting what it asks for without violence is largely due to the broad views held by industrial leaders who for the past few years have in every way possible given to the workman comforts, privileges and care that a generation ago would have been deemed foolish and superfluous. In other words, the heads of companies besides their loyalty to their business are showing a friendship, a loyalty to labor that is as complete as it is sincere.

The response of the workman to this attitude is what will determine the future relations between employer and employes. If the worker cares nothing for his work, his company, his "boss"; if he is ever ready in fault-finding, in unfair demands; if suspicious; is indeed a slacker, the relation will be no better than before, indeed, will be worse.

Loyalty to the workman calls for loyalty from the workmen, and until it is shown there can be no real industrial progress.

A SOUND PLAN OF PATENT REFORM.

IT has often been asserted that the failure of Congress to provide adequate forces and facilities for granting patents that really protect is due to the fact that the situation has not been particularly brought to its attention. If that be true, something may perhaps be accomplished if the inventors, manufacturers, and others who have suffered under our present patent system will make known to their representatives in both branches of Congress that they approve the movement to remedy conditions which is being conducted by the Patent Committee of the National Research Council, and which has the endorsement of the Patent Office Society. The committee is composed of some of the leading inventors, scientists, engineers and patent attorneys of the country and its recommendations are entitled to full acceptance and general support.

The Patent Committee proposes the following program of four features believed to be of fundamental importance: (1) the establishment of a single Court of Patent Appeals to take over the appellate jurisdiction now lodged in the nine independent Circuit Courts of

Appeal; (2) the establishment of the Patent Office as a separate institution independent of the Department of the Interior; (3) an increase in the personnel of the Patent Office to enable it to render prompt and efficient service and an increase in the salaries to approximate those paid in outside patent work, so that qualified examiners may be kept in the public service; (4) a change in the law relating to damages in infringement suits to answer one of the most common and strongest reproaches against the patent system, namely, that a patent does not ordinarily pay the inventor any money.

Apparently the passage of this legislation would go a long way toward eliminating the evils of our patent system, tending to facilitate prompt determination of patent rights and to avoid unnecessary litigation. Patentees of rubber articles, processes, and machinery have frequently resorted to the courts at great expense to protect their rights and will doubtless be numbered among the staunch supporters of the proposed legislation.

A MASSACHUSETTS MANDATORY.

A BILL that will doubtless be passed by the Legislature of Massachusetts points the way toward Americanization in a manner wholly wise and most comprehensive. It relates to the employment of persons unable to speak or write English in the factories and larger mercantile houses. It provides that after January 1, 1921, such persons between the ages of 21 and 40, whose education does not equal the fourth grade in the grammar school shall not be permitted in any place where more than 25 persons are employed. There is the further provision that three hours a week of schooling for at least 40 weeks in the year in approved schools, shall make such persons eligible for employment. Other states please copy.

EXPANSION OF BUSINESS.

TO STIMULATE investment of private capital in foreign securities in order to cut down government loans to allied countries as soon as possible the United States Government is preparing to furnish investors with information concerning the stability of foreign corporations and their stocks and bonds. The movement is designed to give an impetus to our foreign commerce as well as to help other countries and as such is worthy of commendation. Information concerning credit conditions in other countries will be placed at the disposal of prospective purchasers of foreign securities by the Department of Commerce at Washington. Business men desirous of expanding their business will do well to take advantage of this opportunity.

SEA VIEW GOLF CLUB, ABSECON, NEW JERSEY.

Summer Outing of The Rubber Association of America.

GOLFELLOWSHIP reigned supreme, business was forgotten and competitors affiliated, when 300 or more members of the rubber industry gathered for a day's sport and recreation at the Summer outing of The Rubber Association of America, Inc., that was held at Sea View Golf Club, Absecon, New Jersey, Tuesday, June 24, 1919.

It was 1916 when the last outing was held. While our nation was plunged in warfare there was neither the time nor the inclination for such recreation, but with the armistice in force and the treaty which will insure peace to be signed in a few days at the most, the return to the good old custom seemed proper, and a goodly renaissance it was. New York rubber men were out in force. So were Trenton and Philadelphia. New England was well represented, and so were Akron, Cleveland and the Middle West. The day was perfect,

the sky almost cloudless, and the salt sea breeze tempered the sun's fervid heat.

The Sea View Golf Club House is an imposing structure, ideal in many respects. It has all the appurtenances of a first-class country club, and then some. There are golf-links, shooting-grounds,

tennis courts and ball field, also a swimming pool, and all these were reserved for the guests and were well utilized.

The New York contingent, reinforced with detachments from New England, embarked from the Pennsylvania Station on a special train of

INDUSTRIES.

THE TWO BALL TEAMS.

IMPORTERS

Pullmans, and at Newark and Trenton large representations were added. Arriving at Absecon about 11 o'clock, automobiles and busses conveyed the company to the club-house, where luncheon was served. Then the company separated into groups, each to participate in sports in which he was interested,

GOLF FOURSOMES.

H. B. TUBIN, A. B. CORNELL, C. E. STOKES, E. B. FULPER.

and so the afternoon was spent, in tennis, base-ball, golf, trap-shooting, swimming, etc.

A surprise of the day was the arrival of a Curtiss biplane, which, after doing a variety of stunts over the field in front of the clubhouse, alighted there, and was immediately surrounded by a curious crowd, anxious to get a near view of the air conqueror. Then it was discovered that H. H. Durr, president of the Victor Rubber Co., Springfield, Ohio, had taken this novel means of reaching the club grounds. He was hailed with enthusiastic cheers. Edward L. Bullock thought he would like to take a little flight in the azure, and when he had taken the trip, been tipped on end at the sharp turns, and upside down in the loop-the-loops, and came down safely and enthusiastic, a dozen others followed his lead, much to the monetary emolument of the owners and pilots of the machine. Without an exception, these 12 or 15 men were loud in praise of the trip. It was late in the afternoon when the sports were finished. In fact, the day was hardly long enough for the elaborate program of the sports committee.

THE BASEBALL GAME.

The baseball game, in charge of P. C. Botzenmayer, was between a picked nine from the Rubber Industries Athletic

with tables set for 4, 6, 8, 10 or 20 people, and without ceremony of any sort the viands were served, and with appetites whetted by the salt sea-air the company did full justice to all set before them.

THE TENNIS COURT.

Although the recently elected president, Homer E. Sawyer, and the new manager-secretary, A. L. Viles, who takes office July 1, were present, there were no speeches, and the only formality was the award of prizes by F. R. Henderson, chairman of the Sports Committee. The prizes were mostly of silver, and com-

ARRIVAL OF THE AIRPLANE.

prised cups, humidor, table sets, and a fine revolver. The successful winners were as follows:

GOLF.

First prize, low gross, Horace Cook, Trenton, New Jersey.
Second prize, low gross, John W. Herron, Akron, Ohio.
First prize, low net, E. H. Sprague, Omaha, Nebraska.
Second prize, low net, Walter Bass, Akron, Ohio.

The Inter-City contest for the Trophy Cup presented by the Trenton Rubber Manufacturers' Association, which must be won

THE PRIZE MARKSMEN.

League, and a nine chosen from the rubber importers and dealers. Five innings were played, with here and there a brilliant play, even though the field was under a somewhat grilling sun. The umpire, Jack Klinow, formerly with the New York "Yankees," judged with the utmost fairness, and no rebellion followed any of his decisions. The score was: Industries, 6; Importers, 3.

TENNIS.

Singles. The first prize was won by S. H. Johnson, and the second prize by T. R. Shepard, both of New York City.

Doubles. The winning team of doubles was David Kubic and Roger Hardy, both of New York City.

THE BANQUET.

And then the banquet. The big glassed-in piazza was filled

MEMBERS AND GUESTS OF THE RUBBER ASSOCIATION OF AMERICA, INC.

three times to become the permanent property of the territorial division was won this year by Akron, with a score of 314, New York scoring 319, Trenton 320, and Boston 322. This cup was won first by Trenton, second by New York, and now by Akron, and Chairman Henderson stated that it was Boston's turn next to win.

The banquet ended as it had begun, informally and soon the guests were being transported to the station where a special train, started at 9:40 for New York City, carrying most of the party,

though quite a number decided to remain over night at the Club House, or to go to Atlantic City.

That the affair was a perfect success was due to the efficient work of the committee in charge of F. R. Henderson, L. P. MacMichael and A. A. Garthwaite. The sub-committees were: B. W. Henderson, trap-shooting; H. W. French, tennis; and J. W. Herron, golf. All of these gentlemen devoted their entire day to catering to the enjoyment of the members, and strenuously earned the thanks accorded them.

Activities of The Rubber Association of America, Inc.

REGULATIONS ON RUBBER CEMENT EXPRESS SHIPMENTS MODIFIED.

THROUGH THE EFFORTS of the Traffic Division, an order has been promulgated by the Interstate Commerce Commission, effective July 10, 1919, which will permit liquid cements, including leather cement, roofing cement, rubber cement, and liquid cement not otherwise specified, to be transported by express in containers of a capacity not greater than five gallons when the flash point of the liquid is below 80 degrees F. and above 20 degrees F. The present regulation limiting the maximum quantity in one outer container to not exceeding one gallon when the flash point is below 20 degrees F. is still to be enforced.

SUPPLEMENTAL FEDERAL EXCISE TAX RULINGS ON MANUFACTURERS' SALES OF TIRES, INNER TUBES, PARTS, AND ACCESSORIES.

The form of certificate embodied in Treasury Decision 2852 (approved May 31, 1919) has been amended to read as follows:

FORM OF CERTIFICATE.

The undersigned hereby certifies that the tires, inner tubes, parts, or accessories purchased hereunder are purchased with the intention of using them in the manufacture or production of new automobile trucks, automobile wagons, other automobiles, motorcycles, tires, inner tubes, parts or accessories, or for the sale on new automobile trucks, automobile wagons, other automobiles or motorcycles, or in connection therewith or with the sale thereof, or for free replacement under contract or guaranty. In case all of the tires, inner tubes, parts or accessories sold hereunder are diverted from this use, the purchaser will account for such tires, inner tubes or accessories to ———, the manufacturer thereof, at least once during each calendar year and will pay the tax to him at the time such accounting is made.

(Signed) _____

PROOF OF EXPORTATION.

The Treasury Department has officially approved the form of proof of exportation marked Exhibit A, to meet the requirements of Article 43 of Regulations No. 47. The form marked Exhibit B is suggested for general use, as it may be used either

(a) where the manufacturer himself is the exporter or (b) where the exporter is a direct purchaser from the manufacturer. These forms may be obtained from the secretary of the Rubber Association.

PRESIDENT WILSON ADVOCATES REPEAL OF FEDERAL EXCISE TAXES ON SALES OF TIRES, INNER TUBES, PARTS AND ACCESSORIES AND OTHER EXCISE TAXES.

The following is quoted from President Wilson's message to Congress on Tuesday, May 20, 1919, in which he apparently advocates the repeal of the excise taxes on sales of tires, inner tubes, parts and accessories as well as the other excise taxes contained in Title IX of the Revenue Act of 1918:

The main thing we shall have to care for is that our taxation shall rest as lightly as possible on the productive resources of the country, that its rates shall be staple, and that it shall be constant in its revenue-yielding power. We have found the main sources from which it must be drawn.

* * *

Many of the minor taxes provided for in the revenue legislation of 1917 and 1918, though no doubt made necessary by the pressing necessities of the war time, can hardly find sufficient justification under the easier circumstances of peace, and can now happily be got rid of. Among these, I hope you will agree, are the excises upon various manufacturers and the taxes upon retail sales. They are unequal in the incidence on different industries and on different individuals. Their collection is difficult and expensive. Those which are levied upon articles sold at retail are largely evaded by the readjustment of retail prices.

With the end of the world conflict every effort should be made to bring business back to normal conditions. The release of all industries from burdensome taxes, especially when they are of a discriminatory character, should be one of the first steps in that direction.

The taxes on the sales of tires, inner tubes, parts and accessories, are of a most discriminatory character, and add greatly to the burden of the manufacturer. The tax for which the manufacturer is liable presents many almost insurmountable difficulties in accounting, and in many cases it is almost impossible to comply with the regulations of the Treasury Department. If such regulations are not strictly observed, it is probable that many

AT THE SUMMER OUTING AT ABSECON, NEW JERSEY, JUNE 24, 1919.

manufacturers will be called upon to pay a much greater amount of tax than they have reimbursed themselves for. Strict compliance with the regulations would in a great many cases necessitate a considerable increase in the clerical staff of the manufacturer and would require the assembling of a mass of records, the checking of which would probably involve care and time out of all proportion with the amount of tax collected.

The Federal Excise Tax Committee will soon arrange for a meeting of those interested, with a view to making a proper presentation to the members of Congress. In the meantime, everyone interested in the measure should write now to his Congressman and to his Senators, telling of his experience with these taxes, the difficulty of handling them properly and requesting that they be removed as soon as possible.

FIRM MEMBERS ASKED TO VOTE ON REMEDIAL RAILROAD LEGISLATION.

The Board of Directors has supplied all firm members with a copy of Referendum No. 28 of the Chamber of Commerce of the U. S. A. on the Report of the Committee on Railroads on Remedial Railroad Legislation.

This referendum contains recommendations pertaining to (1) corporate ownership and operation, (2) corporate operation, (3) adherence to the period of federal control, (4) consolidation in a limited number of strong competing systems, (5) railroad companies engaged in interstate commerce, (6) federal regulation of capital expenditures and security issues of railroads engaged in interstate commerce, (7) federal regulation of interstate rates, (8) rates in each traffic section, (9) fund for strengthening general railroad credit, (10) federal transportation board.

As it is of immediate importance that an expression of the opinion of the best business minds of the country be obtained regarding these subjects, firm members are requested to register their opinion with regard to the several questions asked in the following ballot and return to the secretary of The Rubber Association not later than July 15, 1919:

BALLOT.

- I. The committee recommends adherence to the policy of corporate ownership and operation, with comprehensive regulation.
In favor.
Opposed.
- II. The committee recommends return of roads to corporate operation as soon as remedial legislation can be enacted.
In favor.
Opposed.
- III. The committee recommends adherence to the period of federal control as now fixed unless and until impossibility of remedial legislation in this period clearly appears.
In favor.
Opposed.
- IV. The committee recommends permission for consolidation in the public interest, with prior approval by government authority, in a limited number of strong competing systems.
In favor.
Opposed.
- V. The committee recommends a requirement that railroad companies engaged in interstate commerce become federal corporations, with rights of taxation and police regulation reserved for States.
In favor.
Opposed.
- VI. The committee recommends exclusive federal regulation of capital expenditures and security issues of railroads engaged in interstate commerce, with provision for notice and hearing for State authorities.
In favor.
Opposed.
- VII. The committee recommends federal regulation of intrastate rates affecting interstate commerce.
In favor.
Opposed.
- VIII. The committee recommends a statutory rule providing that rates in each traffic section shall yield an adequate return on fair value of the property as determined by public authority.
In favor.
Opposed.
- IX. The committee recommends payment into a fund of a share of the excess earned by a railroad system under application of the above statutory rule over an equitable minimum return upon fair value of property, this fund to be

used by Congress directly for strengthening general railroad credit and increasing general railroad efficiency.

In favor.
Opposed.

- X. The committee recommends a federal transportation board to promote development of a national system of rail, water, and highway transportation and articulation of all transportation facilities.
In favor.
Opposed.

Signature of Firm Representative.

SEATTLE WHARFAGE CHARGES TO BE REDUCED.

The difficulties encountered in weighing and sampling crude rubber imports at Seattle, Washington, are being investigated by the Traffic Committee. It is expected that satisfactory arrangements will be worked out in the near future, both in connection with the weighing and sampling by local weighing companies at Seattle and in connection with the absorption of handling charges by steamship companies and railroad companies jointly which will result in the owner of the freight paying only the legal wharfage charge of 25 cents per ton, which is covered by the tariff.

SECRETARY VORHIS RESIGNS.

H. S. Vorhis, for several years secretary and treasurer of The Rubber Association, has resigned to enter other business, and A. L. Viles, formerly manager of the Traffic Division, has been elected general manager and secretary of the Association. An officer of the Guaranty Trust Co. will act as treasurer. These changes become effective July 1, 1919.

SCRAP RUBBER DIVISION MEETING.

The Scrap Rubber Division of the National Association of Waste Material Dealers held a meeting at the Hotel Astor, New York City, June 17, 1919, Herman Muehlstein, the new chairman of the Scrap Rubber Division, presiding.

Mr. Cummings, for the classification committee, reported in reference to a conference which had been held with a committee from the Rubber Reclaimers Division of the Rubber Association of America in connection with the proposed changes in the scrap rubber circular and the advisability of adopting certain trade customs.

One of the suggestions which had been made to the Rubber Reclaimers was that they eliminate that clause under "Rejections," which provided that a reclaimer could charge one-half cent per pound for handling rejected material. It has been the contention of the Scrap Rubber Division of the Association that such a charge was exorbitant in cases where the material was not sorted or rebaled. The reclaimers have consented to change their paragraph covering rejections to read as follows:

"D' REJECTIONS: Upon his request all rejections shall be returnable to the seller within thirty days from the time notice of rejection is received by him and upon payment by him of one-half cent per pound to cover cost of sorting and rebaling or if not assorted, the actual cost of handling, not to exceed one-half cent per pound. If shipping instructions are not furnished within the above-mentioned thirty days, the purchaser shall be at liberty to make such disposition of the material as he may see fit. The above does not apply if rejected material is purchased by the mill."

Another concession made by the rubber reclaimers was to insert under "Claims" as a trade custom the following:

(A) All claims, including claims for overtare, shall be reported promptly in writing, and in no event, later than thirty days from arrival of goods at consumer's station.

(B) Claims for short weight shall be reported within ten days from date of arrival at consumer's mill.

A few other suggested changes are to be made by the Rubber Reclaimers Division, while the Scrap Rubber Division of this association voted in favor of making several changes, all of which will be embodied in the new circular to be issued within the next week or ten days.

Echoes of The Great War.

BRITISH IMPORT RESTRICTIONS MODIFIED.

THE WAR TRADE BOARD announces for the information of exporters in the United States that the following changes of interest to the rubber and allied industries have been made in the import restrictions of Great Britain.

All restrictions have been removed affecting asphaltum, earth colors, earth sienna, bone black, burnt sienna, carbon black, ochre and umber.

Litharge, ultramarine, blue white lead, lamp black and reclaimed rubber will be licensed for import only exceptionally when required.

Toys and games (other than electric toys), including parts thereof, are to be admitted at the rate of 20 per cent of the 1913 importations.

The following articles are to be rationed for importation as specified:

Rubber faced hand dating and numbering stamps to be admitted at the rate of 33 1/3 per cent of the 1916 imports.

Rubber bands for stationery purposes to be admitted at the rate of 75 per cent of the 1916 imports in proportionate quarterly amounts.

Fountain pens containing no gold to be admitted at the present rate of 24 tons per annum distributed among importers.

Insulating cloths and tapes to be admitted at the rate of 25 per cent of the 1913 imports.

CITATIONS FOR TAKING BACK EMPLOYEES.

Employers who give assurance that they will gladly take back their former employees who have served in the armed forces of the United States are entitled to receive a citation issued by the War and Navy Departments. On its receipt they are authorized to place the United States shield as a symbol of this upon the red border of their service flags, provided no names of individuals or business firms appear upon the flags. The shield should be placed at the top when a flag hangs downward, as in a window; otherwise on the border nearest the mast.

Applications for citations should be addressed to Colonel Arthur Woods, chairman of the Emergency Employment Committee for Soldiers and Sailors, United States Council of National Defense, Washington, D. C.

VOCATIONAL TRAINING FOR DISABLED SOLDIERS AND SAILORS.

To meet its obligation to reestablish disabled soldiers, sailors and marines in civil life, the Government has authorized the Federal Board for Vocational Education and Congress has made an appropriation for its maintenance under the direction of Colonel Arthur Woods, assistant to the Secretary of War. Every man who has been in the United States service, whether at home or abroad, and who is considered by the Bureau of War Risk Insurance to be as much as 10 per cent disabled is entitled to be placed in an educational institution at government expense. A disabled man so incapacitated that he cannot take up his old occupation will be taught another in order that he may become self-supporting. He may choose any occupation or trade which he thinks he would like to follow, subject to the approval of the Federal Board. This applies to demobilized men as well as those still in service, and the Federal Board is making every possible effort to get in touch with all men who were discharged before it began to function. Meanwhile such men as wish to avail themselves of this opportunity should make application to the nearest of the fourteen district offices of the Federal Board for Vocational Education, which are located in Boston, New York, Philadelphia, Washington, Atlanta, New Orleans, Cincinnati, Chicago, St. Louis, Minneapolis, Denver, San Francisco, Seattle and Dallas.

While in training a man receives an amount equal at least to the base pay received during his last month's service in the Army, Navy or Marine Corps, but in no case does he receive less than \$65 per month if a single man, less than \$75 per month if living with his dependents, nor less than \$65 per month for himself if living apart from his dependents—in addition to allowances to his dependents if married and living apart from his wife during the period of training. In all cases the wife receives \$15, and each minor child \$10 per month. Men who have been blinded in battle or who have lost both arms or both legs, or who as a result of injuries incurred are permanently and totally disabled, it may be noted, come under a special provision which allows them \$100 per month additional.

THRIFTY WORKERS CUT DOWN PRODUCTION COSTS.

Every business concern to-day faces the problem of cutting down production costs. If the thought "Save!" can be brought home to every employee every day for one year, it should be possible to reduce expenses through economy in material and time, moreover, personal thrift would also be encouraged and the savings would be invested in War Savings Stamps.

Numerous ways to launch a thrift campaign in any business organization have been suggested.

First, in each pay envelope enclose a blank bearing two questions, to be answered by every employee: 1. What can and will you do to cut down the operating expense of the company? 2. What ways can you suggest by which others can cut down expenses?

Second, enclose a blank for stating weekly how the employee was able to cut down operating expenses by some short cut to the saving of material and time.

Pay envelopes and house organs should contain practical economy talks by department heads, showing ways of saving, and articles should also be published telling what individuals have done along this line.

In every work-room, stock-room, sales-room, department and branch, posters should be put up making definite appeals for economy of various costs, and these should be frequently changed.

Personal letters should be written by executives or department heads, commending every employee who has done anything worth while in the saving line, to let him or her know that such effort is appreciated.

Monthly results of saving in figures should be compiled and published.

Wherever savings can be put into figures—reduced costs, increased profits and actual money—the savings should be shared with employees in the form of prizes or bonuses.

THRIFT AND SAVINGS STAMPS TO CONTINUE.

War has taught the country some wholesome lessons in thrift worthy of being perpetuated, for the peace-time needs of the country, especially during the reconstruction period, are very great and should inspire further effort. In order that the habits of saving and the intelligent use of money may become one of the lasting national activities of the American people, and particularly that a safe method of investment may be afforded, the Treasury Department is continuing the sale of Savings and Thrift Stamps. Churches, fraternal and social organizations, commercial associations and business houses, are keeping the benefits of thrift before their membership or employees by the continuation or organization of thrift clubs and savings societies. Many rubber companies are interested because the movement means better citizens, better communities, and a better country.

GERMANY FEARS AMERICAN TRADE PREJUDICE.

Germany's prospects of resuming commercial relations with the United States are dealt with in a statement which the German paper, "Der Konfektionär," attributes to Arthur Dunning, general secretary of the American Chamber of Commerce in Berlin, who is quoted as saying that while business relations cannot be resumed as long as the Trading with the Enemy Act remains in force, the time has come to make preparations for future trade. He believes the best foundations exist for the resumption of business relations, as German warehouses are empty and the credit of the hard-working German business man stands high. American commissions, he points out, are visiting Holland, Denmark and Scandinavia to examine into the opportunities for American export, and similar commissions and trade experts will enter Germany immediately after the conclusion of a preliminary peace and the raising of the blockade. Probably two or three years will have to elapse before the anti-German feeling still prevailing among the masses of the American people will be transformed into a mutual understanding and cooperation. Meanwhile, German industries will hardly be strong enough to supply foreign markets to any large extent, and as extraordinary difficulties will be thrown in the way of permits to enter America during the next few years, German business men will do well to allow their business to be conducted by the American Chambers of Commerce and other official channels shortly to be organized for this purpose.

COMMUNITY TO BENEFIT BY WAR FUNDS.

At the close of its war work, the War Service Union, Jeannette, Pennsylvania, of which Seneca G. Lewis of the Pennsylvania Rubber Co. is president, had \$15,000 on hand, while the Chamber of Commerce had \$10,000. It was decided to use the money for the erection of a combined municipal and community building, containing an auditorium, reading rooms, gymnasium, swimming pool, etc. This will provide a town club of which every resident of Jeannette is to be considered a member.

HISTORY OF RUBBER PRICES DURING THE WAR.

A history of prices during the war, and covering the period from the beginning of 1913 to the end of 1918, is being published by the Price Section of the War Industries Board. It will consist of 57 bulletins which are now in press and will be issued piecemeal as rapidly as possible. The first seven are of general character and will be followed by 50 bulletins, each devoted to a single important branch of industry. Bulletin No. 30 will deal with rubber and rubber products. The history has been prepared for the information of business men and may be had on application.

AMERICAN OFFICERS IMPROVE SPARE TIME IN FRANCE.

The following letter from a former employee of The B. F. Goodrich Co., Akron, Ohio, now a lieutenant in the American Expeditionary Forces, sent in France, which has been received by F. W. Jones, manager of clothing sales.

NANTES, FRANCE.

DEAR "CHIEF":

I was pleased to see your letter of April 14 on my desk when I returned from a week's trip—partly business and pleasure—to Paris, Château-Thierry, Reims, Argonne, Meuse Sector and Verdun. For the past month I have been very busy here, as we emptied and filled the embarkation area several times. At present the 79th Division is here.

My trip up along the old front with Captain Bliss, my Washington friend, was a wonder. We explored miles of trenches, dug-outs, No man's Land, forts, etc. There are still a number of unburied German and French dead; it was a common occurrence to pick up a boot with a leg or foot left in it. Our own American boys have all been well taken care of and laid to rest in well-kept cemeteries—thanks to our Graves Regiment Service. Verdun (which the French consider the Waterloo of this war) is certainly a great military stronghold with its sur-

rounding forts. The citadel, or underground fort in Verdun itself is capable of holding 40,000 troops and is a complete military camp—hospital, bakeries, etc.

My leave to visit points in Italy was granted for May 5, but since the break at the Peace Conference, Italy has been closed as a leave area for the A. E. F. I think the Captain and I will substitute an extended trip through France, visiting Lyons, Marseilles, Nice, Monte Carlo, Mentone, Nîmes, and down into the Pyrenees mountains and Spanish border to Pau, Bayonne and Biarritz. We shall probably be able to get over into Italy by automobile for a day or so, but Spain being neutral, about one foot will be all we can get over the line there.

I am hoping to sail in July if possible. We have lost our colonel here, so I am not sure just what to expect from the present Commanding Officer. Our old colonel was certainly a regular fellow. My brother sailed on the 19th—S. S. *Mercury*, and is in the United States by now, I think. He is very fortunate, as he can be in business by June 1, O. K. I should like to be back by that time, but it is doubtful if I return before August 1. I'll not mind it so much if I succeed in getting to London and into Scotland and Ireland before I return. I am rather disappointed regarding my Italian trip, because I wanted to see Venice and Rome and Mt. Vesuvius.

Conflicting reports continue to reach us over here regarding business conditions. I am enclosing a couple of clippings from Syracuse papers which seem to look good for central New York as a patriotic commercial center. I am very proud of my home city.

Before returning home I expect to see France become sensible and open the door so the much-needed American products can play the part they should in the early reconstruction work. The French work in a peculiar way; instead of returning to their ruined homes or business places and blasting out and rebuilding anew, as we would do, they come back, select one room that has met with the least disaster, roof and wall it up with tar paper, etc. They start in part by part to clean up and rebuild over the parts still standing.

Cordially yours,

TIP GOES.

FAIR AT BRUSSELS TO END WAR ABUSES.

The municipal government of Brussels will hold a commercial fair in September, with the object of putting an end to the abuses brought about by the war, lowering the prices of foodstuffs, and bringing about normal conditions, at the same time attracting world trade in competition with German fairs. This fair will offer the manufacturers and producers of allied and neutral countries an opportunity of meeting and coming into direct contact with the buyers.

Only a moderate charge will be made for space sufficient, it is hoped, to meet expenses, and preference will probably be given to Belgian exhibitors, in consideration of the condition of the commerce and industry of that country at present. The Belgian people look forward to this fair being even more successful than those held during the war at Lyons, Basel, and Utrecht.

RUBBER EXPORTS AND IMPORTS FOR MADAGASCAR.

Madagascar, French East Africa, and its dependencies exported only 70,547 pounds of crude rubber, value 127,468 francs, during 1917, as compared with 220,460 pounds, value 348,530 francs, during 1916. During 1917 it also imported from America only 947,978 pounds of rubber goods, value 1,451 francs, as compared with 1,082,458 pounds in 1916, value 1,784 francs. The extension of American trade with Madagascar has been greatly hampered because of lack of transportation facilities.

DON'T WAIT TO GET THAT LARGE SUM FOR INVESTMENT. PUT ALL the little bits in Thrift Stamps and War Savings Stamps and you will soon have a large sum invested.

Alien Enemy Patents Available Under License.

THE ALIEN ENEMY-OWNED UNITED STATES PATENTS relating to chemical and allied industries which were seized under authority of presidential proclamation by the Alien Property Custodian have been sold to three American companies, The Chemical Foundation, Inc., Grasselli Chemical Co., and Bayer, Inc.

The patents controlled by the Bayer company relate to pharmaceuticals, while those held by the Chemical Foundation and by the Grasselli company relate to industrial processes and products. Such of these patents as are of interest to rubber manufacturers are enumerated in the following lists, which were compiled from that of the Chemical Foundation supplemented from the files of THE INDIA RUBBER WORLD.

All persons desiring to manufacture under any of these patents may now secure licenses permitting them to do so by application to the respective controlling companies.¹

PATENTS OWNED BY THE CHEMICAL FOUNDATION, INC.

Patent No.	Date.	Title.
708,827.	Dec. 30, 1913.	Process of manufacturing vulcanized froth.
708,823.	Sept. 6, 1913.	Process of preparing and treating rubber-coated films.
715,462.	Dec. 9, 1902.	Method of manufacturing molded elastic goods.
715,837.	Dec. 16, 1902.	Cumbr.
716,095.	Dec. 16, 1902.	For motor vehicles.
723,890.	Apr. 21, 1903.	Process of making camphene.
737,745.	Sept. 1, 1903.	Fellose for vehicle wheels.
744,574.	Nov. 17, 1903.	Protecting mantle for cycle or air tubes.
757,831.	Apr. 19, 1904.	Floor or like brush.
757,907.	Apr. 19, 1904.	Tooth brush with washing device.
758,063.	Apr. 19, 1904.	For motor vehicles.
763,489.	June 28, 1904.	Inflatable hose tire.
765,290.	June 29, 1904.	Tire cover of undressed leather.
772,514.	Dec. 7, 1904.	Fastening for man's trousers.
775,567.	Jan. 10, 1905.	Reservoir attachment for pens.
780,409.	Jan. 17, 1905.	Fastenings for wheel tires.
783,466.	Feb. 28, 1905.	Artificial skin.
784,527.	Apr. 4, 1905.	Manufacture of a substitute for caoutchouc.
787,473.	Apr. 18, 1905.	Air cushion.
787,475.	Apr. 18, 1905.	Tire.
788,992.	May 2, 1905.	Elastic stocking.
803,927.	Nov. 7, 1905.	Fountain pen.
804,218.	Nov. 14, 1905.	Gymnastic apparatus.
804,220.	Nov. 14, 1905.	Apparatus with elastic bottom plate.
824,272.	Nov. 14, 1905.	Respirator.
805,503.	Nov. 28, 1905.	Vulcanizing hard-rubber articles having interior cavities.
805,851.	Nov. 28, 1905.	Medicinal injector.
811,109.	Jan. 30, 1906.	Pneumatic tire.
815,771.	Apr. 24, 1906.	Tire for wheels.
821,394.	May 22, 1906.	Dissolving and regenerating rubber.
821,868.	May 29, 1906.	Armor for cycle tires.
822,786.	June 5, 1906.	Elastic wheel tire.
825,060.	July 3, 1906.	Process of reclaiming vulcanized rubber waste.
826,073.	July 10, 1906.	Cushion for hernia trusses.
830,695.	Sept. 4, 1906.	Process of and apparatus for manufacturing lined metallic hose.
833,633.	Oct. 16, 1906.	Device for preventing sea sickness on ships.
844,077.	Feb. 17, 1907.	Process for the production of aqueous caoutchouc solutions and the regeneration of rubber waste.
844,242.	Feb. 12, 1907.	Butt supporter.
851,960.	Apr. 1, 1907.	Process for manufacturing elastic fittings for tires.
852,273.	Apr. 30, 1907.	Elastic cob.
852,274.	Aug. 6, 1907.	Fitter for dust suction apparatus.
863,523.	Aug. 13, 1907.	Letter figure and the like in relief.
865,445.	Sept. 10, 1907.	Mold for pneumatic tires.
866,149.	Nov. 26, 1907.	Mold for pneumatic tires.
873,501.	Dec. 10, 1907.	Elastic tire for wheels.
877,769.	Jan. 28, 1908.	Protector against skidding.
885,530.	Jan. 21, 1908.	Dress preserver or dress shield.
887,292.	May 12, 1908.	Automobile tire.
891,866.	June 30, 1908.	Process of preparing india rubber for vulcanization.
894,490.	July 19, 1908.	Process for the production of pure caoutchouc.
897,334.	Sept. 1, 1908.	Method of manufacturing elastic material.
897,630.	Sept. 1, 1908.	Detachable rim for vehicle wheels.
900,490.	Nov. 24, 1908.	Elastic tire for wheels.
906,306.	Dec. 8, 1908.	Process for vulcanizing a rubber solution.
906,834.	Dec. 15, 1908.	Elastic tire for wheels.
909,010.	Jan. 5, 1909.	Nipple for motor vehicles and the like.
909,061.	Jan. 5, 1909.	Divided wheel rim serving as tire retainer.
909,093.	Jan. 5, 1909.	Nozzle for syringes and the like.
910,536.	Jan. 12, 1909.	Method of manufacturing solutions of caoutchouc.
910,739.	Jan. 26, 1909.	Safety hose coupling for railway air-brakes.
921,148.	Mar. 16, 1909.	Process for regenerating rubber waste of all kinds.
927,198.	July 6, 1909.	Process for the production of a leather substitute.
930,874.	Aug. 10, 1909.	Cellulose substitute.
935,516.	Sept. 7, 1909.	Connecting hose for railway cars.

¹The address of the Chemical Foundation, Inc., is 81 Fulton street, New York City, and of the Grasselli Chemical Co., 347 Madison avenue, New York City.

Patent No.	Date.	Title.
934,184.	Sept. 14, 1909.	Detachable wheel rim.
935,090.	Oct. 19, 1909.	India-rubber, process for devulcanizing.
935,414.	Sept. 28, 1909.	Rubber.
935,849.	Oct. 5, 1909.	Apparatus for washing caoutchouc, gutta percha and similar substances.
936,635.	Oct. 12, 1909.	Apparatus for washing caoutchouc and similar substances.
939,956.	Nov. 9, 1909.	Superheater for use in connection with vulcanizers and other apparatus.
943,019.	Dec. 14, 1909.	Packing for piston rods and the like.
943,450.	Jan. 4, 1910.	Horse-shoe with elastic bridges covering both ends.
946,996.	Jan. 11, 1910.	Machine for armoring cables.
947,545.	Jan. 25, 1910.	Cushion tire for vehicle wheels. Pump.
950,992.	Feb. 22, 1910.	Substitute for celluloid.
951,811.	Mar. 15, 1910.	Utilization of waste rubber.
953,094.	Mar. 29, 1910.	Process for devulcanizing india rubber.
953,272.	Mar. 29, 1910.	Elastic wheel.
960,116.	May 31, 1910.	Method of producing a caoutchouc-like elastic substance.
964,244.	July 12, 1910.	Separator (vulcanized rubber from fiber).
965,823.	July 26, 1910.	Process for hardening condensation products from phenols and aldehydes.
967,240.	Aug. 18, 1910.	Spring tire for wheels (with cushion tire).
967,585.	Aug. 16, 1910.	Compressive tire.
971,364.	Sept. 27, 1910.	Wheel for vehicles.
975,137.	Nov. 8, 1910.	Removable wheel rim for pneumatic tires.
978,541.	Dec. 13, 1910.	Woven elastic fabric.
980,712.	Mar. 14, 1911.	Vat-washing-machine ring.
985,966.	July 25, 1911.	Tire for vehicle wheels.
1,001,891.	Aug. 29, 1911.	Balloon envelope material.
1,003,344.	Sept. 12, 1911.	Purifying rubber or gutta percha.
1,006,274.	Oct. 17, 1911.	Process for the manufacture of rubber substitute.
1,006,976.	Oct. 17, 1911.	Dental substitute.
1,010,751.	Dec. 5, 1911.	Boat-tire for use in treading machines.
1,013,367.	Dec. 19, 1911.	Detachable wheel rim.
1,013,475.	Dec. 19, 1911.	Elastic tire.
1,016,991.	Feb. 13, 1912.	Elastic tire.
1,021,598.	Feb. 13, 1912.	Tire.
1,021,618.	Feb. 23, 1912.	Vehicle wheel with elastic spokes.
1,020,797.	Mar. 19, 1912.	Vehicle wheel rim.
1,025,122.	May 7, 1912.	Machine for making dress shields of india rubber.
1,026,418.	May 14, 1912.	Producing diolefines.
1,026,419.	May 14, 1912.	Producing diolefines.
1,026,420.	May 14, 1912.	Producing diolefines.
1,031,613.	July 2, 1912.	Process for producing coats.
1,031,837.	July 9, 1912.	Manufacture of manufacturing caoutchouc-like products.
1,032,640.	July 16, 1912.	Rubber sole for shoes and the like.
1,032,641.	Aug. 6, 1912.	Tire for automobile wheels.
1,034,779.	Aug. 6, 1912.	Device for holding reins, leashes and the like.
1,035,107.	Aug. 6, 1912.	Elastic material.
1,036,532.	Aug. 27, 1912.	Shelter for dirigible balloons, airships, and the like.
1,037,158.	Aug. 27, 1912.	Process of manufacturing substitutes for oils, caoutchouc, resins and the like.
1,038,950.	Sept. 17, 1912.	Process of manufacturing bet vulcanized froth from india rubber, gutta percha, and balata.
1,039,316.	Sept. 24, 1912.	Method of rendering the joints of the casemated parts of ships war-proof.
1,040,850.	Oct. 8, 1912.	Process of preparing condensates from cascin, phenols, and formic aldehyde and the product obtained thereby.
1,042,795.	Oct. 29, 1912.	Apparatus arranged on locomotives and other power-propelled vehicles for utilizing the resistance of the air.
1,043,650.	Nov. 5, 1912.	Bottle closure.
1,044,632.	Nov. 19, 1912.	Booyant wearing apparel, cloth, and other articles.
1,045,574.	Nov. 26, 1912.	Rupture-truss.
1,047,612.	Dec. 17, 1912.	Turbine compressor or pump for elastic fluids.
1,048,892.	Dec. 31, 1912.	Apparatus for extracting rubber.
1,049,446.	Jan. 7, 1913.	Artificial breathing apparatus.
1,050,191.	Jan. 14, 1913.	Device for vehicle wheels.
1,051,046.	Jan. 21, 1913.	Brake-pipe for railway cars.
1,051,767.	Jan. 28, 1913.	Cushion heel.
1,052,498.	Feb. 4, 1913.	Vulcanizing distinct parts or surfaces of rubber.
1,054,060.	Feb. 25, 1913.	Soldering apparatus.
1,057,680.	Apr. 1, 1913.	Production of isoprene.
1,061,530.	May 13, 1913.	Apparatus for administering narcotics.
1,061,881.	May 13, 1913.	Process for the production of a plastic or elastic substance.
1,062,923.	May 27, 1913.	Producing rubber-like compounds.
1,065,182.	June 17, 1913.	Producing isoprene.
1,066,873.	Aug. 5, 1913.	Vent for nursing nipples.
1,069,151.	Aug. 19, 1913.	Process for the production of an insulating coating on electrical conductors.
1,070,294.	Aug. 12, 1913.	Producing butadiene and derivatives thereof.
1,070,659.	Aug. 19, 1913.	Life-saving device.
1,072,498.	Sept. 16, 1913.	Elastic wheel.
1,074,881.	Oct. 7, 1913.	Dry viscose in a granular, soluble, and stable condition and process of preparing the same.
1,076,490.	Oct. 21, 1913.	Method of vulcanizing.
1,077,143.	Oct. 28, 1913.	Abbrading disk.
1,077,766.	Oct. 24, 1913.	Ear appliance for facilitating hearing.
1,083,164.	Dec. 30, 1913.	Producing isoprene.
1,083,165.	Dec. 30, 1913.	Producing isoprene.
1,086,159.	Dec. 31, 1913.	Process of manufacturing caoutchouc-like products.
1,087,819.	Feb. 17, 1914.	Process of vulcanizing isoprene.
1,087,813.	Feb. 17, 1914.	Horse shoe filling of rubber.
1,088,349.	Feb. 24, 1914.	Removable rim attachment for vehicle wheels.
1,088,907.	Mar. 17, 1914.	Process of manufacturing a substitute for vulcanite.
1,089,482.	Mar. 10, 1914.	Process of manufacturing an elastic foam from volatile solutions.
1,089,805.	Mar. 10, 1914.	Milking appliance.
1,089,832.	Mar. 10, 1914.	Milking device.
1,090,074.	Mar. 10, 1914.	Compound of resins or derivatives of cellulose and process of obtaining the same.
1,095,058.	Apr. 28, 1914.	Adhesive resinous preparations and process of producing the same.

Patent No.	Date.	Title.
1,097,973.	May 26, 1914.	Tennis or like ball.
1,098,331.	May 28, 1914.	Artificial denture.
1,098,353.	June 2, 1914.	Process for manufacturing derivatives of the amyl series.
1,098,859.	June 2, 1914.	Product of isoprene.
1,099,107.	June 2, 1914.	Process for manufacturing a substance resembling natural rubber.
1,099,144.	June 2, 1914.	Device for inflating cushions, etc.
1,100,778.	June 23, 1914.	Fountain pen.
1,101,112.	June 23, 1914.	Process for manufacturing device.
1,103,003.	July 7, 1914.	Detachable wheel rim.
1,104,722.	July 21, 1914.	Vulcanizer.
1,105,368.	Aug. 28, 1914.	Elastic holding plate.
1,106,748.	Aug. 11, 1914.	Pneumatic tire.
1,107,080.	Aug. 11, 1914.	Removable rim attaching for vehicle wheels.
1,107,355.	Aug. 18, 1914.	Spring wheel.
1,121,134.	Dec. 15, 1914.	Process of making caoutchouc substitute.
1,122,465.	Dec. 29, 1914.	Vulcanizer press.
1,125,019.	Jan. 12, 1915.	Elastic heel protector.
1,133,490.	Mar. 9, 1915.	Diving apparatus.
1,140,418.	May 25, 1915.	Tire or shoe article.
1,144,812.	Aug. 29, 1915.	Freely portable breathing apparatus.
1,150,508.	Aug. 17, 1915.	Respiratory mask or helmet.
1,150,642.	Aug. 17, 1915.	Process of manufacturing condensation products from formaldehyde and phenol.
1,153,030.	Sept. 7, 1915.	Diver's dress.
1,153,655.	Sept. 14, 1915.	Telephone cable.
1,156,153.	Oct. 12, 1915.	Vehicle wheel having a solid tire.
1,159,125.	Nov. 2, 1915.	Diver's helmet.
1,159,878.	Nov. 9, 1915.	Process for forming casein masses.
1,159,879.	Nov. 9, 1915.	Process for forming casein masses.
1,160,863.	Jan. 4, 1916.	Fountain pen.

THE SCRAP AND RECLAIMED RUBBER SITUATION.

DESPITE returning activity in rubber goods manufacturing in America stagnation is manifest in the scrap and reclaimed rubber markets. The demand for reclaimed rubber has seriously fallen off and reclaimers are operating their plants at less than full capacity, buying scrap only for actual needs. These conditions have reduced the demand for scrap rubber to a minimum.

This situation is attributable to the low prices ruling for crude rubber and to the relatively high prices asked for scrap. The price of crude rubber is the leading factor and scrap prices are secondary.

The better grades of reclaimed rubber are competitive with crude, consequently they find no sale when the prices asked raise the cost of their rubber content to practically that of crude rubber.

These price conditions have become operative since the first of the year and for some weeks past plantation *Hevea* has been and still remains a better purchase, on the basis of rubber value, than the better grades of reclaim. Manufacturers who were, hitherto, large users of reclaim are now giving preference to crude and this tendency is extending.

Scrap dealers claim there is no profit in their business at less than current prices, and reclaimers assert that the prices at which scrap is held by dealers practically forbid its conversion into products that can compete with crude rubber. Manufacturers of rubber goods are willing to use large quantities of reclaim, but are demanding lower prices. The reclaimers in turn are doing all possible to get the price of scrap on a lower basis and are not paying the prices asked except for shoes. They are fairly well satisfied in respect to tires, but claim that the prices asked for boots and shoes are very much in excess of this comparative value. Reclaimers frankly admit they are facing a critical situation in this matter and whether scrap prices will fall to the levels indicated by them is open to question. No less serious and trying is the difficulty in which the scrap dealers are placed.

Present scrap quotations are nearing the levels indicated as necessary by reclaimers, and the transition to more active buying does not appear to be far off. Probably the situation will ultimately be relieved by mutual concessions. Reclaimers believe that when buying starts there will be a big movement in scrap, owing to the fact that the output of rubber goods will be mostly for civilian use not subject to the restriction of reclaim operative in the manufacture of rubber goods for government use.

The common interest of reclaimers and scrap dealers calls for maximum cooperation to improve their trade situation.

Mutual price concessions must be supplemented by activity in seeking new outlets for the materials.

Already scrap dealers are finding a measure of relief in developing the business of supplying repairable tires for numerous tire-rebuilding companies, and supplying the voluminous demand of the tire repair trade for salvaged building fabric stripped from discarded automobile tires.

It is possible that reclaimers may try the manufacturing field, particularly along such lines as will afford ample outlet for their reclaim products. For example, rubber pavement and tiling have already been satisfactorily demonstrated and doubtless numerous other needs will be developed in the processes of invention and search for increased uses of rubber.

The British and United States Rubber Goods Export Trade Compared—1913-1918.

THE REPORT recently issued by the research bureau of the War Trade Board on the export trade policy of the United Kingdom for 1913-1918 indicates clearly the drastic measures which Great Britain has taken in cutting down her foreign trade in order to win the war, and they seem all the more drastic when her problems concerning foreign exchange are considered as well as the further fact that so much tonnage now departs from her ports in ballast.

While the rubber manufacturing industry has suffered less heavily than some other British industries, the sacrifices are shown to have been great, and the comparison with exports of similar American goods for corresponding periods is of interest.

Both the United Kingdom and the United States show increased exports of various products in different years to the European allies, these increases being greater on the part of the United States, in some instances, than on the part of the United Kingdom, partly because the latter was in the war from the beginning and unable to spare so much to her allies as was the United States.

RUBBER BOOTS AND SHOES.

In 1913 a little over 1,500,000 pairs of rubber boots and shoes were exported from the United Kingdom. In the first half of 1918 this had fallen to about 500,000 pairs, or about two-thirds of the former number. Of the countries specified, France is the only one showing an increase of purchases. British reexports of rubber boots and shoes showed a notable increase to the end of 1916 to Norway, Denmark and other countries. The total reexport in 1917 was over five times as great as the total for 1913, but had dropped to practically nothing by the first half of the calendar year 1918.

As compared with this, the United States exported over 2,666,000 pairs of rubber boots and shoes in 1913. Exports increased to nearly 4,000,000 pairs in 1917, but fell below 3,000,000 pairs in 1918, which, however, was nearly 20 per cent greater than in 1913. Excluding exports to the European allies, the quantity sold by the United States has fallen to one-half what it was in 1913. Early shipments to Belgium and Italy were large, but practically all of the increase, especially since the war began, has been to France and the United Kingdom. There have been large relative increases also in our much less important shipments to Newfoundland and Labrador, and some increase in shipments to Canada and South Africa. The shipments to South America and Asia have fallen off very much.

RUBBER TIRES AND TUBES.

In terms of value the United Kingdom domestic exports¹ of rubber tires and tubes increased from over \$6,000,000 in 1913 to over \$10,000,000 in 1916, but showed a marked decrease in 1917 and the first half of 1918. Were increasing prices taken into account, it is probable that the total exports have decreased in

quantity during the period from 1913 to 1918. A considerable part of the exports went to France and Italy. From 1913 to 1916 there were increases in terms of value, though probably not in quantity, to Sweden, Denmark and Switzerland, as well as to British India and Australasia. There have been decreases, even in terms of value, to Argentina and Brazil.

United States exports² of tires and tubes increased from \$4,500,000 in 1913 to \$21,000,000 in 1916, though the total had fallen to a little over \$15,000,000 in 1918. Excluding exports to the European allies, the total increased from less than \$3,000,000 in 1913 to over \$13,000,000 in 1918.

The great increases to the European allies were in the years 1915 to 1917, mostly in 1916, and the amount sent to them in 1918 was actually less than in 1913 or 1914. There have been especially large increases in sales to Canada, Mexico and North American countries; also huge increases to South American countries, notably to Argentina, Brazil, Chile, Peru, Uruguay and Venezuela, the total to South America being over sixteen times as great in 1918 as in 1913 or 1914. Much the same is true of shipments to Australia, New Zealand and Japan. Quantity statistics are not available, and it should be remembered that statistics in terms of value exaggerate the facts.

OTHER RUBBER MANUFACTURES.

British exports of rubber manufactures other than boots and shoes, tires and tubes, and waterproofed apparel, fell off greatly in terms of value during the years 1914 and 1915, but in 1916 and 1917 were almost as great as in pre-war years. They showed some decline, however, in the first half of 1918. During the years 1914 to 1916, inclusive, exports to France increased about 50 per cent, and there were also increases to British India, China, Australia and New Zealand. During the same period exports decreased about 35 per cent to Italy; there were marked decreases to the United States, Mexico, Argentina and Brazil, while exports to Belgium were practically discontinued. Were the figures converted into terms of tons decreases would be shown in nearly every case.

Prior to the war the value of all American exports of rubber manufactures, other than boots and shoes, tires and tubes, belting, hose, packing, reclaimed, scrap and old rubber, was a little less than half that of corresponding British exports. While the value of such British exports was about the same in 1917 as it had been in 1913, the value of corresponding United States exports had more than doubled, being \$8,250,000, but falling to \$6,000,000 in 1918. There have been large increases in exports of this class of goods to the European allies, especially to France, Italy, and the United Kingdom; also to Canada, Mexico, Cuba, Argentina, Brazil, Chile, Peru, Uruguay, Venezuela, Japan, Australia and New Zealand. Here again, however, the quantities are exaggerated somewhat by the price data.

COMPARISON OF UNITED STATES AND BRITISH EXPORTS.

¹ Calendar year. ² Fiscal year.

Rubber Pavements: A Historical Résumé.

WHILE THE DEMAND of crude rubber constantly reaching new low levels, production capacity on the increase, unused raw stocks, heavy and scrap rubber plentiful, the rubber growers are devoting more attention than ever to finding new uses for their product, especially the lower qualities. The Rubber Growers' Association of London is moving in the matter, but no definite solution of the problem has yet been advanced.

Among the many prospective new uses for rubber, none is more important than its employment as a paving material and the opinion is freely expressed that with rubber at its present price we may look forward to its extensive use for that purpose. Rubber pavements are no longer in the experimental stage; their desirability, efficiency and durability have been convincingly demonstrated; their wide adoption will come when an adequate and continuous supply of rubber at low prices is assured, and that time appears to be near at hand.

Rubber flooring, both in the form of matting and tiling, has long been employed extensively in hotels, banks, churches, libraries, hospitals and other public buildings, stock exchange and large offices of many sorts, steamships, railway coaches and even for skating rinks, tennis and badminton courts, where its qualities of silence, cleanliness, neat appearance and comfort to the feet have been much appreciated and its beneficial effect upon the acoustic properties of large halls fully realized.

The practicability of such floorings is obvious to anybody, but the use of rubber in paving highways has been regarded with considerable doubt by all not thoroughly familiar with the peculiar characteristics of rubber, and before rubber pavements are widely adopted a great deal of missionary work will have to be done. With the cost at about \$25 per square yard, it is useless to expect a municipality to consent to laying down miles of rubber road unless officials are convinced of its durability. While costly at the outset, experience has shown that rubber pavement lasts much longer than any other and will be less expensive in the long run.

ADVANTAGES OF RUBBER PAVEMENTS AND SIDEWALKS.

Aside from their remarkable lasting qualities, the chief claim for rubber pavements is that they eliminate the incessant clatter of city streets. The tremendous nerve-wrack of city noises is everywhere recognized by neurologists who attribute the greater prevalence of nervous disorders in cities to the constant din, of which traffic noises constitute seven-eighths. Most cities of any size have their anti-noise societies seeking to lessen noise nuisances of every sort. In modern rubber pavements such organizations will find a solution of many of their problems, and one which can be advocated with both confidence and conscience.

Rubber pavements would also add much to the comfort of those who must ride in other than pneumatic-tired vehicles, and would be far better for horses than any of the hard pavements now in general use. But there still remain the vast crowds that throng the sidewalks, the subways and the halls of office buildings. Their echoing footsteps on unyielding granite, marble, brick and concrete should stir humanitarians more than the aches of the relatively few remaining horses, or the pains of dray driver or motor-truck chauffeurs. What the cities need is rubber sidewalks before they even consider rubber streets. If there is any virtue in the rubber heel—and the great volume of business in this line indicates that there is much—rubber sidewalks would be a boon to mankind.

The general adoption of rubber tires for vehicular traffic of every sort and of rubber heels for pedestrians has to a certain degree accomplished the claims for rubber pavements and side-

walks, but several of the more important advantages of these improved street coverings cannot be secured by any other means. It will yet become common knowledge that such coverings, quite aside from their varied comforts, are economical in the long run, and at the same time it will be realized that road and sidewalk pavements used in conjunction with rubber tires and heels make for such maximum comfort as one gets in an automobile by adding shock absorbers to the best possible spring suspension.

EARLY PATENTS.

It is interesting to note that the pioneers in rubber, particularly in England, took an interest in rubber roadways.

As early as 1840, William Freeman took out an English patent for improvements in paving or covering roads, which specified a compound of india rubber combined with sawdust, sand or finely broken stone mixed in an iron cylinder, cooled and pressed. The blocks were about the size of bricks and were fastened together by rubber cement.

In 1843 Margaret H. Marshall was granted a patent for a composition which she called "Intonaco." Among other things, it was to be useful for making tessellated pavement. It was a mixture of vegetable gluten, albumin, oil, "indian rubber," and sulphate of lime.

A year later E. E. Cassell patented a paving compound consisting of chalk, mineral tar, melted rosin, liquid caoutchouc and sulphur.

In 1851 Sir John Scott Lillie patented a compound consisting of metallic substances mixed with coarse gravel and like materials, held together by bituminous compounds and cements.

While in 1856 Charles Haichois patented in England certain improvements in paving which consisted in the employment of lime, sand, asphalt, caoutchouc, gutta percha, marine glue and wood for the purpose of forming an even and durable pavement.

ANENT THE COST.

In 1913 Dr. Philip Schidrowitz, the well-known rubber chemist, delivered a lecture on the practicability of rubber pavements before the Society of Chemical Engineers of London. He went carefully into estimated details regarding the initial cost of the pavement, the expense of laying it and of its subsequent maintenance. Basing his calculations on crude rubber at 48 cents per pound, and on a composition that should be one-third rubber, he estimated that a ton of paving material would cost \$484, as compared with a cost for asphalt of \$9.68 to \$14.52, and of cement, concrete or stone of \$9.68 to \$24.20. He then compared the cost per square yard of rubber pavement with that of the materials generally in use, and found that a rubber road surface of the proper thickness would cost about fourteen times as much as asphalt or macadam and about seven times as much as granite or wood. Considering the large initial cost, he doubted the practicability of rubber paving, but with a better present knowledge of its lasting qualities and a very different crude rubber market the prospect seems very favorable.

THE INDIA RUBBER WORLD has consistently predicted that with 50-cent rubber the cost of rubber pavements on a large scale would be prohibitive, but that for certain purposes they would be sure to come to a considerable extent, and that their noiselessness and cleanliness, their freedom from rattle, jar and dust, are bound to bring them into constantly increasing favor where these advantages are most desired—as around hospitals, churches, schools, theatres, concert and lecture halls, around courts, in fine residential avenues, and even about apartment houses and office buildings of the better sort. With plantation rubber now ranging from 40 down to 25 cents per pound, Brazilian Paráns from 56½ cents down to 21, Africans and Centrals respectively from 50 and

40 cents down to 23. Maniocas from 48 to 32 cents, standard reclaimers from 40 cents down to 12, and rubber production considerably in advance of consumption, the early use of rubber pavements on a large scale appears to be in sight, for economy as well as efficiency and durability have become talking points that can be proved. The practicability of general rubber paving being once acknowledged, there is no limit to the amount of rubber that could be usefully employed.

AMERICAN EXPERIENCE.

It is to England that America must look for detailed information regarding rubber pavements, as it is there chiefly that they have been manufactured and used. America is almost entirely without practical experience in the matter.

In 1912, looking ahead to the time when low-priced rubber might make the article economically available for street pavement, the Standard Asphalt & Rubber Co., of Chicago, Illinois, now the Standard Emarx Co., manufactured and exhibited rubber paving bricks 8 by 4 by 2½ inches, having horizontal grooves along their sides. The wearing surface on top contained 25 per cent of rubber and 50 per cent of "M. R. X.," a mineral rubber, the mixture having sufficient tenacity to resist the wear and tear of street travel and to remain unaffected by weather changes. The base or underpart of these bricks was of "Sarco," a compounding ingredient of an asphaltic nature. The bricks were intended to be laid an inch apart, the spaces all around being filled with melted "Sarco." This, flowing into the horizontal grooves, formed when cooled, a dovetailed anchorage which not only held the bricks securely in place, but prevented the slipping of horses and the skidding of automobiles. A practical demonstration of the wearing quality of these bricks was given by means of an old-fashioned tread-mill in which a relay of horses, sharp-shod with heel and toe calks, walked continuously on treads of the rubber brick composition without in the least cutting or bruising them.

The cost and inconvenience of the necessary frequent replacing of planks in the boardwalk at Atlantic City led, in 1913, to a decision to cover certain sections of the walk with a preparation of rubber, and, this experiment showing satisfactory results, to extend its use over the entire length of the promenade. But this project was in the line of rubber flooring rather than of paving.

Even in France little attention has been given to rubber pavements, although in 1917 Ch. de Chaudenberg took out a patent on a composition of rubber, asphalt or bitumen for use as a road surface.

PIONEER WORK IN ENGLAND.

Rubber pavement is by no means new in London, however. When the St. Pancras Hotel was built in 1876, it was necessary to provide a roadway under it leading to the busy St. Pancras railway station. To prevent annoyance to hotel guests that might be caused by traffic noises, this roadway was paved with rubber, and it lasted for thirty years before any renewal was necessary.

Perhaps the first use of rubber for sidewalks was in Edinburgh, Scotland. In 1879 the North British Rubber Co. paved the whole sidewalk in front of its warehouses on Princes street, a very busy thoroughfare, with rubber. The walk was 12 feet wide and 50 feet long. Thirty years later, in 1909, to carry out an agreement with the city, as the firm was vacating the premises, the rubber pavement was removed. Careful examination of the rubber failed to detect the slightest sign of wear. The surface was nowhere oxidized and it seemed to be absolutely unaffected by the elements or by the millions of persons who had passed over it.

In 1881 the roadway under the Euston Hotel to the Euston station in London was paved with rubber. The material was supplied by Charles Macintosh & Co., Limited, and the total approximate cost per square yard was \$32.70, of which \$5.60 per square yard was for concrete foundation work.

When the rubber was laid down it was two inches in thickness. In 1902, after 21 years of service, the portion on the incoming road into the station was taken up and carefully examined when it was found to have worn down to about ¾-inch in the thinnest place, namely, at the incoming end, where horses first stepped on to it from the macadamized road. Other parts of the rubber were worn down to 1 inch and 1½ inches, these places in each case being near the center of the roadway. New material for renewal was furnished by the India Rubber, Gutta-Percha and Telegraph Works Co., Limited, at \$27.09 per square yard, the total cost of renewal, including laying, was \$28.75 per square yard after credit had been given for the old rubber taken up. The average yearly cost of examination and maintenance of the original pavement had been slightly under 6½ cents per square yard.

At this time the paving of the outgoing road from the station was 1½ inches thick, and later, in 1913, after 32 years' service, was still in use, although its early renewal was anticipated. This unequal wear was attributed to the grit brought from outside by incoming vehicles, from which outgoing ones are relatively free.

The courtyard of Claridge's Hotel, the resort of crowned heads and aristocratic travelers, was paved with rubber in 1900, and thirteen years later was found to be about one inch thick. In no case had it been necessary to replace the paving, but the old slabs were relaid, as they were working out of position, caused by their not having been securely fastened down in the first instance.

In 1904 the courtyard of the Savoy Hotel in London was paved with rubber at a total cost of \$9,733. The area of the courtyard is 3,750 square feet, of which 2,195 were covered with rubber. The rubber used was two inches thick, weighing 15¼ pounds per square foot, and it was laid on a smooth concrete foundation. Rubber having advanced materially in price, the cost of the pavement laid, not including the foundation, was \$40.78 per square yard.

The traffic at the Savoy is more exacting than at Claridge's, yet after ten years' service this pavement was reported as being in very fair condition, although the slabs did not in all cases fit very closely. Certain portions had been subjected to special wear, owing to the stopping and restarting of vehicles, particularly where studded tires were used. Oil dropping from motor cars had likewise affected the surface of the rubber paving, and it had been found necessary to relay some of the slabs, possibly owing to their not fitting well.

While the conditions under which the above-mentioned pavements are used do not quite compare with those of ordinary streets, because all are under a roof and are open only to passenger vehicles mostly rubber-tired, they are in constant use and the traffic, especially at Euston station, is very heavy. That they have given satisfactory service, however, for periods of ten to more than thirty-two years demonstrates convincingly their efficiency and durability.

THE DESSAU RUBBER PAVEMENT.

An interesting experiment was made in 1913 at the junction of the New and Old Kent Roads, one of London's most crowded corners, with the rubber-capped wood blocks patented by M. M. Dessau and for which a gold medal was awarded to the inventor by the Rubber Growers' Association. As compared with the ordinary concrete foundation of wood pavement, the new method is claimed to be an improvement, as the wood blocks are imbedded in an ordinary asphalt grouting, while the rubber caps prevent the penetration of moisture into the wood.

In Mr. Dessau's system jarrah wood blocks are used with a surface cushion of rubber, held rightly in position by dovetailing. The blocks are readily movable, an advantage in these days of frequent excavations for electricity, gas, water, telephone and telegraph conduits. They interlock perfectly and give absolutely watertight joints.

PRACTICAL ADVANTAGES OF RUBBER PAVEMENTS.

The section in the old Kent road, after carrying for 295 days some of the heaviest traffic in London, amounting to 90 tons per square foot per hour for twenty-four hours, was not perceptibly worn, whereas an adjacent 4-inch wood block laid half an inch in thickness in the same time under the same load.

So successful was this initial experiment in rubber street paving in the open that in 1914 the Federated Malay States Government subsidized the laying of rubber pavements in front of its Information Agency Offices at 88 Cannon street, London, E. C. This was done in anticipation of the Fourth International Rubber Exhibition in London and to advertise the Federated Malay States as a great plantation-rubber-producing country.

It is claimed that the road foundations do not require to be nearly so strong in the case of rubber roads as with ordinary wood blocks. The reason is that the vibration of the heavy traffic on the latter causes the concrete foundations to disintegrate, even if the thickness of the concrete is in excess of the now frequently adopted twelve-inch standards.

The fact that thinner foundations can be used with rubber roads can be set against the extra cost of the rubber blocks, though even then the costs will not be equal. But the life of the rubber road may be expected to be so much greater as to more than compensate for the extra cost, apart from the advantage of silence and the prevention of skidding and side-slip of vehicles.

The latter claim may at first sight appear a somewhat remarkable one, but it is a fact that the rubber road sections that have already been laid have proved to be most effective "non-skids," notwithstanding the prediction that when wet it would become very slippery. Even when covered with oil, or when black-leaded, the rubber road does not appear to cause motor vehicles to slip. This was hardly expected when the first sections were laid down. In fact, so convinced were English insurance experts that the risk of disaster through side-slip on rubber roads was enormous that they quoted absolutely prohibitive rates when one section was being laid down, and a guaranty had to be given to the local authority. Now the premium is just the same as would be the case for any other road; in fact, it is no longer necessary to insure.

RUBBER ROADWAYS LIMITED.

In 1915 a company known as Rubber Roadways, Limited, was formed under the auspices of the Rubber Growers' Association of London, with a proposed capital of \$150,000 for the purpose of exploiting the Dessau patent on the basis of plantation companies participating in the venture. It was proposed for them to furnish annually without charge during five years one-fifth of one per cent of their output, in addition to a like further quantity at 24 cents a pound. An aggregate output of 20,000 tons a year would have been sufficient to supply 40 tons free and 40 tons at the price named. This would have amounted at that time to a free grant of 1,000 tons of plantation rubber and an additional 1,000 tons at the nominal price of 25 cents per pound.

Owing to the war the project did not fully materialize and the activities of the company ceased, but it is now proposed to revive experiments and as a beginning 400 square yards or nearly a quarter of a mile of rubber roading is to be laid on High street in the Southwark Borough of London. The company is to furnish the rubber blocks for the initial covering and subsequent repairs for a period of years while the borough is to undertake the laying and maintenance.

Meanwhile hardwood blocks have become practically unobtainable in England and are likely to be very expensive for years to come. Experiments have been made to improve methods of attachment and the block now being used is the invention of George Anderson of the Leyland & Birmingham Rubber Co., Limited. The method adopted is that of vulcanizing the rubber cap onto a steel plate; segments of that steel plate are cut and

turned down to form lugs, and it is proposed to lay the blocks directly on the cement crust of the road, embedding the lugs in that crust.

While it is believed that this style of block and method of attachment mark a considerable advance over anything previously devised, it is not contended that it represents the ultimate in methods of road paving. Suggestions for improvement are plentiful and it is anticipated that methods will be found to utilize the lower qualities of crude rubber as well as waste rubber for this purpose. In this direction point the recent experiments in Southwark Borough, London, where the paving blocks are made wholly from reclaimed rubber vulcanized at high pressure in iron molds.

REMARKS ON "UNWOVEN RUBBERIZED FABRICS."

Contributed.

THE FACT that Mr. Respass contributes the result of his experiments in a very interesting article in the June issue of THE INDIA RUBBER WORLD tempts me to indulge in the following résumé of the subject. Researches in the matter resulted in the following conclusions: First, that the rubberizing of unwoven fabrics is by no means new.

GOODYEAR'S TISSUE.

In 1853, Charles Goodyear ("Gum Elastic," by Charles Good-year, 1853, Volume I, page 190) says:

"Tissue is formed of a layer of cotton wool which is sized before it is coated with gum. The dissolved gum is combined with it by the spreading machine which makes a complete admixture of the two articles. The fibre of the cotton is not broken . . . and it is therefore . . . when corded, stronger than woven fabrics of the same weight."

GOODYEAR'S VELLUM.

This is made of a bat of cotton of about 1/4- to 1/2-inch in thickness. The gum is pressed into and intermixed with the wadding at one operation of the spreading calenders, and like other fibrous fabrics it is manufactured with great rapidity. It is made impervious to air and water with much less gum than the woven fabrics. Besides, the yarn is not liable to peel off as easily as it does in other fabrics. It is for most purposes the cheapest as well as the best of the non-elastic fabrics and when corded bids fair to supersede the coated cloths entirely for many purposes, particularly . . . for the heavier uses for india rubber canvas. It is made when desired in imitation of various kinds of morocco, kid and buff leather, and of different thicknesses and degrees of strength according to the thickness of the wadding.

GOODYEAR'S CORDED FABRICS.

Tissue and vellum are made very strong (and are torn with difficulty) when corded with silk, thread, tissue or spun yarn, for the same reason that muslin and other woven fabrics are strengthened by being barred or corded with threads stronger than those of which the cloth is made.

The different fibrous fabrics, when corded in this manner are even stronger than india rubber fabrics that are made of woven cloths. The uses of these fabrics are the same as those of tissue, vellum and vegetable leather, but on account of their great strength are applicable to a great many purposes for which those fabrics would not answer, such as . . . tarpaulins, coach cloths, etc.

As far back as 1825, Thomas Hancock patented a substitute for leather which consisted in saturating and combining various fibrous substances with a solution composed of caoutchouc, in which he mentions the use of a layer or layers of carded cotton. Incidentally in the same year he took out a patent which covered the mixing or covering fibrous substances such as hemp, flax, cotton, wool, etc., with the juice of a tree called the "Hevea."

In 1854, James T. Stoneham secured an English patent which covered the application of caoutchouc compounds in solution as applied to any felted fibrous matter, the rubber being applied by "forcing it into the material by pressure of rollers similar to calender rollers."

Coming down to more recent times the following is to be noted: Clark's patent felt made from rubberized cotton fleece.

("India Rubber, Gutta Percha and Balata," Brannet, 1900, page 208.) In the same line of endeavor may be cited the following: Rubberic, which is fiber blended with india rubber in solution, stretched and dried, used chiefly in making tires and mechanical goods, patented by William Golding, Manchester, England; and Wolfert, another English product, which is felt impregnated with a waterproof substance. ("Crude Rubber and Compounding Ingredients," Pearson, pages 135 and 139.)

Moreover, there should be taken into account the processes employed in making felt shoes several times essayed in New England with more or less success, all of which were based upon the impregnation of unwoven fabrics with rubber shaped and vulcanized.

It would seem, therefore, that the use of cotton bats in connection with india rubber applied either in solution or as a dry dough had been pretty thoroughly described. Special machines may of course assist in the production of a better or a cheaper product and the writer trusts that such is the case. But the product itself in any form which he has described would seem to be available to any who chose to manufacture it.

Note.—As our contributor almost says, it is accomplishment that counts, not suggestion, or experiment. Pneumatic tires were discovered long before they were made commercially. The man who first makes anything on a commercial scale is oftentimes the actual inventor and that in spite of previous predictions, suggestions or patents that ended in failure.—THE EDITOR.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(717.) A correspondent inquires where in the United States Castillo tapping-knives may be purchased.

(718.) An inquiry has been received for the address of manufacturers of paper transfers for marking inner tubes.

(719.) A reader requests information concerning a permanent, glossy, non-crackable varnish for hot-water bottles.

(720.) A subscriber inquires for the names and addresses of manufacturers of rubber tape suitable for patching canoes and small boats.

(721.) A correspondent desires to place with an American manufacturer an order for Hevea tapping tools.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce or its district or cooperative officers. Request for each should be on a separate sheet, and state number.

(29,185.) A firm in Norway desires to purchase and an agency for sale of rubber goods, tires, etc. Cash against documents.

(29,188.) A firm in France desires agency from manufacturers for sale in France and Morocco of dentists' and druggists' supplies.

(29,190.) A man in Switzerland desires to purchase or secure agency for sale of rubber tires, tubes, artificial leather, etc.

(29,318.) A druggist in Algeria desires to purchase pharmaceutical rubber goods of all kinds. Correspondence may be in English.

(29,322.) A merchant in Australia desires to purchase canvas shoes with rubber soles, white and gray, all sizes. Thirty days' sight draft, documents attached.

(29,346.) A firm in Spain desires agencies on commission basis for sale of rubber stamps. Correspondence in Spanish.

(29,359.) A firm in Norway desires to purchase and secure agency for sale of rubber shoes. Cash against documents.

(29,403.) A firm in Norway desires to purchase and an agency for sale of rubber goods and insulating materials. Quote

f. o. b. New York. Cash against documents at destination.

(29,413.) A firm in Norway desires to buy rubber overshoes. Cash against documents.

(29,419.) A firm in New Zealand desires agencies for sale of artificial leather.

(29,435.) A man in Switzerland desires to purchase pneumatic tires. Correspondence may be in English.

(29,443.) A firm in Brazil desires agencies for the sale of rubber tires and rubber goods. Correspondence may be in English.

(29,452.) A firm in Norway desires to purchase transmission belting. Quote f. o. b. American port of shipment. Cash against documents.

(29,456.) A firm in Italy desires to secure agencies for the sale of tires, etc.

(29,466.) The representative of a firm in Scandinavia, now in this country, desires to secure agencies for the sale in Scandinavian countries of all kinds of rubber manufactures, including galoshes, tires, hose, gloves, hot-water bottles, heels and soles, raincoats, and mechanical rubber goods.

(29,475.) A company in Norway desires to purchase and an agency for the sale of tires. Quote f. o. b. New York. Cash against documents at destination.

(29,494.) A firm in Norway desires to purchase rubber and rubber goods. Payment against documents at destination.

(29,311.) A company in Norway desires to buy rubbers and rubber heels; also, an agency for sale of same. Quote f. o. b. New York. Cash against documents at New York or destination.

(29,542.) A merchant in Italy wishes to purchase or secure an agency for the sale of dentists' rubber goods, hospital and orthopedic supplies, and other rubber goods. Payment on receipt of goods. Correspondence may be in English.

(29,547.) An importer in Italy desires to purchase suspenders and garters. Payment through American bank. Correspondence in Italian or French.

(29,586.) A commercial agent in Belgium wishes to purchase and secure an agency for the sale of insulated cables and wires for electric wiring, etc. Correspondence in French or Flemish.

(29,589.) A traveling salesman of Smyrna, Turkey, in the United States for several years, sailing soon for the Near East, desires to secure the representation of rubber goods in Turkey, Greece, the Balkans and Egypt.

(29,617.) A firm in Norway desires to purchase an agency for the sale of rubber and rubber goods. Cash against documents.

(29,656.) A firm in Belgium desires to purchase or act as agent or receiver on consignment for electrical insulating material.

(29,660.) A company in Italy desires quotations on 25,000 to 30,000 square yards of waterproof covering for wagons, to be standard quality; guaranteed samples requested. Correspondence may be in English.

(29,682.) A firm in Brazil desires to purchase cables and insulating material. (Refer to File No. 117,955.) Correspondence in Portuguese.

(29,687.) A company in India desires to purchase electrical cable-making machinery and raw rubber, insulation material, etc. Terms, cash against documents.

(29,692.) Proprietors of a company in Denmark now in this country seek exclusive agencies for sale in Denmark of rubber goods, including tires, hose, raincoat, physicians' and surgeons' sundries, galoshes, toys, etc.

(29,695.) Furniture dealer and manufacturer in Australia desires to purchase billiard rubber. Quote f. o. b. American port. Payment, sight draft with documents attached.

(29,711.) The purchasing agent of a firm having large department stores in several different countries, now in the United States, desires to purchase for immediate delivery fountain pens, rubber goods, etc. Cash or terms suitable to seller.

Tire Rebuilding and Repairing.

REBUILDING.

THE RAPID GROWTH in popularity of automobilizing has developed a wide-spread demand among tire users for dependable rebuilt tires, tire repairs, and devices such as tire reliners, blow-out patches and other means for extending the usefulness of tires. In response to this demand innumerable tire repair plants are to be found on every hand. Some of these are developing their facilities to enable them to rebuild tires and

a number of companies are now organized and operating plants in various sections of the country, exclusively for rebuilding both wrapped tread and full molded tires.

The stock of repairable tires is selected from the standard makes of high-grade guaranteed fabric tires. Such old tires are stripped down from their road-worn condition to a basis of sound fabric plies, and after being repaired, are rebuilt with new rubber and fabric, or salvaged fabric, into a serviceable product salable as legitimate low-priced merchandise.

Restoring old tires to a serviceable condition by repairing is, of course, nothing new. The enormous number of tires in use and the desire on the part of their owners to derive the utmost of tire mileage to compensate for the high cost of motoring, form the basis of a great national business in the United States.

Previous to the abnormal conditions due to the demand for munitions of war, motorists generally did not appreciate the possibilities of expert tire rebuilding, but when convinced through necessity that it is practical economy and that the last thousand miles of tire service is in fact the cheapest, they accepted it as they have the factory-rebuilt automobile. Tire rebuilding is today an

(The B. F. Goodrich Co.)

METHOD OF MAKING SECTIONAL REPAIR.

essential and profitable business, depending fully as much on ability to judge whether casings are worth the necessary repairs as on skill in performing the work.

SELECTING TIRES FOR REBUILDING.

The first selection of road-worn tires for rebuilding is done by the rubber scrap dealers who specialize in old tires and who also salvage sound tire fabric from unrepairable old tires for use in rebuilding such as are repairable, and for manufacture into tire reliners, blow-out patches, etc. The final selection requires the expert judgment of a man familiar with tire construction, and able to diagnose structural weaknesses in order to eliminate all casings that cannot be turned into serviceable rebuilt tires.

TYPICAL METHOD OF REBUILDING TIRES.

Different methods have been developed for successfully rebuilding tires, both wrapped tread and full molded. The work consists essentially of four parts: (1) tearing down, (2) repairing,

(3) rebuilding, (4) curing. Two typical processes are here given.

One method is to tear apart the old tire, layer by layer, and use the material thus obtained (except the old rubber) in building a

(Allentown Tire Equipment Co.)

THE CUTTING-DOWN PROCESS.

new tire, cutting out the damaged portion of the fabric and building up as in building a new tire of new material, except for the use of the beads and the old fabric bases. This method is effective but the cost is very little lower than where new fabric is used.

A more economical and practical way is the following, recommended by a concern which has developed the system of molding described.

TEARING DOWN.

An old tire, carefully selected, having a good body with no rim-cuts, is hung on an ordinary tire core and the center of the tread is skived down to the fabric for a space of about six inches in length. The tire is then put on a machine having an interchangeable tool which cuts through the outside ply of fabric from the tread to the bead point. The tire is then taken off, turned around, and the fabric cut from the center to the opposite bead. This leaves the outside ply of fabric cut through from bead point to bead point. This outside ply, including the tread, is now peeled back for a distance of four or five inches and stripped from the tire with the assistance of hand-tools.

(Hibbs Rubber Co.)

BUILDING UP REBUILT TIRES.

The object in removing the first ply of fabric from the tire to be rebuilt is to minimize the amount of labor in preparing the old tire for rebuilding and to secure the proper vulcanization of the rebuilt tire. The first ply of fabric, generally full of sand, etc., is removed before the carcass or body of the tire is cemented and the new tread applied.

REBUILDING.

The body of the old tire, after removal of the tread and first ply of fabric, is examined and if there are any blow-outs or weak places in it, these are stripped off as for an ordinary sectional repair.

(Allentown Tire Equipment Co.)

STITCHING DOWN THE TREAD.

The tire then goes to the building-up department, where it receives two coats of good vulcanizing cement and is allowed to dry, after which the blow-outs and weak places are repaired with reclaimed tire fabric. Any repairs made on the inside of the tire are made on the bias, giving the ends of the repair fabric the appearance of an ordinary splice. The tire is then mounted on a collapsible core, and one ply of reclaimed fabric is applied on the outside to replace that removed with the old tread. The cushion gum, bead fabric, breaker fabric and tread gum, all of new material, are then applied in the same manner as in building a new tire.

CURING.

The tire is now ready for curing in an adjustable tire mold. An air-bag is inserted in the tire and it is placed in the mold, the upper half is lowered to the proper place, the air-bag inflated to 150 pounds pressure and steam turned into the jacketed mold. After a cure of fifty minutes at sixty to sixty-five pounds the steam is turned off and water is circulated through the molds to cool them. The upper half is then raised and the tire is taken out. The air-bag is removed and the slight over-flow at the

(Hibbs Rubber Co.)

CURING IN ADJUSTABLE MOLDS.

edge of the tread trimmed off with a small V-shaped push-knife. The tire is then finished with a coating of talc.

Different brands of tires vary in size, one make will measure 64 inches from bead to bead, while another brand of the same

size will measure 7 or 7½ inches from bead to bead. Therefore, adjustable tire molds are made that give a perfect cure on either a full or scant size tire of a given size. In curing by the open-steam, wrapple systems this variation in the size of tires is easily overcome, but in the mold cure, the tire must fit the mold or it will not be perfect. If the tire is too large, it will be wrinkled or mold-pinned; if too small to fill out the mold there will be insufficient pressure on the tread.

The adjustable mold is made in two pieces—the lower part curing one side and the tread, while the upper part fits down into the lower and cures the opposite side of the tire, a complete cure being effected in one operation. In curing a scant size tire, the mold is closed completely, while on a full size tire it is left slightly open. Both the upper and lower cavities contain live steam, but valves may be installed in the steam line, so as to cut off the steam in either cavity for curing one side of the tire only, as in the case of a large rim-cut or side-wall repair.

(To be continued.)

ROAD BUILDING AND TIRE BUILDING.

A COMPARISON of American road building and motor vehicle production during the past nine years vividly shows the necessity of enormous highway expansion. In 1910 approximately 7 per cent of this country's highways were improved,

and even to-day improved roads are estimated at only 15 per cent of the total mileage. But while good roads were being 'doubled,' the number of automobiles has been increased some seventeen times. Within five years the main traveled roads will be clogged with traffic, and in figuring highway capacities and building new roads the ratio of increasing traffic must be considered.

Highway building is making great progress to be sure, but it is only in its infancy, and when the expenditures now authorized by the several States and the Federal Government have been exhausted the work will be only fairly under way and tremendous further outlays will be required. More has been accomplished in the Eastern States than elsewhere, but the Middle West and even the South are rapidly awakening to the need. It is probable that the people of thirteen States will have

The total road mileage of the United States is about 2,456,000 miles. With a total registration of 6,146,617 motor vehicles there is an average of 2.5 motor cars for every mile of public road. There is an average of one motor car registration for every 16 persons in the United States. California and Nebraska average one car to every 10 persons. Iowa and South Dakota, 1 to 8. Alabama, 1 to 51. Louisiana, 1 to 46. Arkansas, 1 to 42.

voted in favor of bond issues aggregating more than half a billion dollars for better highways before next winter. Illinois, Pennsylvania, Michigan and Utah have already authorized issues amounting to \$162,000,000, while the legislatures of Montana, Oklahoma, Alabama, California, Missouri, Georgia, Minnesota, Texas and West Virginia have recommended that the people vote this year for good roads appropriations totaling \$371,000,000. The overwhelming vote in the first four States mentioned seems to indicate a successful outcome in the other nine, and

doubtless other States will fall into line, all of which is of vital interest to tire manufacturers.

In proportion to populations, both England and France have made and are making more progress than America. Congress has appropriated \$275,000,000 for expenditure up to and including 1921, for improvement of the 2,500,000 miles of roads in the United States. France plans to spend \$152,000,000 on her national system of highways comprising 65,000 miles, while England has appropriated \$50,000,000 for expenditure on her 150,908 miles.

England has 239 citizens to every mile of road; there are 108 Frenchmen to every mile, and in America there are only 42 persons to the mile. According to these figures the highway system of the United States will not equal the ratio of French mileage to area until we have 5,000,000 miles of highway, while 7,500,000 miles will be necessary to meet the English ratio.

STRAIGHT-SIDE TIRES FOR FOREIGN MARKETS

It is now a conceded fact that the mileage obtained from a straight-side tire is normally greater than that obtained from a clincher of equal size. This is because the absence of a bead permits a given weight of car to be carried on a larger volume of air or inside diameter than does a beaded or clincher tire of the same cross-section. It has played no small part in increasing tire guaranties from 3,500 to 5,000 and even 10,000 miles or more.

These facts are generally admitted in the United States and, subject to demonstration, abroad just as they were here in the beginning. The prejudice of foreign buyers disappears when they are convinced that a straight-side tire will give more mileage at a given cost than a clincher tire. Therefore the problem of popularizing straight-side tires in foreign markets hinges on two things—the attitude of competitors and the ability to get replacements.

It may be conceded as a fact that the Continental European tire manufacturers will do everything they possibly can against the straight-side tires for the reason that they are better equipped to build clincher tires. The European car manufacturer will also combat the straight-side tire because it is an American development, and he will find the European tire manufacturer helping him on every hand. There will also be the European tire dealer to aid them, so that the elimination of the clincher tire will not be accomplished without a great deal of propaganda work and can never be accomplished without united action upon the part of the American car and tire manufacturers.

Whether or not this can ultimately be brought about, depends upon one thing only—the ability of the purchaser of an American car equipped with straight-side tires to get replacements wherever he may go with his car. This means practically universal distribution of straight-side tires, and is a problem which belongs primarily to the tire manufacturer, although looking at the question in its broadest sense, it is one of mutual interest to him and the automobile manufacturer.

The equipping of American cars for export with American clincher tires does not solve the problem, for these are inch-size tires and not interchangeable on the same rim with European millimeter-size tires, with the exception of 34 by 4½ and 880 by 120 m.m., the former, however, being made only with straight sides. Moreover, it is as difficult in most foreign markets to obtain an inch-size clincher as an inch-size straight-side tire. That the problem is susceptible of solution, however, was recently indicated in Argentina, where a change from 100 per cent clincher tire equipment, metric sizes, to 100 per cent straight-side equipment, inch sizes, was made without the loss of a single sale. This was brought about through co-operation with tire manufacturers who were notified in advance so that when the cars arrived there was already a stock of inch-size, straight-side tires to be had.

The same result can be obtained in all markets, with the possible exception of Continental Europe, through the co-operation of American tire and automobile manufacturers, as evidenced by distribution which the more aggressive tire manufacturers have already effected throughout the world.

In Continental Europe it is doubtful if this change can be brought about for some time, because the local manufacturers are at home and we are meeting them on their own ground, where they have every patriotic and local element supporting them, but it could doubtless be done even there through united team work of all American manufacturers of cars and tires. The straight-side tire is a better proposition for the ultimate purchaser, and if we can give him the same replacement service that is afforded with the clincher tires, we have helped him and thus have helped ourselves.

So long as some of our American manufacturers equip with clincher tire equipment, so long must all equip with clincher tire equipment. Not one of us would be willing to sacrifice his individual market and see some other American manufacturer take it, because this would not bring about the desired result. Team work and the united effort of the American manufacturers can accomplish this result while the efforts of one alone would be unavailing.

From "The Tire Rate Book."

USE TIRES OF RIGHT SIZE.

A nation-wide campaign will soon be launched by tire manufacturers to educate automobile manufacturers and dealers in the economic importance of equipping cars with tires of the right size. At the same time an effort will be made to check the wasteful practice of carrying too many "spares." This movement was inspired by the reports of the Commercial Economy Board to the effect that out of 21 cars in a test only seven were equipped with tires of the size recommended by tire manufacturers.

Car makers are now recognizing the principle that tire mileage is governed almost as much by the weight of unsprung parts that bear directly on the tire as by the total weight of the car.

Tire manufacturers will endeavor to drive home to the makers and distributors of cars that the thing of first importance in the selection of tires is size in proportion to the weight of the loaded car; and second, size in proportion to the distribution of weight between sprung and unsprung parts. Selection of tires in sizes recommended by manufacturers will reduce the number of spares necessary to carry on extended tours. This will be emphasized in the educational campaign of the manufacturers.

¹From a paper by D. B. Richardson, foreign sales manager of the Studenbaker Corp., read at the Automobile Export Managers' convention held in New York City, March 7, 1919.

SALVAGING AUTOMOBILE TIRE FABRIC.

A DISCARDED ROAD-WORN AUTOMOBILE TIRE CARCASS averages half rubber composition and half cotton fabric. In the best makes the fabric is Sea Island and Egyptian cotton and much of it is sound and in usable condition for remanufacture.

It is readily salable at a higher price than the old rubber portions. The possibilities in using salvaged tire fabric have led to the development of two profitable lines of business. Reclaiming or "pulling" old tire fabric is comparatively a recent addition to the business of the scrap rubber dealer. Many tons of usable fabric are recovered daily and find ready

THE R. & D. FABRIC PULLER.

sale to the tire repair and rebuilding trades, and to manufacturers of tire reliners, blow-out patches, etc.

Various power devices are employed for stripping or pulling tire fabric which not only lessen the labor cost but produce a uniform product with the rubber wholly on one side of the fabric while the opposite side is entirely bare. Successful machines for this purpose are shown in the illustration and the operation of one is described below.

METHOD OF STRIPPING TIRE FABRIC.

The bead points are first trimmed off the old tire from which the fabric is to be stripped. The work is done with a six-inch knife. The tire is next turned inside out and slipped over the

HIBBS' FABRIC STRIPPER.

expanding drum of the stripping machine. By means of a hand-crank the drum is expanded until the tire is held firmly. One ply of fabric is then cut through clear across from bead to bead. One edge of it is peeled back a short distance by means of a pair of pincers until the end will reach once around the fabric shaft of the machine. This lever is thrown forward, bringing the fabric near the tire, the free end of the fabric is wound round the shaft and the clutch engaged. After the shaft has made a few turns, it is drawn away from the tire to allow room for the accumulation of fabric on the shaft. While the fabric is being removed from the carcass, should it tear or a large blow-out be reached, the clutch is disengaged and the fabric around the bad place

is peeled back with the aid of pincers. The operation of stripping the tire is continued until the level of the beads is reached.

REMOVING THE BEADS.

At that point the tire is taken from the machine and the beads removed on a special machine. This machine is simple of operation and consists of a rigid stand, somewhat like a tire-building machine, with a locking device to hold the tire securely, and an arm actuated by a hand-lever. This arm is provided with an interchangeable tool, of which one end is ground for removing the beads, and the other for cutting through the treads and first ply of fabric. The bead-removing tool engages the exposed bead, pushing it away from the tire for a space of about twelve inches, after which it is easily pulled from the tire.

After removal of the beads the tire is returned to the stripping machine and the remaining plies stripped as described, down to the ply next to the tread. This ply, usually filled with sand and dirt, is worthless for reuse, and is discarded with the attached tread and side wall rubber, as junk.

The cost of stripping fabric by machine is a relatively small item in view of the amount of possible output and profit.

GERMAN WAR TIRES¹

THE FOLLOWING ACCOUNT of what the Germans were obliged to substitute for rubber tires on their army motor vehicles relates particularly to the tire situation in Belgium as affected by the blockade.

SUBSTITUTES FOR RUBBER TIRES.

The loss of rubber was a serious blow. While the Allies ran all their trucks on rubber tires, and even had automobile-hauled gun carriages rubber shod, the tire dimensions going as high as 60 by 9 inches, it was a rare occurrence to see a German truck with rubber tires. Of the hundreds of abandoned or captured German trucks I examined in Belgium, not more than a dozen had rubber tires.

The stories of artificial rubber appear to be a myth. The majority of these trucks had very thick wood rims²; mounted on the rim of the wheel around this was a light steel rim which made contact with the road. Another equally common method was a series of rubber blocks, each of which was set in a pair of cups mounted respectively on an inner and an outer rim. The inner rim was fixed and the rim had a certain amount of elasticity. In this case, as in the first instance, a steel rim was in contact with the road, the rubber giving a cushioning effect without being subject to friction with the road surface.

In some instances this system of rubber blocks between two steel rims was applied to touring cars. The result, however, was not at all satisfactory; speed had to be kept down to 12 miles an hour, the vibration was tremendous, and there was a decided tendency to skid.

Sufficient pneumatic tires were obtainable to supply the cars used by the higher staff officers at the front, but the scarcity of rubber and the impossibility of finding a substitute for pneumatic tires restricted the use of touring cars to officers in the field.

CONVERSION OF A GERMAN TIRE FACTORY.

Because of the special nature of its requirements, the balloon companies had their own main supply depot, independently of the airplane service. It was one of the accidents of war that the factory used by the Continental Tire Co., of Hanover, until August, 1914, was taken possession of by the French, who enlarged it and later turned it over to the American Air Service as a balloon depot. Before the fighting this one-time German rubber factory had become the biggest hydrogen-gas producing center in the world, with an output of 500,000 cubic feet per day. During the active period this depot sent out 1,650 tons of special balloon material.

FROM SALOONKEEPING TO TIRE SALES AND REPAIR.

After July 1, thousands of excellent store locations now occupied as bar-rooms will be released for other business purposes. In Ohio alone the number is estimated at 6000. Tire manufacturers believe that liquor men who enter the retail tire and accessory field are undoubtedly making a wise choice and predict that hundreds of them will do so.

¹ By W. F. Bradley in "Automotive Industries."

WOODEN PACKING CASES AGAIN FOR CRUDE RUBBER.

DURING THE WAR the baling of plantation rubber for shipment from the Far East became a patriotic and necessary expedient to conserve ship tonnage. The plan was effective

A VENESTA CASE.

in that it resulted in a saving of 25 per cent in cargo space and about 20 per cent in weight, and was carried out with a measure of success, yet it was by no means popular with American rubber manufacturers. While it was found that in most instances baling afforded adequate protection, it seemed to have a deteriorating effect on the rubber, and in most cases it greatly increased the tendency of the sheets to stick together, causing considerable difficulty in separating them.

It is not surprising, therefore, that planters are again employing wooden packing cases at the solicitation of their patrons. The standard size measures 19 by 19 by 24 inches, which is equivalent to 5 cubic feet. Each case is securely nailed and banded with iron to withstand the long journey and severe handling. The average net weight of a case of first latex crepe is 150 pounds, and that of smoked sheet 200 pounds, the tare in both cases averaging 20 pounds. A ship ton is equivalent to 50 cubic feet, and as a case of rubber measures 5 cubic feet there are usually 10 cases of rubber to the ship ton.

Experience has shown that cases almost cubical in shape and of the size adopted withstand many hardships better than oblong or larger cases. When filled they are relatively light, very strong and well adapted to Eastern methods of transport. Moreover, the weight of rubber per case is not sufficient to cause much sticking together.

The three-ply wooden cases with the grain crossing at right angles, such as the well-known Venesta, are probably the most suitable. They are shipped flat, put together on the estate, and held together by metal straps bent around all edges and riveted. Interior battens at top and bottom give them great strength and rigidity with extreme lightness. They can be opened at either end, and on taking off the lid the battens are also removed so that nothing remains to obstruct turning out the rubber. Such cases of the same internal capacity as sawed wood cases weigh from 40 to 60 per cent less and save from 10 to 15 per cent of the rail and ocean freight on the packed cases. They are smooth inside, practically dust-proof and air-tight, insuring minimum oxidation of the rubber and the best obtainable price for it. If desired they can be perforated with holes for ventilation without any loss of strength.

Well-seasoned Japanese Momi cases are satisfactory if fully $\frac{5}{8}$ -inch thick and before shipment they should be fastened securely around both end-edges and also around the middle, both endwise and crosswise, with hoop iron, care being taken that the nails used do not damage the rubber. Now that there appears to be no prospect of cases being permanently discarded for bales, the numerous suggestions that cases be devised having some practical method of opening the lid for inspection at various ports and permitting reshipment without the removal

of binding iron and nails or damage to the case will probably receive more attention.

Most estate managers now realize how important it is that all wood chips, saw-dust and splinters, which might become imbedded in the rubber, be removed from the packing cases before filling, also all dirt, leaves and twigs from the rubber itself. They are also aware that unless the rubber is thoroughly dry before packing, decomposition may ruin the entire careful during transit and the shrinkage may exceed the 2 per cent allowed by sellers. This shrinkage, together with rough handling, causes the rubber to shake down until there is a certain amount of play inside the case. If the case is not of smooth planed wood, splinters will become imbedded in the rubber, and this play has even been known to knock out the sides of a case in rough handling. It has often been suggested that case be lined with various materials such as paper, muslin, cheesecloth, jacknet or straw matting, but experience has condemned them all. Of the various packing materials to avoid splinters and exclude extraneous dirt, probably the best is heavy waxed paper. It is preferable, however, to omit it, and if the cases are well-constructed of planed lumber and the rubber is thoroughly dry, none will be needed.

On well-supervised estates the packing is very carefully done, the sheets being laid flat and not folded. They are spread quite close to the sides of the case and as many put in as can be packed without undue pressure, talc or soapstone being used freely between the sheets of rubber to avoid moisture from sweating.

Well-cured, thoroughly dried and carefully packed rubber will reach its destination in ordinary unventilated cases, but if any tendency toward tackiness exists at the time of packing, transit in such cases may cause the whole consignment to ar-

PLANTATION RUBBER IN CASES.

rive in a moldy condition. Air-tight cases are therefore dangerous and a moderate amount of ventilation appears to be desirable.

CONSOLIDATION IN THE LITHOPONE BUSINESS.

A new organization capitalized at 10,000 shares of no par value and an authorized bond issue of \$500,000, has been formed in St. Louis, Missouri, by the consolidation of the Collinsville Zinc Co., the Potter-Barrell Process Syndicate, and various mining interests whose names are at present unannounced. The incorporators and officers of the new company, known as the Collinsville Zinc Corp., are as follows: Otto M. Meister, president; Robert W. Barrell, treasurer; R. W. Wild, secretary; directors, Henry W. Schultz and Joseph Carr. The concern will manufacture lithopone, barium, lead, zinc and arsenic salts, pigments, and insecticides.

RECLAIMING HARD RUBBER.

By Hancock Haskins.

SOFT RUBBER in its great variety of forms as scrap, trimmings, and worn out articles, has been reclaimed, recovered or regenerated almost from the time of Goodyear. Hard rubber scrap, however, for a long time was neglected, first because it was mechanically difficult, and second because none of the common acid or alkali processes were adapted or, rather, needed in its reclamation. It therefore happened that while old boots and shoes, belting, hose, and tires were collected, and a huge business built up on their recovery, hard rubber scrap was not sought for.

Hard rubber scrap comes in a great variety of shapes. Worn out battery jars, bases for truck tires, electrical sheets and rods, valves, druggists' and surgical fittings, etc., etc. Before proceeding to a discussion of the methods of turning hard rubber scrap into dust, a word concerning the use of this dust is in order.

Hard rubber dust is not desulphurized or devulcanized. Nor is this necessary, for the sulphur contained in it is in no sense a handicap. Indeed it is useful for revulcanization. The dust is simply added as if it were so much whiting and under pressure and heat it continues to be hard rubber but shaped and pressed into solid form.

For illustration take one of the well-known "dust compounds." It is: 5 pounds of Pará rubber, 20 pounds of hard rubber dust, 5 pounds of sulphur, and 3 pounds of substitute.

Of course, this is only one of hundreds, some containing much dust, some little, some calling for substitute and some for vegetable oil.

In soft rubber, hard rubber dust is of no use at all, but in hard rubber it is of prime importance, especially for electrical, physical or chemical purposes, or when it is to be made into objects demanding a high degree of polish.

In all of the above the dust must contain neither metal parts nor grit, and the best hard rubber scrap should be used, as it contains the highest percentage of rubber and no fillers such as chalk. The scrap should therefore be sorted by experienced

hands before being ground. The best results are obtained with powerful, short-built mills provided with smooth, not ribbed, rollers. Regardless of the grinding system resorted to, the operation always results in the rollers of the grinders giving off more or less metallic powder. To pass through various sieves the hard rubber dust obtained, even if one of them is magnetic, does not remove all impurities. Sand or grit particles pass through sieves. Washing hard rubber dust means the loss of much of the valuable material; further, the drying of the washed dust requires much care and time, and there is always the risk that sufficient humidity will remain to increase the porosity of the finished product.

The best method of removing impurities is probably to use a combination of ventilators and sieves in a dust-tight room. The

following is a description of one of these fanning installations in a room ten feet high and fifty feet long, the ceiling, walls and floor zinc covered. In the room are two longitudinal partitions, reaching from the ceiling to the floor. At the point where the hard rubber dust enters, there is a sieve, with a wooden frame covered with zinc, the sieve running on iron rollers along an iron track. It is provided at the bottom with small openings for the rubber dust. As the dust leaves the sieve it is caught by a fan which disperses it throughout the room. The heavy particles such as metal and sand, immediately fall.

while rubber dust is blown farther along, where it settles.

The room has two observation windows, through which it can be ascertained that the dust has settled, it also has an air-tight door through which the workman enters to remove the dust, and finally it has a half-dozen slatted windows through which the air forced into the room by fans can escape. It does not take much experience in operating this dust room to discover where the finer dust deposits. Several qualities of hard rubber dust can be obtained simultaneously. Rubber dust not sufficiently fine can be reground and no dust is lost. The room described has been in use for a number of years, works almost automatically, and gives good results.

THE STURTEVANT MILL.

DAY'S DUST GRINDER.

SECOND PAN-AMERICAN COMMERCIAL CONFERENCE.

This congress of 1,181 delegates representing the official, unofficial, commercial, financial and business life of all of the American republics, held in Washington, D. C., June 2 to 6, inclusive, under the auspices of the Pan American Union, was the most successful series of meetings of their kind ever held on this continent. Never before has such a conference been so comprehensive in topics discussed, so fair to all the countries participating, nor so productive of practical results.

Among the principal results of benefit to Latin America which will be early outgrowths of the conference are better steamship facilities, extensive railway, highway and hotel construction; improved commercial methods and regulations; extension of banking connections, ample loans and credit facilities; safeguarding patents, trade-marks and copyrights; extension and simplification of the parcel post and improvement of news and cable service; similarity of consular office administration, invoices and fees; revision and permanency of tariffs, insurance and packing; encouragement of vocational training for Pan American trade; and arrangements for holding the Second Pan American Financial Congress in Washington in January, 1920.

The complete proceedings, which will be the most up-to-date handbook on Pan American commerce yet published, are being printed and can be obtained on application to the director general of the Pan American Union, Washington, D. C.

BUY WAR SAVINGS STAMPS—BUILD FOR AMERICAN PROSPERITY AND YOUR OWN SUCCESS.

BUILDING BIAS BINDING.

IN THE MANUFACTURE of tennis shoes, as well as other shoes having uppers of duck, canvas or other fabrics, a very considerable amount of binding is used to cover the raw edges to prevent unraveling and to give finish to the goods.

Some of these bindings are cut the straight way of the cloth, others are cut on the bias, that is, at an angle of 45 degrees to the weft and warp threads of the fabric. The advantage of these bias bindings is that they lie flat when bound around curved edges or when turned around corners, as is necessary when binding the top of a shoe and continuing down the sides of the lacing opening.

Simple as this product seems, there are details in its manufacture which producers guard closely, and decline to divulge, for there are manufacturers whose sole business is to make these bindings of various materials, and of colors to match the textiles with which they are used.

THE METHOD OF MANUFACTURE.

The illustrations show the manner in which such bindings are made in a leading tennis-shoe factory. The method used is somewhat similar to the production of frictioned duck for the manufacture of tire casings, though of course this cloth is not frictioned but is used just as it comes from the mill, or is stiffened by a proper sizing.

The cloth is run, a number of thicknesses at a time, under a descending knife set to cut at an angle of 45 degrees, in other words, through a bias cutting machine. The diamond-shaped pieces are joined at their selvages, either by sewing or cementing, thus forming a continuous web which is wound tightly on a metal mandrel. This roll is then placed in a machine like that shown in the illustration, and from this wide roll, narrow ones are cut by a rapidly revolving circular knife which is adjustable to cut rolls of any desired width.

THE USES OF BIAS BINDING.

Such bindings, sometimes plain, or stiffened with starch or glue, are used for seam stays in various manufactures, and as

for such folding, some of which do the work and rewind into compact rolls, while others are attachments to the sewing machines, which take in the flat binding, fold in each edge, and feed it to lap over the material to be bound, so that one stitching passes through both edges of the binding and the material between. During this operation the binding is also measured off into exact lengths to fit the part to be bound.

BIAS BINDING MATERIALS.

These bindings are made mostly of cotton cloth, usually white, brown or black for tennis shoes, though poplin and even satin

CUTTING BIAS BINDING.

are used by slipper manufacturers. Such bindings are also used in finishing many other different articles, such for instance as dress shields, in which case they are made from material the same color as the articles to be bound. Some bindings are cut from fabrics imitating leather, for use by the manufacturers of pocket-books. In fact, the uses for this seemingly unimportant line of goods are so many and varied that large factories are devoted exclusively to the production of the many varieties.

GOVERNMENT SPECIFICATIONS FOR RUBBER SHEETING.

M. H. SPECIFICATIONS.

MATERIAL. Shall be a cotton fabric, thoroughly coated with a white rubber compound, single coated, and weigh not less than 13 ounces per square yard. The rubber compound shall be calendered, and not spread upon the sheeting. The rubber sheeting shall be vulcanized by open steam.

FINISH. The rubber sheeting shall have a smooth, uniform soft finish, free from stickiness and defects.

WIDTH.—The rubber sheeting shall be not less than fifty-three (53) inches in width.

CONSTRUCTION. The rubber sheeting shall show on analysis not less than 70 per cent of rubber compound. The rubber compound shall consist of not less than 30 per cent by weight of new and unrecovered rubber and shall show on analysis not over 4 per cent of its weight of organic acetone extract, nor over 2 per cent of its weight of free sulphur.

TENSILE STRENGTH. The rubber sheeting shall have a minimum tensile strength in the warp of forty (40) pounds, and in the filling of thirty-five (35) pounds. The tensile strength shall be determined by using the strip method on strips 9 inches long by 1½ inches wide from both the warp and filling directions of the fabric. The strips to be ravelled to exactly one inch in width.

TESTS. The condition of rubber sheeting shall remain unchanged when submitted to the following tests:

- (1) Subjected to urine for 18 hours.
- (2) Subjected to 5 per cent phenol solution for 18 hours.
- (3) Subjected to steam at 240 degrees F. for two periods of twenty minutes each.

The tests and analyses to be conducted in accordance with the procedure followed at the Bureau of Standards.

PACKING. The rubber sheeting shall be packed in rolls of approximately 50-yard lengths, and not more than 4 rolls to the box. Boxes to be of at least ¾-inch (finished size) lumber, tongued and grooved, white pine or spruce preferred, and must be new and of appropriate make and size. Ends to be reinforced by two cleats running perpendicular to grain of wood, and strapped. (Medical and Hospital Supplies Division, Washington, D. C., April 9, 1919.)

FOLDING BIAS BINDING.

back stays in shoe manufacture. By far the larger use is for binding the edges of cloth which would otherwise ravel out. It is used around the tongues of oxfords and boots, and also along the lace stays and around the tops of canvas footwear, unless the material itself is folded in and stitched to form a finish.

FOLDING, SEWING AND MEASURING.

For this purpose the binding must itself be folded that its own raw edges be concealed and protected. Various devices are used

What the Rubber Chemists Are Doing.

VULCANIZATION WITHOUT SULPHUR.

THE RESULTS obtained by L. Ostromyslenski in vulcanizing rubber without sulphur, that were published in THE INDIA RUBBER WORLD, November 1, 1916, page 65, and November 1, 1917, page 84, have been reviewed by W. Bunschoten,¹ who has made an extended series of experimental investigations on the subject, the results of which are quoted below:

ACTION OF ACCELERATORS WITHOUT SULPHUR.

It seemed of importance to test whether accelerators used in the normal sulphur-curing process would show catalytic action in a mixture without sulphur and thus lead to a well-vulcanized product. In order to carry this out, mixtures were made of the following composition: 100 parts raw rubber, 4 parts dinitrobenzene, 1 part accelerators, or instead of the latter 1 part vulcanite, and these cured for $\frac{1}{2}$, 1, $1\frac{1}{2}$, 2, $2\frac{1}{2}$ and 3 hours at 147 degrees C. in the oil bath. The result was that the products were not vulcanized and in these experiments these accelerators were without effect.

Ostromyslenski found that different metallic oxides which accelerate the normal vulcanization process, in contradistinction to the above-named organic accelerators, do promote the curing without sulphur. Stevens² confirms that with mixtures of nitro compounds to which litharge has been added vulcanization does take place. All of the following tests were made with the addition of litharge, and it was found that vulcanization resulted.

In order to judge as to the behavior of various rubbers with reference to this new curing method, two different raw rubbers were used, namely, a slowly vulcanizing crepe and a fast vulcanizing sheet. The vulcanization coefficients (quantity of combined sulphur calculated on 100 parts of raw rubber) of these rubbers were, respectively, 2.6 and 4.5 in a mixture of 7% per cent of sulphur and 92% per cent of rubber after vulcanization for $\frac{1}{2}$ hours at 50 pounds gage pressure.

With these rubbers the following mixtures were made: 100 raw rubber, 8 litharge, and 4 nitrobenzene. These mixtures were vulcanized for increasing periods in the oil bath at 147 degrees C., corresponding to 50 pounds gage pressure. Tensile tests were then made on a Schopper machine with the following results:

TABLE I. CURING TESTS WITHOUT SULPHUR.

Time of Cure, Minutes.	Smoked Sheet Vulc. Coeff. 4.5.		First Layer Crepe Vulc. Coeff. 2.6.	
	Breaking Load, Kgs. Per Cm ² .	Elongation at Break, Per Cent.	Breaking Load, Kgs. Per Cm ² .	Elongation at Break, Per Cent.
30	0.5	697	Undercured	...
45	14.5	983	Undercured	...
60	20.4	906	Undercured	...
90	35.8	825	10.4	610
120	27.8	874	22.0	704

These figures show that curing took place, but that the mechanical properties are much inferior to those obtained with the normal vulcanization methods. Judging also by the exterior and the course of the elongation curves leads to the conclusion that all the test pieces were much under-vulcanized. That curing did take place was evident from the fact that the product was insoluble in benzene although considerable swelling took place.

Similar curing tests were carried out with m-dinitrobenzene in the same proportions and at the same temperature of cure. The products obtained did not show any swelling in benzene, thus proving that complete curing had taken place. (Table II.)

¹Communication of the Netherlands Government Institute for Advising the Rubber Trade and the Rubber Industry," at Delft, Holland.
²"Journal of the Society of Chemical Industry," February 15, 1917; also THE INDIA RUBBER WORLD, May 1, 1917, page 451.

These figures tend to show that after 10 to 15 minutes the sheet exhibits its best mechanical properties, which decline on prolonged curing. Initially the rubber, on increasing the time of cure, becomes somewhat stiffer. After some time this ceases and the curves of the stress-strain diagram begin to run parallel. If the vulcanization be continued the only consequence is that the end point is situated lower on the curve; in other words, the breaking load is diminished. While the sample with the highest vulcanization coefficient cured the faster in these experiments, this may not be accepted as a rule.

Other mixtures were prepared, consisting of 100 parts sheet rubber (vulcanization coefficient 4.5), 8 parts litharge and, respectively, 1, 2, 3, 4, 6 and 8 parts of m-dinitrobenzene; also of 100 parts sheet rubber (vulcanization coefficient 4.5), 4 parts m-dinitrobenzene, and, respectively, 2, 5, 8 and 11 parts of litharge. The vulcanization was carried out for increasing periods in the oil bath at 147 degrees C. The results are seen in Table III, from which it is evident that with increasing quantities of m-dinitrobenzene and litharge the velocity of vulcanization is increased.

TABLE III. INFLUENCE OF INCREASING QUANTITIES OF M-DINITROBENZENE AND LITHARGE ON THE MECHANICAL PROPERTIES AND THE VELOCITY OF VULCANIZATION.

152	40	926	88	823
157	86	940	94	808	84	760	40	710

The mechanical properties of the cured product do not seem to be influenced much by the temperatures of curing.

The author expresses the opinion that while this method of curing without sulphur could replace vulcanization with sulphur, it would not prove practicable, owing to the rapid deterioration of the product by aging. The alteration of properties that takes place is unexplained. Probably it is not due to oxidation because the acetone extract from a sample after six months' aging was found about equal to that of the raw rubber. From this it is also evident that very little dinitrobenzene remains after vulcanization. Also the product remained entirely insoluble in benzene.

OXIDIZING AGENTS.

The curing action of several inorganic oxidation agents was investigated because Ostromyslenski regards vulcanization as a kind of oxidation. The following list of substances were employed: arsenic acid, potassium persulphate, chloride of lime, potassium bichromate, potassium permanganate, potassium chlorate, potassium nitrate, sodium nitrate, manganese peroxide, and potassium ferricyanide. The test mixtures consisted of 100 grams raw rubber and 4 grams of these oxidation agents. They were heated in the oil bath for one half hour to one hour at 147 degrees C.

Judging by the exterior, with all the compounds a beginning of vulcanization took place, but in no case did a well-defined product result. Still, going by the exterior and the rate of dissolving in benzene, all mixtures were more cured than those of raw rubber mixed with nitro and dinitrobenzene, without the addition of litharge. It seems possible, therefore, that with these compounds also, with the aid of a suitable accelerator, good vulcanization could be obtained.

VISCOSITY TESTS.

A solution of one gram of rubber and 400 mgrs. dinitrobenzene in 100 cc. benzene was kept for some days in a brown bottle, after which the viscosity was measured, both in the light and in the dark. The resulting tests show that the viscosity of the rubber solution diminishes very rapidly under the influence of m.-dinitrobenzene in the light, even so rapidly that it was impossible to measure the viscosity in light, although an increase takes place, as is found from a measurement in the dark.

The same tests were repeated after the rubber solution had been heated for one-half hour at 65 degrees C., after adding dinitrobenzene. The concentration of the solution before and after heating was the same.

The results obtained show that the viscosity is increased under the influence of dinitrobenzene while heating is applied, and again declines rapidly in the light. From this one would be led to assume that dinitrobenzene assists both depolymerization of rubber solutions by light as well as the polymerization by heat. The vulcanization with dinitrobenzene could be regarded, therefore, as a polymerization by heating. Analogous with this the vulcanization with sulphur could be regarded as an acceleration of the polymerization, as assumed by Bernstein¹ and Kirchoff,² while in addition, a combining of sulphur would have to be assumed to take place as a secondary process, either chemically or physically.³

VULCANIZATION OF RUBBER BY ULTRA-VIOLET RAYS.

The following excerpt on the vulcanization of rubber by ultra-violet rays is from a series of articles on ultra-violet rays and their industrial applications by Ellis and Wells in "The Chemical Engineer," July, 1918, page 298:

Practical vulcanization of rubber by ultra-violet rays may be carried out with Olivier's apparatus (United States Patent No. 1,256,496, February 12, 1918). Olivier notes that rubber vulcanized by means of ultra-violet light is particularly useful for cementing purposes, since the treatment produces thick elastic liquids which are real liquid rubbers. With power cementing processes, the surfaces of rubber to be cemented were coated with a solution containing 6 to 12 per cent of rubber and usually several layers of such cement were necessary to effect cementing. With this method of producing the solution a much more dilute solution can be obtained than heretofore. In fact, the dilution may be 0.5 to 0.6 per cent.

When this latter solution is used for cementing, the two rubber surfaces absorb the solution, and it is claimed that when placing the surfaces in contact a real autogenous union of the two rubber surfaces can be obtained. When surfaces of rubber are so united, they are not separated by a comparatively thick layer of cement, as with former cements, but they are in immediate contact on account of the penetration due to the dilution of the solution.

In carrying out the process, the first factor to be fixed is the duration of the exposure to the ultra-violet rays. Experience has shown that after a certain time of exposure, the decomposition of the rubber increases rapidly, whereas the vulcanization effect increases to only a small extent. The duration of exposure of course changes according to conditions, depending on the size of lamp used, the thickness of the solution, and the distance of the solution from the lamp. When using a 220-volt, three-ampere quartz lamp, and a solution a fraction of a millimeter in thickness placed at a distance of five centimeters from the lamp, the duration limit would be 40 seconds.

When solutions of rubber are being vulcanized with ultra-violet rays, the sulphur usually used can be replaced by sulphides and, in a general way, by any sulphides which can be decomposed by ultra-violet rays, such as carbon disulphide, allyl sulphide, or antimony sulphide. After vulcanization, when these sulphides are used, there is no uncombined sulphur left in the solution as, according to Olivier, it is precisely the sulphur which is decomposed out of the sulphides which allies itself with the rubber. Vulcanization can also be effected by adding to the solution at the same time ordinary free sulphur and carbon disulphide.

Under these conditions, vulcanization occurs concurrently between the rubber and the sulphur decomposed out of the sulphide.

DIFFUSION OF GASES THROUGH INDIA RUBBER

A study of the diffusion of gases through india rubber by Sir James Dewar appears as an appendix to a lecture on "Problems of Hydrogen and the Rare Gases" in the "Proceedings of the Royal Institute," volume 21, page 543. A few of the interesting results are as follows:

The relative rates of diffusion of the following gases, through Pará rubber membranes 0.1-mm. thick, at one atmosphere pressure, and 15 degrees C. are: air, 10; nitrogen, 0.69; carbon monoxide, 0.94; helium, 1.75; argon, 1.28; oxygen, 2.0; hydrogen, 5.6; carbon dioxide, 14.0. The absolute rate for air is 200 cc. per square centimeter per day. The relative rate varies with the temperature. It is difficult to associate the order of diffusibility with any chemical or physical property. For example, the rate of diffusion of helium, the most volatile of gases, is one-eighth that of carbon dioxide.

The rate of diffusion through india rubber of gases dissolved in various liquids was investigated. The relative rate of gases in solution is not so low as their proportional lowering of the volume concentration in the liquid. Water, for example, at 15 degrees C., dissolves 1/60 of its volume of air or hydrogen, but the rate of diffusion from air or hydrogen-saturated water is only reduced to one-quarter of that of the rate in air. The behavior in alcohol is the opposite. Air goes through the membrane with equal rapidity whether alcohol is around it or not.

"THE MUTUAL CONDENSATION OF UNSATURATED COMPOUNDS IN Connection with Terpenes, Resins and Rubber." H. J. Prins. Hilversum. "Chemisch Weekblad," Volume 16, 64-74 (1919). A review, with particular reference to polymerization of unsaturated compounds and the vulcanization of rubber. It is maintained that this type of reactions cannot be explained under one grouping without the aid of the valence theory and the theory of mutual activation. ("Chemical Abstracts," May 20, 1919, page 1071.)

CHEMICAL PATENTS. THE UNITED STATES.

PROCESS OF PRODUCING RUBBER COMPOSITIONS AND VULCANIZATION PRODUCT, consisting of adding to rubber a wet precipitate of barium sulphate formed in the presence of a colloidal gel (animal glue), mixing the resultant precipitate with the rubber, drying the mix, and heating it with a vulcanizing agent to effect vulcanization.

The homogenous vulcanized product formed by adding to rubber and animal glue formed into a gel by water, mixing the gel with the rubber, driving off the water, and heating the resultant dry mix with a vulcanizing agent to effect vulcanization. (Robert C. Hartong, assignor to The Goodyear Tire & Rubber Co., both of Akron, Ohio. United States patent No. 1,301,693.)

IMPREGNATION OF FABRICS FOR BALLOONS. The fabric is first impregnated with soft paraffin or petroleum, etc., and coated on one side with a compound of rubber, ceresin wax, litharge, and sulphur, applied in a dissolved state and subsequently vulcan-

ized. (Joseph Harold Mandelberg, Pendleton, Manchester, England. United States patent No. 1,302,064.)

COMPOSITION FOR IMPREGNATING AND COATING BALLOON AND LIKE FABRICS: 100 parts by weight of rubber, 1 to 5 parts of wax, $\frac{3}{4}$ to 2 parts of litharge and 2 to 4 parts of sulphur. (Joseph Harold Mandelberg, Pendleton, Manchester, England. United States patent No. 1,302,066.)

TREATING RUBBER TO INCREASE ITS ELASTICITY, which consists of subjecting it to the action of a resinous gummy preserving juice in its natural state. (Ruben Zertuche, Torreón, Mexico. United States Patent No. 1,302,266.)

PUNCTURE-CLOSING SOLUTION. A compound consisting of equal parts by volume of distilled water and alcohol, there being admixed to each gallon of the combined liquid three ounces by weight of a filler such as paper pulp, and silk fiber, the liquid serving to carry the fiber and pulp to a hole in a tire whereby a mat is formed to bridge the hole. (Ralph Noll and Christopher C. Shephard, Chadron, Nebraska. United States patent No. 1,302,416.)

VULCANIZABLE COMPOSITION. Powdered scrap leather is boiled in water containing sufficient caustic to saponify the fatty matter in the leather without dissolving the leather, then the treated leather powder is dried, and mixed with a resilient vulcanizable binding material under the action of heated mixing rolls. (John Stuart Campbell, London, England. United States patent No. 1,302,463.)

PLASTIC COMPOSITION. A solution of glue containing sulphonated fish oil and formaldehyde. (Lothar E. Weber, Brighton, Massachusetts. United States patent No. 1,302,739.)

PLASTIC MATERIAL AND PROCESS. A solution of glue and water, adding thereto sulphonated fish oil, adding and mixing therein a quantity of fibers, supplying to the product a comparatively weak solution of formaldehyde, and subjecting the product to pressure and heat. (Lothar E. Weber, Brighton, Massachusetts. United States patent No. 1,302,740.)

RUBBER COMPOSITION AND METHOD OF MAKING. A mixture of rubber and chemically treated cotton in powdered form, and free, or substantially so, from the tensile strength possessed by untreated cotton. (John M. Bierer, assignor to Boston Woven Hose & Rubber Co., both of Boston, Massachusetts. United States patent No. 1,303,759.)

RESILIENT RUBBER COMPOUND MATERIAL.—A sheet of resilient material having a non-slipping hairy surface consisting of a vulcanized rubber binder and incorporated wool fibers; the proportion of rubber to wool being such that the resulting material possesses the tensile strength and wear-resisting property of vulcanized rubber loaded with zinc oxide, and the elasticity of pure rubber. (Talmon H. Rieder and William B. Wiegand, Montreal, Quebec, Canada, assignors to The Goodyear's Metallic Rubber Shoe Co., Naugatuck, Connecticut. United States patent No. 1,305,008.)

THE UNITED KINGDOM.

VULCANIZING INDIA RUBBER. Potassium or sodium dissolved in a primary or secondary aromatic amine is used as an accelerator of vulcanization. The particular accelerators described are sodium or potassium in aniline or potassium in diphenylamine. (Dunlop Rubber Co., 14 Regent Street, Westminster, and D. E. Twiss, Royal Road, Sutton Coldfield, Warwickshire, England. British patent No. 124,276.)

BALLOON FABRICS, ETC. Fabrics for balloons are impregnated on the uncoated side with petroleum jelly solution. (J. Mandelberg & Co., Albion Waterproofing Works, Pendleton, Manchester, England. British patent No. 124,494.)

IMPREGNATING AND COATING FABRICS. Balloon and like fabrics or materials are rendered impermeable to gases by impregnation and coating with a solution of a composition consisting of 100 parts of rubber, 1 to 5 parts of ceresine or paraffine wax, $\frac{3}{4}$ to

2 parts of litharge, and 2 to 4 parts of sulphur. A number of coatings of different strengths are applied to the fabric, the earlier one being very thin, so as to cause thorough impregnation. After vulcanization by slowly raising the temperature to 285 to 295 degrees F, the fabric may be treated with petroleum jelly in solution. (J. Mandelberg & Co., Albion Waterproofing Works, Pendleton, Manchester, England. British patent No. 124,495.)

BALLOON OR AIR-SHIP FABRICS. Gelatine is used for or in addition to layers of hitherto used materials, such as rubber, oil, cellulose compositions, etc. (R. T. Glazebrook, National Physical Laboratory, Teddington, Middlesex; W. M. Rouse, 74 New Oxford Street, London; and A. Johnston, Castle Mills, Fountainbridge, Edinburgh. British patent No. 124,520.)

THE DOMINION OF CANADA.

SOLE COMPOSITION. A vulcanized shoe sole or heel composed of a mixture of comminuted waste felt roofing saturated and treated with asphaltum and boiled linseed oil, reclaimed rubber, and vulcanizing material. (Charles S. Bird, assignee of George R. Wyman and Andrew E. Currier, all of Walpole, Massachusetts. Canadian patent No. 190,652.)

RUBBER SUBSTITUTES. The process and product of a vulcanized composition of matter consisting of linseed oil which has been oxydized at a temperature of 200 to 250 degrees C., aluminum stearate, a numeral hydro-carbon of high boiling point, an inert filler, and sulphur. (Edward S. A. Cohen, Hague, The Netherlands. Canadian patent No. 190,802.)

THE FRENCH REPUBLIC.

PROCESS OF REGENERATING VULCANIZED SOFT OR HARD RUBBER. (B. J. F. Varenhorst and J. G. Fol. French patent No. 489,230.)

GERMANY.

PROCESS FOR IMPROVING CAOUTCHOUC-LIKE SUBSTANCES. The caoutchouc-like substances obtained by treating butadiene or its homolog with metals such as sodium, in presence of carbon dioxide (see French patent No. 459,005), do not yield satisfactory products on vulcanization. Good results are obtained, however, if the substances before vulcanization are subjected to mild oxidation, corresponding to an absorption of 3–4 per cent or even 6 per cent of oxygen. For example, the product obtained from isoprene by the action of sodium in presence of carbon dioxide, after being washed with water, is spread out while still moist and exposed to the air. After three days, when about 3 per cent of oxygen has been absorbed, the sticky mass is worked on the rolls, mixed with sulphur, etc., and vulcanized. (Badische Anilin und Soda Fabrik. German patent No. 307,341.)

LABORATORY APPARATUS. IMPROVED AUTOMATIC BURETTE.

THE improved automatic burette shown in the illustration was devised by Mr. George J. Hough, Bureau of Soils, United States Department of Agriculture. Its merits are that it requires no bracket and can be quickly cleaned and used for different solutions.

The base of the burette consists of a glass tube, *a*, one-half-inch in diameter, for elevating the solution, surrounded by a much wider tube; and when inserted in a rubber stopper to fit the solution reservoir, this gives the apparatus sufficient stability so that it requires no bracket to hold it upright. The tube *c* is for the attachment of a rubber pressure bulb, and tube *d* is closed with the finger when pumping air into the reservoir. The hole *h* in the outer tube equalizes the pressure in the reservoir and must be above the level of the liquid in the reservoir.

AUTOMATIC
BURETTE.

New Machines and Appliances.

COMBINED IMPREGNATING VACUUM DRYER AND SOLVENT RECOVERY APPARATUS FOR FABRICS.

THE ACCOMPANYING ILLUSTRATION shows a unit of an apparatus in which fabrics and tire duck may be impregnated with rubber solution, dried in a vacuum and the solvent subsequently recovered for reuse.

In front of the first section is placed a chamber which is fitted with a sealed connection, separating it from the dryer. The first

THE DEVINE IMPREGNATING AND SOLVENT RECOVERY APPARATUS.

section is built of sufficient size to contain the entire roll of fabric and is equipped with an impregnating tank filled with the rubber solution. As the roll unwinds, the fabric passes through the tank and is impregnated with the solution. The fabric is then automatically taken into the large chamber of the dryer and thence runs through the entire length of the dryer in four passes.

The heat vaporizes the solvent in the impregnated duck, this vapor going over to the condenser, where it is condensed, and the solvent passes through the solvent recovery apparatus where it is recovered. The finished, dried, impregnated duck is wound up on another roll and after the operation is completed, the door of the unit is opened and the finished roll removed. (J. P. Devine Co., Buffalo, New York.)

CRUDE RUBBER SLICING-MACHINE.

When cases or bales of crude rubber arrive at the factory and the coverings are removed, it is quite a difficult matter to separate the rubber sheets, while the baled rubber is often a solid mass. For reducing the rubber to pieces convenient for the

THE PEERLESS RUBBER CUTTER.

washing machines, a novel machine has recently been invented that combines the power hand-saw principle with mechanical features necessary in a machine, for slicing crude rubber of all sorts.

It is of the horizontal type with direct-connected motor, or belt drive, and special gearing for actuating the sickle blade

that reciprocates in a guide. A spiked vise, 28 inches between the jaws and 24 inches high holds the block of rubber while a film of water is distributed to all parts of the blade to facilitate the cutting operation. If a hard foreign substance should be encountered in the rubber, a relief is automatically applied which offsets the machine and prevents breakage.

This machine operates at a speed of 150 strokes per minute and feeds downward at the rate of $\frac{1}{4}$ -inch per stroke. Although it weighs 1500 pounds, and occupies 8 by 3 feet of floor space, it may be moved wherever desired with comparative ease. It is claimed that 125 to 150 bales of rubber can be cut in ten hours on this machine by one man. (Peerless Machine Co., Racine, Wisconsin.)

PNEUMATIC-TIRE-BUILDING MACHINE OF NOVEL CONSTRUCTION.

FILLER THREADS of tire-building fabric are stronger than the warp threads. Therefore, a better tire is made by reversing the warp and filler threads in building up the carcass of a pneumatic tire. In cord-tire construction the same reason

THE KNIGHT TIRE-BUILDING MACHINE.

exists for reversing the threads of cord fabric. For this purpose the present machine is provided with two independent fabric-feeding tables and mechanisms, and is operated in the following manner.

The first fabric strip is threaded through the feed-mechanism, the pressure adjusted by a hand-wheel, and the fabric end drawn down by hand until the cone-roller rests on the core to which the fabric is attached. When the machine is started the cone-roller revolves the feed-mechanism at a speed 14 per cent slower than the core speed, thereby providing uniform tension.

As the core revolves, another ply is attached to the first ply on the table, and when the end of the first ply reaches the core the machine is stopped and the second ply separated from the first and thrown back over the pressure-bar. When the two ends of the first ply are joined together on the core, the latter is revolved at an increased speed and the first ply stitched down. The core is then removed to the second feeding mechanism and the process repeated in applying the second ply. In making a small tire that does not require more than four plies of fabric, the bead-setting arm is swung against the tire and the bead set

in proper place by one revolution of the core. This is again shifted to the first position, the opposite bead set in place and the end of the fabric taken from the pressure bar and drawn down until the cone-roll rests on the core and the core revolved to apply the third ply. After this is stitched down, the core is again shifted to receive the fourth ply, which completes the process for a small tire. (The Knight Manufacturing Co., Canton, Ohio.)

AN IMPROVED AUTOMATIC MIXER.

Enclosed mixers of the type here shown are now considered as standard rubber-mill equipment and have demonstrated their superiority on the softer stocks, all black tread stocks and many mixtures that are injurious to workmen.

THE DANBURY MIXER

The important improvements embodied in this new machine include a large cooling area to reduce the temperature of the material being mixed; it is practically dust proof; the discharge door easily slides so that small effort is required to discharge the material that leaves the machine in comparatively small pieces; the shafts, bearings, and general construction are of a rugged design to withstand the severest strain; and the motor drive is substantial in construction and quiet in operation.

This machine handles batches from 75 to 150 pounds, depending on the gravity. A larger size is capable of successfully mixing batches of 450 pounds, gravity 1.5. (Birmingham Iron Foundry, Derby, Connecticut.)

COLLAPSIBLE TIRE-BUILDING FORM.

The D. M. B. collapsible tire-building form shown in two views is unique in design and simple in operation. It is specially adapted for use in making tires which are cured in molds on air-bags, because by its collapsible construction it can be so folded

CLOSED. THE D. M. B. TIRE-BUILDING FORM. OPEN.

upon itself that the unvulcanized tire can be removed with little effort from the form without stretching the beads or otherwise damaging it.

It is claimed that the use of this form will greatly lessen the cost and labor of tire building. In fact, its introduction has made possible the employment of women as tire builders on account of the simplicity and ease of its operation.

Referring to the illustrations the view on the left shows the form in closed position ready for building the tire, the view on the right shows it in open or collapsed position for removal of the tire. This building form is very easily and quickly changed from closed to collapsed position by drawing inwardly the upper sliding section by means of a rack and pinion actuated by a hand socket wrench.

The section is then folded over toward the center on a hinge and each hinged side section is in turn folded, as shown in the view on the right. When the form is in this position the tire can be easily lifted from it without strain or distortion. (De Mattia Bros., Inc., Garfield, New Jersey.)

PNEUMATIC CHUCKS FOR TIRE-BUILDING MACHINES.

Air-operated chucks have recently come into use for holding the bases of solid tires and the cores of pneumatic tires during building operations.

The 12-jaw chuck shown on the left in the illustration is a special chuck designed for use in connection with a solid rubber tire-trimming machine. It will take tires from 28 to 36 inches in diameter, each of the jaws having a movement of over 4 inches. Owing to the narrow width of the small tires, it is necessary to make the chuck only $3\frac{1}{2}$ inches wide on the outside diameter. The chuck has 12 jaws, which are necessary to avoid springing the tire ring out of shape, which is the main difficulty with a four-jawed chuck. All working parts are fully enclosed, making them dust-proof and eliminating danger to the workman.

The movement of the jaws is obtained through a rack-and-pinion movement that is operated by a 12-inch standard double-acting air cylinder. This chuck can also be made for external gripping by using false jaws.

AIR-OPERATED CHUCKS.

TWELVE-JAW CHUCK

THREE-JAW CHUCK.

The three-jaw chuck shown in the illustration on the right is used on pneumatic tire-making machines and the interior construction is similar to that of the twelve-jaw chuck. It has a range from 17 to 24 inches, to accommodate regular-sized cores. These chucks are operated by a standard 10-inch double-acting air cylinder. The three-jaw chuck can also be used on tire-building stands, there being four chucks to each stand. (American Pneumatic Chuck Co.; Neidow & Payson Co., 9 South Clinton Street, Chicago, Illinois, general sales agents.)

P. I. W. TIRE-BUILDING STANDS.

Both of these stands are built alike, with the exception that the ratchet holding the arm in position is operated by a foot-lever on one machine while the other is hand-controlled.

The spider revolves on a turned shaft, riveted into the arm, and is provided with three adjusting screws capable of accommodating cores for any size of tire from 28 to 44 inches in diameter. The ratchet catch on the spider is reversible, enab-

ling the operator to work on either side, or it may be thrown out, permitting the spider and core to turn freely.

The lever system on the foot-operated stand is made of bar steel, counterbalanced with a weight, thus doing away with springs and the inconvenience they cause. The lever can be changed from the right to the left by reversing the connecting rod and attaching the foot lever to the line on the opposite side

TIRE-BUILDING STANDS.
FOOT-OPERATED. HAND-OPERATED.

of the stand thus permitting the operator to work on either the right or left side of the stand. (Pechstein Iron Works, Keokuk, Iowa.)

PORCELAIN FORMS FOR DIPPED GOODS.

The forms used in the manufacture of dipped goods are now largely made of porcelain and require specialized knowledge in order to produce an article that will be satisfactory in every respect.

PORCELAIN FORMS.

(The Colonial Sign and Insulator Co., Akron, Ohio.)

The difficulty with an ordinary porcelain form is its liability to craze after being in use for some time. This objection, however, has been finally overcome and vitreous forms are now made that will withstand the steam or acid cure without crazing. They are supplied in the proper size and are easy to maintain in a cleanly condition.

Forms for rubber gloves, finger-cots, nipples, toy balloons, and in fact almost any special shape used in the dipped rubber goods business can be made of porcelain.

MACHINERY PATENTS.

APPARATUS FOR FEEDING COMMINUTED MATERIALS TO MIXING-MILLS.

THIS machine feeds powdered ingredients to a mixer and collects and returns to the mill surplus material until all of the charge has been worked into the rubber.

The materials are contained in the hopper 5 that discharges by gravity into a pipe line 6, to which other material hoppers may be connected. The fan 10 forces the materials that are deposited in pipe 6, through pipe 11 to a hopper 12, from which the discharge falls on one of the rolls 6.

The surplus powder that falls between the rolls is collected in the center of an endless belt 13 and is drawn through nozzle 10 by suction of the fan, back to the upper part of pipe 6 and again delivered to the hopper 12. (William Jameson, assignor

DRY POWDER FEEDER FOR MIXERS.

to The Fisk Rubber Co., both of Chicopee Falls, Massachusetts. United States patent No. 1,302,053.)

New Goods and Specialties.

A RUBBER-OPERATED RIFLE.

Boys playing at soldiering always enjoy a rifle. The one shown here looks enough like the regulation Army one to satisfy, besides shooting actual bullets—made of harmless soluble material which will not injure even if swallowed. There is a flexible rubber tube extending backward from the breech-end of the barrel, terminating in a sanitary glass mouthpiece, and the "bullets" are slipped into an opening at the breech end. This toy may be had either with or without a target of five cut-out horsemen mounted on hinged supports. (The Evanston Supply Co., 118 North La Salle street; C. J. Van Houten & Zoon, distributors, 140 South Dearborn street—both in Chicago, Illinois.)

JOY-TOY WINDFESTER RIFLE.

HARD-RUBBER RADIO RECEIVER.

A new type of radio receiver, named "Murdock" for its manufacturer, is made from hard rubber composition and bakelite. It is said to be unusually sensitive and therefore dependable. It is held in place by an adjustable head-piece of metal which is divided into two parts that may be spread away from each other or used close together to suit the contour of the operator's head. (William J. Murdock Co., Chelsea, Massachusetts.)

"MURDOCK" RADIO RECEIVER.

"SEALTITE" PATCHES.

A tire-repair patch that will permit the user to apply it and immediately use the mended tire has been devised. It is self-vulcanizing and requires only a little cement for its application after the surface around the puncture or blow-out has been buffed. It is reinforced with fabric, making a strong, tight-holding mend. (The Federal Rubber Co., of Illinois, Cudahy, Wisconsin.)

A WAR-DEVELOPED EXCLUDER.

The demands of war have given an impetus to many novelties in footwear, or at least to the production of distinctive varieties from previous standards. One of these is the two-buckle style of arctic shown here. The upper is of fine black cashmerette, while the sole and foxing are of gray or white rubber, the heel being reinforced at the back. This has a wide folded tongue reaching to the top, which keeps out snow, slush and water as effectively as a rubber boot. This is named the "Army" excluder by the company

THE ARMY EXCLUDER.

which made many thousand cases of footwear for Canadian field troops during the war. (Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada.)

A HIGH-GRADE BATHING CAP.

A bathing cap which attracts because of its good quality as well as because of its practicability is illustrated below. It is one of the many bathing-cap developments of the present season that has not been set aside for something better. It is made of pure rubber, gray in color, with a surface mottling for decoration. It has ear-tabs to keep out the water and keep the hair dry, and a chin-strap to hold it in place. This strap is held by a white enameled snap-fastener.

The picture here shows a man wearing the cap, but it is made in larger sizes for women. Those who dive will appreciate its practicability. (The Miller Rubber Co., Akron, Ohio.)

RUBBER BATHING ACCESSORIES.

One set of new bathing accessories (Stern Brothers, 60 West 42nd street, New York City) included a cape, parasol and beach cushion of red rubber, worn with a red rubber cap. The parasol was square-pyramid shape and the beach cushion was square. All were decorated with flights of birds painted on with black waterproof paint, touched with colors. The edges of the cape and its collar, and of the parasol, and cushion were finished with a wide double fold of rubber, slashed to make loop fringe.

Another set (Saks & Co., Sixth avenue and 34th street, New York City) was composed of a cape, cap, parasol, bathing-suit bag, and beach cushion. These were made of rubberized navy-blue fabric with a white polka-dot design. The cape had a close-fitting shoulder-yoke with scarf extensions, of red rubber, cemented to the body. The Tam-O-Shanter cap had squares of blue checked off with red at its edge, and a red rubber tassel. The parasol, bag, and cushion were edged with narrow slashed fringe. The bag was of the new type, full, gathered to a wide top. This set was worn with a suit of navy-blue satin.

A NOVEL BALL.

A rubber ball that should delight the little folks has recently been patented, which comprises some unusual features.

Over an ordinary rubber ball on which are painted two grotesque faces, are two semi-spherical caps vulcanized to the top and bottom of the ball but free elsewhere. When these are turned back, as shown in the illustration, the faces are revealed. At the juncture point of one of these caps a long rubber thread is attached, by means of which the toy can be used as a return ball. When a toss ball is desired, the thread is wound up inside the cap. With the caps open, the thread is wound around the juncture point, forming a sort of collar. (C. Otis Griffin, New Bern, North Carolina.)

THE GRIFFIN RUBBER BALL.

GOLF BALL WITH RUBBER-WOUND CORE.

Another new golf ball claims to be "different" in the manner of winding the rubber thread said, gives the ball liveliness.

"STACUS" GOLF BALL.

Control on approach is also claimed for this ball because of its pitted cover. It is conducive to surer putting, and the ball is not swerved by wind pressure. The fixed center of gravity makes the ball hug the green closer and roll steadily and surely, although it lifts easily and with certainty because the club grips it so well. (Thos. E. Wilson & Co., 701 North Sangamon street, Chicago, Illinois, and 25 West 45th street, New York City.)

RUBBER-LINED AND RUBBERIZED BAGS.

The two bags shown in the accompanying illustrations are intended to be used to carry diapers, but could be used as well for bathing-suit bags. The one on the left is of black saten and has a silk draw-cord at the top and a silk tassel at the bottom. It is fitted with a removable waterproof bag inside,

WATERPROOF
DIAPER BAGS.

held in place by snap fasteners at the top. This bag is fourteen inches long, but weighs only a few ounces. The bag on the right is made of double-faced rubberized cloth and has two sections besides a pocket on the outside. It is

checked in black and white. (Montgomery Ward & Co., Chicago avenue and Larrabee street, Chicago, Illinois.)

A NEW USE FOR SPONGE RUBBER.

The writer recently found in a Western drug store a shaving "brush" of sponge rubber—a simple contrivance, yet effective and eminently useful. A cylindrical piece of sponge rubber about two inches in diameter and a little more than that in length, was compressed at one end and tightly embedded in an enameled wood handle. The other end of the sponge flared out in conical shape with rounded base. This formed a shaving-brush, both for applying soap or cream, and for rubbing it in to soften the beard.

This is a simple article, easy to manufacture, inexpensive enough to sell well at a small price. No maker's name appears on it, nor is there any mark to show it was ever patented. It would seem to be a good article for the novelty manufacturer.

SPONGE RUBBER SHAVING-BRUSH.

TESTBESTOS BRAKE LINING.

A new kind of brake lining is called "TESTBESTOS." It is manufactured from extra long asbestos fibers woven and interwoven in strong brass mesh and impregnated with sufficient rub-

ber to bind it properly. This brake lining is made in widths from one to four inches by quarter-inches and in five thicknesses from one-eighth-inch to five-sixteenths. (American Asbestos Co., Norristown, Pennsylvania.)

"UNIVERSAL" LIFE-
SAVING SUIT.**A SUIT FOR LIFE-SAVING.**

Among the many articles whose production was particularly stimulated by the recent war is the life-saving suit of many kinds, some odd but interesting, and many intensely practical. One of the newer ones is illustrated here. It is made of rubberized material which is nevertheless sufficiently soft and pliable to allow freedom of movement. No air cells are used, but the garment gets its buoyancy from a lining of kapoc such as is used in government life-preservers of the ordinary type.

It is claimed that in this suit the wearer can swim, recline, or float on the water, and even sleep. It can be folded up compactly and takes less than a minute to put on over the usual clothing. It is made in sizes for men, women and children. (G. H. Masten Co.)

A TRADE-MARKED BLOW-OUT PATCH.

The manufacturer of a blow-out patch so successful that it was widely imitated, devised the scheme of marking his product with a trade-name. This is why the "Major" appears under

its own name. Just as the title of his rank distinguishes the army officer, so the blow-out patch which is dignified with a name is easily identifiable and procurable. It is said in behalf of this patch that it will not bulge through the blow-out in the casing and become road-cut. (The General Tire & Rubber Co., Akron, O.)

THE "MAJOR" PATCH.

A NEW FABRIC TIRE.

A new fabric tire, made with long-fiber Sea Island cotton in its carcass, has an extra thick tread and a white, thick sidewall which gives it a neat appearance as well as materially increasing its strength. The wall cushion extends through to the beads, which are anchored by a chafing strip so wide that it reaches up into the side-walls.

The extra width of the chafing strip is said to give increased flexibility to the sides, add a tensile strength of two hundred pounds to the inch, and stiffen the grooves, at the same time eliminating rim-cuts.

Breaker strips of additional width are also used in this tire, thereby minimizing the danger from separation of plies and eliminating stone-bruises. (The Gates Rubber Co., Denver, Colorado.)

GATES "DOUBLE-
MILEAGE" TIRE.**THE "ERCO" WAR-SOLE.**

A new rubber and fiber sole brought out during the war is called the "Erco." It is said to give very satisfactory wear. (Essex Rubber Co., Trenton, New Jersey.)

Tire Accessories.

A SIMPLE NON-SKID CHAIN.

A SIMPLE NON-SKID CHAIN which is easily and quickly adjusted is shown in the illustration below. It fits the tire, because it is made in different sizes in order to accomplish this, and it has no special connectors or links, so that it is easily replaced. Any standard cross chain can be used in an emergency until the "Arrow Grip" can be obtained.

The special feature of this accessory is the clamp by which it is attached. This clamp is attached to the spoke of the wheel and is lined with rubber so that it cannot injure the spoke. Once

it out, because a strip of leather is cushioned between the tire tread and the protector. The openings between the sections permit sand, mud, gravel, and water, to escape. The device is light in weight. (The Bukolt Manufacturing Co., Stevens Point, Wisconsin.)

A RIM-TOOL FOR SPLIT RIMS.

A rim-tool that fits all sizes and types of transversely split rims is practical and useful. The one shown here is made to spread a rim one-quarter of an inch when required, as well as to raise one end two inches and carry it four inches over and by the other, thereby contract-

"ARROW-GRIP" CHAINS.

GREB RIM TOOL.

"JIFFY" COLLAPSIBLE RIM.

sary. The hook to which the chains are fastened is integral with the clamp and the latch when once pressed down cannot open accidentally. The clamp is rust-proof and no special tools are required to attach or detach it. The chain is twisted so that it lies flat on the tire, and the pull is on the felloe, not on the spokes or clamp. No jacking up of the truck is required. (Arrow Grip Manufacturing Co., Inc., Glens Falls, New York.)

fitted, it can remain permanently, making the attachment of the chain the only operation necessary.

ing the rim. The lever swings by center and the spring of the rim holds it in position. The operation is reversed for replacing tires. (The Greb Co., 165 State street, Boston, Massachusetts.)

WEED CHAIN JACK.

A PROTECTOR AGAINST PUNCTURES.

"HIGHWAY" TIRE PROTECTOR.

grade steel studs. These tire protectors, in addition to guarding against punctures, keep the car from skidding in sand and on muddy roads. They fit easily over the tire and do not wear

A tire protector that prevents the tire from becoming punctured is composed of a series of sections so fastened together that any individual one may be removed if damaged. These sections are made of a light, water-proofed, specially treated vulcanized fabric reinforced with strips of belting across the tread and high-

A chain-jack operated by pulling chain in either direction. (American Chain Co., Bridgeport, Connecticut.)

"ARMOR-CORD" TUBE.

An inner tube that strengthens the tire is of cords embedded in rubber, so arranged that while the outer surface expands, the inner one contracts lengthwise, preventing creeping. (Armorcord Rubber Co., Salem, Ohio.)

SIMPLY OPERATED CHAIN-JACK.

"ARMORCORD" INNER TUBE.

Gibraltar Tire & Rubber Corp., May 11 (Delaware), \$400,000. A. Watson, Nyack; R. Krause, Sound View avenue, Claret; M. A. Heyser, 446 Lexington avenue, Brooklyn—all of New York. Delaware agent, United States Corp. Co., 311 State street, Dover, Delaware. To manufacture and generally deal in tires.

Gillette Tire Co., Inc., June 2 (Delaware), \$50,000. F. R. Hensell, Philadelphia, Pennsylvania; E. M. MacFarland, J. V. Fimm, both of Philadelphia, Pennsylvania. Delaware agent, Corporation Guarantee & Trust Co., 227 Market street, Wilmington, Delaware. To import, export and manufacture automobiles, tires, tubes, etc.

Hercules Rubber Corp., May 27 (Delaware), \$1,000,000. E. H. L. Haefliger, 10401 Street, both of Mead and C. E. J. A. Robinson, 440 and Vine streets—all of Cincinnati, Ohio. Delaware agent, Corporation Co. of Delaware, 901 Market street, Wilmington, Delaware. To deal in other products.

Hood Tire Shop, March 13 (Indiana), \$25,000. B. L. Heer, J. J. Carney, R. J. Diekmeyer—all of Terra Haute, Indiana, Principal office, Terra Haute, Indiana. To buy and sell automobile accessories.

Indiana Tire Co., Inc., February 27 (Indiana), \$50,000. D. K. Hall, R. M. Haggis, J. W. Heckman, H. Dicks—all of Indianapolis, Indiana, Principal office, Indianapolis, Indiana. To buy and sell automobile tires.

Jackson-May Rubber Co., April 23 (Arkansas), \$50,000. R. May, president; V. L. Jackson, vice-president; J. D. Simpson, secretary and treasurer—all of Little Rock, Arkansas. Principal office, Little Rock, Arkansas. To manufacture rubber specialties.

Levy, Kelban & Co., Inc., June 19 (New York), \$2,000. B. Levy, 75 East 104th street; I. Kelban, 412 East 104th street, both of New York City; S. Levy, 391 Kosciuszko street, Brooklyn, New York. To deal in auto tires and accessories.

M. & M. Tire Service Co., Inc., May 29 (New York), \$5,000. E. C. Handwerker, W. G. Merovitz, W. J. Ehlhoff—all of Buffalo, New York. Principal office, Buffalo, New York. Tire service station.

Madison Tire & Rubber Corp., June 12 (New York), \$625,000. C. W. Smith, H. H. Macquibban, H. L. Kimbrell—all of 36 East 42nd street, New York City. To manufacture.

Milner Rubber Co., W. F. The, April 9 (Kentucky), \$10,000. W. F. Milner, R. H. and B. M. Rivers—all of Louisville, Kentucky. Principal office, Louisville, Kentucky. To buy, sell and repair automobiles and parts.

New Jersey Savold Tire Co., May 22 (New Jersey), \$2,000,000. H. A. Black, A. F. McCabe, J. R. Turner. Principal office, 15 Exchange Place, Jersey City, New Jersey. Agent in charge, Tire Corporation Trust Co. To manufacture, purchase, sell, import, export, rebuild and repair tires.

Phenix Tire Corp., June 5 (New York), \$5,000. R. H. Forbes, 153 East 24th street, New York City; T. F. O'Brien, 124 Martine street, East 16th street—all of New York City. To manufacture tires.

Pierces Tire Co., Inc., June 7 (New York), \$5,000. H. L. Lewen, 60 W. 129th street, C. Fehner, Broadway; J. Weininger, 734 East 16th street—all of New York City. To manufacture tires.

Pressman Tire & Rubber Co., May 27 (Delaware), \$3,000,000. T. L. Croteau, P. B. Drew, C. L. Rimlinger—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To buy, sell and generally deal in rubber tires, tubes, etc.

Rainbow Tire & Rubber Co., February 5 (Ohio), \$250,000. C. E. Ross, president; H. L. Gilbert, vice-president; C. Gayler, secretary; C. A. Wagoner, C. A. Morrison, treasurer; H. E. Fesley and C. A. Wagoner, directors. Principal office, 310 People's Loan Building, Delaware, Ohio. To do general rubber business.

Redden Resilient Wheel Co., June 4 (Massachusetts), \$50,000. E. E. Redden, 101 Oakland street; P. J. O'Brien, Jr., 58 Belmont street; J. L. Connell, 17 Jenkins street—all of Springfield, Massachusetts. Principal office, Springfield, Massachusetts. To manufacture and deal in automobile parts, accessories, etc.

Rialto Tire & Rubber Co., Inc., May 28 (New York), \$3,000. J. Jacobs, S. Bernheim, W. Loewenthal—all of 1877 Broadway, New York City. To manufacture tires, etc.

Rubber Products Corp., June 13 (Delaware), \$500,000. A. W. Britton, S. B. Howard, R. K. Thistle—all of 65 Cedar street, New York City. Delaware agent, United States Corporation Co., 311 South State street, Dover, Delaware. To manufacture and deal in goods made entirely or partly of rubber.

Serber Rubber Co., Inc., The, June 11 (New York), \$20,000. D. C. and M. C. Serber, both of 1123 Broadway; L. A. Malkie, 116 Nassau street—all of New York City. To manufacture tires, etc.

Smith Tire & Rubber Co., Inc., May 15 (New Jersey), \$100,000. F. W. Smith, L. A. Ely, both of Rutherford, New Jersey; R. Arbozo, New York City. Principal office, Ely Building, 5 Erie avenue, Rutherford, New Jersey. Agent in charge, W. H. J. Ely. To manufacture, buy, sell and deal in all kinds of rubber goods.

Standard Tire & Rubber Co., The, May 6 (Massachusetts), \$150,000. W. P. Cronin, Belmont; J. S. Waddell, Winchester, both in Massachusetts; S. Gold, New York City. Principal office, Boston, Massachusetts. To manufacture and deal in automobile tires, rubber goods, etc.

Stanley Tire & Rubber Corp., May 24 (New York), \$50,000. H. A. Chan, 300 East 49th street, New York City; S. Fischel, 891 10th street, Bronx; R. Heller, 1431 60th street, Brooklyn—all in New York. To manufacture tires, etc.

Universal Rubber Products Co., May 26 (Delaware), \$2,000,000. T. L. Croteau, P. B. Drew, C. L. Rimlinger—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture tubes, tires and rubber goods.

W. F. The, June 7 (Delaware), \$50,000. W. F. O'Keefe, G. G. Stiegler, J. H. Dowdell—all of Wilmington, Delaware. Delaware agent, Corporation Co. of Delaware, 901 Market street, Wilmington, Delaware. To manufacture and deal in automobile tires, tubes, etc.

Wayne Tire & Rubber Co., May 19 (Delaware), \$600,000. H. R. Platt, E. C. Love, C. A. Wyer—all of Orville, Ohio. Delaware agent, Capital Trust Co. of Delaware, Dover, Delaware. To manufacture automobile tires, tubes, etc.

Weston Wheel Corp., June 10 (New York), \$5,000. F. G. Fischer, 900 Riverside Drive, C. F. Bailey, 226 Loring Place, both of New York City; W. Sawyer, 60 Berkeley Place, Brooklyn, New York. To manufacture auto wheels.

Yale Tire & Rubber Co., April 29 (Connecticut), \$500,000. J. E. Hubinger, C. W. Murdock, G. P. Smith—all of New Haven, Connecticut. Principal office, New Haven, Connecticut. To manufacture tires.

SPAWNING TIRE COMPANIES.

With headquarters in New York City, a group, perhaps two or three groups, have within the last six months incorporated some forty tire companies, probably more. This does not necessarily mean forty new factories, nor does it mean—in fact, just what is the idea? The list, the capitalization and the names of the incorporators is, however, illuminating to a degree.

One group consists of J. Jacobs, S. Bernheim and W. Loewenthal, all of 1877 Broadway. They are incorporators of the following companies during the last few months:

Arch City Tire & Rubber Co., Inc., capital \$5,000.
Arrow Tire & Rubber Co., Inc., \$15,000.
Charlestown Tire & Rubber Co., Inc., \$6,000.
Charlotte Tire & Rubber Co., Inc., \$4,000.
Cotton States Tire & Rubber Co., Inc., \$10,000.
Ellison Tire & Rubber Co., Inc., \$10,000.
Great Western Tire & Rubber Co., Inc., \$30,000.
Huguenot Tire & Rubber Co., Inc., \$3,000.
Oval Tire & Rubber Co., Inc., \$4,000.
Rialto Tire Rubber Co., Inc., \$20,000.
Spartan Tire & Rubber Co., Inc., \$5,000.
Tennessee Tire & Rubber Co., Inc., \$5,000.
Union Hill Tire Sales Station, Inc., \$4,000.
Valley Tire & Rubber Co., Inc., \$2,000.
West Gate Tire & Rubber Co., Inc., \$5,000.

The other group includes H. S. Hartstein, C. A. Weldon, A. Hirsch, S. Bernheim and M. Kittay, all of 35 Nassau street, New York City. Some three of these five are incorporators of the following companies:

Bridgeport Tire & Rubber Co., Inc., \$2,000.
Boston Tire & Rubber Co., Inc., \$4,000.
Bayonne Tire & Rubber Co., Inc., \$2,000.
Central New York Tire & Rubber Co., Inc., \$20,000.
Connecticut Tire & Rubber Co., Inc., \$2,000.
Davenport Tire & Rubber Co., Inc., \$1,000.
Capitol Tire & Rubber Co., Inc., \$2,000.
Columbus Tire & Rubber Co., Inc., \$5,000.
Erie Tire & Rubber Co., Inc., \$5,000.
Essex Tire & Rubber Co., Inc., \$4,000.
Elmhurst Tire & Rubber Co., Inc., \$2,000.
Fair Tire & Rubber Co., Inc., \$5,000.
Fresno Tire & Rubber Co., Inc., \$5,000.
Gom Tire & Rubber Co., Inc., \$5,000.
Jamaica Tire & Rubber Co., Inc., \$5,000.
Lion Tire & Rubber Co., Inc., \$1,500.
Missouri Tire & Rubber Co., Inc., \$5,000.
Newburgh Tire & Rubber Co., Inc., \$1,500.
Norfolk Tire & Rubber Co., Inc., \$1,000.
Newark Tire & Rubber Co., Inc., \$4,000.
Paterson Tire & Rubber Co., Inc., \$2,000.
Palace Tire & Rubber Co., Inc., \$3,000.
Reading Tire & Rubber Co., Inc., \$4,000.
Raleigh Tire & Rubber Co., Inc., \$2,000.
Schenectady Tire & Rubber Co., Inc., \$3,000.
Saxet Tire & Rubber Co., Inc., \$2,000.
Tire Export Co., Inc., \$2,000.
Watertown Tire & Rubber Co., Inc., \$5,000.
Wilmington Tire & Rubber Co., Inc., \$1,000.
Williamsburgh Tire & Rubber Co., Inc., \$3,000.
Yonkers Tire & Rubber Co., Inc., \$3,000.

Looking farther back, we find quite a number of other companies whose incorporators are S. Bernheim, C. A. Weldon and H. H. Jacobson, the address of the latter being 373 or 555 Grand street, Brooklyn, New York. Among these may be mentioned:

Blacklock-Posner Tire Co., Inc., \$15,000.
Loston Tire & Rubber Co., Inc., \$4,000.
Colorado Tire & Rubber Co., Inc., \$1,000.
Chicago Tire & Rubber Co. of America, Inc., \$100,000.
Commercial Tire & Rubber Co., \$1,000.
Delta Tire & Rubber Co., \$1,000.
Eim City Rubber Co., Inc., \$1,500.
Equitable Tire & Rubber Co., Inc., \$1,000.
Fulton Tire Corp., \$200,000.
Government Tire & Rubber Co., \$2,400.
Leader Tire & Rubber Co., Inc., \$5,000.
Pacific Tire & Rubber Co., Inc., \$2,000.
Quality Tire Co., Inc., \$1,000.
Queen City Tire & Rubber Co., Inc., \$1,000.
Service Tire & Rubber Co., Inc., \$1,000.
Sea Gate Tire & Rubber Co., Inc., \$12,000.
Syracuse Tire Co., \$10,000.
Tire Company of Baltimore, Inc., \$100,000.
Tire Company of California, Inc., \$7,500.
Tire Company of Philadelphia, Inc., \$6,000.
Tire Outlet Co., Inc., \$1,000.
World Tire Corp., The, \$3,000.

Besides these there are some others in which one or more of the names of individuals mentioned above appear as incorporators.

From Rubber Planters in Mexico.

Letters to the Editor.

"I SOMETIMES WISH that the American rubber trade could have been with you in 1903, 1904 and 1905 when you visited Mexico, examined the plantations, and studied conditions. Could they, for example, have been crowded into the little launch that went up the Coatzacoalcas river, then up the Usapapa and finally entered the Chichigapa, landing at the long river pier at Plantation Rubio. Then after luncheon the whole party to take horse and ride for hours through the miles of rubber trees, visiting the villages of thatched houses, put up for the hundreds of laborers, viewing the substantial storehouses, together with the bungalows of the superintendent and foremen; they certainly would have been impressed, not only by the enterprise shown in the clearing and planting of thousands of acres of jungle but they could not but note how prosperous and contented were the workmen and their families. There would also have come to them the feeling of safety that we all had under the protection of Diaz and incidentally Uncle Sam!

"Had they taken that trip I could wish that they might take it again to-day. To be sure, the launch would afford a good target for bandit snipers along the river banks and would need to be armored. Over at Rubio the charred and rotting remains of the long pier might help one to flounder up to the site of the once tiled and brick *bodega*. Then up to the main road now choked with jungle growth, to the plantation where stood the administration settlement. Here would be seen destruction, wanton and complete—homes burned to the ground or dismembered and wrecked beyond description. Possibly they would wish to visit the graves of young Saenz and two other American white men killed by bandits because they tried to protect the property of their American employers. It would hardly be safe to visit the rubber plantings but could they do so they would find trees

Uncle Sam sleeps almost as soundly as scores of young Americans, whose graves dot the once prosperous plantations of the *tierra caliente*."

DESTRUCTION OF HEVEA TREES.

"As I have before indicated—I believe 50 per cent of the rubber plantations in Mexico, by adding cattle, corn and the like, would to-day be on a paying basis if they had been protected.

BRICK AND TILE FACTORY BURNED BY BANDITS.

But banditry prevailed, the workmen were driven away or forced into the army, and property destroyed in all directions. Americans left, those who could, and it seems hopeless to try to do anything. It is a shame, a shame that has continued for years.

"I do not suppose many know it but the experiments with the *Hevea* tree in Mexico proved that it would do just as well as in the Far East. Under fair conditions there should have been thousands of acres now in bearing. It would have meant the financial salvation of scores of American planters in Mexico. But the *Hevea* trees have been practically wiped out through forced neglect or wilful destruction.

"I might add that the American planter was a godsend to the Mexican laborer. *Hevea* plantations or any successful plantations meant food, clothing and schooling to a people sadly in need of all three. It also meant added revenue to a bankrupt government."

RUBBER FOOTWEAR SCHOOL.

Factory training under direct supervision and upon a production basis has proved eminently satisfactory for two years past in teaching the rudiments of rubber footwear construction in a leading American factory employing 8,500 persons, approximately 50 per cent of whom are women engaged upon the manufacture of rubber footwear. Learners remain in this school two weeks, or until they are able to produce 60 pairs a day. While in training they are paid \$10 per week, or if they are able to turn out a "full ticket" of 102 pairs, they receive \$16.50 per week. When transferred to the shoe-working department they are put upon a piece-rate basis.

Numerous pamphlets of value to those interested in various methods of industrial training have been published by the Department of Labor and may be had on application to the United States Training Service, 618 Seventeenth street, N. W., Washington, D. C.

BODEGA DESTROYED BY BANDITS.

slashed and burned and the choking jungle growth covering everything. Of all the old order nothing remains—all is changed, except the collection of taxes. This goes right on, and perhaps will result in final confiscation.

"This of course would be but one example. It could be duplicated many, many times had the visitors the heart for such inspection. Diaz is dead, God rest him, and Uncle Sam sleeps!

News of the American Rubber Industry.

GENERAL MANAGER AND SECRETARY OF THE RUBBER ASSOCIATION.

ALBERT L. VILES, who becomes general manager and secretary of The Rubber Association of America on July 1, is of English ancestry, and was born at Orland, Maine, December 20, 1881, and here he passed his boyhood days. He

ALBERT L. VILES.

attended the country school in that town, but his parents removing to Dover, New Hampshire, he continued his education at the Dover public schools.

His first employment was in the woolen mills, at Dover, and later in Auburn, New York. But his ambition was to be a railroad man, and in 1901 he entered the employ of the Lehigh Valley railroad as a laborer. Determined to succeed, he rose from one position to another, becoming telegrapher, station agent, accountant, assistant chief clerk in superintendent's office, ticket agent and freight agent.

In 1910 he accepted the position of investigator with the Official Classification Committee of the railroad lines east of the Mississippi river and subsequently became special agent and assistant to the chairman, specializing in commercial analysis of all lines of business throughout the Official Classification Territory in so far as related to freight classification. He prepared, presented and defended cases of the Interstate Commerce Commission and also engaged in special investigation work for various member railroad lines in the Official Classification Territory.

In August, 1918, he was called to become manager of the Tariff Division of The Rubber Association of America, Inc., which position he filled most efficiently until last April, when he resigned to become assistant manager of the Eastern Freight Inspection Bureau, United States Railroad Administration, in charge of freight inspection in Official Classification Territory. It is this position which he relinquished to become general manager and secretary of The Rubber Association.

He is a member of the Transportation Club and the Traffic Club, both of New York City, and also of the B. P. O. Elks.

DIVIDENDS.

E. I. du Pont de Nemours & Co., Wilmington, Delaware, manufacturer of chemicals for the rubber trade, has declared a quarterly dividend of $4\frac{1}{2}$ per cent, payable June 14, on stock of record May 31. A quarterly dividend of $1\frac{1}{2}$ per cent has also been declared on the company's debenture stock, payable July 25, on stock of record July 10, 1919.

The Firestone Tire & Rubber Co., Akron, Ohio, has declared its quarterly dividends of \$1.50 on its common stock, payable June 20, on stock of record June 10, and of $1\frac{1}{2}$ per cent on its preferred stock, payable July 15 on stock of record July 1, 1919.

The General Electric Co., Schenectady, New York, has declared a dividend of \$2 a share and a further stock dividend of 2 per cent, both payable July 15 on stock of record June 7, 1919.

Globe Rubber Tire Manufacturing Co., New York City, has declared a quarterly dividend of $1\frac{1}{2}$ per cent on its common stock, payable June 15 on stock of record May 31, 1919.

Kelly-Springfield Tire Co., New York City, has declared a quarterly dividend of \$1.50 on its 6 per cent preferred stock, payable July 1 on stock of record June 16, 1919.

The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio, declared its regular quarterly dividend of three per cent on the outstanding common stock, payable June 1, 1919.

The Plymouth Rubber Co., Canton, Massachusetts, has declared its regular quarterly dividend of $1\frac{1}{4}$ per cent, payable June 2 on preferred stock of record May 26, 1919.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, has declared a quarterly dividend of $\frac{1}{8}$, payable July 31 on common stock and July 15 on preferred.

THE NEW MAYWALD LABORATORIES.

For many years Dr. Austen, and later Dr. Maywald, operated laboratories at 89 Pine street, New York, chiefly for rubber investigation. Changes in lower New York and the need of more room has led Dr. Maywald to move to Newark, New Jersey, which is actually almost as near in point of time from uptown New York as is Pine street.

The new office and chemical laboratory is at 86 Park Place, two doors from the Public Service Terminal and two blocks from the Hudson Tube station, and the experimental laboratory is at Nutley, New Jersey.

Here a modern, well-equipped rubber-testing and experimental plant has been installed, including a washer, dryer, mixing mill, calender, vulcanizer and the varied array of instruments and devices for dissection, testing and analyzing rubber products of every sort. Ample accommodations are afforded for handling rubber research work and consultation practice, and visitors are cordially invited to inspect the new laboratories.

PRESIDENT-ELECT OF BRAZIL VISITS NEW YORK

President-elect Pessoa, of Brazil, arrived in New York City last month, en route to his own country, after serving as president of the Brazilian delegation to the Peace Conference. During his stay in the United States, the Pan American Society of the United States and government officials entertained Dr. Pessoa, thus affording the Government and people of the United States an opportunity of reciprocating the generous hospitality extended to ex-President Theodore Roosevelt and ex-Secretary of State Root, when they visited Brazil.

President-elect Pessoa has had a brilliant career in connection with the government affairs of Brazil, and is thoroughly representative of the new progressive generation that is coming forward in that country and Latin America. He believes in Pan Americanism which stands for real and lasting friendship between the United States and its sister American republics.

VAIL RESIGNS AS TELEPHONE PRESIDENT

Theodore N. Vail, a director of the United States Rubber Co. since 1912, has resigned as president of the American Telephone & Telegraph Co., an office which he has held since 1907. He retires from this important position to be released from many details, and to have more time for other interests. His connection with the company dates back to 1878, when he became general manager of the American Bell Telephone Co., which position he filled until 1887, after which he spent several years in travel, later going to Argentina to introduce electric railways in several South American cities. When Frederic B. Fish retired from the presidency of the great telephone company, Mr. Vail accepted the position and has filled it most acceptably ever since.

Although in his 74th year, he is keen and active, and his retirement from the presidency does not mean a severance from the company as he is still chairman of the board of directors.

TRADE NOTES.

The Dominion Asbestos & Rubber Corp., 154 Nassau street, New York City, has recently opened branches in Albany, New York, Atlanta, Georgia, and Allentown, Pennsylvania. The company increased its capital to \$100,000 the first of the year.

The Mechanical Tire Co., Inc., 49 North Third avenue, Mt. Vernon, New York, has been recently formed, with a capital of \$10,000, for the purpose of rebuilding pneumatic tires with a 3,000-mile guaranty. The plant is in operation and the business prospects are very good. Aaron Bers, who is well-known in the rubber scrap trade, is president and Charles S. Bornheim is treasurer.

The Mileage Tire Co., Inc., 2118 South Michigan avenue, Chicago, Illinois, is agent for the "Dri-Cure" retreader and uses the "Drico" rebuilding process in retreading tires. It has nine "Dri-Cure" molds in operation and besides the retreading of tires, sells the finished product, retreading equipment, tools, rubber stocks, etc.

The Alliance Tire Co., 259 West 57th street, New York City, is now handling the Goodrich line of "Safety Tread" tires and tubs.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has opened an office in the Woolworth Building, New York City, for its export department. F. B. Beck will be in charge during the absence of D. D. F. Yard, who is going to the Far East on a business trip for the company.

The Republic Rubber Corp., Youngstown, Ohio, has recently opened a branch at Charlotte, North Carolina.

The Advance Rubber Co., Brooklyn, New York, is planning the erection of a one-story plant, 200 by 130 feet, in which it will install machinery for the manufacture of high-grade fabric and cord tires.

The Excello Tire & Rubber Co., 215 North 15th street, Philadelphia, Pennsylvania, has increased its capital stock from \$500,000 to \$1,000,000, including \$400,000 preferred stock and \$600,000 common, par value \$10. J. C. Brennan is president of the company, which was established in 1914 and manufactures "Xlo" tires and red inner tubs.

The Majestic Tire & Rubber Co., Indianapolis, Indiana, has increased its capital stock from \$100,000 to \$250,000.

The Indiana Rubber & Insulated Wire Co., Jonesboro, Indiana, is building a new three-story structure, with basement, 125 by 60 feet, to be used as a warehouse and shipping room. The company manufactures automobile, motorcycle and bicycle tires and soft rubber specialties as well as insulated wire and cables. The officers are: A. F. Seiberling, president; N. Huber, vice-president; S. H. Miller, treasurer, and R. W. Seiberling, secretary and general manager.

The Hydraulic Press Manufacturing Co., Mount Gilead, Ohio, has opened a branch office in the Union Bank Building, Pittsburgh, Pennsylvania, under the management of J. E. Holveck.

Wm. B. Scaife & Sons Co., Oakmont and Pittsburgh, Pennsylvania, has opened a sales and engineering office at 38 South Dearborn street, Chicago, Illinois, with Charles F. O'Hagan, formerly chief engineer of the company at Pittsburgh, as resident engineer and manager. This concern manufactures steel tanks for air, gas and liquids, steel shipping drums and range boilers, and the well-known Scaife water softeners and filtering equipment.

The Du Pont Chemical Co. has removed its executive and sales offices to new quarters on Vandever avenue, east of Market street, Wilmington, Delaware.

The Washington Rubber Co., Washington, Pennsylvania, recently elected the following officers: J. L. Lockhart, president; S. L. McCurdy, vice-president; B. F. Mevay, Jr., secretary and treasurer; Burt S. Shafer, John W. Warrick, T. W. D. Hieber, and T. R. McKenna, directors.

The Gates Rubber Co., Denver, Colorado, is building five additional units to its factory. Two of these are four stories high with basement, of steel-reinforced concrete. One is reinforced concrete, two stories with basement. Two are brick with steel beam reinforcements. The concrete buildings are to be faced with pressed brick to harmonize with the architecture of the other buildings of the plant. All are expected to be finished and in use before the end of the summer.

The Pacific Trading Corp. of America, 90 West street, New York City, which was recently incorporated in New York and has affiliated companies in Europe and the Far East, will in future handle all rubber and other export and import business in New York, except where buyers prefer to deal directly with Far Eastern concerns. C. C. Halling is president and general manager, and F. H. Lyon, manager of the rubber department.

The American Chic Co., Long Island City, New York, is building a new factory to occupy the full block, 200 by 600 feet, at the Dequon Terminal. It will be six stories high, of reinforced concrete, and will cost \$2,000,000.

The Tamms Silica Co., Stock Exchange Building, Chicago, Illinois, is selling amorphous silica to manufacturers of rubber erasers.

The Keystone Tire & Rubber Co., Inc., 1877 Broadway, New York City, has contracted to take the entire tire output of the Batavia Rubber Co., Batavia, New York.

TENSILE STRENGTH OF RUBBER-SULPHUR MIXTURES.

O. De Vries and H. J. Helleendoorn, using a mixture of 92½ rubber and 7½ sulphur, cured in live steam at 148 degrees C, for increasing periods, have determined that the tensile strength for short cures increases rapidly with increasing cure till it reaches a maximum at two hours' cure with a coefficient of vulcanization of 4.99 per cent. The tensile strength then decreases and finally the region is reached where the rubber becomes brittle and gives low and irregular breaking points.

Maximum tensile strength is important in several ways. (1) It is a property of more definite and typical character than the tensile strength at an intermediate cure, and therefore better suited to express and compare the properties of rubber in this respect. (2) From a practical point of view a maximum of any property is of special value for testing purposes, as small deviations due to experimental error in the neighborhood of the maximum have little influence on the numerical result which is to be determined.

OTHER MIXTURES.

The relationships existing for mixtures of 92½ parts of rubber with 7½ parts of sulphur do not obtain with other compounds as shown by the results published by Gottlob¹, Eaton and Grantham², Spence³, P. Brent⁴, Stevens⁵ and De Vries and Helleendoorn⁶.

Systematic investigation of the relation between tensile strength and state of cure for mixtures containing other compounds than sulphur only have not yet been published. There are enough data available, however, to allow the conclusion that quite distinct forms of curves will be obtained with these compounds. It is to be hoped that the systematic investigation of at least some of the more simple and most used of them will soon reveal the connections governing these cases, and so form a scientific basis for testing the rubber in such mixtures.

Money must work to succeed. Put yours to work in War Savings Stamps.

THE RUBBER ASSOCIATION'S PRESIDENT.

IN ELECTING HOMER E. SAWYER as its president, The Rubber Association of America placed at its head one who knows every detail of the manufacture of rubber from its crude state to the finished product, and one who is also a notably successful executive.

He began in the factory of the Boston Rubber Shoe Co. in Malden, Massachusetts, at the age of 19, just after being graduated from the English High School in Boston in 1885. Working successively in each department, and mastering all the details of manufacture, he was first appointed assistant superintendent, and in 1893 was made general selling agent of the

HOMER E. SAWYER.

company. This position he filled until 1901.

In the meantime the Boston Rubber Shoe Co. had been absorbed by the United States Rubber Co., and in June of the year mentioned Mr. Sawyer was elected manager of sales of the latter company. Later he was elected a director and vice-president in charge of footwear division.

He is also a director in several affiliated companies, among them being the American Commerce Co.; Canadian Consolidated Rubber Co., Limited; General Rubber Co.; General Rubber Co. of Brazil; Hastings Wool Boot Co.; United States Rubber Plantations, Inc.; Netherland Langket Rubber Co.; Rubber Regenerating Co.; Shoe Hardware Co.; United States Rubber Co., Limited, London; United States Rubber Export Co., Limited; and United States Tire Co.

Fond of out-door sports, Mr. Sawyer is a member of the Westchester Country Club, St. Andrews Golf Club, and the Racquet and Tennis Club, as well as of the Metropolitan, Union League, and Lotos Clubs of New York City, and of the Detroit Club, Detroit, Michigan.

At his home on Park avenue, New York City, is an excellent library where he spends a large part of such leisure time as his business duties allow. Believing that "the proper study of mankind is man," his favorite reading is biography, and his library is largely made up of the life-stories of prominent men, not only of America, but of other countries.

Deeply interested in the improvement of industrial conditions, Mr. Sawyer has been chosen to represent the rubber industry in the newly founded Inter-Racial Council, an association of business men formed to promote a better understanding between American employers and foreign-born employees.

He is a man of rare executive ability, keen business judgment, and quick perception, and to him is due, to a large extent, the marked success of the footwear business of the great company with which he is connected.

R. W. Palm will make his second trip to South America for the Pennsylvania Rubber Co., Jeannette, Pennsylvania, leaving this country July 1, 1919.

PERSONAL MENTION.

J. W. Coulston and J. W. Bossert, the president and treasurer of Reichard-Coulston, Inc., New York City, importer and dealer in rubber-makers' colors and chemicals, have returned from Europe after two months spent in going over the company's property there and investigating trade conditions.

J. C. Witwer has been appointed assistant superintendent in charge of production for the International India Rubber Corp., South Bend, Indiana. He was previously connected with the Kelly-Springfield Tire Co. and The Goodyear Tire & Rubber Co.

G. E. Habich has opened an office at 49 Liberty street, New York City, as a broker in crude rubber.

J. P. Cahoon has succeeded George A. Davidson as manager of the Albany, New York, branch of the Kelly-Springfield Tire Co., New York City.

A. W. Barry is the new manager of the Rochester, New York, depot of the Kelly-Springfield Tire Co., New York City. He succeeds F. T. Bailey.

D. D. F. Yard, sales director of the export division of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, will visit Honolulu en route to Australia, Straits Settlements, New Zealand, China, Japan, India, and South Africa in the interest of the company, sailing from San Francisco about July 1, 1919.

Frank L. Williams has been designated New York representative of the Tyer Rubber Co., Andover, Massachusetts, under the authorization of the company to do business in the State of New York, at 302 Broadway, New York City. Mr. Williams has been with the Tyer company for thirty-four years and manager of the New York City office for fifteen years.

W. D. Palmer has been promoted to the position of manager of the New York City office of The Portage Rubber Co., Barberton and Akron, Ohio, with headquarters at 1924 Broadway. Mr. Palmer has been New York City salesman for the Portage company since 1917.

C. D. Studebaker has been appointed district manager for the Firestone Tire & Rubber Co., Akron, Ohio, controlling its four branches in New York City, Brooklyn, and Albany, New York, and Newark, New Jersey. His headquarters will be at 1871 Broadway, the company's New York City office.

H. L. Smith, until recently of the mechanical sales department of The Republic Rubber Corp., Youngstown, Ohio, at its branch in Detroit, Michigan, has been transferred to the Philadelphia district, with headquarters at 806 North Broad street, Philadelphia, Pennsylvania.

A. S. Hetzel, who has won considerable recognition as a tire sales executive in the past two years, as manager of the Cleveland branch, has been promoted by The Republic Rubber Corp.

Youngstown, Ohio, to district manager of the Philadelphia branch. In his new position Mr. Hetzel will have charge of one of the most important territories in the country and will make his headquarters in Philadelphia, Pennsylvania.

L. N. Bartlett has been appointed manager of the office of The Republic Rubber Co., Youngstown, Ohio, at 2018 Locust street, St. Louis, Missouri.

O. S. Tweedy, who recently resigned as vice-president of the L. A. Young Industries, Inc., Detroit, Michigan, to which he went in the spring of 1918, after ten years with the Diamond Rubber Co., Akron, Ohio, has been elected vice-president of the Dryden Rubber Co., 1014 South Kildare avenue, Chicago, Illinois.

A. S. HETZEL.

The following well-known men in the trade arrived in New York City last month, from England: O. Shaw, managing director Francis Shaw & Co., Limited, Bradshaw, Manchester; Thomas H. Hewlett, managing director, Joseph Anderson &

Sons, Limited, Clayton, Manchester, and M. H. MacKusick, managing director, The Rubber Regenerating Co., Limited, Trafford Park, Manchester.

Sir Francis Watts, head of the Imperial Department of Agriculture for the West Indies, was in New York City recently en route for England.

E. A. Andersen, president and general manager of the Rubber Regenerating Co., of Naugatuck, Connecticut, while in New York City recently, entertained O. Shaw, Thomas H. Hewlett and M. H. MacKusick, friends from England.

ALDENS' SUCCESSORS, INC., SUCCEEDS AMERICAN BRANCH OF ALDENS' SUCCESSORS, LIMITED.

Aldens' Successors, Inc., 260 Broadway, New York City, importer and dealer in crude rubber and other general merchandise, was formed June 23, with the following officers: Thomas A. Maguire, president and treasurer; Alvah H. Brown, vice-president and assistant treasurer; M. A. Howser, secretary. Directors: Thomas A. Maguire, Alvah H. Brown, John Cone, Edwin T. Rice and John French. This firm succeeds to the American business of Aldens' Successors, Limited, of London, England.

WESTON JOINS AJAX RUBBER CO.

Announcement is made by the Ajax Rubber Co., Inc., New York City, of the appointment of Joseph C. Weston as vice-president and director of that company.

For a number of years Mr. Weston has been vice-president and director of sales of the United States Tire Co. His resignation from this position is effective July 1, 1919. Mr. Weston's career in the rubber trade has been one of steady and well-merited advancement covering a period of over 20 years.

SHUGART UNITED STATES TIRE SALES MANAGER.

Within less than a year from his promotion to the post of general branch sales manager of the United States Tire Co., New York City, George S. Shugart has been advanced to the position of general sales manager. In this position Mr. Shugart succeeds Joseph C. Weston, who resigned to make an important connection with the Ajax Rubber Co.

It is particularly interesting to note that Mr. Shugart's advancement is another example of the policy of the United States Tire Co. to fill vacancies in its high places from the ranks of its own workers.

A NEW FRENCH-AMERICAN BANKING HOUSE.

Hereafter, through the recently organized French-American Banking Corporation, American business men will be able to avail themselves of banking facilities in France as advantageous as Frenchmen themselves enjoy. This alliance to promote trade between France and the United States is capitalized at \$2,000,000, with a surplus of \$500,000, all paid in, and represents combined resources of over \$1,250,000,000. Half the stock of the corporation is held by the Comptoir National d'Escompte de Paris, while the other half is shared equally by the First National Bank of Boston and the National Bank of Commerce in New York.

The corporation will engage in the acceptance business and generally assist in financing trade between the United States and France, including French colonies in all parts of the world. The First National Bank of Boston has a branch in Buenos Aires, while the Comptoir National d'Escompte de Paris has, in addition to two hundred-odd offices throughout France, branches in Spain, England, Belgium, Australia, New Zealand and India, and is preparing to open further branches in Alsace and Lorraine. These facilities will enable French and American importers and exporters to secure the best of terms and services in developing or extending their trade.

The corporation has leased the ground floor at 65 William street, corner of Cedar street, New York City.

HORACE DE LISSER RETURNS.

AT A MEETING of the board of directors of the Ajax Rubber Co., Inc., Horace De Lissier was again elected president, thereby succeeding H. D. McClaren.

Mr. De Lissier was born in 1866, in Kingston, Jamaica, where his father was for more than 20 years collector of His Majesty's customs, subsequently moving to the United States and entering the cotton business.

Horace De Lissier was educated in the elementary schools in Jamaica and the public schools of New York City, and after graduation entered the cotton goods business. In 1894 he conducted a bicycle tire factory in England, which was later sold to a London syndicate. In disposing of this business he agreed to remain out of the rubber business for five years, and therefore took the United States agency for the Holbrook Sauce Co. of London.

At the expiration of the five-year agreement he identified himself with the International Tire & Rubber Co. of Milltown, New Jersey, resigning in 1905 to establish the Ajax Standard Rubber Co., of which the present Ajax Rubber Co., Inc., is the outgrowth. With the exception of two periods of short duration, he has been president of the company since its formation, and has retained continuously the post of chairman of its board of directors. At all times he has been the guiding spirit, and under his leadership the company has made continuous progress.

In 1910 he resigned the presidency to assume the vice-presidency and management of sales of the United States Motor Co., which position he resigned in 1912 to give again his whole attention to the Ajax-Grieb Co., sailing for Europe in July to study the situation of the tire business there. In August, that year, he married, at Covent Garden, London, England, Miss Ione Maggard.

During the Great War he was appointed to the "Business Men's Staff" of General Pershing, with the rank of major, to direct the erection of factories behind the firing lines in France. He was also chairman of the Liberty Loan Committee, representing the automobile and accessory trades, and was active in floating the several bond issues.

Besides being president and chairman of the board of directors of the Ajax Rubber Co., Inc., he is director and vice-president of the Briscoe Motor Co., Jackson, Michigan; vice-president and director of the Broadway Association of New York City; treasurer of the Annual Orphans' Automobile Day Association; member of the Executive Committee of the Tire Division and chairman of the Arbitration Committee of The Rubber Association of America.

He is an ardent yachtsman and a member of the Friars, Lambs, Lotos, New York Athletic, Great Neck Country, Bankers and Traffic clubs of New York, as well as of high Masonic bodies and Mecca Temple, A. A. O. N. Mystic Shrine.

HORACE DE LISSIER.

THE OBITUARY RECORD.

A PROMISING CRUDE RUBBER MAN.

THE SUDDEN DEATH by pneumonia, May 17, 1919, of C. J. Adams, as announced last month, was a shock to his many friends in the rubber industry.

Mr. Adams was engaged in the crude rubber business in New York City for a period of fourteen years. He began originally with the crude rubber firm of H. Hagemeyer & Brunn, and later joined the firm of A. W. Brunn & Co., crude rubber brokers. On the death of A. W. Brunn, he continued in the business with the firm of Fred Stern & Co., crude rubber importers, New York City. In the latter connection he became extensively known in the rubber trade and was universally well liked in both his social and business relations.

C. J. ADAMS.

A RUBBER FACTORY MECHANICAL ENGINEER.

Daniel J. Kirkham, mechanical engineer of The McGraw Tire & Rubber Co., East Palestine, Ohio, and Cleveland, died recently at Battle Creek, Michigan, where he went for medical treatment. His death came after a prolonged illness. Mr. Kirkham was born in Trenton, New Jersey, April 7, 1880, and was educated in the public schools there and at the Trenton Mechanical School.

DANIEL J. KIRKHAM.

Mr. Kirkham is survived by his widow and three children. A Masonic funeral was held at East Palestine, Ohio, and the interment was at Trenton, New Jersey.

A WELL-KNOWN NEW HAVEN RUBBER MAN.

The many friends of Hiram S. Raley were grieved to learn of his sudden death early in June. He was secretary-treasurer of the Raley Rubber Co., Riverton, Connecticut, manufacturer of dipped goods and nipples.

Mr. Raley was 46 years of age and was born at Eagle Harbor, Michigan. He was an expert chemical engineer, a capable and conservative manager, and for many years was associated with The Seamless Rubber Co., New Haven, Connecticut. He leaves his widow and four children.

ONE OF THE FOUNDERS OF THE RUBBER GROWERS' ASSOCIATION.

Sir William Hood Treacher, K. C. M. G., late Resident-General of the Federated Malay States, died May 3, 1919, at the age of seventy.

He was born in 1849, the son of the late Rev. J. S. Treacher, and was educated at St. Mary Hall, Oxford, England. He was

appointed Colonial Secretary at Labuan, and in 1881 was made the first Governor of British North Borneo. Later he became successively Secretary to Government, Perak; British Resident, Selangor and Perak, and Resident-General, Federated Malay States. He retired in 1904, later returning to England. He was one of the founders of the Rubber Growers' Association and a member of its council from 1907 until about a year ago, retiring because of declining health. He was a director in a number of planting companies in Sumatra, Borneo and the Federated Malay States, and as an author he wrote extensively of Borneo, on which his intimate knowledge made him an authority.

THE RAMSAY MEMORIAL FUND.

A movement deserving the favorable attention of the American rubber industry is the Ramsay Memorial Fund to commemorate the thirty-five years' service of the late Sir William Ramsay, devoted to the physical and chemical sciences, education, and public welfare. A central committee of distinguished men under the chairmanship of Lord Rayleigh and sub-committees in most of the great countries of the world are raising a fund of £100,000 for the establishment of Ramsay Research Fellowships, tenable wherever necessary facilities may be available, without national restrictions, and a Ramsay Memorial Laboratory of Engineering Chemistry at the University of London, where Sir William served twenty-six of his most fruitful years.

About half of the fund has been raised, but as only about £1,000 has been contributed by residents of the United States, the United States committee will welcome other gifts large and small. Checks may be mailed to the chairman of the United States Committee for the Ramsay Memorial Fund, Dr. Charles Baskerville, College of the City of New York, or to the treasurer, William J. Matheson, 21 Burling Slip, both in New York City.

FIFTH NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES.

What promises to be the world's greatest exposition of the chemical industries is to be held in the Coliseum and First Regiment Armory, Chicago, Illinois, during the week of September 22, 1919.

Many features of general interest are being arranged in addition of the special programs of the several technical societies which will be in convocation with the exposition. The most important of these will be a symposium upon safety in the plant and mine, by speakers of authority, to be followed in the evening by a series of motion pictures of safety work in industrial plants all over the country, made under government supervision.

That the exposition will include much of interest to rubber goods manufacturers is indicated by the following roster of exhibitors identified with the rubber and allied trades: American Hard Rubber Co., Buffalo Foundry & Machine Co., Foamite Firefoam Co., General Bakelite Co., General Electric Co., Hunter Dry Kiln Co., Innis, Speiden & Co., Arthur D. Little, Inc., National Aniline & Chemical Co., Inc., the New Jersey Zinc Co., Products Sales Co., Schaeffer & Budenberg Manufacturing Co., Stresen-Reuter & Hancock, Inc., C. J. Tagliabue Manufacturing Co., Taylor Instrument Companies, Werner & Pfleiderer Co., Westinghouse Electric & Manufacturing Co., and Whittall Tatum Co.

These exhibits will include hard rubber and substitutes; machinery of various sorts, laboratory equipment and instruments; electrical apparatus, dryers and temperature controllers; colors, chemicals, accelerators and compounding ingredients; druggists' sundries and molded rubber goods; fire-extinguishers, and chemical engines.

IT IS TO YOUR BEST INTEREST TO PUT YOUR LIBERTY BOND INTEREST IN W. S. S.

A COURSE IN CORPORATION CHEMISTRY.

The Newark Technical School, 367 High street, Newark, New Jersey, announces that during the coming term Dr. Frederic Dannerth will deliver a course of thirty lectures on corporation chemistry, covering the five following general topics: Natural resources, executive departments, advisory departments, laboratory management, and the economic office.

Dr. Dannerth is a well-known industrial chemist and also the inventor of numerous secret processes employed in manufacturing rubber, resins, and plastics. The aim of his course will be to show how the principles of industrial chemistry are applied to the problems of manufacturing corporations. The lectures and seminars will be conducted in such a manner that the work of the course can be taken to advantage by the heads of the departments for purchasing, manufacturing, selling, engineering, law, and research, as well as by fourth-year men in chemistry.

Complete details can be had by addressing either Dr. D. R. Hodgdon or Dr. Frederic Dannerth at the school.

HEYDEN CHEMICAL WORKS SOLD FOR \$1,500,000.

The Heyden Chemical Works, Garfield, New Jersey, one of the largest concerns of its kind in the United States, and which was German-owned before its seizure by former Alien Property Custodian Palmer, has been sold to Allan A. Ryan for \$1,500,000. The property includes about seven acres of land on which stand an office, laboratory, seventeen mill buildings and a salicylic acid sublimation plant.

While the products of the concern are chiefly of a pharmaceutical character, a few are of interest to the rubber trade, namely, hexamethylene tetramine, a vulcanizing accelerator, and salol, a vulcanized rubber solvent.

AJAX RUBBER CO., INC., REPORTS PROGRESS.

The Ajax Rubber Co., Inc., New York City, in its recently published annual report for the year ended December 31, 1918, comments on the unusual aspects of the business year just completed, in spite of which it recorded a gain of 40 per cent in sales over those of 1917. A summary of the report shows the following:

ASSETS.	
Capital assets	\$4,034,823.20
Current assets	6,924,239.94
Organization expenses, insurance, etc.	112,571.15
LIABILITIES.	\$11,071,634.29
Capital stock, authorized and issued.	\$7,100,000.00
Current liabilities, including notes and accounts payable, bonuses, taxes (including war profits and income taxes), etc.	2,839,425.44
Surplus, including profits for year after providing for Federal war profits and income taxes and deducting dividends paid.	1,132,208.85
	\$11,071,634.29
PROFIT AND LOSS ACCOUNT.	
Sales, less expenses, allowance for depreciation of plants and equipment, discounts, etc.	\$5,459,346.14
Administration expenses, bonuses, bad debts, interest on borrowed money, loss on Liberty Bonds, etc.	3,522,885.66
	\$2,936,460.48
Donations to war relief funds.	\$21,092.23
Provision for Federal war profits and income taxes (estimated)	1,700,000.00
	1,721,092.23
Profits for year.	\$1,215,368.25

CANADA PRODUCING RUBBER MACHINERY.

UP to two years ago practically all the machinery needed in the 23 rubber factories of Canada had to be imported, nearly all of it coming from the United States or Great Britain. More than one-half of these factories are owned and operated by the Canadian Consolidated Rubber Co., Limited, and it occurred to T. H. Rieder, formerly the president, that the machinery requirements of its own factories and such outside trade as could be secured would warrant a plant exclusively devoted to the production of special rubber machinery.

Accordingly the Rubber Machinery Shops were established, the plant shown here was erected at Kitchener, Ontario, and thus

was started the first and only concern devoted to this business in Canada. The buildings are of brick, of mill construction, fireproof, admirably adapted for the purposes intended, and fully equipped with the necessary machinery and tools.

Although the business is only 18 or 20 months old, between 100 and 150 men are steadily employed. Plans are already under way to cooperate with the city government of Kitchener: in

the event of a public technical school being established, the wood-working pattern-making, and machine-shop departments will form a valuable adjunct to the school.

The concern has established a most liberal apprenticeship system, has provided for the health and comfort of its employees, and in other ways made the work in its shops attractive. The business is flourishing and is constantly enlarging.

The executive staff is as follows: F. W. Harding, general manager; H. S. Poole, chief engineer; C. H. Harding, superintendent; Allen Clarke, production engineer, and C. W. Cressman, in charge of office.

CANADIAN NOTES.

The K. & S. Canadian Tire & Rubber Co., Limited, Weston, Ontario, is to build a factory addition which will double its present floor space and provide facilities for the manufacture of dipped goods. It now manufactures rubber sundries and half-heels and whole heels. This concern is also having plans prepared for a tire factory. Connections have been established on the Continent, in England and in the United States.

The Hercules Rubber Co., Limited, Brampton, Ontario, has completed its factory and began operations early in April. It is specializing on tires, tubes, and accessories.

The Premier Rubber Co., Limited, Guelph, Ontario, has changed its name to The Northern Rubber Company, Limited. F. E. Partridge is president and A. F. Dwyer, secretary. The concern will manufacture rubber footwear exclusively in its new four-story factory now building.

The Sterling Rubber Co., Limited, Guelph, Ontario, manufacturer of high-grade rubber specialties and sundries, is building an addition to its factory which will practically double its present floor space. The cost will be about \$25,000.

The Aero Cushion Inner Tire & Rubber Co. of Ontario, Limited, Wingham, Ontario, has purchased two factory buildings, one 200 by 80 and the other 165 by 65 feet, for which it is ordering machinery to manufacture its "Aero" cushion

PLANT OF THE RUBBER MACHINERY SHOPS.

inner tires. The officers of the company are: Thomas R. Bennett, president; M. E. Zurbrigg, vice-president; G. L. Bisbee, secretary-treasurer; E. L. Sherbondy, general manager; C. E. Judson, sales manager; directors—Thomas R. Bennett, M. E. Zurbrigg, Jesse Button, Edward L. Sherbondy and L. Kennedy.

The Regina Tire & Repair Shop, 1707 Scarth street, Regina, Saskatchewan, has acquired a site for the building of a new block. J. C. Wilson is manager.

D. Duncan has been appointed credit manager of the Calgary, Alberta, branch of the Dunlop Tire & Rubber Goods Co., Limited.

The Canadian press reports that The Goodyear Tire & Rubber Co., of Canada, Limited, has disposed of the balance of its preferred treasury stock, for \$200,000 of which employees subscribed at \$95.

NEW RUBBER INTERESTS OF TALMON H. RIEDER.

The Ames Holden Tire Co., Limited, Montreal, Quebec, has just been incorporated at \$3,000,000 to manufacture automobile tires and accessories. The incorporators are Talmon H. Rieder, Douglas L. McGibbon, Stephen J. LeHuray, and others. Property has been purchased at Kitchener, Ontario, where a factory will be built.

The Mount Royal Rubber Co., Montreal, Quebec, capitalized at \$500,000, has been incorporated to manufacture rubber tires and other kinds of rubber goods. The incorporators are Talmon H. Rieder, Douglas L. McGibbon, Charles H. Ancrum, and others. Mr. Rieder, who was formerly president of the Canadian Consolidated Rubber Co., Limited, Montreal, is president. The company is planning to build a \$100,000 factory.

Talmon H. Rieder was recently elected president of the Ames-Holden-McCready Co., Montreal, which manufactures shoes.

ALL-WHITE POLICE UNIFORMS.

The fashion of wearing white rubber coats and caps in rainy weather, started by the police department of New York City, has been adopted by other cities. The police force of Montreal, Canada, is equipped for heavy, rainy weather with white rubber coats, caps, and boots, and the accompanying picture shows the

MONTREAL POLICE IN WHITE RUBBER COATS.

escort of a procession of returned soldiers on a recent Sunday morning. The coats, caps, and boots were manufactured by the Canadian Consolidated Rubber Co., Limited, Montreal, Canada.

JAPANESE RUBBER TOYS IN CANADA.

A report from the consul at Kingston, Ontario, comments on the replacing of German-made toys, including those of rubber, by those of other countries, with special reference to the development of the Japanese toy industry. In this connection he cites an article

which recently appeared in a Japanese magazine, from which it would appear that the Japanese product is largely supplanting the German. However, after careful investigation in his district, he finds that the American article, whether mechanical, metal or rubber, is preferred to any from Europe or Asia and that the annual trade is on the increase.

A MILL VILLAGE FOR THE HANES RUBBER CO.

The Hanes Rubber Co., Winston-Salem, North Carolina, is developing a 135-acre tract adjoining its factory as a modern mill village of the most approved type.

COTTAGES FOR HANES RUBBER CO. EMPLOYEES.

A tract of some 135 acres of attractive topography that will afford opportunity for expansion of both plant and village has been selected and a firm of well-known village planners are in charge of the work, thus assuring good architecture and pleasing landscape features.

The plans include several miles of graded, grass-bordered streets with concrete sidewalks. All traffic arteries lead to two important centers—the plant, and the community center, where will be located a building for entertainments, motion-pictures, a gymnasium, a swimming pool, also modern stores of various sorts.

A twelve-acre tract is reserved for expansion of the plant. Seven storage warehouses will be erected for raw materials, and two textile mills are projected nearby, to supply fabric needs, the first of these to be of 10,000-spindle equipment for the production of tire-building fabrics.

NEW TIRE INDUSTRY FOR BUFFALO.

The Madison Tire & Rubber Co., Inc., has erected in Buffalo, New York, a modern plant equipped with the most approved machinery for the manufacture of highest quality automobile cord and fabric tires and inner tubes. A large chemical laboratory, fully equipped with facilities for chemical control of raw materials, manufacturing process, and physical testing of the products, has been installed. In fact, provision has been made to render effective the determination of the management to place on the market only strictly high-class goods and to maintain them at a uniformly high standard of quality.

It is expected that the plant will begin operation early in July, on a daily production of 250 tires and tubes. The output will be steadily increased to full capacity of the equipment, approximately 1,000 tires and 1,000 tubes daily.

William Meyers, formerly with the Racine Auto Tire Co., is superintendent, and will be ably assisted by equally competent experts.

The main office and eastern sales department, 57th street and Broadway, New York City, will be in charge of Jean Nehmelmann, eastern sales manager, formerly with the Mohawk Rubber Co.

The control of the company is held by men connected with the United States Rubber Reclaiming Co., Inc., and with the banking firm of Ladenburg, Thalmann Co., New York.

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

THERE IS A WIDE-SPREAD MOVEMENT in this state to anticipate legislation and make 48 hours the legal measure of a week's work. Several of the rubber companies are already running their plants on this basis, and in most cases this is virtually an advance of wages, as the workers are paid the same amounts for the shorter week's work as they have received for the longer.

The Boston Rubber Shoe Co., Malden and Melrose; the Apsley Rubber Co., Hudson, and the American Rubber Co., Cambridge, are now running on the 48-hour schedule. The Converse Rubber Shoe Co., Malden, and the Hood Rubber Co., Watertown, are also running their plants 48 hours a week, this being so divided in five days that it gives the employees a double holiday, Saturday and Sunday. The Monaquot Rubber Works Co., and the Mayflower Rubber Works Co., of South Braintree, are also running on this five-day, 48-hour schedule. In some of these latter plants the five-day schedule is an experiment, and is for the summer season only, but if the plan is successful, it may be adopted throughout the year.

* * *

The New England representatives of The B. F. Goodrich Co. convened in Boston late in May, where conferences were held with executives from the Akron headquarters at the company's branch store on Boylston street, the affair winding up with a dinner at the Copley-Plaza Hotel. Among those who addressed the meeting were: S. V. Norton, manager of truck sales; E. C. Tibbetts, advertising manager; H. H. Eager, assistant manager of truck tire sales; A. H. Leavitt, manager of pneumatic truck tire sales, and E. J. Hughes, manager of sales personnel.

A feature of the dinner was a reminiscent address by S. C. Lowe, of New Bedford, Massachusetts, the oldest Goodrich distributor in New England. A theatre party concluded the convention.

* * *

Another meeting worthy of notice, which was held too late to be reported last month, was the occasion of a visit of vice-president Homer E. Sawyer and general factory footwear manager Myron H. Clark, of the United States Rubber Co., to the plant of the Boston Rubber Shoe Co. Under the escort of G. L. Lawrence, factory manager, and P. C. Benjamin, superintendent, the two factories were inspected. At factory No. 1, where Mr. Sawyer served his apprenticeship, he was cordially greeted by a number of employees who were fellow-workers with him.

The Boston Rubber Shoe Association promptly called a special meeting for that evening at Fells Hall to entertain the visitors. An excellent dinner was served, at which Mr. Lawrence acted a toastmaster. President Guilford of the association welcomed the guests, and declared Mr. Sawyer an honorary member, Mr. Clark having previously been elected as such. Employment Manager John T. Cooper extended greetings on behalf of the employees and officials. Mr. Clark spoke earnestly of the importance of the best possible industrial relations and of the value of the foreman's influence. He referred to some of his experiences in London, and described the wonderful salvage plants there.

The address of Mr. Sawyer was of much interest as an interpretation of the desire of the company as to the relationship with the employees, and of his own personal interest in them, for he referred frequently to old friends in the factory whom he had never forgotten.

The Boston Rubber Shoe Association, which was responsible for this meeting, is composed of the heads of departments in the factories and offices of the company, and was organized in October, 1918, to bring about a better acquaintance. It has a membership of 120, and holds at least one social meeting a

month, and has been very successful in every way. Last month a ladies' night was held, in which more than a hundred couples participated. A concert, impersonations and character dancing preceded refreshments, after which a program of dancing occupied the remaining two hours before midnight.

* * *

Francis H. Appleton, the well-known reclamer, attended the four-day meeting of the Ancient Arabic Order of the Mystic Shrine at Indianapolis last month, being a delegate of Aleppo Temple, of Boston, of which body he is now Chief Rabbah. Mr. Appleton is very enthusiastic regarding this order, of which there are over 8,000 members in this state.

* * *

Abraham Sydean, general manager of the Plymouth Rubber Co., Canton, Massachusetts, is a member of the board of directors of the Citizens' National Bank, a new institution which commenced business in Boston the 19th of last month.

* * *

The Hood Rubber Co. is offering to preferred stockholders 10,000 shares of 7 per cent preferred stock, being all that remain unissued of such stock authorized to be issued at not less than par by a vote of the stockholders in July, 1917. Each holder may subscribe for one new share for each four shares, or fraction thereof, that he held June 19, and arrangements have been made to dispose, by private subscriptions, of any stock not taken by the preferred stockholders.

* * *

At a meeting of the stockholders of the Mayflower Rubber Works Co., South Braintree, Massachusetts, George E. Jean-dheur was elected vice-president, and Richard K. Fields, secretary. Both these gentlemen were formerly connected with the New Jersey Car Spring & Rubber Co., Inc., of Jersey City, New Jersey.

* * *

William Whitlock, for over 15 years with The Fisk Rubber Co., Chicopee Falls, Massachusetts, has severed his connection with that concern, and will take a vacation of several months before again entering business. He has been connected with the tire business many years, at first with the G. & J. Tire Co., Indianapolis, Indiana, where he rose from foreman to superintendent, holding that position until he resigned to become assistant superintendent of the Fisk plant. Mr. Whitlock was very popular at the factory, and he leaves with the best wishes for his future of the entire Fisk organization.

* * *

Ernest C. Clark, formerly vice-president of the Clark Rubber Manufacturing Co., Franklin, Massachusetts, has severed his connection with that concern, and is now with Beck, Van Sien Co., exporter, New York City. He is succeeded by his father, Maurice C. Clark, who was for several years with the Banigan Rubber Co., and since then has superintended the erection and installation of a number of rubber mills and reclaiming plants.

* * *

W. Irving Bullard, manager of The Merchants National Bank of Boston, Boston, Massachusetts, has been elected treasurer of the National Association of Cotton Manufacturers.

* * *

Charles T. Wilson Co., Inc., New York City, crude rubber dealer, has opened an office in the Winthrop Building, 1 Water street, Boston, Massachusetts, under the management of Marston Haviland.

* * *

A. G. McClurg has been appointed factory manager of the Carlisle Cord Tire Co., Andover, Massachusetts.

* * *

The Revere Rubber Co., Chelsea, Massachusetts, a subsidiary of the United States Rubber Co., has elected the following

officers for the ensuing year: directors—Walter S. Ballou, Charles C. Case, Samuel P. Colt, H. E. Converse, James B. Ford, Lester Leland, Charles B. Seger, and Elisha S. Williams; officers—Samuel P. Colt, chairman; Lester Leland, vice-chairman; Elisha S. Williams, president; W. H. Blackwell, treasurer; John D. Carberry, secretary; F. L. Bunker, assistant treasurer and assistant secretary; F. O. Miles, assistant treasurer.

* * *

The Fisk Rubber Co., Chicopee Falls, Massachusetts, has disposed of its new issue of \$15,000,000 of seven per cent cumulative first preferred stock, tax-exempt in Massachusetts, on which dividends are payable on the first days of February, May, August and November.

* * *

Stickney, Tirrell & Co., importers of chalk and manufacturers of whitening, have removed to the Old South Building, Washington and Milk streets, Boston, Massachusetts. Their factory is in East Boston.

THE RUBBER TRADE IN OHIO.

By Our Regular Correspondent.

THE SCARCITY of home accommodations in Akron has furnished the stimulus for the movement to be undertaken by the Akron Home Owners' Investment Co., the president of which is Harvey S. Firestone, who is also president of the Firestone Tire & Rubber Co., Akron. Mr. Firestone has worked out a plan by which the \$5,000,000 company will erect 5,000 houses in Akron and assist those who wish to buy them on first mortgages with a proper interest rate, or on second mortgages without commission and a low rate of interest. Titles will be examined free of charge and architects' plans may be consulted in the company's office. It is hoped to provide shelter for 20,000 persons.

AKRON NOTES.

The Firestone Tire & Rubber Co., Firestone Park, Akron, has organized a colony of deaf employees under the direction of B. M. Schowe. The Firestone company has the honor of having in its employ the first deaf men ever employed in the Akron rubber industry. It is not generally known that deaf people, and deaf mutes, as well, make exceedingly expert workmen. The company also has in its employ a man who is totally blind, but who can turn out tire repair work equal to that produced by those possessed of full sight.

The Firestone company has also organized a class to study the sign language used by the deaf, under the direction of B. M. Schowe of the Labor Department. The lessons will be given twice a week and will be conducted in the sign language. The spoken word will be forbidden in the classroom.

* * *

The Goodyear Tire & Rubber Co., Akron, now employs more than 500 deaf mutes in its various departments. A special class in the factory school is conducted for their benefit and they have their own social and athletic organizations.

* * *

Miss Merry C. Echols, a graduate of Akron City Hospital, whose experience has included private nursing and institution work as the superintendent of Massillon City Hospital for eight years, has been secured by the Firestone Tire & Rubber Co., Akron, Ohio, for the position of superintendent of nurses. She had recently been resident instructor at the Akron City Hospital.

* * *

Francis A. Seiberling, president of the Goodyear Tire & Rubber Co., Akron, has been elected president of the newly formed Para Co., which is to build a \$750,000 hotel and office building where the Hotel Buchtel now stands. The company is incorporated for \$40,000 and has obtained a 99-year lease of

the hotel property, dating from April 1, 1919, but construction of the new ten-story building will not begin until late this autumn or early next spring, due to unexpired leases of tenants of the present structure.

The Goodyear Tire & Rubber Co., Akron, has appointed E. M. Sonntag special representative of the company at Madrid, Spain, to engage in promotional and investigational work throughout the chief Spanish cities.

The Goodyear Tire & Rubber Co., Akron, is building a new clubhouse for employees, opposite the factory office on Market street and Goodyear avenue, 170 by 400 feet. It is to be of brick and steel construction, five stories high, and will include all the modern industrial clubroom features, such as gymnasium, bowling alleys, showers, rest-rooms, reading-rooms, and a theatre which will seat 2,000. A corporation school with classrooms, study hall and auditorium is also provided, while on the top floor will be a lunch and dining-room on the cafeteria plan. The building will cost about \$500,000.

Fifty boy scouts with their officers will enjoy a motor-truck camping trip in trucks furnished by the Goodyear Tire and Rubber Co., Akron, beginning June 26, 1919. The boys will cover about 3,000 miles and pass through nine states, visiting the historical and scenic points along a route across the upper part of New York, through Niagara Falls, Utica, Syracuse, and Albany, across New Hampshire to Portland, Maine, and return via Boston, Providence and New Haven to Ithaca, Lake Chautauqua, and Youngstown. The trucks will be provided with pneumatic tires and have double-deck upper and lower sleeping berths.

* * *

The athletic team of The B. F. Goodrich Co., Akron, at the Memorial Day meet, rolled up a score of 59, as compared with that of 45 by the Goodyear team, 40 by Firestone, and 9 by Miller. The entry list totaled over 180, and all contestants were bona fide members of the concerns represented.

All point winners in this meet will be entered in the national factory employees' track and field meet, to be held at Gary, Indiana, July 4, 1919, under the auspices of the American Industrial Athletic Association. Horseshoe pitching and wrestling have been added to the regular list of events.

Boy Scouts connected with the Goodrich company are building a log cabin at Rex Lake from plans drawn by Henry Bishop, of Department 18-U. The cabin will be a model Scout home, with folding tables that pull to the ceiling, a 4 by 6-foot fireplace, and spacious porch, besides the customary benches, bunks and lockers.

* * *

The Mohawk Rubber Co., Akron, is completing the factory wing which will house portions of the cord-tire building and curing departments.

* * *

The American Rubber & Tire Co., Akron, has contracted for another factory wing, to be of standard mill brick and steel construction, five stories high, to cost approximately \$100,000.

* * *

Fred J. Horn, recently discharged from the Army, will represent Fred Stern & Co., crude rubber importers, New York City, in Akron, assisted by Paul Bloom.

CLEVELAND NOTES.

The Polson Rubber Co., Doan avenue and Nickel Plate Railroad, Cleveland, is planning to build a large modern factory to take care of its increased business in tire accessories.

* * *

The Ideal Tire & Rubber Co., Cleveland, has increased its capital from \$2,000,000 to \$5,000,000, consisting of \$2,500,000 worth of both preferred and common stock.

MISCELLANEOUS OHIO NOTES.

The Henderson Tire & Rubber Co., Bucyrus, has bought a three-acre site on Goodale street, Columbus, where it is building a two-story factory, 100 by 400 feet, for which new and improved machinery and equipment has been purchased. The factory is expected to be in operation by October 15, 1919.

* * *

The Long Wear Rubber Co., Elyria, Ohio, has taken over the production and sales of the Quality Tire & Rubber Co., Anderson, Indiana, and will shortly build an addition to its plant at Elyria. Both factories will be under the supervision of Frank W. O'Brien, general manager.

* * *

The annual meeting of the stockholders of the National Tire & Rubber Co. was held on Wednesday, June 11, 1919, when a financial report of the year's business was read, showing a prosperous year's business, exceeding all previous records. The sale of the remaining unissued capital stock, both common and preferred, was outlined as the initial step in a comprehensive plan for immediate expansion of the business that provides for the trebling of the output.

At the meeting of the board of directors, the following officers were elected: C. L. Merwin, president; S. L. Warner, vice-president and general manager; C. W. Helman, secretary; R. B. Taggart, treasurer.

C. E. Miley has been elected vice-president in charge of sales of the National Tire & Rubber Co., East Palestine, Ohio. Mr. Miley is widely known in the tire industry through his ten years' service as general sales manager for the McGraw Tire & Rubber Co. His affiliation promises an aggressive policy of broadening the field of distribution of the National company's products.

* * *

The Clarke Rubber Co., Elyria, Ohio, recently elected the following officers and directors: H. A. Beck, president; W. H. Clarke, vice-president; E. P. Clement, treasurer, and C. A. Squire, secretary. Directors: E. T. Clauser, C. W. Smalley, C. D. Lehman and J. A. Reublin.

* * *

The Rainbow Tire & Rubber Co., Delaware, Ohio, has acquired a factory site of 24 acres of land between the Pennsylvania and Big Four railway systems, and is planning a two-story building, 100 by 300 feet. The officers are: Charles E. Ross, president; H. L. Gilbert, vice-president; C. A. Morrison, treasurer; George E. Caylor, secretary and attorney. The directors include the above and H. E. Fegley and C. A. Waggoner.

* * *

The board of directors of The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio, recently set aside some of the common capital stock of the company for purchase by their employees at par value on the following plan. The stock may be purchased for cash or by deferred monthly payments. When first payment is made, all cash dividends are credited to the subscriber's account as additional payment until the full price has been paid. Provision is made to extend time of payment in cases of unavoidable inability to meet the regularly due installments.

The McGraw company are demonstrating their interest in promoting the welfare of their employees, having recently presented each with individual insurance policies under the industrial group plan. The company has purchased a large tract of land near the factory, with plenty of water facilities, and plans a park for employees' use. Swimming, boating, and fishing facilities will be provided; also athletic fields and a golf course.

THE FOUNDER OF THE MCGRAW COMPANY.

EDWIN C. MCGRAW, founder and president of The McGraw Tire & Rubber Co., East Palestine, and Cleveland, Ohio, is a man of varied business interests, and the industry with which his name is most prominently identified, he established when well past middle life.

EDWIN C. MCGRAW.

Born in Pittsburgh, Pennsylvania, in 1857, and educated there by private tutors, he became a member of the firm of J. A. McGraw Brothers at the age of 23, and while with this concern he was interested successively in brick manufacture, and the hotel and real estate business. In 1908, to start his son, R. W. McGraw, in business, he secured the patent right on what was then known as

the "Vertical Fabric Thread Tire," and contracted with a Dayton, Ohio, concern to manufacture it.

In 1909 he decided to build a tire plant, and selecting East Palestine, Ohio, as a good location, he started with an initial production of eight tires a day. Additional capital and an enlarged plant has brought the product up to 5,000 tires and 6,000 tubes a day. A year ago, the company changed its policy from that of manufacturing popular-priced tires to the production of high-grade tires, and today the fabric and cord tires being turned out carry the 5,000-mile guaranty, and in addition the McGraw solid motor tires command a prominent place in the trade.

In all this progress, Mr. McGraw has been the moving spirit. Though spending the winter months at Miami, Florida, he keeps in close touch with the home office, and by his advice and counsel directs the business. He is a member of the Pittsburgh Athletic Association, is a life-member of the Elks, and is president of the Fidelity Trust and Savings Co., and a director of the Fidelity Trust Co., both of Miami, Florida, where he is also First Commodore of the Biscayne Yacht Club.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE MANUFACTURING RUBBER INDUSTRY of Rhode Island is at present in a quiescent state and marking time, awaiting the resumption of rush conditions which is believed to be inevitable in the replenishing of regular stocks during the reconstructive period. In the meanwhile the larger plants have closed down for repairs, and in some instances to make improvements. The indications on every hand are for an indefinite period of activity following the readjustment of conditions that is now under way. The manufacturers are still handicapped by the shortage of labor, especially skilled workmen, as comparatively few of the men returning from service have yet resumed their former positions in the mills, preferring, at least during the summer months, a continuance of outdoor life.

Notices were posted on May 24 in the Woonsocket Rubber Co.'s plant, the Alice rubber mill at Woonsocket, and the Millville rubber boot mill at Millville, employing 2,500 hands; and in the National India Rubber Co.'s plant at Bristol, employing more than 4,500 operatives, announcing that, effective June 2, these footwear mills would adopt a 48-hour weekly schedule instead of the 54-hour schedule, and that rates of pay would be so readjusted that the help would earn as much wages in the 48 hours as they had been making in the 54.

* * *

The American Wringer Co., Woonsocket, employing more than 700 hands, went on a 48-hour a week schedule on June 2, instead of the 49½ hours that it has been operating on for several months, and wages were readjusted so that the pay of the operatives is not diminished. W. Maxwell Reed, plant manager, has arranged the new schedule into five working days, so as to close the factory on Saturdays and thus allow the operatives a whole holiday. With the resumption on June 2, after the Memorial Day shut-down, the plan also started running nights as well as days to take care of increasing orders.

* * *

A new time schedule has also become operative at the rubber cloth factory of the O'Bannon Corporation at West Barrington, whereby the mill starts at 7 o'clock in the morning instead of a quarter of an hour earlier, the lapse being made up at the end of the work day. A night, as well as a day shift is being operated, double shifts of men are engaged, and the plant is being operated almost continuously.

* * *

The factory of the National India Rubber Co. in Bristol, which was closed for a period of two weeks the latter part of May, resumed operations on June 2. Douglas Morey, who resigned recently as manager of the planning and industrial relations departments at the National Co., has gone to New Haven, as New England manager of the National Thrift Bond Corporation. Lawrence S. Edwards is head of the planning department, and Andrew W. Anthony has taken over the industrial relations department. James P. Murphy, former superintendent at the Narragansett Rubber Co.'s mill at Bristol, has accepted a position with the National Co.

Fire, which threatened the entire shoe division of the National company's plant, broke out on the afternoon of June 19 in the training department of the shoe room, located on the third floor of building No. 3. The sprinkler system flooded the room when the fire started, and the water penetrated through the floor into the stitching room on the second floor, and also into the paper-box-making department on the first floor and the wooden-box factory in the basement. The damage in the stitching and box departments was entirely by water, the stock and machinery being soaked. The shoe division was closed about a week, affecting about 3,000 hands.

A new pump house in addition to the present plant is being erected on the south side of the old pumping station of the National company, at the foot of Church street, to enlarge the salt-water pumping plant. This will greatly facilitate the pumping of salt water from Bristol harbor for cooling purposes.

The management of the National India Rubber Co., at Bristol, has formulated plans for an active campaign of Americanization among its operatives in connection with the general policy of the concern for the general welfare, education and uplift of employees. At the last meeting of the Bristol public school board a proposal was received from the company that a teacher from the school department be assigned to the company's works to conduct a school for five hours a day, five days a week, for 50 weeks in a year, for the purpose of teaching general education with special attention to Americanization. The proposition has been taken under consideration by the school committee.

* * *

Work has been commenced by the Woonsocket Rubber Co.

on a two-story brick building at the Alice Mill plant for the offices of the industrial relation department, which includes the employment and planning departments. The building measures 62 by 21 feet, with a one-story ell that is to be 21 by 10 feet. The second story is to be an assembly hall, where the overseers, forewomen and the various committees of the employees of the concern will meet for business purposes, and also where dances and other social gatherings will be held.

* * *

Twelve salesmen of the United States Rubber Co. arrived at the Alice Mill plant, a subsidiary of the corporation, about the middle of the month to enroll in the Woonsocket division of the training school, which is being established in the principal factories of the corporation throughout the country. After remaining a week, these left and on June 28 another class arrived, the attendance for the second week being about 60. The salesmen were instructed in the construction of all the varieties of the newer types of rubber shoes, and also given an opportunity to become acquainted with every part of the shoe. The starting of the school is to prepare the salesmen for the coming winter campaign.

The first class was entertained at luncheon in the factory restaurant one noon as guests of Henry C. Wagner, factory manager, and Herman Fahrenholz, superintendent, and at the close of the week's session a dinner was given the departing salesmen. The members of the party included F. H. Buckingham and T. H. Furlong, Buffalo, New York; Champ Beaumont and R. B. Carney, Baltimore, Maryland; H. D. Brow and C. O. Braden, Omaha, Nebraska; J. L. Kenham and W. A. Quinn, Boston, Massachusetts; C. J. Milikan and A. Baumgarten, New York City, and B. L. Andrews and M. Melman, Chicago, Illinois.

* * *

Colonel Samuel Pomeroy Colt, chairman of the executive committee, and former president of the United States Rubber Co., started on June 1 for Camp Colt, located at the foot of Mt. Katahdin, Maine, with a party of guests, whom he will entertain at his camp for three weeks, enjoying outdoor life, fishing, hunting, etc. The members of the party included Mr. and Mrs. Edwin A. Barrows, Colonel and Mrs. Harold J. Gross of Providence; Mr. and Mrs. Andrew W. Anthony; Roswell C. Colt of Bristol; Mrs. Florence Miller Beresford, Mrs. Imogene Waldron; Mrs. John W. Bicknell of New York; Countess Eleanor Moroni of New York; Charles B. Seger of New York, president of the United States Rubber Co.; Walter S. Ballou of Providence; Dr. I. Hart Noyes of Providence, and George E. Leighton of Bristol.

* * *

The Narragansett Cotton Mills, Inc., 614 Jackson Building, Providence, with mills at Apponaug, Rhode Island, will start the manufacture of tire fabric as soon as the installation of machinery is completed.

* * *

According to the last report of the Rhode Island factory inspector, dated January, 1919, there are fifteen rubber firms in the state employing 8,630 persons as follows: 4,878 men, 3,276 women, 184 boys under 16 and 292 girls under 16. The sanitary condition of five of these places of business was reported as good, of two very good, and of eight excellent.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

AN INVOLUNTARY PETITION in bankruptcy has been filed in the United States District Court at Trenton against the India Tire & Rubber Co., of New Brunswick, New Jersey, by August C. Streitwolf, of that place, on behalf of three creditors of the concern. Mr. Streitwolf acted for the Rolfe Building Materials Co., the New Brunswick Iron Works, and Anthony Roth, Jr., all of New Brunswick.

Recently the company filed a voluntary petition in bankruptcy, through R. E. Watson, and this action was held by Vice-Chancellor Lane to constitute a contempt of court, as Elgin McBurney had already been named receiver for the concern through proceedings instituted in the Court of Chancery. The voluntary bankruptcy action has since been dismissed. It is now said that the creditors represented by Mr. Streitwolf, including the New Brunswick men and a number in New York City, will seek to handle the affairs of the concern, instead of having them directed through the Chancery Court.

* * *

William J. B. Stokes, head of the Thermoid, Home and Joseph Stokes rubber companies, Trenton, is now acting as chairman of the board of trustees of the big fund being collected for the family of a Trenton policeman who was slain by automobile bandits.

* * *

The Ajax Rubber Co., Inc., Trenton, has caused the arrest of the ringleader of the gang of thieves that recently stole several hundred dollars' worth of tires from its plant. The gang operated in boats along the Delaware & Raritan canal at night. Entrance was gained each time by climbing through a window when the watchman was in another part of the plant. Feet of land along the Reading railroad and are planning to build a new one-story factory on it to take care of increased business.

* * *

Charles W. Carl's Sons, Trenton, New Jersey, manufacturers of steel tables, steel calendar shells, steel stock bins, tire racks, and other specialties for the rubber trade, have acquired 550

* * *

William H. Ivens' Sons are erecting a two-story brick and steel building, 60 by 60 feet, on Beakes street, Trenton, for the manufacture of hard rubber specialties.

* * *

The members of the Trenton Rubber Manufacturers' Association have recently made their annual donation of \$100 to the Trenton Day Nursery.

* * *

The Capitol Tire & Rubber Co., of New York, has opened a salesroom at 103 South Warren street, Trenton.

* * *

W. Bradford Stryker, for nine years connected with the Acme Rubber Manufacturing Co., Trenton, looking after the trade in central New Jersey and eastern Pennsylvania, and who recently returned from overseas, where he was a member of the 303d Battalion, Heavy Tank Corps, has leased a property on East State street and opened a tire and tube establishment. Mr. Stryker will devote his time to the territory he has been covering for the Acme company, while Ralph Hackett will be in charge of the office and store.

* * *

The plant formerly owned by the Diehl Manufacturing Co., in Newark avenue, Elizabeth, New Jersey, and later transferred to the Millitor Corp., of New York, has been purchased by the Overland Rubber Co., a subsidiary of the Willys-Knight interests. The purchase price is reported to be \$265,000. The new owners manufacture rubber goods and automobile tires.

* * *

The Vulcanized Rubber Co., Morrisville, New Jersey, contemplates erecting a modern office building and recreation room and dining-room for the employees. The company recently bought a large plot of ground at Bridge street and Pennsylvania avenue for the purpose of expansion.

* * *

The young people of the Clinton Avenue Baptist Church, Trenton, recently held a novel "rubber social," and the admission was anything in the line of rubber. The rubber articles were donated to the worthy poor.

The girls employed at the new plant of the Semple Rubber Co. on Lambertson street, Trenton, recently held a dinner in the new dining-room at the factory. The Semple company has given the employees permission to give dinners whenever they so desire.

* * *

The Globe Rubber Tire Manufacturing Co., Trenton, has built a small addition to its storehouse. The company has taken out another permit for a one-story building on Prospect street, to cost \$1,000.

* * *

The Brighton Mills, Passaic, New Jersey, manufacturers of tire fabrics and cotton yarns, are having plans prepared for small houses in Allwood, one of the suburbs, and in the issue of its house organ, "Warp and Weft," for June 6, 1919, calls attention to the desirability of these plans for employees who desire to own their own homes. Five illustrations of attractive houses are shown, including several different styles.

* * *

The Broadway Tire Jobbers, Inc., 250 West 54th street, New York City, has received authorization to do business in New Jersey, and has opened an auto tire exchange at 255 Halsey street and a public service tire station at 270 Halsey street, Newark, New Jersey.

PACIFIC COAST NOTES.

By Our Regular Correspondent.

ONE of the most novel events of interest to the tire trade was the tire changing contest recently held at Pomona, one of the thriving suburbs of Los Angeles and Pasadena. The results were as follows:

First, Pomona Tire Co., represented by Elmer N. Rose, using a Diamond tire; prize, Bulletin trophy cup and \$25; time, 5 minutes, 32 seconds. Second, Wurl's Garage, Pomona, represented by Claude Berry, using a Hartford tire; prize, \$15. Third, G. P. Gafford, Upland, represented by Angus McCallum; prize, \$10.

Herold Daig, representing Casa Blanca Garage, Ontario; E. Austin, representing Emil Lindstrand, Monrovia, and J. E. Granger of Granger's Garage, Spadra, were the first three men to finish in the race, but were disqualified by the judges at the end of the contest, when their tires failed to show the 80 pounds pressure.

Working like mad with every nerve tingling, the contestants went through the stunt without a mishap. At each step the excitement on the part of the audience grew more and more intense as the contestants reached the pumping-up stage. When all ten were battling with the back-breaking task of pumping up the tires to the required pressure the enthusiasm reached its limit. In a remarkably short space of time the tasks were finished, when the judges examined the air and decided upon the winners, who were announced by A. V. Storer, secretary of the Citrus Belt Auto Trades Association.

When it is considered that it takes the average person perhaps about 25 minutes to change a tire and pump it up again, the winner's time of 5 minutes and 25 seconds may be considered remarkable. The record in a similar contest held in Oakland in 1917 was 3 minutes and 43 seconds, with 85 pounds as the pressure. The best time in 1919 so far was also made in Oakland, being 4 minutes and 25 seconds at 80 pounds. Another record at the same pressure was made at Stockton in 5 minutes and 10 seconds.

* * *

John Hannerwaas, vice-president of the Pacific Rubber Co., has been discharged from the Navy, where he served as an ensign through the war, and has resumed his duties with the concern in Los Angeles.

Mayor Higgins, of Brawley, in the Imperial Valley, in addition to his political and municipal duties, has accepted the agency for Globe tires in that district, representing the Hawley King Co., of Los Angeles.

* * *

The Bell Rubber Co., of Los Angeles, has started retreading solid tires with a new process, and reports remarkable success. Charles Fleming, vice-president of the concern, says that at least 45 per cent of the cost of a new tire is saved by their method and the guaranty given is the same as that on a new tire, the retreaded product often running as high as 20,000 miles. George T. Bell, president of the concern, has been in Akron, Ohio, looking over the construction of a factory with a capacity for turning out 100 reconstructed tires a day.

* * *

F. A. Seiberling, president of the Goodyear Tire & Rubber Co., Akron, Ohio, who is also president of the Lincoln Highway Association, will be present at the dedication ceremonies of the completion of the 17-mile strip of highway in the desert regions of Utah, which will take place July 20, 1919. The construction was financed by the Goodyear company.

* * *

R. R. Colby, local manager of the Oldfield Tire Co., has received a letter from Mr. Oldfield, stating that he has already closed enough contracts to give the concern \$4,000,000 worth of business this year, and that with contracts yet to come they may run over \$10,000,000.

* * *

William T. Brooks, of Mesa, Arizona, dealer in "Horseshoe" tires for that territory, has been in Los Angeles, the guest of Roy R. Meads, president and general manager of the Pacific Rubber Co., distributor for California and Arizona. Mr. Brooks spent thirteen months in overseas service, and participated in the battles of Chateau-Thierry, St. Mihiel and the Argonne, assisting in the operation of observation balloons.

* * *

F. C. Millhoff, general sales manager of The Miller Rubber Co., of Akron, Ohio, was a recent visitor in Los Angeles. He predicted a larger demand for tires this year, due to the increase in automobilism. His company is making heavy duty tire equipment for motor trucks, and most of the testing of these tires is done in California, where many of the stage lines are equipped with them. Among them are the El Dorado stage line, the delivery trucks of the Bradford Baking Co., the White Bus Line, running from Los Angeles to San Bernardino and intermediate points, and also the Big Bear Mountain stage.

* * *

F. V. Springer, vice-president of the Hewitt Rubber Co., and Charles W. Harris, president of the Hewitt Rubber Co. of California, have been in Los Angeles conferring with J. B. Wood, distributor of Hewitt tires for this territory.

* * *

The Western Wheel Co., on Los Angeles street, has been chosen distributor of Firestone truck tires as well as Firestone rims. This company, which was formerly the Phineas Jones Co., is one of the best-equipped wheel-manufacturing plants in the entire West.

* * *

The B. F. Wade Tire & Rubber Co., which has taken over the distribution of the Knight and the Blackstone fabric tires for Southern California, will henceforth concentrate exclusively on the wholesaling of these lines. The Los Angeles retail business of the company has been purchased by Howard S. Reed, who will continue to conduct it at 512 West Eighth street. Mr. Reed was formerly in the tire business in San Bernardino, giving up his business to enlist in the Navy, where he won a commission as ensign during the war. Fred C. Schweitzer, sales manager, has just returned from seventeen months' service overseas.

Manager Bershon, of the Bershon Tire Co., announces that the Victor Rubber Co., of Springfield, Ohio, will shortly make deliveries of their cord tires, and are starting shipments to the coast.

* * *

Hugo Hoffstaedter, general manager of the Polack Tire & Rubber Co., which is distributed in California and Arizona by the Pacific Rubber Co., was a recent visitor in Los Angeles, calling on distributors and dealers in the district.

* * *

William H. Yule, until recently manager of mechanical sales for The B. F. Goodrich Rubber Co., Akron, Ohio, has resigned and will leave the rubber industry to take charge of an orange and fruit ranch which he has lately purchased near Santa Barbara, California. Mr. Yule has been with the Goodrich company since 1908.

* * *

WILLIAM H. YULE.

The Goodyear Tire & Rubber Co., 104 North 14th street, Portland, Oregon, is building a second story addition to its present building, giving 10,000 square feet of additional floor space, the building being 50 by 200 feet. This is a branch of The Goodyear Tire & Rubber Co., Akron, Ohio, and has no connection with the Goodyear Rubber Co., 67 Fourth street, Portland, Oregon, with which, through the similarity in names, it is sometimes confused.

* * *

The Western Rubber Co., 521 West 8th street, Los Angeles, California, manufacturer of tires and tubes, has changed its name to the Bradstreet Rubber Co.

* * *

E. H. Trader, sales manager of The American Rubber & Tire Co., Akron, Ohio, has left on a trip through the West, intending to spend the greater part of the summer with the distributors of American-Akron products in Los Angeles, San Francisco, and Seattle. On his way out he will stop in Denver and will return by way of Canada.

* * *

The New Jersey Zinc Co., New York City, has established warehouses in San Francisco and Los Angeles, and will hereafter distribute its zinc oxide, lithopone, and other products to the Pacific Coast trade from these centers.

THE SOUTHWEST COTTON INDUSTRY

That Southern California is destined to be the outlet for the rapidly growing cotton industry of Arizona and the Imperial Valley is evident from the significant business developments in that direction. A \$100,000 cotton-buying company, with its full capitalization paid up, has been incorporated in Los Angeles, having connections with most of the important cotton buyers in the South and East. K. M. Turner, of New York, is president; H. M. Fraser, of New York, and Richard A. Fanto, of San Francisco, are vice-presidents; J. Robinson, of New York, is treasurer, and G. C. Dennis, a Los Angeles attorney, is secretary. The new firm is known as Turner, Kuhn, Frazier, Inc. According to Mr. Dennis, the company has already made market connections with all the big cotton-buying centers of the world, and plans to make Los Angeles the concentration point for all the cotton shipping in the Southwest, its idea being that baled cotton should go to eastern and foreign markets by boat from Los Angeles harbor, after being transported here by rail.

A new cotton compress is to be erected at Los Angeles harbor and has been authorized by the city council, the Harbor Commission being instructed to enter into a contract for the installation of the plant at a cost not to exceed \$80,000. It will be

operated by the Harbor Commission as a public utility. Traffic Manager Matson of the commission says:

With a high density compress located at this port, not only will Southern California cotton for export to the Orient be brought here, but also that which goes to Europe at present through Galveston move this way.

Local interests have filed with the United States Railroad Administration an application for a concentration rate so that Los Angeles will be made a point of concentration for cotton shipments. I have taken up with the Railroad administration the subject of adjusting export rates on cotton from the Texas cotton belt.

I am also in receipt of information from L. M. Fowler & Co., that several hundred thousand bales of Texas cotton, in addition to that of Southern California and Arizona, already are in sight for moving through this port the coming season, providing a high density compress is installed in time.

DUOPLEX CUSHION TIRE IN CALIFORNIA.

The National Auto Wheels Corp., Wausau, Wisconsin, will begin, on September 1, the construction of another factory near Los Angeles, California. The company manufactures wheels of a new type that are claimed to be practicable and will do away with pneumatic tires.

The outer part of the wheel is a non-skid resilient cushion tire mounted on a metal rim and guaranteed for 20,000 miles. The rim fits over a rubber cushion, inserted between the felloe and rim, and is guaranteed for the life of the car. It is con-

CROSS SECTION.

TRANSVERSE SECTION.

structed to give the utmost resiliency and absorb all shocks and rebound. It is protected on both sides by steel channels, and is insurance against crystallization.

The manufacturers claim 150 per cent saving in tire expense during the life of the car. While the initial expense in equipping a car with these wheels is greater than that of pneumatic tires, it is declared that ultimately the economy of the device will be demonstrated.

EAGLE-PICHER BUYS INTEREST IN MIDLAND CHEMICAL.

The Eagle-Picher Lead Co., Chicago, Illinois, has acquired an interest in the Midland Chemical Co., of the same city, manufacturer of "Sterling" lithopone. The offices of the Midland company will be removed to adjoin those of the Eagle-Picher company in the Continental & Commercial National Bank Building. The new board of directors of the Midland company is as follows: O. S. Picher, president; W. T. Sheffield, vice-president and secretary; T. S. Brown, Jr., treasurer; A. W. Ayer, superintendent; and H. G. Clopper. A sketch of Mr. Clopper appeared in THE INDIA RUBBER WORLD, June 1, 1919.

The General Asbestos & Rubber Co., Charleston, South Carolina, manufacturer of asbestos brake lining, steam packing, asbestos textiles, etc., are installing a power plant, which is being erected by Lockwood, Greene & Co., Atlanta, Georgia.

RUBBER FROM SAGE BRUSH AND GREASEWOOD.

CONGRESSMAN JOHN E. RAKER of California has introduced a bill in the House of Representatives for an appropriation of \$5,000 "for the investigation and study of methods and testing sage brush and greasewood, which may be used for producing rubber, alcohol and acetic acid, including their utilization." This bill is, in effect, the same as one introduced by Mr. Raker during the 1913 session of Congress but which did not get beyond the committee to which it was referred. The present bill has been referred to the Committee on Agriculture, and ordered to be printed, and is designated as Bill H. R. 1129.

Mention might be made in this connection of the investigations now in progress or recently completed, bearing on the subject of producing rubber from plants growing in the Western and Pacific States, which have been described at some length in THE INDIA RUBBER WORLD. The work of Professors H. M. Hall and Thomas H. Goodspeed is reported in the issue of June 1, 1918, naming plants containing from 2 to 10 per cent of rubber, notably the Giant Rabbit Bush (*Chrysothamnus*) and the Dwarf Rabbit Bush (*Ericameria*).

In the April 1, 1919, issue of THE INDIA RUBBER WORLD, Professor Hall is reported as saying, after further investigation of this subject, that the total amount of wild shrub in California with a rubber content is "so great that it is safe to say that there is enough rubber present to constitute an emergency supply in case we ever get into a war in which our importation would be curtailed, but the extraction of this would be an expensive process, since the average content for the whole West is probably not more than 2½ per cent, and even in the best districts it will not be more than 4 or 5 per cent on the average."

This investigation has proved the existence of over 70 species of rubber-producing plants growing in California, and Professor Jones, who is assisting Professor Hall, is extending his investigations over Utah, Nevada, Idaho, Wyoming and Colorado. Professor Hall describes as the most interesting the *Chrysothamnus nansous*, or "Common Green," which produces a rubber said to be superior to that from the guayule plant of Mexico. Ten or fifteen years ago endeavors were made to exploit commercially the *Picradenia floribunda utilis*, or "greasewood" of Colorado, but the result was not encouraging. However, the subject of a native rubber supply grown in the United States is one worthy of still further investigation, and the result of Mr. Raker's resolution will be watched with interest.

CONNECTICUT NOTES.

The Kelly-Springfield Tire Co., New York City, is represented in Connecticut by G. G. Winsor, who is general supervisor of the depots at New Haven, Hartford, and Bridgeport. A. C. Peoble has charge of the New Haven district and H. A. Goodale of the trade in New Haven, with headquarters at 88 College street and a service station at 274 Crown street. In Hartford, at 41-45 High street, C. C. Chaffee is in charge of the district and W. H. Lacey of the city trade. In Bridgeport, at 359 Fairfield avenue, George A. Davidson is in charge of the district and R. L. Whittington of the city trade.

The Hartford Rubber Works' Co., Hartford, Connecticut, a subsidiary of the United States Rubber Co., has elected the following officers: C. B. Whittlesey, president; E. Hopkinson, vice-president; J. P. Krogh, treasurer, and J. D. Carberry, secretary.

The McMinn Tire Co., Inc., has been formed in Bridgeport, Connecticut, by Stanley P. McMinn and Harold F. Blanchard, formerly on the "Motor World," associated with George P. McMinn, until recently superintendent of the Detroit, Michigan, plant of the Barrett Co. Headquarters are at 629 Fairfield avenue, and the officers are: S. P. McMinn, president; H. F. Blanchard, vice-president, and George McMinn, secretary-treasurer.

The Economic Revolution in British Rubber Factories.

THE BRITISH have a reputation for meeting emergencies coolly and solving problems sensibly. During the darkest days of the war they considered the after-peace development of industry and decided that war losses must be made up by hard work, and that capital and labor should work happily together. It was realized that both the volume and quality of output would have to be increased through the active co-operation of labor and capital to raise the general level of productive capacity and efficiency, to maintain a high standard of workmanship and to improve working conditions. Organization must be improved, a better spirit created, and all friction and waste eliminated, and it was agreed that labor, as a party to industry, should have a voice in matters directly concerning its special interests, such as wage rates and conditions of employment.

Machinery was then created for securing united action in the pursuit of common ends and for adjusting points involving competing interests, the organization being powerful enough to insure the acceptance of its decisions with confidence by both sides; with the knowledge that they would be generally adopted.

As a result, every organized branch of British labor is being invited by the Government to participate in industrial management, and every employer's organization is being asked to take organized labor into partnership. British labor wants shorter hours, higher wages, better working and housing conditions, but more important than these it wants a share in indus-

trial management, and it is getting it with the full consent and cooperation of employers.

At the head of the new system of industrial government which is being developed in England there is a permanent council or parliament, composed of an equal number of representatives of the workers and of the employers, which literally makes laws for British industry. In each trade there is a national council comprising an equal number of representatives of employers and employees, while in each section of the country there is a district council and in each shop, factory or mine there is a workers committee made up in the same way.

Thus the British working-man and woman is getting a share in management and a real copartnership between capital and labor is being effected. The present system is by no means perfect, but it provides a basis of development and in bringing about a peaceful economic revolution has probably avoided a revolution of violence such as now threatens France. Thinking men believe it will bring greater prosperity to the British people as a whole, mitigate the labor situation and effect no damage to other than profiteering interests.

The objects, functions and constitutions of the National Joint Industrial Council of the Rubber Manufacturing Industry, and its district councils and works committees, which follow, are typical of the organizations being effected in various other industries.

THE NATIONAL JOINT INDUSTRIAL COUNCIL OF THE RUBBER MANUFACTURING INDUSTRY

Constitution Adopted at the First Meeting of the Council, Held at Montagu House, Whitehall, London, July 16, 1918.

OBJECTS.

To secure the largest possible measure of joint action between employers and workpeople for the safeguarding and development of the rubber manufacturing industry as a part of national life and for the improvement of the conditions of all engaged in that industry.

It will be open to the Council to take any action that falls within the scope of its general object. Among its more specific objects will be the following:

1. The consideration of the proposals for District Councils and Works Committees as put forward in the Whitley Report, having regard in each case to any such organizations as may already be in existence.
2. The consideration and adoption of measures for securing the inclusion of all employers and operatives in their respective organizations, and for securing the loyal observance by them of collective agreements.
3. Regular consideration of wages, hours, and working conditions in the industry as a whole.
4. The consideration of the existing machinery for the settlement of differences between different parties and sections in the industry, and the establishment of machinery for this purpose where it does not already exist.
5. The consideration of measures for securing maximum production and regular employment.
6. The encouragement of research and invention, with a view to perfecting the products of the industry.
7. The adequate safeguarding of the rights of operatives inventing or designing improvements.
8. Inquiries into special problems of the industry, including the comparative study of the statistics, organization and methods of the industry in this and other countries, and, where desirable, the publication of reports.
9. The improvement in conditions, with a view to removing danger to health in the industry, and the provision of special treatment, where necessary, for workers in the industry.
10. The supervision of entry into, and training for the industry, and co-operation with the educational authorities in arranging education in all branches for the industry.
11. Cooperation with the industrial councils of other industries to deal with problems common to them and the rubber manufacturing industry.

12. Representation of the needs and opinions of the industry to government departments and other authorities.

13. The consideration of any other matters that may be referred to it by government departments or other authorities.

CONSTITUTION.

MEMBERSHIP.

The Council shall consist of twelve representatives of the employers and twelve representatives of the operatives, appointed by the following organizations:

ASSOCIATIONS OF EMPLOYERS.

India Rubber Manufacturers' Association, Limited.	} Twelve representatives.
British Rubber Tyre Manufacturers' Association Limited	
Rubber Shoe Manufacturers' Association.....	

TRADE UNIONS.

Amalgamated Society of India Rubber, Cable, and Asbestos Workers	Four representatives.
National Amalgamated Union of Labour.....	Two representatives.
National Union of General Workers.....	Two representatives.
Workers' Union	Two representatives.
Amalgamated Society of Gas, Municipal and General Workers	One representative.
Waterproof Garment Workers' Trade Union.....	One representative.
Total	Twelve representatives.

REAPPOINTMENT.

One-third of the representatives of the said association and unions shall retire annually and shall be eligible for reappointment. Members of the Council shall retire at the end of the first and second year in an order to be determined by lot, and thereafter on the expiration of three years' membership.

COMMITTEES.

The Council may appoint such committees for special purposes as it may consider necessary, and define their powers.

CO-OPTED MEMBERS.

The Council shall have the power of appointing on committees or allowing committees to co-opt such persons of special knowledge not being mem-

bers of the Council as may serve the special purposes of the Council, provided that on such committees—

- (a) The two sides of the Council shall be equally represented, and
- (b) Any appointed or co-opted members shall serve only in a consultative capacity.

OFFICERS.

The officers shall consist of a chairman, a vice-chairman, a secretary or secretaries, and a treasurer or treasurers.

When the chairman is a representative of the operatives, the vice-chairman shall be a representative of the employers, and *vice versa*. The chairman (or, in his absence, the vice-chairman) shall preside at all meetings, and shall have a vote, but not a casting vote.

The Council shall be empowered to appoint and maintain a secretary or secretaries, and such clerical staff as it may think fit. It shall be empowered to pay them such remuneration as it may think fit.

All honorary officers shall be elected by the council at its annual meeting for a term of one year, and, subject to the condition that chairman or vice-chairman from the employers' side shall be succeeded by a representative from the operatives' side, shall be eligible for reelection.

MEETINGS OF THE COUNCIL.

The ordinary meetings of the Council shall be held as often as necessary and not less than once a quarter. The meeting in July of each year shall be the annual meeting. A special meeting shall be called on the requisition of six members of the Council. Seven days' notice of such meeting shall be given, and the business of the meeting stated in the notice.

VOTING.

The voting shall be by show of hands, or otherwise, as the Council may determine. No resolution shall be regarded as carried unless it has been approved by a majority of the members present on each side of the Council.

QUORUM.

Seven members from each side shall constitute a quorum of the Council.

FINANCE.

The expenses of the Council shall be met by the two sides of the Council in equal proportions.

Areas, Functions, and Constitution of District Councils, Adopted by the National Council at a Meeting Held at Montagu House, Whitehall, London, September 25, 1918.

AREAS OF DISTRICT COUNCILS.

- | | |
|--|----------------------------|
| 1. London District | 4. Lancashire and District |
| 2. West of England. | 5. Edinburgh District. |
| 3. Birmingham and the Midlands District. | 6. Glasgow District. |

FUNCTIONS OF DISTRICT COUNCILS.

The main functions of the District Councils shall be as follows:

1. The consideration of any matters that may be referred to them by the National Joint Industrial Council, and executive action within their district in connection with decisions arrived at, and matters deputed to them by the National Council.

2. To make recommendations to the National Joint Industrial Council on any matters affecting the well-being of the industry as a whole.

3. To take executive action within their respective districts in connection with matters of purely local interest, including matters referred to them by works committees, subject to the right of the National Council to require notice of all decisions, as per Clause 10 hereof, and, within ten days, to veto any such action if it be found to involve the interests of other districts. The secretaries of the National Council shall communicate to the District Councils within seven days from the receipt of the minutes, as required by Clause 10 hereof, as to whether in the opinion of the officers of the National Council such action involves the interests of other districts, and a final decision must be made by the National Council within a further fourteen days. If the National Council do not exercise their right to veto any particular action of the District Councils, such decisions shall come into operation retrospectively from the date of the decision by the District Councils.

4. Cooperation with the District Councils for other industries to deal with problems of common interest.

5. Where no adequate machinery exists for the settlement of differences between parties and sections of the industry, such differences as cannot be settled within an individual factory or workshop shall be referred to the District Council, and failing a settlement by the District Council, such differences shall be referred to the National Council.

CONSTITUTION OF A DISTRICT COUNCIL.

6. MEMBERSHIP.

The Council shall consist of ——— members, appointed as to one half by associations of employers, and as to the other half by the trade unions. The unions shall be represented on District Councils in the proportion of their members employed at the associated firms in the respective areas. At least one member from each side of the National Council shall be members of the District Council in their area.

Associations of Employers.

No. of Representatives.

7. REAPPOINTMENT.

The representatives of the said associations and trade unions shall retire annually, and shall be eligible for reappointment by their respective asso-

The following named men constitute the employers' representatives:

FOR THE INDIA RUBBER MANUFACTURERS' ASSOCIATION, LIMITED.

P. A. Birley, Chas. Macintosh & Co., Limited, Manchester.

Hugh C. Coles, Wm. Warne & Co., Limited, London.

J. T. Goudie, The Leyland & Birmingham Rubber Co., Limited, Leyland, chairman.

E. Healey, W. & A. Bates, Limited, Leicester.

Sir G. Charles Mandelberg, J. Mandelberg & Co., Limited, Albion Waterproofing Works, Manchester.

Stuart A. Russell, The India Rubber, Gutta Percha & Telegraph Works Co., Limited, Hertford, London.

William F. Wilson, The India Rubber Manufacturers' Association, Limited, Manchester, joint secretary.

FOR THE BRITISH RUBBER TYRE MANUFACTURERS' ASSOCIATION,

F. C. Baisley, The Dunlop Rubber Co., Limited, Aston Cross, Birmingham.

F. W. Hinde, The Avon India Rubber Co., Limited, Melksham, Wilts.

Alexander Johnston, The North British Rubber Co., Limited, Castle Mills, Edinburgh.

R. H. Mallett, The Beldam Tyre Co., Limited, London.

FOR THE RUBBER SHOE MANUFACTURERS' ASSOCIATION.

The Hon. F. H. Hamilton Smith, The New Liverpool Rubber Co., Limited, Rice Lane, Walton, Liverpool.

A like number of operatives represent the Amalgamated Society of India Rubber, Cable and Asbestos Workers, National Amalgamated Union of Labour, National Union of General Workers, Workers' Union, Amalgamated Society of Gas, Municipal and General Workers and the Waterproof Garment Workers' Trade Union.

ciations and trade unions. Casual vacancies shall be filled by the organization concerned, which shall appoint a member to sit until the end of the current year.

8. COMMITTEES.

The District Council may delegate special powers to any committee it appoints. The reports of all committees shall be submitted to the District Council for confirmation, except where special powers have been delegated to the Committee, and the District Council shall have power to appoint on committees or allow committees to co-opt such persons of special knowledge, not being members of the District Council, as may serve the special purposes of the Council, provided that on such committees:

- (a) The two sides of the Council shall be equally represented, and

- (b) Any appointed or co-opted members shall serve only in a consultative capacity.

9. OFFICERS.

The officers shall consist of a chairman, a vice-chairman, a secretary or secretaries and a treasurer or treasurers.

When a chairman is a representative of the operatives, the vice-chairman shall be a representative of the employers, and *vice versa*. The chairman (or, in his absence, the vice-chairman) shall preside at all meetings, and shall have a vote, but not a casting vote.

The District Council shall be empowered to appoint and maintain a secretary or secretaries, and such clerical staff as it may think fit. It shall be empowered to pay them such remuneration as it may think fit. All honorary officers shall be elected by the council at its annual meeting for a term of one year, and, subject to the condition that a chairman or vice-chairman from the employers' side shall be succeeded by a representative from the operatives' side, shall be eligible for reelection.

10. MEETINGS OF THE DISTRICT COUNCIL.

The ordinary meetings of the District Council shall be held as often as necessary and not less than once a quarter. The meeting in the month of May shall be the annual meeting. A special meeting of the District Council shall be called within seven days of the receipt of a requisition from one-third of the members of the District Council, with a minimum of two. The matters to be discussed at such meetings shall be stated upon the notice summoning the meeting.

Copies of the minutes of all meetings of District Councils shall be forwarded to each member of the National Council within one week of the meeting.

11. VOTING.

The voting, both in District Council and in the committees thereof, shall be by show of hands or otherwise as the District Council may determine. No resolution shall be regarded as carried unless it has been approved by a majority of members present on each side of the District Council.

12. QUORUM.

The quorum shall be a majority of the members on each side of the District Council.

13. FINANCE.

The expenses of the District Council shall be met by the two sides of the Council in equal proportions.

14. RELATION OF DISTRICT COUNCILS TO THE NATIONAL INDUSTRIAL COUNCIL AND TO THE GOVERNMENT.

The functions and constitutions of District Councils shall be submitted to the National Council for their approval.

No communications shall be addressed to government departments by District Councils, but must be forwarded through the National Industrial Council.

WORKS COMMITTEES.

Objects, Functions and Constitution of Works Committees, as adopted by the National Council at a Meeting Held at 16 Deansgate, Manchester, on November 27, 1918.

THE ——— COMPANY, LIMITED.

WORKS.

OBJECTS, FUNCTIONS AND CONSTITUTION OF WORKS COMMITTEES.

OBJECTS.

1. The objects of the Committee are:
 - (a) To provide a recognized channel of communication between the employees and the firm, in order to secure the largest possible measure of joint action between them in any matters relating to the welfare of the workers, and to the general advancement of the business and the employees as a whole.
 - (b) To consider any matters that may be referred to it either by the management or by the employees of the works.
 - (c) To present to the firm through the Committee any suggestion which, after full consideration, it is decided should be put forward.

FUNCTIONS.

2. The functions of the Committee shall be purely advisory or consultative, the intention being that by discussion of matters between employees and the management a mutually satisfactory conclusion may be reached in respect of questions discussed.

Amongst other suitable matters for discussion may be quoted the following:

1. Welfare and social subjects.
2. Suggestions.
3. Working hours.
4. Regularity of employment.
5. Output.
6. Improvements in methods and machinery.
7. Discipline.
8. Grievances.
9. Disputes.

CONSTITUTION.

3. The committee shall be a joint committee consisting of not more than twelve representatives of the management and, unless otherwise agreed by the parties, not more than twelve representatives of the employees engaged in one or other of the manufacturing operations of the india rubber trade. The employees' side of the Committee shall be elected by ballot by constituencies into which the works are divided as shown in the particulars contained in Part II, and according to the rules therein mentioned. The representation shall be based on the principle that all departments shall be directly represented according to their importance, the smaller departments being grouped in such a way that their interests can be properly looked after by one representative.

4. No one shall be eligible for membership of the Committee who is under 21 years of age and who is not actually working in the factory and who has not a service qualification of one year with the firm and three years in the industry, unless with the consent of the management.

5. The representatives of the management on the Committee shall be appointed by the firm.

6. The period for which employee members shall hold office shall be twelve months, ending on the ——— day of ——— in each year, and the appointment and period of office of management members shall be at the discretion of the firm.

7. Women shall be entitled to election on the Committee as provided for in Part II hereof.

8. In cases where a member of the Committee leaves the employment of the firm, such member, shall thereupon cease to be a member of the Committee. Casual vacancies may be filled either by ballot or otherwise as the Committee may determine.

OFFICERS.

9. The officers shall consist of a chairman, who shall be nominated by the firm, and two secretaries, one appointed by the management, and the other by the operative members of the Committee.

MEETINGS.

10. The Committee shall meet once a month, at a date and time to be fixed by the firm, but extra meetings may be held when necessary on the requisition of four members, who shall state the special object for which the meeting is to be held.

11. The employee members shall be paid for the time occupied at meetings on the basis of the sum lost by them through their absence from work.

12. Meetings shall take place at the works, and may be summoned informally by verbal notice to the members.

13. The presence of one half of the members from each side of the Committee shall be necessary to form a quorum.

14. An agenda shall be prepared by the secretaries for all meetings, and items may be included by either or both sides of the Committee.

15. No delegate shall bring forward a complaint at a meeting unless it has first been ascertained that the same has been referred for settlement through the ordinary channels.

16. Any matter which it is desired to bring forward for discussion at the regular monthly meeting should be notified to the Secretaries at least three days before the date of the meeting.

17. No recommendation shall be regarded as made, or resolution passed, unless it is approved by a majority on each side of the Committee.

18. Regular minutes shall be kept of the proceedings at meetings of the Committee.

CONNECTION WITH DISTRICT AND NATIONAL COUNCILS.

19. The Works Committee may by resolution decide what matters shall be referred to the District Council for decision.

20. The Works Committee may not deal with wages questions or other matters which would affect the district as a whole unless with the consent of the District Council.

21. The Works Committee shall respect any decisions of the National Joint Industrial Council of the Rubber Manufacturing Industry and the District Council thereof as to the functions and work which may be properly undertaken by the Works Committee.

FINANCE.

22. The expenses of the Committee shall be borne by the Firm.

PART II.

REGULATIONS REGARDING BALLOTING FOR OPERATIVES' REPRESENTATIVES.

1. Elections of operatives' representatives on the Committee shall be held in the month of ——— in each year.

2. Any of the operatives in a department fulfilling the service qualification may be nominated for election, provided a nomination form signed by three employees entitled to vote is lodged with the returning officer not later than 14 clear days before the date fixed for the election.

3. A serving member of the Committee shall be eligible for reelection.

4. The form of nomination shall be as follows:

To the Returning Officer for Election of Works Committee.

We, the undersigned employees in the ——— department, and entitled to vote, hereby nominate ——— for election to the Works Committee as representative of No. ——— constituency.

5. The returning officer and counters shall be appointed by the management for the first election, and thereafter by the Works Committee.

6. A register of operatives, having at least one month's service with the firm as the period entitling them to vote, shall be settled as soon as possible, and at least one month before the first committee is appointed, and may be amended from time to time by the inclusion of new employees and the deletion of names of operatives left or deceased.

7. The ballot shall be secret, and numbered balloting papers, giving the names of those nominated, shall be issued to voting operatives.

8. No canvassing shall be allowed in the works, and balloting papers will be collected in the departments by the returning officer or his assistants.

9. The certificate of the returning officer as to the members elected shall be final.

10. The regulations contained in this section (Part II) as to the arrangements and balloting may be amended by resolution of the committee, subject to the approval of the District and National Councils.

11. The following is a specimen scheme for the division of the Works into constituencies, showing the allocation of representatives. Each firm will draw up a list to meet its own particular conditions.

DIVISION OF WORKS INTO CONSTITUENCIES.

Departments.	Representatives	
	Male.	Female.

10	1	1
11	1	1
12	1	1

These councils and committees of the rubber and allied industries aim to solve the problems of industry by agreement. They plan to adjust the hours of work instead of striking or resorting to Parliamentary legislation; they specify wage rates instead of fighting for them; they standardize products, eliminating wasteful competition, cooperating in selling, and helping to link together all the industries of the country into a great national business for the common good.

This new democracy of British business is laying the foundation for an industrial nation far greater than Germany could ever hope to build up through government subsidies, for the coming power of British industry lies in the cordial relations developing between capital and labor. As Arthur Henderson, secretary of the British Labor Party, aptly puts it, labor and capital in England have recognized themselves as the "trustees of industry."

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

TRADE RESTRICTIONS.

MOVEMENTS with regard to restrictions on trade are now becoming more general and no doubt those which particularly interest the readers of this paper are well known to them before this correspondence appears in print. Of special interest was the announcement on May 14 that all restrictions on the import of rubber goods were taken off and that tires and rubber boots could be imported to the extent of 50 per cent of the 1913 import. As the great rush of American tires was in 1915 and 1916, the present concession does not amount to so very much for America, but more for France, as her chief tire factories are situated in the non-invaded area. The proofing branch of the trade is quite indifferent as to the removal of import restrictions, especially with regard to America.

While on this point I may say that I was discussing the relative importance of British and American proofing works the other day with a certain patentee. He said that he had been surprised to learn how much more important both in size and output the British works are as compared with the American. He was, I may say, new to the trade, but he had imagined that the reverse was the case.

Restrictions still hold on dress preservers which have come to us largely from America, although British firms seem to be very chary in risking capital in the necessary plant to enable them to compete successfully with America. It is pointed out that the rubber plate hitherto made only in America and Germany accounts for only one-tenth of the cost of the finished article. The unrestricted imports of vulcanite goods will hardly suit those rubber manufacturers who have laid themselves out for this branch during the last four years. The general idea seems to be that practically all our vulcanite goods in the past came from Germany, but certain buyers say that much has always come from America and that America is quite Germany's equal as regards quality. A recent feature of our trade has been the manufacture of small articles like pipe mouth-pieces and magnets by firms who used to get the goods from Germany and found that British rubber firms would do the business only at too high a price. Moreover, in many cases the quality was unsatisfactory. It will be interesting to see whether these makers of vulcanite mainly for their use continue to supply their own requirements or revert to buying the imported goods.

Now that restrictions are off, buyers of American reclaimed rubber can now get brands which have been almost unobtainable for more than two years. It cannot be said, however, that business is very brisk, as regards reclaims, though the extensions in progress at our largest works indicate that the future is looked forward to with confidence.

W. T. GLOVER & CO., LIMITED.

At the annual meeting of this Manchester cable-making concern on May 12, the important announcement was made by the chairman, A. L. Ormerod, that arrangements had been made by Vicker's Limited, the well-known armament firm of Sheffield and Barrow-in-Furness, to acquire a controlling interest in the company. The terms to be paid by Vicker's are 17s. 6d. for every £1 preference share, the market quotation, and five ordinary Vicker's shares for every four ordinary £1 Glover's shares. The chairman regarded the deal as being eminently satisfactory to the shareholders of Glover's. This is by no means Vicker's first absorption or amalgamation, in view of after-war enterprise, two or three other important deals of the kind having already been put through.

It was pointed out by the chairman that Vicker's ordinary

shares had a dividend of 12½ per cent while Glover's had never exceeded 7½ per cent, this being the dividend for 1918, viz., 5 per cent plus 2½ per cent bonus, all tax free. It is understood that no change will take place in the management and that the works will continue their usual routine.

THE REVIVAL OF SPORTS.

The sporting goods branch of the trade, which was very badly hit by the war, is now having a good time, as cricket, lawn tennis, etc., have come again into their own. Players, however, are finding their expenses much increased, as not only are club subscriptions generally increased, but all accessories have gone up. For instance, lawn-tennis balls of match quality are now retailed at 2 shillings each, the great rise being due to the cost of labor and the felt cover. Some surprise has been expressed at the golf ball being still at its pre-war price, but this is not so much concerned with labor and there is no textile present; moreover, I believe I am right in saying that you can use last year's stock. In some cases the lawn-tennis balls are turned out finished by the rubber works; in other cases the large dealers in sporting goods buy the uncovered balls and put on the felt or melton cover to which a pure rubber coat has been applied by some rubber works in the piece. This is the procedure with the recognized tournament balls.

MANDLEBERG'S IMPROVEMENTS IN THE TREATMENT OF BALLOON FABRIC.

Two patents have recently been taken out by J. H. Mandleberg and J. Mandleberg & Co., Limited, with this object, one claiming the impregnation of the fabric with petroleum jelly, and the other giving the details of the impermeable rubber mixing which is applied to the impregnated fabric. The detailed account of the rubber mixing is interesting, mainly because it forms somewhat unusual subject matter for a patent, such details usually being kept as what is known as a secret process. It is stated in the patent that the invention provides an improved composition mainly consisting of india rubber for impregnating and coating balloon fabrics imparting a higher degree of impermeability relatively to the weight of the composition per unit of area treated than the composition hitherto employed for the said purpose, so that for any predetermined degree of impermeability a fabric or material treated with the improved composition will be of less weight than similar material treated with known compositions. The composition comprises india rubber, the nerve of which is completely destroyed, wax, litharge and sulphur in specified proportions.

With regard to this, it seems to me that there must be great difficulty in knowing what mixings or formula have been used by the various manufacturers of balloon fabric. It may be that the patentees have examined all other makes and proved the absence of wax and litharge either jointly or separately, though it would be impossible to testify to the number of coats put on, the exact quality of the rubber, the precise physical condition of the sulphur and so on. For these reasons it has always seemed to me to be a very difficult thing to protect a rubber formula—that is in the way of proving.

Interesting points about the details given are the exclusive use of fine, hard Pará, and the use of precipitated sulphur, an article which dealers have always found it very difficult to sell to the trade. As regards solvents, the use is advocated of a solvent having a low boiling point, such as very pure coal-tar naphtha or benzene. It is somewhat curious to find these two products lumped together, as there is considerable difference between their respective boiling points and it is rare to find

them satisfactorily employed for the same purpose in spreading. As many as 16 coats are given to the fabric to obtain the best result and vulcanization is effected in steam at 285 to 295 degrees F. for $1\frac{1}{2}$ to 2 hours, with $\frac{1}{4}$ -hour rise, the high temperature having, it is stated, very beneficial results in the impermeability of the fabric.

At the annual meeting of the firm, held on May 2, the chairman, Sir Charles Mandelberg, gave some interesting references to the war-time activities of the firm.

The subject of gas-mask material had been investigated, he said, in their laboratory and a large amount supplied to the Government. With regard to airship fabrics also, special investigation had been carried out, this material having been made in large quantities as well as airship envelopes and complete kite balloons. The profits for 1918 were £91,089, which, with the last substantial carry forward allowed a dividend and bonus of $22\frac{1}{2}$ per cent in the ordinary shares, the sum of £82,772 being carried forward. Speaking of the future, the chairman, like many others in a similar position, referred to the present demands of labor and the influence that increased working expenses cannot fail to have upon our capacity to compete in the export trade.

A HUGE NEW CALENDER.

David Bridge & Co., Limited, of Castleton, Manchester, has made recently to the order of a well-known firm of rubber manufacturers, a large motor-driven three-roll universal calender. The size is remarkable, as it weighs 65 tons, the center roll being $9\frac{1}{2}$ tons, while the top and bottom are $8\frac{1}{2}$ tons. It runs at the rate of $2\frac{1}{2}$ yards per minute.

The special gearing of the machine allows of the following effects being produced:

1. All the rolls can be run at even speed.
 2. The bottom and middle rolls can be run at friction speed while the top and middle rolls remain at even speed.
 3. The bottom and middle rolls can be run at even speed while the top and middle run at friction speed.
 4. Both the top and bottom rolls can be run at friction speed.
- The rolls, which are 30 inches in diameter, are made of deep chilled cast iron.

HOOLEY HILL RUBBER & CHEMICAL CO.

In connection with the disastrous explosion which took place in June, 1917, at this factory in the Manchester district, litigation has been in progress with the insurance companies, which were willing to pay for the damage caused by the fire which broke out, but not for the further damage done by the subsequent explosion of dangerous material being made for the Government. The arbitrator gave judgment in favor of the insurance companies, but stated a case for the High Court which upheld his judgment. The Hooley Hill company, therefore, gets £12,740 instead of double that amount. The wrecked building was one which had been specially fitted up for Government work and was not the main building connected with the ordinary trade of the company.

INFLAMMABILITY OF CARBON BLACK.

The article on this subject in the May issue of THE INDIA RUBBER WORLD, is of interest as dealing with a topic that is little understood in rubber work, i. e., the danger of explosion when the atmosphere of a room is heavily laden with fine particles of a combustible substance. I find that possible danger from this source is very rarely apprehended. Similar tests with regard to the propagation of flame in such dusts have been carried out in our special testing stations in connection with colliery explosions, though I have not seen any reference to them in rubber journalism. From the article quoted, carbon black does not seem to be particularly dangerous and now that methods of working it which obviate the production of a dusty atmosphere are known, there seems no reason to apprehend anything disastrous in the rubber-mixing room.

BASEBALL IN ENGLAND.

Baseball teams have been organized at various centers where Americans are now in residence, notably the Universities of Cambridge, Dublin, Manchester and Birmingham, and so the public is getting an insight into the game which is generally described by the non-expert as a combination of cricket and rounders. I had an opportunity recently of witnessing my first game, a contest between Manchester and Birmingham Universities, and shall now take more interest in the accounts which appear from time to time in THE INDIA RUBBER WORLD of matches at summer outings. In the match in question Manchester won by 23 runs to nil, but the one-sidedness of the game did not matter to the audience, which had no idea what the score was. The applause was concentrated on feats most closely resembling those of cricket, such as catching the ball in the long field and hits out of the ground. Whether you understand the game or not it is certainly interesting and exciting to watch. It was a thoughtful act of the management to provide each of those who paid for admission with a small pamphlet containing a diagram and description of the game. Though I could not read the letter and watch the game at the same time, I elected to keep the literature for home perusal.

THE MENACE OF THE TRUSTS.

It can hardly escape notice that the rubber goods import restrictions favor two branches of the home trade more than any others and that these two branches, viz., tires and footwear, have special trade organizations of their own and are thereby able to bring pressure upon the authorities. As an addendum to what I said in these notes in the May issue of THE INDIA RUBBER WORLD, a government committee has been considering the extension of trade organization and combinations from the point of view of public interest. The contention is made that these trade combinations are necessary in order to meet foreign competition abroad and this view is evidently held in America, to judge by the Webb Act recently passed. Whatever may be the case in countries which have long lived under protection the British, who have lived under free trade, are more than apprehensive that these various combinations mean high prices all around to home consumers. The government committee is agreed that it is desirable to institute a tribunal to examine into the operation of our trusts and combines in the interest of the home consumer on the lines of the tribunals which already exist in American and some of our colonies.

INSULATED WIRE AND CABLES FOR AUSTRALIA.

The Minister of Customs of Australia has published a new Customs regulation governing the standard of test and quality for imported electric cables. Some of the cables previously imported have been unsafe to use, leading to the fusing of the conductors and outbreaks of fires.

Each coil of insulated wire imported must bear a label stating the manufacturer's name and address, length of coil, date of manufacture, gage of conductors, and the insulation resistance. These regulations are effective July 1, 1919.

RUBBER STATISTICS FOR BRITISH INDIA.

The Madras Presidency, British India, through all ports, imported from the Atlantic Coast of the United States during the year ended March 31, 1918, manufactured rubber goods as follows: tires and tubes, \$3,666; miscellaneous, \$10,570.

A NETHERLANDS RUBBER FACTORY.

The Naamloze Vennootschap Vereenigde Nederlandsche Rubberfabrieken is located at Doorwerth, Province of Gelderland, Netherlands, and controls other factories at Doorwerth (near Wageningen), Hoogeveen, and Amsterdam, while it maintains branch offices at Groningen, Rotterdam, Leeuwarden, and in Amsterdam at 647 Keizersgracht.

Miscellaneous Foreign Notes.

MARSEILLES CRUDE RUBBER IMPORTS INCREASING.

SOME years ago the quantity of rubber imported through Marseilles into France was negligible. French factories imported their African and South American rubber through Bordeaux, Le Havre and Antwerp, while their plantation rubber came through London. But, since the war started, there has been a great increase in the Marseilles imports, with a corresponding decrease of imports through the other ports mentioned. In 1916 Marseilles rubber imports already amounted to 6,019,640 pounds and they increased in 1917 and 1918, but the French Government no longer publishes the exact amounts.

CHAMBER OF COMMERCE ESTABLISHED IN PERSIA.

Under the auspices and with the financial support of the Persian Government, a chamber of commerce has been organized in Teheran, to consist of not less than six nor more than eighteen members, one-half to be appointed by the Minister of Commerce and one-half by the merchants of the city. Sub-chambers may be organized in other Persian cities. The object of the organization is to strengthen and extend commercial relations with the United States, and to this end American trade catalogs and publications are desired. They should be addressed to the Chamber of Commerce, Teheran, Persia, and will be available to those interested, at a reading room maintained by the Chamber.

NORWEGIAN-AMERICAN EXHIBITION IN CHRISTIANIA.

September 10-24, 1919, has been set as the dates between which the Norwegian-American Exhibition will be held in Christiania, Norway.

MARKET IN SWITZERLAND FOR TIRES AND TUBES.

It is expected that after the peace treaty is signed there will exist a large demand in Switzerland for rubber tires and tubes.

NEW ZEALAND IMPORTS OF RUBBER BOOTS AND SHOES.

A comparison of available figures for the years 1914 and 1917 covering the imports of the chief classes of rubber footwear into New Zealand and the countries of origin shows that while the United States has not even held her own in some of these specialties, Japan has made considerable gain. Canada, also, has increased her trade, particularly in rubber boots. This is partly due to the difference in tariff and the improved quality of Canadian rubber footwear of the present day.

Articles and Countries of Origin.	1914.		1917.	
	Dozen Pairs.	Value.	Dozen Pairs.	Value.
Molded rubber and cork soles:				
From United Kingdom	\$5,329	\$8,492
Canada	798	1,840
Japan	29	871
United States	29	842
Other countries	389	82
Totals	\$6,545	\$11,416
Galoshes, rubber overshoes, gymnasium shoes, etc.				
From United Kingdom	24,167	\$86,624	16,193	\$65,722
Canada	3,160	22,746	3,800	24,955
Japan	1,680	5,621
United States	2,850	17,807	2,401	16,585
Other countries	405	1,289
Totals	30,582	\$128,466	24,220	\$112,883
Rubber boots:				
From United Kingdom	223	\$11,246	67	\$3,621
Canada	360	11,689	886	27,705
Australia	14	744	29	871
United States	1,272	48,942	1,449	50,563
Totals	1,869	\$72,621	2,431	\$82,760

Further figures comparing the value of the imports of rubber goods other than tires show that during the month of January, 1915, these amounted to only \$12,652 as against \$13,621 for the month of December, 1918.

The consul at Auckland states as his opinion that if favorable adjustment were made of the duties imposed on the importations of these goods, American business could be considerably increased in New Zealand as American goods are well received and sell readily in competition with other makes of similar quality.

SIAMSE TRADE IN RUBBER GOODS.

According to a report issued by Vice-Consul Carl C. Hansen at Bangkok, the exports of crude rubber from Siam to foreign countries for the fiscal year ended March 31, 1918, amounted to 24,000 pounds, against 23,123 pounds in 1916. These figures also include rubber substitutes.

The customs reports for the past five years show an increasing demand for rubber goods, the following figures representing the total imports through the port of Bangkok:

	Pounds.	Value.
1914	158,782	\$119,509
1915	143,206	103,702
1916	157,601	127,507
1917	189,061	165,081
1918	194,226	166,800

This covers automobile, cycle, and all other tires and also rubber manufactures.

The origin and declared value of rubber goods, landed at Bangkok during five fiscal years ended March 31, 1918, are given below:

Articles and Countries of Origin.	1913-14.	1914-15.	1915-16.	1916-17.	1917-18.
Motor car tires	129,928	103,534	140,480	157,203	163,136
United States	1,500	8	2,354	24,603	33,513
France	1.26	250	2,000
Germany	11,312	6,480
Italy	1,271	1,271	3,252
Singapore	21,075	74,233	107,884	111,198	129,871
United Kingdom	98,827	21,229	30,238	20,803	7,085

*One tal = 37 cents, United States currency.

A NEW SUBSTANCE RESEMBLING RUBBER.

"The 'Bulletin de l'Office Colonial,' volume XI, Nos. 127-128, Melun, France, 1918, contains an article by F. Heim, giving the results of an investigation made by the director of the 'Service d'Etude des Productions Coloniales' to determine the commercial value of a rubber-like substance from North Kamerun, Africa, samples of which were submitted. These samples were in the form of small bars and in large pieces and blocks in loaf form.

The product is rose-colored with a slightly darker surface which can possibly be attributed to oxidation. The dark red or black particles easily separate from the substance when heated and are of the quality of rubber. The substance seems to have properties between caoutchouc and gutta percha. The

viscosity is from 1 to 1.01 and at 40 degrees C. it becomes soft.

In the raw state it is well adapted for the manufacture of molded articles and use in surgery, dentistry, etc. The strength is less than that of caoutchouc, while the elasticity can be retained by a weak vulcanization. The substance can be hardened by vulcanizing and rendered inviolable for surgical and chemical uses. It is especially valuable as an insulating material for electric cables.

INCREASE OF RUBBER EXPORTS FROM THE STRAITS SETTLEMENTS.

The statistics given in our issue of April 1, 1919, concerning the gross quantities and values of the imports and exports of rubber for the Straits Settlements during 1917, were compiled before the Government figures were obtainable relative to the imports and exports by articles and countries of origin and destination.

The official figures recently published, according to the United States Consul General at Singapore, show that the total value of rubber exports for 1917 was much larger than that of 1916. United States exports of Para rubber alone amounted in value to \$84,000,000, as compared with \$47,291,000 in 1916. Imports of manufactured rubber from the United States show a decrease of \$26,000 for 1917, compared with 1916 figures.

In the following table is given the value of the imports and exports of crude and manufactured india rubber and gutta percha for 1916 and 1917:

EXPORTS.		1916.	1917.
UNMANUFACTURED—		Value.	Value.
India and Borneo rubber:			
To United Kingdom	\$421,000	\$133,000
Japan	112,000	68,000
United States	27,000	25,000
Totals	\$560,000	\$226,000
Para rubber:			
To United Kingdom	\$15,564,000	\$18,201,000
Australia	203,000	266,000
Canada	885,600	6,554,000
France	635,000	1,034,000
Italy	167,000	1,236,000
Japan	2,812,000	3,610,000
Russia	6,716,000	3,173,000
United States	47,291,000	84,000,000
Totals	\$74,273,000	\$118,074,000
Gutta percha:			
To United Kingdom	\$558,000	\$865,000
France	8,000	23,000
Italy	1,000	20,000
Japan	11,000	30,000
Russia	20,000
United States	261,000	600,000
Totals	\$839,000	\$1,558,000

IMPORTS.		1916.	1917.

Other rubber goods:			
From United Kingdom	\$60,000	\$71,000
France	4,000
Japan	34,000	44,000
United States	5,000	4,000
Totals	\$103,000	\$119,000

MEXICO TO HAVE NEW RUBBER FACTORY.

The Fomento de Comercio Internacional, S. A. (International Commerce Exchange), is the name of the new rubber company which is building a factory in Mexico City, Mexico, for the manufacture of automobile tires and inner tubes. While not yet completed, work on production has already been begun, about 100 hands being employed. About 25 tires and tubes daily are now being turned out, according to the president of the concern.

The factory is of modern brick and cement construction, with its own electric lighting plant, and oil is used for fuel. It is equipped with American machinery and American foremen are in charge.

Equipment for the manufacture of raincoats, hot-water bags, and rubber soles and heels has also been installed, and the company hopes later to manufacture all kinds of rubber goods, employing 350 hands when running at full capacity.

There is one other small rubber factory in Mexico City, equipped for the manufacture of rubber tires, but it is producing none at present.

RUBBER EQUIPMENT FOR MEXICAN RAILWAYS.

Among the items of rubber materials required by railway lines south of Mexico City are the following: 15,300 pieces air-brake hose, and 3,150 pieces air hose.

Quotations should be addressed to either Mr. Silviano Pruneda, Purchasing Agent, Estación Buenavista, Ferrocarril Mexicano, Mexico, D. F., or to Mr. F. P. de Hoyos, General Agent, Mexican Government Railway Administration, Woolworth Building, New York City.

GUAYULE FROM THE TORREON DISTRICT OF MEXICO.

Guayule rubber has been manufactured and exported of late from the consular district of Torreon, Mexico, at the rate of about 500,000 pounds a month, the exports to the United States for the month of March amounting to 442,596 pounds valued at \$112,751. This district includes the southwestern quarter of Coahuila, the northwestern corner of Zacatecas and the entire state of Durango except the railroad terminals in the northwest and guayule rubber is one of the leading sources of wealth of the district.

RUBBER TEXTILE IMPORTS INTO ARGENTINA.

Statistics for the year 1917 and the first quarters of 1918 show that Argentina imported during those respective periods rubberized textiles as follows:

Articles.	First Quarter, 1918.	1917.
Elastic garters, silk or mixture.....	4,983	16,632
Elastic garters, thread.....	4,418	21,251
Silk elastic for boots.....	1,791	5,073
Thread elastic for boots.....	6,054	41,176
Rubberized silk or crepe.....	5,376	36,300
Waterproof cloth.....	31,912	117,253
Elastic fabric other kinds.....	27,271	126,525
Waterproof coats.....	2,847	14,484
Soles for canvas shoes.....	45,149	139,849
Totals.....	129,801	519,645

¹A peso equals \$0.965 United States currency.

PANAMA SIGNS THE COMMERCIAL TRAVELERS' TREATY.

The Panama Government has ratified the commercial travelers' treaty with the United States, the purposes of which are to facilitate the operations of commercial travelers and to foster trade. Panama is one of the fourteen countries which have agreed to such a treaty, Uruguay and Guatemala having already signed similar agreements. The United States Senate has ratified the Uruguay and Guatemala treaties.

Under these treaties commercial travelers may operate throughout the country for a single fee, and samples without commercial value will be admitted free of duty.

¹A peso equals \$0.965 United States currency.

BOLIVIA APPROVES PLAN FOR RUBBER GOODS FACTORY.

The National Congress of Bolivia has approved the law proposed by the President, by which fifty per cent of a capital of 300,000 bolivianos (1 boliviano=\$0.389) is guaranteed for the establishment of a rubber goods factory in Santa Cruz, or Cochabamba. ("Bulletin of the Pan American Union.")

Rubber Planting Notes.

RUBBER PROFITABLE IN FEDERATED MALAY STATES.

THE RUBBER-GROWING INDUSTRY of the Federated Malay States experienced a year of great prosperity during 1917, in spite of the decline in price during the second half of the year.

The total acreage owned by rubber estates exceeding 100 acres in area amounted to 1,044,839, of which 612,268 acres are planted with rubber only, as against 543,729 in 1916, and of this area 408,574 acres are in bearing. The amount of rubber exported increased from 62,764 tons in 1916 to 79,831 tons in 1917, valued at \$83,803,546 and \$107,317,739, respectively.

An experimental shipment of rubber seed was sent to England. The oil extracted from this was sold at \$243 a ton.

The scale of wages has recently tended to become more nearly uniform. The rates in Perak are approximately 23 cents for men and 17 for women, but are sometimes as high as 26 and 20, respectively, while some women tappers draw 26 cents. The rate paid to efficient tappers at the end of the year was from 19 to 20 cents daily, but estates near the boundaries of Perak and Negri Sembilan paid from 23 to 26. However, the price of rice, the principal food, remained nearly stable.

RUBBER EXPORTED FROM DUTCH GUIANA.

The declared exports from Dutch Guiana during 1916 and 1917 show a decrease in the amount of rubber exported, as follows: 1916—18,578 pounds, value \$12,284; 1917—8,134 pounds, value \$6,345.

SINGAPORE RUBBER EXPORTS.

Statistics are now available for the month of February, 1919, showing the exports of rubber from Singapore, and the countries of destination, as follows:

	Great Britain.	United States.	Continent of Europe.	Totals.
Jelutong	21	638	939	659
Gutta percha	272	642	939	939
Para rubber	5,764	20,065	2,352	33,181
Totals	6,057	21,345	2,352	34,769

TOGOLAND RUBBER.

In spite of depressing conditions, rubber production increased in the British sphere of occupation in Togoland during 1917, when the production amounted to 64,272 kilograms, valued at \$10,273. In 1916, the production amounted to 22,592 kilograms less, and the value was \$2,900 lower. But local prices were lower during 1917 than during the previous year. The whole quantity produced was exported to Great Britain.

RUBBER IMPORTS AND EXPORTS FOR ECUADOR.

During 1917, Ecuador imported manufactured rubber goods to the amount of 54,191 pounds, value \$34,713, as against 90,493

pounds during 1916, value \$27,416. During the same periods she exported 909,940 pounds of crude rubber, value \$354,542, as against 837,454 pounds, value \$327,937.

UTILIZATION OF WASTE PRODUCTS ON STRAITS SETTLEMENTS RUBBER ESTATES.

Rubber-seed oil has been found to be a satisfactory substitute for linseed oil, and rubber estates in the Straits Settlements are beginning to experiment with the utilization of rubber seeds in the production of this oil. As there is an almost unlimited supply of the seeds, it is thought this industry may develop into one of importance, in which case oil-extracting machinery will find a good market.

ANNUAL RUBBER REPORT FOR THE UGANDA PROTECTORATE.

The exports of rubber from the Uganda Protectorate for the year ended March 31, 1918, as reported by the Department of Agriculture in Uganda, were 144,727 pounds of plantation rubber, value \$48,490, and 9,362 pounds of forest rubber, value \$4,492. This is double the amount for 1917, the figures being: plantation rubber, 71,955 pounds, value \$27,495; forest rubber, 400 pounds, value \$175.

Tapping results obtained in the Botanic Gardens, Entebbe, and on government plantations are satisfactory, the Kivuvu and Mabira plantation proving the success of rubber growing on a large scale.

PRODUCTION OF DUTCH RUBBER COMPANIES.

The following table by Frank W. Mahin, United States Consul at Amsterdam, shows the comparative production of Dutch rubber companies for 1917-1918. One-half kilo equals 1.1 pounds.

Companies.	1917. Half Kilo.	1918. Half Kilo.
Fransch-Nederlandse Koloniale Cultuur-Maatschappij	534,600	390,109
Rubber Maatschappij "Basilim"	221,600	338,300
Cultuur-Maatschappij "Bajabang"	543,400	609,000
N. V. Cultuur My "Nieuw-Tijsslak"	273,949	314,436
Rubber Maatschappij "Tjibantjet"	82,030	123,650
Cultuurmaatschappij Salatri Plantations (1917 four months)	5,175	30,926
Zuid-Fraenger Rubbermaatschappij	230,951	322,247
Nederlandsche Rubbermaatschappij	1,525,200	1,611,300
Lampong-Sumatra Rubber Maatschappij	161,100	237,600

RUBBER IN THE BENI DISTRICT OF BOLIVIA.

From the British Vice-Consul, Riberalta.

TRADE DEPRESSION in the Beni district, which marked the opening quarter of 1918, continued with greater emphasis during the quarter ended 30th June.

Owing to late rains and the consequent water-logged condition of the estates, the extraction and transport of rubber to suitable points on the rivers for exportation were greatly retarded. This fact, however, did not materially influence the rubber market, as, owing to the lack of transport facilities at the Atlantic ports during the first quarter of the year, large stocks became accumulated, and for this reason chiefly trade depression was markedly felt.

DIFFICULTIES OF THE INDUSTRY.

The prices for fine rubber, both in the English and United States markets during the quarter ended 30th June were considered fairly satisfactory, even taking into consideration the high rates for transport and insurance. To the scarcity of

for the corresponding periods of 1917 and 1916 being given for comparison. From these statistics it will be seen that the crisis really only began to be realized in the month of June, when exports were restricted to approximately 60 tons.

Totals	1,607,774	2,017,020	1,645,372

NEW WIRELESS COMMUNICATIONS.

The extension of radiographic communication with Brazil has been effected, an arrangement which offers great facilities to rubber merchants whose interests are bound up with the Amazon valley. At Trinidad, the capital of the province of the Beni, a wireless has been established on the Telefunken system, while at Cobjia, the frontier town of the Brazilian Acre territory, another is being built. In addition to these improvements, the Bolivian Government has made a further concession to the public by the reduction of wireless rates by 50 per cent, resulting in a notably increased business.

RUBBER IN SEYCHELLES.

Rubber exports from Seychelles during 1917 amounted to 8,631 pounds, valued at \$1,907.84; in 1916, to 6,025 pounds, and in 1915, to 625 pounds. New areas are being opened for planting and there are enough trees already set out to produce 224,000 pounds in a few years.

The rubber is remarkably free from disease and actually thrives on the lateritic soil of this country, which is quite worn out. Signs of two kinds of fungi have been reported which were identified as *Hirnicola hispidula*, a harmless species growing on any dead branches, and *Hexagonia discopoda*, having a peculiar inclination for the dead branches of trees that are alive.

DISCOVERY OF TALC IN SOUTH AFRICA.

Since the outbreak of the present war a new industry has been developed in the Barberton district of South Africa, due to the discovery there of talc or soapstone. Large quantities are used in garages for the inside of tires as well as for many other purposes. Only the scarcity of shipping freight is said to hinder a large export trade.

AMERICAN CHAMBER OF COMMERCE IN ARGENTINA.

The American Chamber of Commerce in Argentina has recently changed its name to The Chamber of Commerce of the United States of America in the Argentine Republic.

BUY WAR SAVINGS STAMPS—BUILD FOR AMERICAN PROSPERITY and your own success.

CUTTING RUBBER FROM PADDOLES, BOLIVIA.

shipping at the Atlantic ports is attributed the most acute crisis which has ever been felt in the Bolivian rubber industry. For a time it was believed that Brazilian rubber was getting the preference of shipment, over Bolivian transit rubber, at the ports of Manaus and Pará, and while this would only seem to have been a natural procedure, no proof was ever forthcoming in support of the allegation which doubtless originated in subtle pro-German minds.

The two largest exporters of rubber from the Beni received instructions during the period under review to withhold all exportation, and the smaller firms, dealing through commercial houses in the Brazilian centres of Manaus and Pará, were compelled to adopt a similar action on account of the lack of buyers, whose business disappeared with the scarcity of shipping at these ports. A moderate estimate of the stocks of rubber and cauchó stored in Riberalta and Cachuella Esperanza ready for export on June 30 was 1,000 tons. The inevitable result of this accumulation of stocks was a big slump in the local prices. Hesitancy characterized the action of the limited circle of buyers, and only nominal rates were offered, fine rubber being quoted at 1s. per pound, and cauchó at 4d. per pound, thus affording a magnificent opportunity to the speculator with a little ready capital.

MOVEMENT OF BOLIVIAN RUBBER.

The following table shows the movement of Bolivian rubber from the three principal northern centres of export, by way of the Madeira-Mamore Railway, with outlet to the Amazon at Porto Velho, for the first six months of the year, the figures

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED APRIL 22, 1919.

- N**O. 1,301,067. Split demountable rim for tires. R. S. Bryant, assignor to his assignments to The Standard Parts Co.—both of Cleveland, O.
- 1,301,228. Rubber-soled fabric shoe. M. H. Clark, Hastings-upon-Hudson, N. Y., assignor to The Goodyear's Metallic Rubber Shoe Co., Naugatuck, Conn.
- 1,301,317. Fountain Pen. L. Plancher, New York City, assignor to M. Fintone, Brooklyn—both in New York.
- 1,301,343. Non-skid pneumatic tire. H. R. Waterman, San Francisco, Calif.
- 1,301,352. Demountable rim for tires. C. E. F. Ahlman, Cleveland, assignor to W. A. Neracher, Warren, and Alfred Fritzsche, Cleveland—all in Ohio.
- 1,301,354. Rubber-lined hose. C. M. C. Baird, Chicago, Ill.
- 1,301,467. Resilient tire. J. Lorenz, Milwaukee, Wis.
- 1,301,501. Cork for hot-water bottles, having melting portion to determine whether water in bottle is too hot for safety. A. R. Robertson, Vancouver, B. C., Canada.
- 1,301,509. Hot-water bottle. C. F. Schuh, Newark, N. J., assignor to A. Albright, Jr., New York City.
- 1,301,686. Brake lining. J. E. Grosjean, Lima, assignor of 1/2 to L. F. Montgomery, Fort Recovery—both in Ohio.
- 1,301,695. Demountable rim for tires. A. B. Henson, Franklin, Ky.
- 1,301,711. Stopper for hot-water bottles, etc. H. P. Kraft, Ridgewood, N. Y.
- 1,301,762. Bottle with rubber packing-ring in groove of neck. T. E. Suffolk, Elizabeth, Pa.

ISSUED APRIL 29, 1919.

- 1,301,841. Coating joints of paper containers with rubber solution to make them waterproof. E. C. Hawkins, Noblesville, Ind.
- 1,301,865. Curved elastic cap for corsets, etc. S. T. Metz, Brooklyn, N. Y., assignor to Victory Corset & Girdle Co., a New York corporation.
- 1,301,938. Dust-cap for tire valves. C. A. Herle, Rochester, assignor to D. H. Wright, Webster—both in New York.
- 1,301,998. Reinforced pump tire. J. F. Beechman, East Chicago, Ind.
- 1,302,038. Kevlar-protector. J. Hayes, Cleveland, Ohio.
- 1,302,091. Pneumatic tire composed of two layers of two different gages of wire mesh with composition of rubber and canvas between. E. M. Reid, Postville, Idaho.
- 1,302,133. Anesthetic apparatus. A. C. Clark, Chicago, Ill.
- 1,302,156. Split demountable rim for tires. H. D. Hamilton, Kenosha, and J. Goodman, Racine—both in Wisconsin.
- 1,302,173. Resilient tire. W. J. Kent, Brooklyn, N. Y., assignor to Revere Rubber Co., Chelsea, Mass.
- 1,302,177. Resilient tire. J. P. Kolby, L. P. Larson, and C. P. Nielsen, all of Ephraim, assignors to Kolby Wheel Co., Salt Lake City—both in Utah.
- 1,302,369. Truss with elastic insert. A. J. O. Horschek, Brooklyn, N. Y.
- 1,302,417. Fountain pen. C. H. North, Cleveland, O.
- 1,302,418. Pneumatic tire with separate tread member. W. H. Northall, assignor of 1/2 to S. C. James and 1/2 to H. Males—all of Evansville, Ind.
- 1,302,441. Dust-cap for tire valves. M. C. Schweinert, West Hoboken, and J. Volckhausen, Weehawken—both in New Jersey, assignors to A. Schrader's Son, Inc., Brooklyn, N. Y.
- 1,302,447. Rim for pneumatic tires. W. I. Stark, Vancouver, and S. R. Ramsay, New Westminster, B. C.—both in Canada.
- 1,302,454. Carriage lamp. Theodore (legal name T. Anagnostopoulos), Eunice, La.
- 1,302,473. Stretchable laminated fabric composed of leather cemented to elastic webbing. M. Scheuer, New York City.

ISSUED MAY 6, 1919.

- 1,302,585. Combination pencil and fountain pen. A. L. Oppenheim, New York City.
- 1,302,763. Operating device for rotary disk erasers. F. H. Call, Portland, Ore.
- 1,302,792. Dust-cap for valves of pneumatic tires. W. P. Hammond, Passaic, N. J., assignor to A. Schrader's Son, Inc., Brooklyn, N. Y.
- 1,302,842. Fountain or stylographic pen. F. M. Peart, Liscard, Eng.
- 1,302,954. Combined closure and eraser for fountain pens. S. Newell, Wapello, Ia.
- 1,302,970. Puncture-proof lining for pneumatic tires. W. H. Pritchett, U. S. Marine Corps.
- 1,302,974. Resilient tire. U. S. Robinson, assignor of 1/2 to M. Forcés—both of Lagrange, Ga.
- 1,303,027. Rubber connecting member for joining ends of belts. G. E. Carr, Boston, Mass.
- 1,303,139. Detachable tire rim. A. C. Wright and W. Dukes, assignors to The Warland Dual Rim Co., Limited, Aston—all in Birmingham, Eng.
- 1,303,144. Lisle rubber suit. A. G. Afandri, New York City, assignor to C. Kenyon Co., Brooklyn—both in New York.
- 1,303,154. Repair boot for insertion between inner tube and casing of pneumatic tires. R. C. Bingham, Spokane, Wash.

ISSUED MAY 13, 1919.

- 1,303,224. Tire cover having elastic auxiliary warp threads for drawing it into circular shape. W. Achtmeyer, assignor to The Russell Manufacturing Co.—both of Middletown, Conn.
- 1,303,357. Demountable rim for tires. J. H. Miskimen, Glendive, Mont.
- 1,303,389. Inflatable bathing garment. J. Rebel, Cleveland, O.
- 1,303,546. Nipple for nursing-bottle. A. C. Eggers, Brooklyn, N. Y., assignor to The Goodyear's India Rubber Glove Manufacturing Co., Naugatuck, Conn.
- 1,303,589. Improvement in demountable rim for tires. L. H. Perlman, New York City.
- 1,303,641. Non-skid cushion suction-heel. C. E. Siegfried, Akron, assignor of 1/2 to W. Hoyt, Cleveland Heights—both in Ohio.

ISSUED MAY 20, 1919.

- 1,303,865. Armored pneumatic tire. W. de Rooy, New York City.
- 1,303,869. Rubber-heel lift with fastener embedded therein. G. S. Ellithorpe, assignor of 1/2 to N. D. Fraser—both of Chicago, Ill.
- 1,303,871. Rubber sole for turn shoes. G. Ferguson, Wollaston, Mass., assignor by mesne assignments to United Shoe Machinery Corp., Paterson, N. J.
- 1,303,903. Surgical bandage. B. W. Jansen, College Point, assignor to Traun Rubber Co., New York City—both in New York.
- 1,303,995. Pneumatic tire. W. I. Vincent, Cardiff, Wales.
- 1,303,998. Pneumatic tire. H. L. von Trotter, Fort Madison, Ia.
- 1,304,011. Cushion wheel. A. L. Bennett, Kansas City, Mo.
- 1,304,038. Dental plate with suction device. A. J. Glaser, Comfort, Tex.
- 1,304,054. Uterine syringe. T. Imaizumi, Seattle, Wash.
- 1,304,115. Hydrometer to carry in automobile tool kit. J. Steiner, Long Island City, N. Y.
- 1,304,116. Auxiliary tire valve. T. J. Stephens, Spokane, Wash.
- 1,304,147. Inner tube. F. E. Bessler, Akron, O.
- 1,304,177. Pneumatic tire. I. Greenberg, Baltimore, Md.
- 1,304,193. Combined rubber ring and cover-piece to form bottle-cap. W. G. Nichols, Wingham, Man., Canada.
- 1,304,292. Pen with magazine for soluble ink. A. L. Flegel, Racine, Wis.
- 1,304,308. Attachment for telephone, to do away with holding receiver. E. Gransall, New York City.
- 1,304,424. Dust-cap for tire valves. J. T. Ward, Los Angeles, Calif.

ISSUED MAY 27, 1919.

- 1,304,576. Inflating coupling for tire-valve casing. H. P. Kraft, Ridgewood, N. Y.
- 1,304,593. Shoe protector in two parts with elastic webbing connection. J. J. Farnum, Chicago, Ill.
- 1,304,739. Self-rolling fountain pen. H. L. Carman, New York City.
- 1,304,794. Dual rim for motor-car wheels. R. L. Morgan, Worcester, Mass.
- 1,304,801. Resilient tire. C. P. O'Brien, Omaha, Neb.
- 1,304,813. Tire mold to accommodate non-skid chain. C. E. Schneider, Chicago, Ill.
- 1,304,817. Non-puncturable ring for pneumatic tires. F. J. Slifka, Chicago, Ill.
- 1,304,915. Pneumatic inssole. B. A. Spinney, Des Moines, Ia.
- 1,305,196. Pneumatic tire. A. L. Cole, Auburndale, Mass.

THE UNITED KINGDOM.

ISSUED MAY 7, 1919.

- 129,133. Crutch having pneumatic pad in arm-rest. F. A. Pennington, 10 Hudson Road, Heston Chapel, and T. R. Day, Bankfield, Daythill—both in Lancashire.
- 124,004. Rim for solid tires. Dunlop Rubber Co., C. Macbeth, and H. C. Young, 14 Regent street, Westminster.
- 124,085. Improvements in fountain pens. D. Anderson, 114 West street, South Side, Glasgow.

APPENDIX TO ABRIDGEMENT OF SPECIFICATIONS (1918).

ISSUED MAY 14, 1919.

- 12,684. Rubber or rubber and canvas stream-line covering for stay-wires of airplanes, etc. (Not yet accepted.) A. R. Pettit, Waylands, Wraybury, Buckinghamshire, and Martinside, Limited, Brooklands Aviation Grounds, Byfleet, Surrey.

ISSUED MAY 21, 1919.

- 124,239. Cutting-machine for fabrics, having rubber ribs on either side of cutters to clamp material during cutting and divert it from the cutting roller. P. M. O. Cohen, Aquatite Mills, Derby street, Cheadham, Manchester.
- 124,271. Resilient wheel having rims separated by rubber rollers. N. W. McLeod, 15 Kingsbury Place, St. Louis, Mo., U. S. A.

ISSUED MAY 21, 1919.

- 124,282. Portable marine life-saving device in form of trunk, having water-tight cloak for occupant. C. T. Drijenko, Russian Government Commission, India House, Kingsway, London.
- 124,342. Tire valve. A. E. White, 88 Chancery Lane, London. (Holt Auto Devices Co., 1123 Conway Buildings, Chicago, Ill., U. S. A.)

- 124,347. Speaking tube having cup-shaped rubber mouth-piece, secured by head-strap, to prevent extraneous noises entering. W. Plumbridge, 10 Verdun avenue, Hamble, and C. H. Fernain, Spring House, Spring Road, Sholing—both in Hampshire.
- 124,373. Catamenial appliance having waterproof shield and elastic strap. E. Andrae, 99 Trinity Road, Edinburgh.
- 124,395. Life-saving garment with inflatable air tube. Robinson & Cleaver, Donegal Place, Belfast, and J. J. Evans, 1 Park avenue, Church End, Finchley, London.

124,404. Waterproof garments having art-printed face outside instead of inside. H. Weinberg, Aquarecol Mills, North street, Chesham, Manchester.

ISSUED MAY 28, 1919.

- 124,607. Flapping-wing airplane having wings connected to body by elastic webbing. H. W. Hetherington, 75 Rochambeau avenue, Providence, R. I., U. S. A.
- 124,628. Nipple for feeding bottles. F. R. Graham-Yoell, Dulham Towers, East Trinity Road, Leith.
- 124,673. Rubber pads for crutches. F. C. Lynde, 51 King street, Manchester, New Hampshire.
- 124,679. Band clip for securing rubber sleeves to metal pipes, etc. F. G. Pickering, 4 Petteril street, Carlisle, Cumberland.

THE DOMINION OF CANADA.

ISSUED MAY 20, 1919.

- 190,388. Valve cap. A. E. Bronson, Cleveland, Ohio, U. S. A.
- 190,555. Wear plate and attaching means, combined with circular rubber sheet. V. F. Maliszewski, Detroit, Mich., U. S. A.
- 190,577. Tire valve. S. C. Sladden, New York City, N. Y., U. S. A.
- 190,583. Rubber sole-protector for boots and shoes. A. Thill, Barmouth, Merioneth, Wales.
- 190,606. Sole for turn shoes, having rubber body portion and fibrous insole strip. The United Shoe Machinery Co. of Canada, Limited, Maisonneuve, Quebec, assignee of G. Ferguson, Wollaston, Mass., U. S. A.
- 190,616. Footwear with rubber outsole and upper of rubberized fabric. The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, assignee of M. H. Clark, Pelham, N. Y., U. S. A.
- 190,624. Air-valve for pneumatic tires. Firestone Tire & Rubber Co., assignee of L. Greenwald—both of Akron, O., U. S. A.

ISSUED JUNE 3, 1919.

- 190,704. Dental plate with rubber suction trough in each aperture. J. Lehnert, Pittsburgh, Pa., U. S. A.

ISSUED JUNE 10, 1919.

- 190,823. Solid rubber tire. G. A. Morier, Preston, Lancaster, Eng.
- 190,863. Stretchless machinery belting. The Lambert Multiplex Co., assignee of H. M. Lambert—both of Portland, Ore., U. S. A.

NEW ZEALAND.

ISSUED MAY 1, 1919.

- 39,972. Respirator. R. Donald, 30 Parliament Hill Mansions, Highbury Road, London, Eng.
- 41,151. Resilient matting. W. J. Dyas, 80 Queen's Drive, Musselburgh, Dunedin, N. Z.

THE FRENCH REPUBLIC.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 20,662/483,285. (April 30, 1917.) First certificate of addition to patent taken out December 30, 1915, for pneumatic tire casings. P. Moet and J. B. Haegy.
- 20,664/455,434. (May 9, 1917.) First certificate of addition to patent taken out May 23, 1915, for soles made of rubber, leather and steel combined. Société Française du Cuir Armé.
- 489,289. (March 15, 1918.) Rubber paving for roadways and other uses. G. Anderson, The Leyland & Birmingham Rubber Co., Limited, and Rubber Roadways Co., Limited.
- 489,301. (March 16, 1918.) Improved elastic tire for automobiles and other vehicles. R. Trautwein and H. Bokanoski.
- 489,306. (March 14, 1918.) A device to be placed between the tread and mud-chains of automobile tires to prevent slipping. H. G. MacWilliam.
- 489,324. (March 18, 1918.) Spring tire for automobile wheels. G. Huber.
- 489,331. (March 19, 1918.) Life-saving belt. M. Halperin.
- 489,340. (March 19, 1918.) Improvements in resilient wheels. W. A. Black.
- 489,409. (March 15, 1918.) Improvements in rubber soles. M. H. Laudou.
- 489,550. (February 2, 1917.) Insubmersible life-saving valise. B. N. C. Mollard.
- 489,551. (March 2, 1917.) Parachute clothing for aviators. B. N. C. Mollard.
- 489,620. (April 5, 1918.) Puncture-proof pneumatic tire. L. S. Odell.
- 489,657. (April 10, 1918.) Improvements in pneumatic tire casings. A. S. Burdick and J. C. Hermann.
- 489,671. (April 9, 1918.) Pneumatic wheel with large tire having weak tension on soft earth. E. Perrot, 22 boulevard de la Trémoille, Dijon (Côte-d'Or).
- 489,690. (May 25, 1916.) Improvements in pneumatic tire treads. T. Dureyns and R. Hustinx.
- 489,733. Improvements in shoes for tires of motor vehicles. A. E. Powell.
- 489,844. (April 2, 1918.) Improvements in rubber tires for vehicles. A. A. Crozier.
- 489,854. (April 19, 1918.) Douche for washing the eyes with running water. J. J. Pouly and J. M. Daudard.

- 489,856. (April 20, 1918.) Economical sole without leather, flexible and interchangeable, adapted for rapid attaching or detaching. C. Auscher, Cluny, Saône-et-Loire.
- 489,861. (April 25, 1918.) Improvements in wheel tires reinforced with steel. J. H. Hamlin and J. C. Burford.

TRADE MARKS.

THE UNITED STATES.

- N. O. 100,667. A monogram in white composed of two F's against a black background—denial vulcanizers, rubber, etc. Fawcett & Fawcett, Brooklyn, N. Y.
- 100,631. Representation of a phenix rising from flames within a double outlined circle, above the word PHOENIX—finished vulcanized boots and shoes, soles and heels. The Phoenix Rubber Co., Akron, O.
- 100,845. The word CHILDHOOD in script letters—infants' rubber pants, etc. Caisson, Pirie, Scott & Co., Chicago, Ill.
- 109,591. Representation of a pennant bearing the word Federal—composition soles and heels. The Federal Rubber Co., Cudahy, Wis.
- 111,215. The word JIFFY—fountain pens. Jiffy Pen Co., Sioux City, Ia.
- 111,768. Representation of a punctured tire within which appears the word INFLATITE superimposed upon the initials H & G, and the words TIRE PATCH SUPREMACY—tire-repair outfits and patches. Huff & Cutler, Boston, Mass.
- 112,330. The word LIBERTY within a double-outlined circle—rubber heels and composition soles. The Anchor Grip Heel Co., Eliza, O.
- 113,050. The words CLINCHER CROSS—golf balls. North British Rubber Co., Limited, Edinburgh, Scotland.
- 114,040. The words VULCO-CORD—rubberized woven fabric belting. The Gater Rubber Co., Denver, Colo.
- 114,515. Representation of a stencil bearing the words and characters AMERICAN ZINC L & S. CO., AZO, L—zinc oxides for pigments in rubber compounding, etc. American Zinc, Lead & Smelting Co., Boston, Mass., and St. Louis, Mo.
- 114,518. Same as No. 114,515.
- 114,519. Same as No. 114,515 and No. 114,518.
- 114,610. The words WARNER FOUNTAIN SHAVING BRUSH—"Everything out the Razor"—shaving brushes. Warner-Patterson Co., Chicago, Ill.
- 115,220. The words HOOD RUBBER COMPANY, Boston within an oval—rubber boots and shoes, overshoes, and canvas shoes with rubber soles. Hood Rubber Co., Watertown, Mass.
- 115,256. Representation of a stencil bearing the word CHICKADEE between lines composed of dashes, beneath an Indian's head—stitched and impregnated canvas belting. The Rossendale-Reddaway Belting & Hose Co., Newark, N. J.
- 115,260. Representation of a stencil bearing the word SEMINOLE between lines composed of dashes, beneath an Indian's head—stitched and impregnated canvas belting. The Rossendale-Reddaway Belting & Hose Co., Newark, N. J.
- 115,292. The words GOLD SEAT, MILLMAN's on a conventional design—chewing gum, etc. Millard Gum Vending Corp., New York City.
- 115,395. The word TIMESCO—rubber tires and tubes. Times Square Air Supply Co., Inc., New York City.
- 115,487. The words PINE-NENE—rubber filler and wood-preserving oil. Spiritine Chemical Co., Wilmington, N. C.
- 115,678. The word NUSOLE over representation of two soles, one with a hole in it—waterproofing compound for shoe-soles. The Nusole Co., Colorado Springs, Colo.
- 115,943. The word IMPER—rubber dolls, balls, etc. Zadek Feldstein Co., Inc., New York City.
- 116,778. The word KANTSLEP above representation of an inch-worm—self-vulcanizing patches for pneumatic tires. Kant Slip Co., Manzanola, Colo.
- 116,869. The word YARWAY combined with lines forming a triangle between the two syllables—valves of various kinds, spray nozzles, etc. Yarnall-Waring Co., Philadelphia, Pa.
- 116,381. The word BROWDEL—rubber-impregnated belting. The Manjarian Rubber Manufacturing Co., New York City.
- 116,458. The word GLOWB—rubber belting. The Goodyear Tire & Rubber Co., Akron, O.
- 116,462. The word GOODYEAR—asbestos packing. The Goodyear Tire & Rubber Co., Akron, O.
- 116,867. The word YARWAY—valves of different kinds, clamps, spray nozzles, etc. Yarnall-Waring Co., Philadelphia, Pa.
- 117,016. The word KIRKFIX—rubber cement. Alick Merriman, Freehold, N. J.
- 25,911. The word TYCOS—all kinds of recording meters, gauges, etc. Taylor Instrument Cos., 95 Main street, Rochester, N. Y., U. S. A.
- 25,994. The word MACHINAME—machines for slitting, winding, cutting, and perforating flexible materials; also parts and accessories. Cameron Machine Co., 61 Poplar street, Brooklyn, N. Y., U. S. A.
- 26,031. The words RALL BAND—boots and shoes of rubber or rubber and fabric. Mishawaka Woolen Manufacturing Co., Hill and Water streets, Mishawaka, Ind., U. S. A.
- 26,032. Representation of a ball—boots and shoes of rubber or rubber and fabric. Mishawaka Woolen Manufacturing Co., Hill and Water streets, Mishawaka, Ind., U. S. A.
- 26,033. The word VAC—boots and shoes of rubber or rubber and fabric. Mishawaka Woolen Manufacturing Co., Hill and Water streets, Mishawaka, Ind., U. S. A.
- 26,222. The words ROVAL CORD—rubber tires for vehicles and similar articles. United States Tire Co., 1790 Broadway, New York City, U. S. A.
- 26,280. The words VULCO-CORD—belting. The Gates Rubber Co., 999 South Broadway, Denver, Colo., U. S. A.

AUSTRALIA.

TO AMERICANS.

- 28,565. Representation of a tire through which is thrust an arm and hand wearing a rubber glove and holding a spatula, with the word *Mitix* beneath, in class No. 40 manufactured from rubber and gutta percha. The Miller Rubber Co., 1269 South High Street, Akron, Ohio, U. S. A. C. A. Hack, Collins street, Melbourne, Australia.)
- 24,416. Representation of a shield formed by bows and arrows, bearing the word *Mohawk*—rubber tires. The Mohawk Rubber Co., Akron, Ohio, U. S. A. (P. M. Newton, Fink's Buildings, Elizabeth street, Melbourne, Australia.)

DESIGNS.

THE UNITED STATES.

- O. 53,223. Tire. Patented April 22, 1919. Term 14 years. E. Hopkinson, New York.
- 53,278. Tire. Patented May 6, 1919. Term 7 years. J. Stungo, Pittsburgh, assignor to Stungo-Radium Rubber Co. (now Washington Rubber Co., Washington—both in Pa.)
- 53,279. Tire. Patented May 6, 1919. Term 14 years. M. L. Wiener, assignor to the Firestone Tire & Rubber Co. both of Akron, O.
- 53,282. Tire. Patented May 13, 1919. Term 14 years. E. H. Cooper, Kansas City, Mo.

- 53,316. Tire. Patented May 13, 1919. Term 14 years. W. O'Neill, assignor to The General Tire & Rubber Co.—both of Akron, O.
- 53,331. Tire. Patented May 20, 1919. Term 14 years. J. G. Gates, assignor to The Gates Rubber Co.—both of Denver, Colo.
- 53,348. Windshield cleaner. Patented May 20, 1919. Term 14 years. J. F. White, assignor by mesne assignment to White Products Co.—both of Chicago, Ill.
- 53,359. Rubber heel. Patented May 27, 1919. Term 14 years. W. H. Clarke, Akron, O.
- 53,372. Non-skid tire. Patented May 27, 1919. Term 14 years. C. B. Kleppenstein, assignor to Iowa Cord Tire Co.—both of Des Moines, Ia.

RECENT PATENTS IN URUGUAY.

According to a consular report, under date of March 21, 1919, the Ministry of Industries, Uruguay, granted patents on the following: improvements in suspenders; a substance known as "Tamponina" for the prevention and repair of punctures in tires; and a tire for vehicles.

JAPANESE TO PROTECT TRADE-MARKS.

It is reported that an association has been established at Osaka, Japan, for the purpose of protecting Japanese trade-marks against infringement, particularly in China where the subject matter of trade-marks is not regulated. Japanese business houses have suffered much by reason of the infringement of their trade-marks in China.

TRADE-MARKS IN URUGUAY.

A consular report from Asuncion, Uruguay, advises manufacturers who have not registered their trade-marks in that country to omit them on goods sent there, as it sometimes happens that individuals in Uruguay register such marks to prevent competitors from handling the line or for the purpose of exacting a premium for the right to sell goods bearing such marks.

PROTECTION OF TRADE-MARKS IN CHINA AND JAPAN.

A consular report calls attention to the importance of adequate protection of trade-marks in China. This may be accomplished by registering them with the customs officials in Shanghai and Tientsin, after which the superintendents of customs issue proclamations for their protection. Trade-marks should also be registered in Japan to secure adequate protection there.

HONDURAS HAS NEW TRADE-MARK LAW.

A new trade-mark law enacted in Honduras, effective August 1, 1919, provides for a registration fee of \$50 gold for each trade-mark registered. This fee will not be required, however, on applications filed prior to that date.

METHOD OF DETERMINING TON-MILEAGE OF TRUCKS.

A SIMPLE AND ACCURATE METHOD for figuring the ton-mileage of motor trucks is described by The B. F. Goodrich Rubber Co. Before arriving at the cost of truck operation it is essential to have the ton-mile figure for comparison with the average daily cost of operation. Such a system will allow the owner to compare the operating cost of one make of truck with another, and as well, truck haulage with horse and wagon delivery.

There are two classes of units used for measuring truck haulage. One is the absolute ton-mile, while the other is the commercial ton-mile. They should not be confused.

The absolute ton-mile is similar to that used in figuring railroad freight mileage. Because of the various systems of delivery, contingent on stops and loads to be dropped en route, what is called the commercial ton-mile is adopted as a standard of measurement. The absolute or railroad ton-mile is one ton carried one mile; thus, one ton carried five miles equals five ton-miles, and five tons carried one mile also equals five ton-miles. Similarly, five tons carried three miles makes fifteen ton-miles.

Absolute ton-miles should be figured in connection with motor truck haulage only when uniform hauls are made, that is, when one truck carries the same load over the same distance. By multiplying the number of miles covered by the number of tons carried the owner can easily determine the cost per ton-mile by the additional operation of dividing the average daily ton-mileage into the average daily cost of operation. The result will be the cost per ton-mile. These figures are indispensable in keeping an accurate account of delivery expense and profit.

The commercial ton-mile is figured for trucks employed in continually making deliveries of portions of their loads. The big majority of trucks are operated under this condition. It can readily be seen that absolute ton-mileage would necessitate separate figuring for each stop and would be decidedly impracticable. Hence, the commercial ton-mile used.

The information from which to figure the commercial ton-mile comes from the driver's card. All that is needed is the number of deliveries made, the weight of each load and the total mileage for the day. First, determine the average tons per trip. This is found by reducing the total number of pounds hauled to terms of tons, i. e., 12,000 pounds would be termed as 6 tons. The average tons per trip, or the average load, is found by dividing the number of tons hauled by the number of deliveries made, i. e., 6 (tons) divided by 5 (deliveries) equals one and one-fifth tons, or the average load. This result multiplied by the total mileage for the day gives the ton-miles. For example, if the mileage covered by the truck is 60, the ton-miles for the day amount to 72, or 60 times one and one-fifth. When the truck makes but one trip a day, multiply the mileage by the number of miles carried, thereby using the absolute ton-mile basis.

Ton-miles are nothing more than the units for measuring truck performance. The principle of ton-mileage may be applied to any class of motor-truck haulage whether the units are baskets, bundles, kegs, cases, or thousands of feet of lumber. For the concern which does not do its hauling in tons the same measure of haulage may be had by substituting for the ton the unit best served to measure the delivery system. Thus, instead of the ton-mile we have the package-mile, multiplying the number of packages delivered by the number of miles covered in delivering them, or the keg-mile, or the case mile.

INTERCONTINENTAL CLOSSES TORREON FACTORY.

The directors of the Intercontinental Rubber Co. have decided to close the factory at Torreon, Mexico, for an indefinite period, owing to the low price of crude rubber and present conditions in Mexico.

Review of the Crude Rubber Market.

NEW YORK.

DURING JUNE the tone of the crude rubber market has been dull and inactive. About the middle of the month the downward trend of prices resulted in large purchases by short interests. This was followed by a sharp reaction in the price of plantation first latex crepe, with the price falling promptly to the new low level of 40 cents. This is attributable to ample supplies in the hands of manufacturers and the reported excessive stocks in the Far East, London and New York. The month closed with nominal quotations.

PLANTATIONS. June 7, first latex crepe, spot 43 and 44 cents; June arrivals, 43 cents; July to December arrivals, 45 and 46 cents; 1920 arrivals, January to June, 47 and 46 cents; January to December, 47 and 48 cents. June 21, spot, first latex crepe was quoted at 40 and 41 cents; July to December arrivals, 43 and 42 cents; January to June, 1920, arrivals, 44 cents; January to December, 1920, arrivals, 46 cents.

June 7, spot ribs, 42 and 43 cents; July to September arrivals, 43½ and 43 cents; July to December arrivals, 44 and 45 cents; January to June, 1920, arrivals, 46 and 45 cents; January to December, 1920, 46 and 47 cents; June 21, this grade was: spot, 39 and 40 cents; July to September arrivals, 42 and 41 cents; January to June, 1920, arrivals, 43 cents; January to December, 1920, arrivals, 45 cents.

June 7, No. 1 amber crepe, spot, 39 cents; June 21, spot was 37 cents; June 7, No. 1 roll brown crepe, spot 30 and 29½ cents. June 21 this grade, spot, was quoted 28 and 30 cents.

The spot market was weak on plantation grades. Futures lower but not as weak as spot.

PARAS. On June 7 spot prices were: upriver fine, 56 and 56½ cents; islands fine, 46 and 47 cents; upriver coarse, 33½ and 34 cents; islands coarse, 21½ and 22 cents; Cameté coarse, 21½ and 23 cents; June 23, the spot quotations on these grades were: Upriver fine, 56 cents; islands fine, 47 cents; upriver coarse, 33½ cents; islands coarse, 21 cents; Cameté coarse, 22½ cents.

There was plenty of spot stock held at the above figures. The market at Pará held at higher figures, 66 cents being quoted for upriver fine.

NEW YORK QUOTATIONS.

Following are the New York spot quotations, for one year ago, one month ago and on June 25, the current date:

RECLAIMED RUBBER.

The market for reclaimed rubber continues very quiet. This condition will continue until the three controlling factors are modified. One of these factors is the extremely light demand for reclaim by the mechanical goods division of the rubber industry. This condition it is hoped will shortly disappear following with the advent of peace.

The other factors of market influence are the high prices at which dealers are holding scrap rubber which are well high prohibitive, and the low price of crude rubber.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert B. Beers, broker in crude rubber and commercial paper, No. 68 William street, New York City, advises as follows:

During July the demand for paper has been light and mostly from outside banks, the best rubber makers going at 5½ per cent to 5¼ per cent, and those not so well known at 6 per cent.

WEEKLY RUBBER REPORT.

CITICORP & CO., LIMITED, Singapore, report (May 1, 1919): Following advances of declining values in London and New York, the weekly rubber auction opened yesterday with a slightly weaker tone, and, in the earlier stages of the sale, not more than 76½ cents was paid for fine ribbed smoked sheet. Later in the day, however, dealers came in rather heavily and prices strengthened considerably, the advancement being maintained to the close. Fine pale crepe sold up to 79 cents (79½ cents was paid for one lot), showing a decline of ½ cent on the week. The top price for ribbed smoked sheet is ½ cent up at 78 cents (78½ cents was paid for one small lot), but very few lots sold at a higher figure than 77 cents. Clean brown and dark crepes were in strong demand and received advances of 1½ to 2 cents. Barky crepes received more attention than usual, and are 2 cents up on the week. Small quantities of plain smoked and unsmoked sheet sold at fairly good prices. The total quantity catalogued was 905 tons, of which 623 tons were sold.

The following is the course of values:

	In Singapore per Pound.	Sterling Equivalent per Pound in London.
Sheet, fine ribbed smoked.....	72 to 78c	2/0 to 2/0 1/2
Sheet, good ribbed smoked.....	71 to 75½	1/10½ to 1/11½
Sheet, plain smoked.....	58 to 61	1/6 to 1/6 1/2
Sheet, plain, unsmoked.....	53 to 57½	1/5 to 1/5 1/2
Crepe, fine pale.....	77 to 79	2/0 to 2/0 1/2
Crepe, good pale.....	73 to 76½	1/13 to 1/13 1/2
Crepe, fine brown.....	65 to 69	1/9 to 1/9 1/2
Crepe, good brown.....	58 to 65	1/7 to 1/7 1/2
Crepe, dark.....	45 to 59	1/3 to 1/3 1/2
Crepe, bark.....	39 to 47	1/13 to 1/14
Scrap, virgin and pressed.....	35 to 42½	1/0 to 1/0 1/2
Scrap, loose.....	29 to 30	1/11 to 1/11 1/2

¹ A quintal = 230.46 pounds.² A lire = \$0.193.THE MARKET FOR SCRAP RUBBER.
NEW YORK.

THERE HAS BEEN NO IMPROVEMENT in the scrap rubber market over the generally poor condition that has characterized it for the past few months. The most important factor in maintaining this condition is the weakness in crude rubber and the large spot supplies of it available in New York. Scrap dealers and reclaimers are considering the possibilities for export trade to Europe.

Prices on all grades of scrap rubber are nominal and stock movements are at a minimum. The business is confined practically to dealings in mixed auto tires, repairables and automobile fabric.

The following quotations are nominal.

THE MARKET FOR COTTON AND OTHER FABRICS.
NEW YORK.

UNFAVORABLE WEATHER, reduced acreage and scarcity of labor are responsible for the strong position of the market for American cotton during the past month. According to the general outlook, only a moderate crop is expected. On June 2, middling uplands, spot, was 32.80 cents, and with the exception of a decline early in the month, the market has advanced and June 23 the quotation was 33.50 cents.

The following report concerning the Egyptian, Arizona and Sea Island cotton situation is furnished by John Malloch & Co.:

EGYPTIAN COTTON. Prices have not changed, the selling being still controlled by the commission. This condition, however, will probably change after July 31, as the Cotton Control Commission will cease to buy cotton after that date. There is a very large stock of Egyptian cottons of all kinds in Alexandria, but thus far no plan has been announced for disposing of this accumulation, which is owned by the commission. The future contract market in Alexandria is still closed, although the Liverpool Egyptian future market reopened on June 2. The general tendency is for firmness in fall deliveries, figures being quoted a cent or two above present fixed prices. The growing crop in Egypt is doing well thus far, but a water scarcity is feared later on, which may affect the quality of the cotton rather than the quantity. Acreage estimates are not yet available, but it is understood that there is considerable increase over last season.

AMERICAN EGYPTIAN COTTON. Conditions in Arizona have been favorable to the growing crop, and it is expected that from 45,000 to 50,000 bales will be grown in the Salt River valley during the present season. Last year's crop is practically sold, but small quantities of desirable cotton are still available at around 53 to 55 cents for prompt delivery. New crop prices are not available at this time.

SEA ISLAND COTTON. The better grades of Sea Island cotton are becoming very scarce and hard to buy, most holders desiring to sell round lots which contain a fair quantity of low grades. A first cost price of 60 cents is being asked in the South. There have been sales of average extra choice recently at 61 cents, but it would take at least 63 cents to move any appreciable quantity. This marks a rise of fully 10 cents per pound since early May.

Various estimates of the growing crop in Georgia and Florida agree that there has been a tremendous reduction in acreage, and the average guess places the probable number of bales which will ultimately be ginned next fall at around 25,000, as compared with a normal crop of 90,000 to 120,000 bales a short time ago.

DUCKS AND DRILLS. The market has been exceedingly strong and all cloths of standard construction are scarce. Prices have all advanced.

RAINCOAT FABRICS. Stocks appear to be all sold for several months ahead. Prices are advancing in the face of a steady demand for all grades.

TIRE FABRICS. The steady call for tire fabrics of all grades has continued through the month with a noticeable scarcity of standard grades. The price undertone is firm and quotations are a little lower than last month.

THE MARKET FOR CHEMICALS AND COMPOUND-INGREDIENTS.
NEW YORK.

THE MARKETS for the base metals, pig lead, and spelter, have been marked by little change except a slight tendency to advance toward the close.

The demand for rubber chemicals and ingredients has improved since last month and the price situation is about the same, with the exception of a lower tendency noted in certain materials.

ANILINE. There has been a good demand the entire month with the price steady, between 21 and 22 cents per pound.

BARYTES. The demand has steadily increased and has become fairly active. The price remains steady at \$21.50 per ton.

BENZOL. This material is gaining in use as a motor fuel, which tends materially to increase the demand and stiffen the price, which remains firm at from 22 to 27 cents per gallon.

CARBON TETRACHLORIDE. The demand has continued weak during the month, with prices unchanged.

GILSONITE. This is sold at higher prices than those prevailing before the heavily increased freight rates went into effect, but there is this advantage that shipments can now come forward all rail at the same rate as applies for rail and water, insuring quicker deliveries and arrivals in better condition.

LITHARGE. There has been a fair demand, and the price steady at 10½ cents per pound.

LITHOPONE. The demand has been particularly active the entire month, following the reduction of the price to 6½ cents per pound. Early in the month 144 tons which had been held by the United States Navy was marketed at auction. Manufacturers are said to be working to capacity to meet the growing demand.

WAXES. These are higher. All importations are taken up quickly by the trade. Carnauba waxes were quoted two weeks ago at about 4 cents per pound below the primary market prices, but the market is gradually working up to a parity, prices having advanced an average of 6 to 7 cents per pound within the last month. There is a heavy demand for montan wax, with no stock available, and there will be no stock until the growing demand is opened up.

WHITE LEAD. There is a very steady call for white lead. The price remains fixed and is not expected to change before November 30.

WHITING. The market for whitening holds steady. Receipts of foreign supplies are influencing lower prices.

ZINC OXIDE. American-made zinc oxides are said to equal in quality the best grades of foreign manufacture. This condition bids fair for a good American export trade in this product. The domestic demand continues to be very active.

The New Jersey Zinc Co. has abolished the usual quarterly price schedule. This indicates that contracts will be made with the trade for a longer period than formerly, and should have a beneficial effect on the market for all lead products.

NEW YORK QUOTATIONS.

JUNE 25, 1919.

SUBSCRIPTIONS: \$3.00 per year, \$1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, \$3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank draft. Post Office or Express money order on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**THE RISE OF RUBBER AND FABRIC SHOES.**

RUBBER, THE GREAT SUPPLANTER, is making as remarkable headway in the footwear field as it has made in many other lines of manufactured goods. Time was, for example, when all fire hose and all belting was of leather. Now all fire hose is of rubber and fabric, likewise most belting. Rubber is constantly entering new fields—often with difficulty, fighting its way into favor and eventually, through superiority, economy or both, supplanting or partially supplanting its rivals.

As most innovations gain momentum slowly, so it was at first in introducing rubber and fabric shoes for general summer wear. The merits of the early so-called "tennis" shoes for athletic sports and outing purposes were quickly recognized and a large annual output resulted. These shoes were efficient and economical, but not attractive to the eye. Then came the perfection of leather-topped fiber soles and heels, whereupon rubber men began to foresee the unlimited possibilities which this development opened up. High and low shoes of many styles for men, women and children were quickly brought out with duck uppers of several colors, and by the application of welt construction, Louis heels, and or-

namental bows and buckles, a new type of pumps, Oxfords and Bals was produced that combined style, comfort and serviceability with moderate cost. Heavy waterproof work shoes for both indoor and outdoor wear were also placed on the market at \$2.50 to \$3.50 per pair.

Only the sales problem of bringing about the general adoption of the new footwear appeared to remain. The shoes would have sold on their fine appearance alone but for the skepticism and conservatism of human nature. Advertising did much, however, and the trade was growing satisfactorily at the outbreak of the war. Then came the leather shortage and increasing wages, and prices began to soar until at present high-grade leather shoes for both men and women that formerly sold at \$5 to \$10 per pair are now bringing nearly three times those figures.

Persons obliged to combat the rising cost of living turned to the new footwear and found it as durable as it was attractive and learned through experience that the claims of greater summer comfort were not overstated. To-day the rubber and fabric shoe is the most popular hot-weather footwear in the world. Millions of persons are wearing it and the demand is constantly greater than the supply, despite ever-increasing manufacturing facilities. This, however, is but a beginning. All-weather footwear made by great rubber factories is already popular. The problem has become one not of sales but of production. The new footwear may never completely supplant leather shoes, yet this development of the rubber industry promises to become second only in magnitude to that of the rubber tire.

WORLD STANDARDIZATION OF WEIGHTS AND MEASURES.

ONE OF THE MOST PECULIAR ANOMALIES in history is the fact that the weights and measures of Great Britain and of the United States are German, whereas those of Germany are British. The British pounds, both sterling and avoirdupois, originated with the old German Osterling Hanseatic League, which controlled the trade of England for hundreds of years until ousted by Queen Elizabeth. The Germans forced these old standards on the British, who in turn imposed them on the American colonies. But the remarkable fact is that, despite their absurd complications, they continue in use among the English-speaking peoples, although as long ago as 1871 Germany adopted the simpler decimal system of weights and measures invented by that great Briton, James Watt, in 1783.

Just as all the world has adopted the alphabet of letters for written expression, each people in its own language, and the Arabic numerals for mathematical computation, so there is need of a universal scheme of weights and measures such as the metric system affords. To-day America and Britannia are the only civilized nations that have not adopted this system and thereby find themselves in the strange position of lagging behind the march of

progress. That their foreign commerce is greatly hampered by failure to scrap these obsolete standards is obvious, and that both must eventually accept the new order of things cannot be doubted.

With its raw material produced in the tropics and manufactured in the temperate zones, the rubber industry is of such a pronounced international character that it would unquestionably be benefited by universal employment of the metric system, and the American rubber trade at least will probably lend its hearty support to the campaign for adoption by America and Britannia being waged by the World Trade Club of San Francisco.

PAY FOR RUBBER PLANTATION LOSSES.

ANTICIPATING THE LIKELIHOOD of early Congressional action on the Mexican problem, the National Association for the Protection of American Rights in Mexico is circulating blank forms on which owners of Mexican property who have suffered loss through revolutionary activities may summarize their claims against the Mexican Government for presentation to Congress by the association.

The information sought on which to base claims includes description and location of property lost, destroyed, damaged or confiscated, and how; the names of the faction responsible and of the leader of the party, also the amount of the claim.

Full particulars are asked regarding all American citizens killed or injured and regarding all American women and children outraged. Corporations are asked to state the number of male and female stockholders and the amount of money paid in by stockholders.

The losses of the American rubber interests in Mexico will alone make a large total. Hundreds of thousands of acres of rubber plantations have of necessity been abandoned and buildings destroyed. Claims for these losses should be satisfied.

THE EMPLOYMENT MANAGER.

EMPLOYERS have come to recognize that the science of hiring men and keeping them requires an expert with as keen an intelligence as is demanded in the sales or purchasing department. Selecting the proper man for the proper place, grading employees according to their capabilities and starting them out with the realization that loyalty to the firm will be recognized as a prerequisite to advancement are essential qualities in the makeup of the employment manager. One who possesses proper qualifications is invaluable in any industrial establishment and given a free hand can make his department of the first importance. In dealing with the men he must have not only a few simple rules of procedure, but a knowledge in detail of the requirements of the work and the fitness, ability and adaptability of the help.

Once hired, a man should be kept unless experience demonstrates absolute unfitness or lack of adaptability.

Ceaselessly the employment manager must see that the little causes of friction which constantly arise in the conduct of a shop or factory are ironed out quickly and quietly. Tact in dealing with political, religious and racial questions is also a prime requisite. When it is necessary to transfer a man from one department to another, the reasons therefor should be noted as a guide to the future.

There is, of course, such a thing as too much efficiency, so much that the human element is lost sight of. If the employee comes to feel that he is but a cog in the great machine, a unit in a card-indexing system, the very object for which the employment manager is working may be defeated. There is no definite standard by which an employment manager can regulate the conduct of his department, but a careful checking up of results at the end of a year will show whether he has been successful or not. His job is in a class by itself, requiring a combination of experience, diplomacy and knowledge of human nature, second only to the head of the administrative offices itself.

PATENTS UNDER THE PEACE TREATY.

OF MUCH MOMENT to the rubber and allied industries is that section of the peace treaty which provides that Americans who were prevented during the war from patenting their inventions or registering trade-marks in Germany or other signatory countries may now do so within six months after the treaty became effective. Patents may be renewed in Germany or any of the other signatory countries by fulfilling the requirements of the war period beginning August 1, 1914.

The licensing and liquidation of German-owned American patents by the United States during the war are recognized as valid and remain effective. Germany waives the liability of the United States for infringement, but the right of Americans to sue for infringement during the war by the German Government or German individuals is not waived. A list of the alien enemy rubber patents available under license was published in *THE INDIA RUBBER WORLD*, July 1, 1919.

Had Germany been able to procure the amount of rubber she required, the number of American infringement suits would doubtless have been considerably increased.

AMERICAN SHIPS LOADED WITH GOODS WILL SOON SET sail for Germany. England and France have already issued permission for trading with the Teuton. The much-talked-of boycott therefore falls to the ground. If one sells to Germany, one must buy from Germany, which is of course sensible and unavoidable.

THE CORN PRODUCTS REFINING CO. AT ITS GREAT plant at Argo, Illinois, will, hereafter, refuse to employ any who do not speak English. Some 700 aliens, said to be I. W. W.'s, will be dropped through this ruling. Tickets to Russia and a speedy bon voyage would be an added relief.

The Sumatra Plantation of the United States Rubber Plantations, Inc.

THIS IS A GENERAL VIEW OF THE HOSPITAL AT THE SUMATRA PLANTATION OF THE UNITED STATES RUBBER PLANTATIONS, INC., WHERE EMPLOYEES RECEIVE THE BEST OF MEDICAL ATTENTION.

AN EXAMINATION of the statistics of the rubber industry reveals the singular fact that while America is the largest consumer of rubber in the world and has invested millions in the manufacture of rubber goods, the amount invested in the actual production of crude rubber is comparatively negligible. The vast rubber manufacturing industry of the United States is almost entirely dependent on supplies from foreign producers. That this state of affairs will not long continue is shown by an increasing interest in planting, and certain representative rubber men have not been slow to seize the exceptional opportunities granted by Sumatra for their capital and energy.

Few great American enterprises in foreign lands have so much interest for American citizens as the big rubber plantation

EARLY DEVELOPMENTS.

The Sumatra plantations of the United States Rubber Plantations, Inc., first came into existence in 1910 under the name of the Holland-American Plantation Co., a subsidiary of the General Rubber Co. of New York, which is also a subsidiary of the United States Rubber Co.

After a thorough investigation by well-known plantation experts of the possibilities of successfully growing rubber in the Far East, it was decided that the northeastern shore of Sumatra, a Dutch island, offered by far the most favorable conditions.

In May, 1910, the Soengei Sikassin estate was bought and subsequently ten other contiguous estates were acquired until the company owned in one piece of irregular shape a tract

THE NATIVE PATIENTS ARE PROVIDED WITH EVERY COMFORT AND EXPERT MEDICAL ATTENTION, HERETOFORE UNKNOWN IN ORIENTAL HOSPITALS.

THIS IS ONE OF MANY WEEDING GANGS, COMPOSED OF MEN AND WOMEN EMPLOYED ON THE PLANTATIONS, FOR WEEDING YOUNG TREES.

of the United States Rubber Plantations, Inc., in Sumatra. Far away on the other side of the world, in the midst of Oriental conditions, lies this great rubber-growing tract, a project developed by Yankee genius and Yankee capital.

comprising 81,000 acres, or some 133 square miles, measuring 30 miles across its greatest length and 20 miles across its greatest width. This tract is only 17 miles inland from the port of Tandjong Balei Bale and 105 miles south of the city of Medan,

a place of 27,000 inhabitants. From the outset it had also the advantage that much of it had already been cleared and well drained for tobacco growing and that more than 175 miles of good roads had been built.

THE BEGINNING OF PLANTING.

Planting was begun in June, 1910, only a month after the initial purchase, and the speed with which it was pushed may be inferred from the fact that by the end of the year 15,000 acres had been planted with growing trees. By the end of 1913 about 34,000 acres, or over 53 square miles, had been planted with *Hevea brasiliensis*. The trees were planted nineteen feet apart each way, 121 trees to the acre, with the view of bringing 100 trees per acre into bearing.

THE FACTORY OFFICES ARE HOUSED IN A BUILDING OF MODERN CONSTRUCTION.

The company also acquired two detached estates, one at Langkat and the other at Si Pare Pare. These were handled as separate estates. Their area is approximately 7,000 acres, about 5,000 acres of which are now bearing.

The plantation managers assured the directors of the home company that they would have rubber from their own plantation in five years' time, but the growth was so rapid and healthy that rubber was obtained from newly-planted trees in less than four years.

Notwithstanding its size, the plantation is one of the cleanest and best kept in the East, the managers believing that the heavy initial expense of pulling out stumps and roots and thoroughly clearing up the ground, though large, is warranted by the ulti-

THERE ARE SIXTY-FIVE MILES OF RAILROAD ON THE PLANTATION.

mate result. About 20,000 coolies, representing a half-dozen contiguous nationalities, are employed on the plantations.

EMPLOYEES' WELFARE CONSIDERED.

The company gives careful attention to the welfare of its employees. It finds its chief difficulty in work along welfare

lines in the well-known hostility of the Asiatic to anything that is new. But step by step the company is making progress in this phase of its work. Especial efforts are made to give the various nationalities represented the sort of diet and home surroundings to which each is accustomed.

If the coolies are so well taken care of, it may be realized that the numerous European staff is excellently provided for.

THESE BUILDINGS ARE PART OF THE FACTORY WHERE THE LATEX IS CONVERTED INTO CRUDE RUBBER.

Indeed, the estate is dotted with the tastefully built and decorated dwellings of directors, managers, assistants, chemists, and botanists. Drainage is properly looked after and a filter supplies the necessary pure water for drinking purposes.

As the plantation is rather removed from centers of amusement, the tedium which would otherwise characterize the leisure hours of the staff is relieved by ample means of diversion, there being football fields and tennis courts, a club and a motion-picture theatre.

A MODERN HOSPITAL.

One of the features of the plantation company's efforts on behalf of its employes that has attracted wide attention all through southern Asia is a large hospital which is regarded as the best

THESE FIVE-YEAR-OLD TREES HAVE ALREADY BEEN TAPPED AND WILL CONTINUE TO PRODUCE INCREASING QUANTITIES OF LATEX.

in the Asiatic tropics. The Dutch Government has shown its appreciation of this by conferring a medal on the company.

The hospital is equipped to take care of 800 patients, and is situated on the road from Kisaran to Tanah Radja on a site giving good drainage. Adjoining the hospital twenty-two acres have been reserved on which are situated the quarters of the head doctor and the hospital staff, as well as a hospital for Europeans. The buildings are of brick plastered with cement, while the floors are of concrete, cleanliness and ventilation being carefully provided for. The wards number thirteen, and every room has sufficient space for fifty sleeping tables. Each table

consists of a white lacquered iron frame, on top of which are white lacquered planks. To each table belong a mat, a head-cushion and a blanket. Mosquito-proof wards are provided for malaria patients and special wards are set apart for the treatment of anemia and beri-beri. Filtered water is furnished from a near-by well under pressure. Food in the hospital is prepared for the Chinamen by Chinese cooks and for the Mohammedans by Javanese. The staff includes both European and native surgeons and chemists.

THE WORLD'S LARGEST RUBBER ESTATE.

At the present time the company owns property in Sumatra aggregating about 90,000 acres, of which 45,000 acres, or approximately 70 square miles, are fully planted. This constitutes the largest group of rubber estates in the world. Perhaps the New Yorker will obtain a clearer conception of its size by the statement that the planting acreage is over three times the size of Manhattan Island. If its more than five million trees were planted in a row nineteen feet apart—the distance between each tree on the plantation—they would extend over 19,000 miles, or more than three-quarters the distance around the world.

PRODUCTION STEADILY INCREASING.

During 1914 the first shipment of rubber from the company's own plantations was received in America, and while the quantity

HERE THE RUBBER IS BEING BLOCKED AND BALED FOR SHIPMENT TO THE HOME FACTORIES.

that year and also in 1915 was relatively small as compared with the requirements of the United States Rubber Co., the amount received in the ensuing period has steadily increased. About eighty-five per cent of the trees on the plantations are now in bearing, and with many young trees arriving at the bearing age and all the trees increasing in yield with their increasing girth, the plantations will produce more and more rubber each year.

A VALUABLE ASSET.

Due to the efficiency of the Dutch planting organizations and the able staff of the company, the yearly development program has been carried out practically without interruption. Extensions to the planted area are contemplated at an early date, and the outlook for the future is regarded as promising. Already the plantations are proving to be one of the most valuable assets of the United States Rubber Co.

RUBBER CEMENTS. ACID PROOF.

RUBBER cements may have varied composition. If equal parts of fresh unvulcanized rubber and oil are used the mass is so stiff that it could probably be used alone. If as much as four parts of linseed are used considerable filler can be incor-

porated and make a workable putty. Equal weights of rubber and boiled oil are taken; the rubber is first dissolved in carbon disulphide in the proportion of 4 cc. of carbon disulphide to 1 gr. of finely cut rubber. Boiled linseed oil is then mixed in, and if the oil is warm the mixing is facilitated. The solvent is generally not removed by evaporation until the paste is applied.

Another formula differs in having four times as much boiled linseed oil and then fire clay or other filler, such as siliceous, is used.

	Parts of Weight.
Crude, finely cut rubber.....	1
Linseed oil, boiled.....	4
Fire clay.....	6

MARINE GLUE.

Standard preparation of this class of cements, which are applied to crevices, hot, and get firm but not brittle when cold, is composed as follows:

	Parts of Weight.
Crude rubber.....	1
Shellac.....	2
Pitch.....	3

The rubber is first dissolved in carbon disulphide or turpentine before mixing with the heated (not superheated) mixture of the other two. The advent of blown petroleum residuums has made it possible to make up hard but flexible compounds without rubber. Grahamite is a good base to which fluxes, such as these just mentioned or soft asphalts, are added.

GASKET COMPOSITIONS.

In the laboratory one can generally make out for low temperatures and pressures by saturating heavy "kraft" wrapping paper with soft pitch, such as wood pitch for steam or with gelatine and glue (hctograph) composition for oils. For high pressures, slots filled with lead rings and a V-shaped rim to the lid are most satisfactory.

MACHINISTS' CEMENTS.

A few words might be said here with reference to machinists' cements. These are the well-known red and white leads. The red lead is often diluted with an equal bulk of silica or other inert substance so as to make it less powdery on drying. The best way to accomplish this is to add rubber or gutta percha to the oil as follows:

	Parts of Weight.
Linseed oil.....	6
Rubber or gutta-percha.....	1

The rubber or gutta percha is dissolved in sufficient carbon disulphide to give it the consistency of molasses, mixed with the oil, and left exposed to the air for about 24 hours. The red lead is then mixed to a putty. Oxide of iron makes less brittle cements than red lead.

LEATHER CEMENTS.

The following formulas are given in the "Papier Zeitung": (1) equal parts of good hide-glue and American isinglass, softened in water for 10 hours and then boiled with pure tannin until the whole mass is sticky. The surface of the joint should be roughened and the cement applied hot. (2) One kilo of finely shredded gutta percha digested over a water-bath with 10 kilos of benzol, until dissolved, and 12 kilos of linseed-oil varnish stirred in. (3) Seven and one-half kilos of finely shredded india rubber are completely dissolved in 10 kilos of carbon disulphide by treating while hot, 1 kilo of shellac and 1 kilo of turpentine are added, and the hot solution heated until the two latter ingredients are also dissolved. Precautions against fire and vapors should be observed. (4) Another one noticed in the "Journal of the Society of Chemical Industry": gutta percha, 8 ounces; pitch, 1 ounce; shellac, 1 ounce; olive oil, 1 ounce. These are melted together.

SOUVENIRS.

The Pioneer Asphalt Co., Lawrenceville, Illinois, is presenting its customers with a novel "Redipoint" pencil.

A useful desk souvenir from the Rolle Rubber Co., of New York and Chicago, is a permanent stone blotter.

Prices of Rubber Products.

From "Prices of Rubber and Rubber Products," War Industries Board, Press Bulletin No. 30, Prepared by Isador Lubin, Special Expert, Price Section, War Trade Board.

RUBBER PRODUCTS.

THERE APPEARS TO BE NO LIMIT to the variety of products in the manufacture of which rubber is employed, and it is said that one of the large rubber concerns in this country manufactures nearly 30,000 different articles. Rubber goods vary from conveyor belts to the finest elastic bands; all of which, however, can be grouped in nine important categories.

The following is a classification of the important rubber products in the order of their importance as determined by the amount of crude rubber consumed in their manufacture.

TABLE I.—CRUDE AND RECLAIMED RUBBER CONSUMED IN THE UNITED STATES IN THE PRODUCTION OF RUBBER GOODS, 1917.¹

Class.	Crude rubber consumed, total.	Per cent of rubber consumed, total.	Reclaimed rubber consumed, total.	Per cent of rubber consumed, total.
Automobile tires and tubes, long tons	110,270	70.0	21,006	23.5
Mechanical rubber goods	21,323	14.0	33,633	38.0
Boots and shoes	12,688	8.0	15,778	18.0
Druggists' and stationers' sundries	3,732	2.0	176	.2
Insulated wire, and insulating compounds	2,756	1.7	8,470	9.5
Waterproof clothing and cloth	2,176	1.3	5,667	6.3
Rubber cement	1,462	1.0	9	0.0
Hard rubber goods	1,166	1.0	2,163	2.0
Miscellaneous	1,798	1.0	2,266	2.5
Total	157,371	100.0	89,168	100.0

DEVELOPMENT IN THE UNITED STATES.

The United States has always led the world in the manufacture of rubber goods, the industry having had its inception here. The output is approximately seven times as large as that of the next manufacturing nation, and its growth is shown by the fact that in 1906 we consumed 24,113 tons of crude rubber, as against 13,838 tons consumed by Great Britain, the next largest consumer; in 1917 our consumption had reached 157,369 tons, as compared with 25,983 tons consumed by Great Britain. This was an increased consumption for the United States of approximately 130,000 tons, or about 600 per cent. The consumption of Great Britain increased by 12,145 tons, or about 100 per cent in the same period.²

It is evident from Table I that rubber tires and tubes are the most important products of the industry, having taken over 70 per cent of the total crude rubber consumption in 1917. In 1914 the United States produced 8,021,371 pneumatic tires, while in 1917 the output amounted to 25,835,573 tires.³

Commensurate with the growth of automobile tire production has been that of other rubber products. In 1917 the total value of the rubber goods output in the United States had reached \$896,000,000, as contrasted with \$301,000,000 in 1914.

FINISHED RUBBER GOODS.

The great number of products turned out by the rubber industry and the limited space available makes impossible as comprehensive an analysis of price fluctuations as would otherwise be desirable. An attempt was made to select representative commodities which would fairly portray the price situation in the various branches of the industry, and for this purpose the method of classification adopted by the War Service Committee of the Rubber Industry of the United States for determining the amount of crude rubber which went into the various forms of rubber goods was used. As shown in Table I, this classification consists of nine sections.

Because of difficulties experienced in securing price quotations, however, it was found necessary to omit certain classes of goods. The most important of these was insulated wire. It appeared impossible to separate the price of insulating materials from that of the finished insulated wire, so that quotations for this class would have little worth in showing price fluctuations. The classes of products included are as follows:

1. Tires and tubes.
2. Mechanical rubber goods.
3. Boots and shoes.
4. Druggists' sundries.
5. Waterproof clothing.

Reference to Table I will show that the branches of the industry producing these goods took 94.3 per cent of the total rubber consumption of the United States in 1917, and it is believed that together they are fully representative of the total rubber product output of the country.

TIRES AND TUBES.

This type of rubber goods has been divided into 3 groups: (1) automobile pneumatic tires, (2) solid tires, and (3) automobile pneumatic tubes. Since approximately 50 per cent of the automobiles in the United States in 1917 were Fords, it is reasonable to conclude that about one-half of the pneumatic tires manufactured in that year were of the size used on such cars. Therefore 30 by 3½ inch tires, together with the 33 by 4 inch size, which is another variety commonly used, were selected as the types for which prices are quoted. Corresponding sizes were taken as most representative for automobile tubes.

As regards solid tires, which have played an ever-increasing part in the rubber industry, the 36 by 5 inch type which was used in considerable quantities by the United States Motor Transport Corps was selected as representative.

MECHANICAL RUBBER GOODS.

A number of commodities are included in this general category, namely: belting, hose, packing, tubing, lining, tape, and innumerable other rubber goods. The most important are belting and hose, and their price fluctuations have been used to characterize the situation in the mechanical goods section.

BOOTS AND SHOES.

For this branch of the industry, two samples have been selected: (1) rubber boots, and (2) arctics. The types taken as representative are of relatively standard variety and form an important part of the sales of a large producer of boots and shoes.

DRUGGISTS' SUNDRIES.

Hot-water bottles and ice bags may be considered the most typical of the products of the manufacturers of druggists' sundries. Two types of hot-water bottles which have an extensive sale were used in quoting prices for this class of goods, while in the case of ice bags there were selected three styles which were sold in large quantities by two important manufacturers.

RUBBER CLOTHING.

Rubber clothing, according to The Rubber Association of America, may be divided into two distinct classes: (1) calendered rubber clothing, (2) double and single texture raincoats.

¹ These data were secured by The Rubber Association of America through a questionnaire sent to 503 consumers of rubber, 448 of whom replied.

² Memorandum on the Rubber Industry.

³ The growth of the rubber tire industry is well reflected in the patents issued by the United States Patent Office. Fully one-half of the American patents issued in 1916 relating to rubber apply to rubber tires, tread, tire-building, tire-repair machines, rims, etc.

FIG. 1.—U. S. Consumption, Rubber, 1917.

Price quotations were secured for five representative varieties of the former class and for four of the latter. In the calendar rubber clothing class the following have been included¹:

1. Sheetting (dull finished).
2. Double-coated fire coats.
3. Jeans (dull finished).
4. Single-texture westerns.
5. Double-texture cowboys.

Under double and single texture clothing have been classed:

1. Bombazine raincoats.*
2. Cashmere raincoats.*
3. Woolen raincoats.*
4. Women's raincoats.*

METHODS OF MAKING CHARTS.

In order to determine the relation between crude rubber prices and those of rubber products, and in order to define further the bearing of the price situation in the rubber industry as a whole on that in other industries, a uniform method of averaging price fluctuations was resorted to, and the method used in all the bulletins of the present series was applied to rubber.

After selecting representative articles to typify the various classes of crude rubber and rubber products, monthly quotations were secured from trade journals and from members of the trade for the period 1913 to 1918. (See Tables III and V.) Prices of the more important grades of crude rubber, as well as of the more important rubber goods, were then individually averaged on the basis of their pre-war level and charted. Since the inquiry centers about the effect of the war upon prices, the charts were made to show the movement of prices away from the pre-war level. This effect was produced by treating the average of the actual prices for the twelve months preceding the outbreak of the war (July, 1913, to June, 1914) as equal to 100, and reducing the actual prices for each month from January, 1913, to December, 1918, to the form of relative prices on that scale. Thus, for example, if the selling price of a given unit of a product averaged \$2 in the year ending June 30, 1914, and fell to \$1.80 in 1915, the relative price of that product for that month would be 90; if the price rose to \$4 in June, 1918, the relative price would be 200.

The numerous price charts scattered throughout this bulletin, as well as through the other studies of the series, were drawn

*Double-texture. bSingle-texture print.

FIGURE 2. WEIGHTED INDEX NUMBERS OF PRICES OF RUBBER PRODUCTS AND "ALL COMMODITIES".—BY MONTHS, JANUARY, 1913, TO DECEMBER, 1918. (AVERAGE QUOTED PRICES, JULY, 1913, TO JUNE, 1914=100.)

FIGURE 3. RELATIVE PRICES OF RUBBER TIRES: SOLID RUBBER (36 BY 5); PNEUMATIC PLAIN TREAD (30 BY 3 1/2).—BY MONTHS, JANUARY, 1913, TO DECEMBER, 1918. (AVERAGE QUOTED PRICES, JULY, 1913, TO JUNE, 1914=100.)

FIGURE 4. RELATIVE PRICES OF MECHANICAL RUBBER GOODS: CONVEYOR BELTING; WATER HOSE.—BY MONTHS, JANUARY, 1913, TO DECEMBER, 1918. (AVERAGE QUOTED PRICES, JULY, 1913, TO JUNE, 1914=100.)

on this uniform scale,² and under this arrangement all the relative price charts in the present series of price histories are comparable with one another.

For those who are interested not merely in the fluctuations of particular commodities such as rubber tires or rubber clothing, but also in the price fluctuations of the class of rubber products as a whole, "index numbers" are provided. A simple average of commodities sold—some by the dozen, some by single units, and some by the foot, as is the case with hot-water bottles, rubber tires, and rubber hose, respectively—would obviously be of little value. Therefore in making index numbers, each individual commodity is "weighted" by multiplying the monthly prices from 1913 to 1918 by the amount of the commodity produced in the United States in the year 1917, plus imports. In the case of crude rubber, since there is virtually no domestic production, the imports for 1917 are used as the weighting factor. The year 1917 was selected as the weighting year so that war-time conditions could be reflected. Figures for 1918 may have been more typical of the war situation, but such data were not available for many commodities when the studies were being written.

TABLE II.—IMPORTS OF CRUDE RUBBER INTO THE UNITED STATES, 1913 TO 1918.³

	1913.	1914.	1915.	1916.	1917.	1918.

Total	51,480	60,726	102,824	115,043	167,062	156,215

¹ These samples of rubber clothing are designated by their respective trade names and have been selected with the aid of The Rubber Association of America.

² The one exception to this statement is the case of dyestuffs, where the extraordinary rise in prices necessitated a change in scale.

³ Since the amount of crude rubber re-exported from the United States is practically negligible, the figures presented in the above table may be taken as analogous to our rubber consumption. Data from THE INDIA RUBBER WORLD, 1917.

⁴ Caucho has been included in Paras.

⁵ Included in "all other" from 1913 to 1916.

TABLE III. WHOLESALE PRICES OF RUBBER PRODUCTS BY MONTHS QUARTERS AND YEARS: 1913-1918. I.

[illegible]

Pieces of rubber products from private firms,

A review of the successive steps taken in making these index numbers will illustrate the process. In dealing with crude rubber, for example, the amount of each individual type imported into the United States in 1917 was first determined, and this amount was adopted as the weighting factor. (See Table II.) Secondly, the price of each type in every month of the six-year period covered was multiplied by this weight. Thirdly, the products of the prices of the nine different types of rubber, times their respective weights, were added up separately for each month; and, finally, these monthly aggregates were turned into relatives on the pre-war base; that is, the average of the aggregates for the 12 months, July, 1913, to June, 1914, was made equal to 100, and all the other individual monthly aggregates converted into relatives on that scale.

The method adopted in weighting rubber products was somewhat different. In this instance, because of the lack of information regarding the amount of the various classes of goods produced, it was found necessary to give to the individual classes a weight which was proportionate to their importance in the entire rubber industry. The amount of rubber consumed in the manufacture of the various types of goods was here used as the determining factor (see Table I), and the number of tons of rubber which went into the production of each class was used as the weight for that class.

It is apparent that index numbers made on this plan for the entire rubber industry are comparable with the relative prices for individual commodities as shown in the various charts. By using these index numbers the reader can get a clear idea of average price fluctuations in the rubber industry as a whole and can have at the same time a basis for comparing such fluctuations with those in other industries.

RUBBER PRODUCT PRICES.

To understand fully the course of the prices of rubber goods during the war period, it is necessary to review briefly the status of the rubber industry in the years prior to 1913. The first two years of the present decade saw the plantation industry still in its infancy, and in 1911 the amount of rubber taken by the five leading rubber-consuming countries surpassed the world's total production. A similar situation, in a less marked degree,

existed in 1912, and two-dollar rubber was not uncommon. Talk of synthetic rubber and the future sources of supply was rife in the trade and 1913 opened with rubber prices around one dollar and rubber products still reflecting the high level of the previous year. It should, therefore, be borne in mind that the base year (July, 1913, to June, 1914) was one of high prices for the rubber industry and that these high prices were the result of crude rubber costs. Later, the situation changed, and in 1917 and 1918, after a period of relative sluggishness, the price of rubber goods rose to a point above the pre-war level. This time the high cost of cotton fabrics and other ingredients was the controlling factor; indeed crude rubber prices in these years were considerably below their pre-war level.

Rubber products did not feel the effects of the speculative price rises experienced by crude rubber at various intervals during the six years here considered. Unlike crude rubber, the prices of finished products continued along a more or less level path, broken at relatively few points, tending downward throughout the first half of the period and upward during the second. It will be noted, on the one hand, that the rise in the price level of rubber goods began almost simultaneously with that of all commodities (see Figure 2), while on the other hand it lagged almost a year behind the rise in the level of ingredients, such as cotton and chemicals.

Rubber goods in general, however, never reached the high level of either their ingredients or commodities in general, the low price of crude rubber having exercised a tempering effect. Thus the rubber-product price level had by the latter half of 1918 advanced but 57 per cent above its lowest point in the past five years, while prices of the ingredients rose by 164 per cent. The index for "all commodities" had jumped 110 per cent in the meantime.

Few industries, on the other hand, experienced anything equal to the price slump of rubber commodities in 1915. In that year practically all rubber goods underwent a price decrease, and the average level for rubber products fell approximately 20 per cent. This situation may be explained by the fact that crude rubber was relatively cheap at the time, while the glut of the cotton market had sent the price of that commodity to a low

FIGURE 5. RELATIVE PRICES OF RUBBER BOOTS AND RUBBER ARTICLES.—BY MONTHS, JANUARY, 1913, TO DECEMBER, 1918. (AVERAGE QUOTED PRICES, JULY, 1913, TO JUNE, 1914=100.)

FIGURE 6. RELATIVE PRICES OF RUBBER CLOTHING: DOUBLE AND SINGLE TEXTURE; CALENDERED.—BY MONTHS, JANUARY, 1913, TO DECEMBER, 1918. (AVERAGE QUOTED PRICES, JULY, 1913, TO JUNE, 1914=100.)

point. Another reason assigned by some members of the trade was the growing competition in the rubber industry and the desire of the large manufacturers to crowd out the new arrivals.*

An analysis of the price fluctuations in the individual branches of the industry will bring out in further detail the factors bearing on the price situation.

RUBBER TIRES.

The general low-price level of rubber goods in early 1915 was characteristic of every product of the industry. In the case of tires, however, the price fall was most marked, a 27 per cent decrease taking place within the first quarter of the year. This may be accounted for by (1) the abnormally low prices of cotton fabrics—the aftermath of the shutting off of cotton exportations—and (2) the abnormal competition in the rubber industry, the results of which were at that time making themselves felt. This competition was the culmination of the situation in the three preceding years. In 1912, when prices were highest, there was talk in the trade of the prodigious profits of the tire manufacturers. This talk naturally resulted in a rush to make tires, and soon capacity of production outran capacity of consumption. An inevitable scaling of prices followed, and pneumatic tires continued downward until the low point was reached in early 1915. The low price of February continued until December, when the price started on an upward course, which reached its summit in April, 1918. This rise was, of course, due to the increasing cost of labor and materials other than rubber. In no case, however, was the rise proportionate to either of these factors.

Solid rubber tires are a relatively new product of the rubber industry. In 1913 and 1914 they were relatively little in demand and it was not until the motorization of the Allied transport system after the outbreak of the European War that they became a factor of large importance. Solid-tire prices continued unchanged through 1913 and 1914, falling early in 1915 in sympathy with all other rubber goods. In late 1915 the war demand for solid tires made itself felt. This demand tended to reinforce the rise of tire prices in general, and January, 1916, witnessed an increase of 16 per cent, as contrasted with a 7 per cent rise in the price of pneumatics. (See Figure 3.)

In 1917 and 1918 solid-tire prices rose quite regularly with those of pneumatics. The tremendous demand resulting from Army needs accentuated the rise in the price of the former, however, and 1918 ended with solid-tire prices 45 per cent above their pre-war average, as contrasted with pneumatics, whose prices had risen but 16 per cent above the 1913-1914 level.

MECHANICAL RUBBER GOODS.

It was in this branch of the rubber industry that price increases were most evident in the six years dealt with in this study. Rubber hose, for example, increased 125 per cent above its pre-war level, while belting reached a level which was 75 per cent above the 1913-1914 average. The rise in the price of hose may be attributed to both the increasing cost of labor and materials—the amount of crude rubber used in the production being relatively small—and the stimulated demand. The Army, the Navy, and the Shipping Board used large amounts of rubber hose, whereas in the case of garden hose civilian consumption also increased appreciably.

Rubber belting is fast becoming a competitor of its leather prototype, and its price rise may be in part attributed to the increasing price of the leather product. The extension of industrial plants in the last two years and the consequent demand for transmission and conveyor belting was another potent factor in price determination.¹⁸

*THE INDIA RUBBER WORLD, March 1, 1915, page 318.

¹⁸It should be noted that although the price increase of mechanical goods was larger than that of the products of any other branch of the rubber industry, yet when compared to prices in general in late 1918, rubber hose was slightly above and rubber belting slightly below the level of "all commodities."

RUBBER FOOTWEAR.

Although rubber boot and shoe prices did not drop to the low level of tire prices, they nevertheless remained considerably below their pre-war average for a longer period than did the latter. This may be attributed in part to the low prices of reclaimed rubber, tremendous quantities of which are used in the footwear branch of the industry. The mild winters of the first half of the six-year period dealt with and the consequent difficulty of disposing of stocks also played an important part in the price situation. Increasing costs added to a demand stimulated by war needs sent the price of rubber footwear upward at the end of 1916. It is notable that only three increases were made in the price of rubber footwear during the period of the war—a situation characteristic of very few important commodities. (See Figure 5.)

RUBBER CLOTHING.

The rise of rubber clothing prices, which was surpassed by only one other rubber commodity herein dealt with, namely, rubber hose, may be attributed almost entirely to the cost of labor and materials. The Army demand for raincoats had its effect, of course, and this factor was especially evident during 1917 and 1918. The relative cost of the rubberization of clothing is of little importance as compared with that of the fabrics and labor employed. Moreover, the cost of rubberization did not increase to any appreciable degree in the past six years. The price of fabrics employed, on the other hand, increased from 12 to 48 per cent, varying with the individual types of coats; while other costs such as labor, trimmings, etc., which comprise the largest part of the expense of production, rose from 47 to 78 per cent.

The following table shows the respective increases in the cost of the nine types of coats, the average relative prices of which are shown in Figure 6.

TABLE IV.—INCREASED COST OF RUBBER CLOTHING, 1913-1918.

	Per cent of increase.		
	Rubber- com- pound.	Fabric.	Other items. ¹¹
Coat I	13.3	21.0	65.5
Coat II	16.0	22.0	60.0
Coat III	12.5	30.5	57.0
Coat IV	13.0	28.5	58.5
Coat V	10.0	32.5	57.0
Coat VI	6.0	29.0	64.0
Coat VII	6.0	45.0	48.0
Coat VIII	5.0	48.0	47.0
Coat IX	9.0	12.0	78.0
Average	10.1	29.8	59.6

DRUGGISTS' SUNDRIES.

This class of rubber products, like that of rubber footwear, experienced but few price changes prior to 1916. In fact, the price of water bottles, with the exception of a slight drop of two per cent in 1914, remained unchanged until April, 1916, when it started a rise which ended in the middle of 1918. Ice bags, on the other hand, changed but little in value during the period prior to America's entrance into the war, the low price of 1914 having remained relatively static until June, 1917. The demands of the Red Cross and the Medical Department of the Army stimulated prices at this time, bringing a rise which had been a long time due. (See Figure 7.)

CONCLUSION.

A review of the run of prices for the rubber industry as a whole—that is, for crude rubber, ingredients, and rubber products combined—as presented in the Figure 2, makes apparent the fact that with the exception of the 16 months ended January, 1915, the rubber industry price situation had little in common with commodities in general. Low prices characterized the industry by and large. During the six years dealt with in this study there were only 12 months in which the index number of the rubber industry was higher than that of "all commodities,"

¹¹Includes findings, trimmings, waste, packing, labor, overhead, profit and loss. Data from confidential source.

and in all but four of these instances variations above the general price level were less than 10 per cent. In February, 1915, rubber prices fell 16 per cent below the level of all commodities, and from that time on the index numbers of the rubber industry and of commodities in general followed individual courses. The latter, after remaining relatively static for some nine months, ascended rapidly, reaching its first apex in July, 1917, at a point 89 per cent above the level of February, 1915. The governmental policy of price-fixing inaugurated in the summer of 1917 resulted in a slight recession, which continued until June of the following year, when the upward course of prices was resumed. The year 1918 ended with the index number of all commodities 103 per cent above its pre-war level.

The index number of the rubber industry, on the other hand,

followed a rather slow upward course, which was interrupted now and then by cycles of depression varying from 1 to 10 months in duration. At no time did it approach the index number of "all commodities," and throughout the period following February, 1915, the price level of the rubber industry was at least 16 per cent below that of commodities in general. This difference in levels was highest in July, 1917, when the "all-commodities" index number was 80 per cent above that of the rubber industry. Throughout 1917 and 1918, in fact, the divergence existing between the two levels was one of great significance and is to be found in the price fluctuations of but few industries. The signing of the armistice found the price level of the rubber industry 72 per cent below that of all commodities, or, in other words, 31 per cent above its own level of 1913-1914.

Influences Operating on the After-the-War Demand for Rubber Goods.

By L. W. Alwyn-Schmidt.

GREAT EVENTS of such an elementary force as a world's war must result in an upheaval of all the ordinary standards of life. Progress advances at a higher speed than during normal times and the world experiences the evolution of a century in the comparatively short space of a few years. The period which divides us to-day from the advent of the war is still too short to enable us to realize fully what it has done to hasten industrial and economic progress. As yet we have not had a chance to draw the balance of loss and gain. It certainly has had a powerful influence upon inventors in all countries. As to the rubber industry, it has so far been unable to utilize synthetic rubber, but the field of application for the genuine article has widened materially and the rubber industry emerges from the war as a powerful factor in the economic life of the world.

This development cannot fail to exert a strong influence on our domestic rubber industry in its relation to both home and foreign markets. Considering the enormous strides made by the American rubber industry in the expansion of its foreign influence, it is the effect upon foreign markets which will undoubtedly receive the greatest attention from our manufacturers. The average manufacturer or exporter is inclined to look upon foreign trade as a matter of orders and delivery. The great economic factors operating in the world's markets do not apparently concern him and he does not trouble about the development of favorable trade prospects. This policy has been especially noticeable in our own country. It has marred for a long time our politically and economically desirable trade relations with South America and it is again interfering very seriously in our relationship to our former allies in Europe. It is, however, the comprehensive understanding of the present and future requirements of a market which develops the successful exporter. Only the manufacturer who makes himself useful to his customer can expect to acquire his permanent confidence. It is, therefore, necessary that American rubber manufacturers should be conversant with the economic tendencies underlying the development of markets for American rubber goods.

OUR PAST PROVINCIALISM.

The American rubber industry can easily be called the most powerful and progressive of the rubber industries of the world. No country has provided during peace times so many difficult problems for the rubber chemist and engineer than our own and it is only our somewhat provincial habits which have prevented the American rubber industry from taking first place as an exporting industry in the years before the war. Matters have now changed. We have been forced to take a hand in international

affairs and the rubber industry was burdened with an unusual load of foreign orders which cost a great deal of exertion to fill. In the future we shall receive automatically a share of the export business of the world and this will be measured more or less by the general ability of our industry to supply the demand. This share in foreign trade flows as a natural result of international trade exchange to any leading industry of any country. It is the tribute due to the existence of a powerful economic producer. The successful exporter, however, cannot wait to let others determine his share of the business of the world, and by making use of the existing opportunities obtains a larger proportion of the trade. And such opportunities are now especially numerous. They have arisen as the result of the war.

RUBBER IN DRY COURSING.

It is not always easy to recognize favorable market developments in their early stages. Often we cannot determine with certainty what particular consequences will follow a certain event. But there are at present many so-called fundamental economic causes which must lead to an extensive business for the rubber industry of the world. Only a few can be mentioned in the space of a short article. There is a considerable shortage of houses in England, and in fact, all over the world. It is estimated that England will have to build 500,000 dwellings within a few years. France may require even more. And we can estimate conservatively that several million houses will be erected all over Europe in the near future. All these houses require dry coursing and waterproof roofing. This question of dry coursing is still in its initial stages. In England slate is frequently used for the purpose. But the old houses in Europe were often entirely without dry courses, resulting in damage to the masonry caused by the infiltration of water. Shortly before the war a proposition was made to use rubber for this purpose. The advantages of rubber sheets laid along the fundaments were obvious. Rubber is absolutely damp proof, it would stretch in case the fundaments settled and will not break like slate, and, moreover, the cost was not materially higher. The building of a large number of houses offers the rubber industry an opportunity to manufacture dry course material. Large strips of rubber, 1 to 2 feet wide and $\frac{1}{2}$ or $\frac{3}{4}$ -inch in thickness, are required. Figuring at the basis of 30 yards of material for each house, the very small English workman dwelling being considered, the English consumption of that kind of dry course sheeting would amount to 15 million yards alone, not to speak of the large demand which might be developed on the European continent. Some advertising would be of course required to acquaint the build-

ers with the material and also to educate the public to demand its use in the new buildings.

FIBER SOLES IN EUROPE.

In the early stages of the war, to give another example, the writer had a hurry call from Switzerland for American composition soles made from rubber or any other material. A similar call came from Rumania a few weeks later. In both instances the fact was communicated to a number of American rubber firms likely to handle a large development of this kind, but only one firm made use of this opportunity. Before the war it was difficult to convince the European public of the usefulness of rubber heels and soles, or any other waterproof leather substitutes. The few firms which imported these goods in Europe did not do a very large business because European opinion was generally adverse to the use of anything but leather in footwear. Leather has become exceedingly rare in Europe and shoe prices have mounted to figures which would be incomprehensible even in our own country. Composition materials have been introduced quite generally and great numbers of the European population have reconciled themselves to wearing them. We have made great progress in this country during the last few years in the production of rubber soles and heels and our manufacturers might find it well worth their while to study the European situation for the purpose of making a profitable use of its opportunities.

AMERICAN TIRES FOR EUROPE.

As a third example the automobile industry may serve. This industry, though highly developed in Europe, is comparatively a small factor in the American market. It is reported that the European automobile industry will start building small passenger and carrier automobiles on American lines, adopting, if possible, the design of American rims and tires. The outcome will be a greater demand for small American tires, not only in Europe but in other parts of the world where European automobiles will be sold.

All three tendencies, and there are many more to be found under the cover of the present industrial reorganization, have not come about spontaneously. They are rather the result of a slow evolution of earlier causes. The war, however, has hastened the development and has made a necessity out of what was five years ago only a convenience. It has cost the makers of rubber heels and soles thousands of dollars to make the public acquainted with the advantages of wearing rubber heels and the educational campaign is still going on in this country. In Europe, the war has acted as an educator in this respect and Europe is now ready to accept the leather substitutes made of rubber or any other material. The same refers to building material and automobile tires.

FOREIGN OPPORTUNITIES IN RUBBER.

But the evolution now taking place in favor of employing rubber is not confined only to building materials, wearing apparel and automobiles. It is prevalent in medical and surgical appliances, the electrical industry, plumbing, steam and industrial engineering, and the large circle of domestic industries where the guiding hand of the rubber manufacturer is required to make a fact out of what at the present time may only be a tendency. There is hardly a rubber manufacturer in this country who has not been asked during the last five years whether a certain article might be made with advantage from rubber. Many of these inquiries have been turned down, not because they were unsuitable but because the factories were too busy to consider them. In many instances the desired articles have been manufactured, but their use has not extended beyond their particular field. Now is the time to follow up these leads; the inquirer should again be approached and his particular requirements investigated. The work will fall principally to rubber manufacturers specializing in certain articles or to the special departments of large enterprises. This will be an advantage

as the investigation will be conducted by men competent to give the new proposition its best chance for a complete success.

As to the foreign side of this evolution in the demand for rubber goods our industry will find plenty of material. The need of the foreign consumer for the employment of new materials is very great. No doubt much of the business which would have fallen to our manufacturers if they had taken hold of these suggestions early during the war, will now flow in the direction of foreign rubber manufacturers who are just as keen to take hold of any new development, but a good deal should still be left to pay for the trouble of making the necessary experiments. It is not as a rule very difficult to perfect a technical process or an implement of some sort if once its usefulness has been established. But it requires much astuteness to introduce its use generally and thereby make the article worth its industrial production.

The influence of this present development on our foreign trade will soon show. We should witness a rapid growth in the demand for many articles new to the industry and those which have been in less demand in former years. Upon the ability of our industry to forestall this development and to direct it in channels favorable to our own manufacturers, the future success of the American rubber industry in new markets will depend.

THE MILEAGE GUARANTIES INCREASE.

Following the recent reduction of pneumatic tire prices on the part of several leading companies comes a more or less general increase in mileage guarantees and adjustment basis for tires ranging from about 30 to 75 per cent of the previous guarantees. The movement was started by The B. F. Goodrich Co. and its subsidiary, the Diamond Rubber Co., and a canvass of the trade shows to what degree other companies are falling in line:

Make.	Kind.	Former Mileage Guaranty.	Present Mileage Guaranty.
Diamond	fabric	3,500	6,000
Diamond	cord	5,000	8,000
Federal	plain tread	4,000	6,000
Federal	"Rugged" tread	5,000	7,000
Federal	cord	6,000	8,000
Firestone	fabrics	5,500	6,000
Firestone	cord	8,000
Fisk	"Red Tops"	4,000	7,000
Fisk	cord	8,000
General	"Jumbo"	7,500
General	cord	7,000
Goodrich	fabric	3,500	6,000
Goodrich	cord	5,000	8,000
Keystone	fabric	4,000	6,000
Norwalk	"Forkside"	5,000	7,500
Racine	non-skid fabric	5,000	6,000
Racine	cord	7,500	8,000
South Bend	7,000
Stronghold	Ford sizes.	7,500
Stronghold	Other sizes.	6,000

Several companies have made no change because their mileage basis was already high enough. A few of the larger firms give no mileage guaranty as a basis of adjustment, preferring to adjust claims on poor material or defective workmanship in the individual case. This method, they believe, gives greater satisfaction than setting a fixed scale which is often inapplicable to the case in hand.

About five years ago an unlimited guaranty covering the full life of the tire was adopted for Goodyear passenger-car tires, and that form of guaranty has now been extended to solid and cushion tires. No matter how far a Goodyear tire has been driven, whether it be 5,000 or 50,000 miles, or how long its period of service, a fair and equitable adjustment will be made if it proves defective.

FRAZAR & CO. BUY NEW YORK BUILDING.

Frazar & Co., a firm well known to the rubber trade through its chemical department, which supplies the "States" brand of antimony, zinc oxide, magnesia, etc., has recently purchased the Trinity Court Building at 72-76 Trinity Place. This will be known as the Frazar Building and after extensive alterations will be occupied by Frazar & Co. for their New York offices.

Echoes of The Great War.

RESUMPTION OF TRADE WITH GERMANY.

EFFECTIVE JULY 14, 1919, it was announced by the War Trade Board Section of the Department of State that a general enemy trade license had been issued authorizing all persons in the United States to trade and communicate with persons residing in Germany and to trade and communicate with all persons with whom trade and communication is prohibited by the Trading with the Enemy Act, except those in Hungary or that portion of Russia under the control of the Bolshevik authorities.

The above-mentioned general license does not authorize the importation into the United States from Germany or elsewhere of dyes, dyestuffs, potash, drugs or chemicals which have been produced or manufactured in Germany; nor does it authorize trade with respect to any property which heretofore, pursuant to the provisions of the Trading With the Enemy Act as amended, has been reported to the Alien Property Custodian, or should have been so reported to him, or any property which heretofore, pursuant to the provisions of said act, the Alien Property Custodian has seized or has required to be conveyed, transferred, assigned, delivered or paid over to him.

Exports to and imports from Germany may now take place under Special Export License RAC No. 77 and General Import License PBF No. 37.

FEDERAL INCORPORATION OF AMERICAN FOREIGN TRADE FIRMS.

The bill to permit the Federal incorporation of companies engaged in foreign trade that has been introduced in Congress with the approval of the Government, the National Foreign Trade Council, and other organizations, is of much moment to the rubber industry, which necessarily involves international relations to a considerable degree.

Our state incorporation laws vary so greatly and change so frequently, and court procedure and decisions differ to such a degree as to be so generally distrusted abroad, that it is often difficult to secure investment of foreign capital in American companies organized under these laws.

Federal incorporation of American concerns doing business abroad would lend the confidence and prestige of the federal name and authority to our foreign traders, and nothing is as important to foreign trade as mutual confidence.

It is highly desirable that firms abroad made up of Americans, but depending largely upon foreign money for their capital, be permitted to do business under the American flag in such a way as to attract the investment of foreign money. This investment in American concerns would inevitably lead to the purchase of American goods, and would therefore be of the greatest value in aiding the growth of American foreign trade.

COUNCIL OF NATIONAL DEFENSE TO CONTINUE.

The war has shown conclusively the country's need of a governmental agency that shall in time of peace collect, study and centralize in a scientific way all information bearing upon the national defense, particularly with regard to the mobilization of industries, science, and labor in time of war.

The United States Council of National Defense, created nearly a year before America entered the war, is such an agency, and the amount of constructive work it has accomplished with an expenditure of only \$1,574,000 up to May 1, 1919, has been truly remarkable.

Under the Sundry Civil Bill there has been reappropriated to the Council of National Defense its unexpended balance for the fiscal year 1918, and the Council is now maturing plans to return to its peace-time functions. During the war the Council has been in effect an administrative laboratory and clearing

house of study and action in matters touching the national defense. Broadly speaking, it purposes to continue under the same policy.

With the closing of the work of the Capital Issues Committee, the Committee on Public Information, the Food Administration, the Fuel Administration, the War Industries Board, and the War Trade Board, the Council remains the single interdepartmental unit which can centralize the study of the records established by these war agencies. It will undoubtedly become in effect the residuary legatee of these war agencies to the extent that their records are not allocated to the executive departments.

The Council of National Defense is composed of the Secretaries of War, Navy, Interior, Agriculture, Commerce, and Labor. With it throughout the war acted an advisory commission of seven members, composed of Daniel Willard, Samuel Gompers, Bernard M. Baruch, Howard E. Coffin, Julius Rosenwald, Dr. Franklin Martin, and Dr. Hollis Godfrey.

WASTE RECLAMATION IN AKRON, OHIO.

Waste reclamation, a war-time concept, has become a peacetime development that promises eventually to accomplish much good throughout the country by inculcating habits of individual and corporate thrift. The plan was originated by the Commercial Economy Board of the Council of National Defense, but its successful operation is attributable to the activity and interest of George W. Sherman, manager of the salvage department of The B. F. Goodrich Co., Akron, Ohio.

Fostered by 75 per cent of the industrial capitalization of the community, the Akron Industrial Salvage Co., capitalized for \$25,000, was incorporated in May, 1918. It was not a movement for profit but for betterment and the company has operated on the theory that waste material often has a value in use far greater than its value in price, and that nothing of use in industry should be destroyed.

In order to assist other communities in organizing similar companies, the development of a short, intensive training course for salvage executives, to be conducted by one of the local colleges, is contemplated by the Waste Reclamation Council of Akron, and the feasibility of a full-year course of salvage engineering for senior college men is also under consideration.

The waste-saving work is still in its infancy but it is safe to predict that this civic improvement company will make a contribution to the movement for national waste reclamation as fundamental as that of National Waste Products, Limited, in England, a government corporation operated on strictly commercial lines.

BELGIUM GETS BACK HER MACHINERY.

Belgian machinery, stolen by the German invaders, is being returned by them at the rate of some 3,000 tons weekly. The total amount returned on July 1 was 18,000 tons and there is much more to come. The law of righteous retribution is still in existence.

AMERICAN RUBBER COATS IN GERMANY.

Rubber coats were among the first goods offered by American manufacturers to Germany, according to the "Deutsche Allgemeine." This newspaper states that the initial result of the raising of the blockade is the flooding of Cologne with foreign goods, and that America and France were among the first in this trade.

IT IS TO YOUR BEST INTEREST TO PUT YOUR LIBERTY BOND INTEREST in War Savings Stamps.

Tire Rebuilding and Repairing—II'.

TIRE REPAIRING OPERATIONS.

REMOVING THE TREAD.

THE WORN TREAD, breaker strip and cushion stock down to the fabric are completely removed with a sharp knife, and the exposed edges of the side-wall gum are skived or beveled, care being taken to avoid cutting into the fabric. The side walls are allowed to remain intact unless defective, in which case they also must be removed in the same manner, together with the chafing strip. If the tread is so badly cut that it is difficult to skin, a buffing machine equipped with a rotary rasp will be more effective than the knife. The casing is next reversed to expose the inside and carefully examined for weak places. For small inside repairs two tire jacks or "reversers" will hold the beads open while the work is being done and obviate the necessity of reversing the entire casing. All fabric, bead, and side-wall damages are then treated by the usual methods of tire repairing and vulcanizing, quite irrespective of the retreading to follow.

TIRE-BUILDING LASTS OR MANDRELS.

BUFFING.

When the fabric or cord repairs have been completed, all particles of old rubber and dirt are removed from the outside of the casing by means of a buffing machine equipped with a rotary wire brush which also roughens the surface of the fabric. All rubber dust and loose fabric particles are dusted off with a whisk broom or fine hand-brush, when the casing is ready for retreading, unless recovering of one or both side walls is necessary.

RECOVERING.

If the side walls of the casing are damaged to such an extent that a small local repair after the well-known manner is not sufficient, the damaged side wall or walls and corresponding bead or chafing strip will have been removed with the tread, and the casing must first be recovered. Two or three coats of vulcanizing cement are applied to the well-buffed fabric of the carcass as needed, each coat being allowed to dry separately. The bead strip is first replaced with an 8 ounce fabric frictioned two sides, lapping 1 inch on the outside and 1½ inches on the inside. The side walls are next applied, using one ply of black, white, gray, or red unvulcanized gum of proper thickness—usually 1/16 or 3/32-inch—and wide enough so that the tread when put in place will overlap 1 inch. Careful rolling to eliminate all air blisters is essential.

RETREADING.

There are at the present time four principal methods of retreading tires in common use. They are as follows:

1. Building up the tread of unvulcanized rubber, wrapping and curing in a pot heater or kettle vulcanizer. If a ribbed tread is desired, the cure is effected in a retread mold.
2. Using a "camel back" tread gum specially prepared in one piece to proper thickness, and then curing in a kettle.
3. Applying endless semi-cured retread bands with beaded or non-skid tread designs, filling around the raised parts of the tread with soap-stone mortar, or using a negative wrapping pad, wrapping and curing in a kettle vulcanizer.
4. Supplying a new tread by any of the foregoing methods and vulcanizing in sections by three or four cures in a cavity retread mold.

BUFFING THE CASING.

BUILDING UP AND APPLYING THE TREAD.

To the buffed outside surface of the casing two or three coats of vulcanized cement are applied as needed, permitting each to dry thoroughly. From one-half to one hour must be allowed for the first coat or coats and from two to five hours for the last coat. A longer time is required in cold damp weather than in warm dry weather.

Cord tires require not less than three coats of cement, each being allowed to dry separately. The first coat should be a thin solution that will soak into the roughened cords, the second and third coats medium heavy solutions. The first two coats must be allowed to dry at least one hour and the third coat from six to twelve hours. Over night is usually convenient and sufficient.

When the cement is thoroughly dry, a strip of cushion stock, usually 1/64 or 1/32-inch in thickness, and wide enough to cover the cemented surface completely or within an inch on either side, is applied.

TOOLS USED IN TIRE REBUILDING AND REPAIRING.

*Continued from THE INDIA RUBBER WORLD, July 1, 1919, pages 552-553.

Above the cushion stock is laid the breaker strip of coarsely woven fabric frictioned and coated on both sides, and rolled firmly into place with a hand roller. To prevent air pockets, the edges of the breaker strip are bound with half-inch strips of cushion stock rolled down firmly. The breaker strip is of great importance to the tire. It prevents separation of the tread; obviates the formation of mud boils, and reduces the possibilities of fabric breaks resulting from stone bruises.

The tread is next applied. First, however, it must be built up with three or four strips of black, white, gray or red unvulcanized tread gum of suitable width and length sufficient to reach around the entire circumference of the casing. In building up the tread the second widest ply, $\frac{3}{4}$ -inch narrower than the widest ply, is placed at the bottom. Above this are placed the required number of piles, each $\frac{3}{4}$ -inch narrower than the one beneath it, until finally the widest ply is placed at the top. Each ply is rolled down securely as laid with a flat hand-roller and all air blisters removed by pricking with an awl.

In applying the tread to the casing the second widest ply is brought into contact with the breaker strip, the tread is carefully centered all around and pulled tight to prevent wrinkles. It is then rolled down with a hand-roller or a tread-rolling machine, all air blisters being pricked with an awl. The edges of each tread ply are stitched down with a rotary wheel-stitcher, and the splice trimmed off even with the surface of the tread.

"CAMEL BACK" TREAD GUM.

To obviate the necessity of building up treads as called, there is a specially prepared unvulcanized tread gum called "camel back," because it is built up to a hump in the center where the thickness is needed. This requires only to be cut off to the desired length; waste is thus reduced to the minimum and ply separation, low spots, and air blisters are obviated.

Manufacturers also supply endless retread bands with ribbed and non-skid designs in all standard sizes to be applied instead of built-up or "camel back" treads.

VULCANIZING THE COMPLETE REPAIR.

Plain retreads, retread bands, relines, and rim cuts entirely around are all vulcanized in a pot heater, also known

closed to fit the different diameters. To insure a perfectly smooth surface, a fabric pad should be wound around the coil.

Adjustable cast iron or aluminum segment cores are often used instead of air-bags or coil springs. They are the exact size and shape of the inside of the tire. Each segment is $\frac{1}{2}$ -inch thick at the inside and $\frac{3}{8}$ -inch at the outside, making them conform solid to the circle of the average tire. A sufficient number of these segments is strung on two wires to go nearly around the casing, and the adjustment between the different casings is made by using more or less segments. Where the coil springs gaps apart to conform to the diameter of the casing, these segmental cores lie close together so that the casing can neither shrink nor stretch in curing.

Split curing rims, with clincher or straight-side beads as required, are next put in place upon the casing and the two sides clamped securely together by bolts. A strip of wet muslin cut on 45 degrees bias is stretched around the casing as a surface liner, and over this a heavy wet jacket. In the case of a re-covered tire the light muslin jacket is put on before the curing rims.

The tire is next cross-wrapped with wet strips of 8-ounce fabric 2 $\frac{1}{2}$ inches wide. The wrapping should be even and very tight to insure uniform pressure, particularly on the side walls of the casing, and to help the beads hold correct shape. The wrappings are wound completely around the casing in one direction and then the operation is reversed and the entire casing wrapped in the opposite direction. For convenience in working, these strips of fabric are previously rolled like surgeon's bandage, either by hand or with one of the several rag rollers on the market.

If an air-bag is used instead of coils or segmental cores, it is inflated to 70 pounds pressure, and the casing is finally cured in a kettle vulcanizer. Common cures are 45 minutes at 35 pounds steam pressure, and 40 minutes at 40 pounds.

IN CONCLUSION.

It seems unlikely that the price of tires will soon reach pre-war levels. This, together with the greater spirit of thrift engendered by the war, means that rebuilt tires will be used more

SECTIONAL VULCANIZER.

HORIZONTAL RETREADING VULCANIZER.

KETTLE OR POT VULCANIZER.

WRAPPING MACHINE.

as a kettle vulcanizer, or in a retread mold. In the case of a pot heater a complete air-bag or an endless retreading coil is first placed in the casing. Complete air-bags made of specially treated gum and wound with fabric will give from 100 to 300 cures. Endless retreading coils will last indefinitely. They are made of tempered hard steel flat wire, long enough to accommodate casings of any diameter, and wound so that they may be opened or

and more; that tire rebuilding has become and will continue to be a great and growing business. Some 6,000,000 automobiles are now in use in the United States and the number increases enormously every year. Allowing five tires to each car, four in use and one spare, it is seen that some 30,000,000 tires are now in use. Of these, probably one-third, or 10,000,000, could be rebuilt annually.

HOW NEW YORK AND LONDON CRUDE RUBBER IMPORTS ARE HANDLED.

NEW YORK METHOD.

THE METHOD employed in handling crude rubber imports in New York differs from the London method in that the rubber, if unsold, is handled by the owner or consignee instead of the broker.

When the rubber is discharged from the vessel or cars the owner's dock man samples 10 per cent of each mark. These samples are used to represent the lot as a whole, or the individual marks when sales are being effected, the rubber being stored at one of the numerous warehouses in or near New York.

When the rubber has been sold before arrival to manufacturers, the same process of examination and sampling takes place, the rubber being forwarded to the factory direct from the dock.

When sold between importers or dealers it is the usual custom for the buyer's representative to meet the representative of the seller and together make the examination of 10 per cent of each mark. If the buyer is not satisfied with the examination, he can demand a more thorough or full examination, the expense of which beyond the 10 per cent is borne by the buyer. This joint examination and passing the weigher's scales constitutes a good delivery from which there is no appeal.

When rubber is sold "to arrive," but more particularly in the case of the grades other than the standard, it is customary to deposit with the broker, if the sale is made by a broker, all or part of the sample, which the broker seals and holds against possible dispute as to quality.

Should dispute arise an arbitration is held under the rules of the Rubber Trade Association, of New York, the result of which is final, but with right of appeal to be heard by the full Arbitration Committee, from whose decision there is no appeal.

Terms upon which rubber is sold to manufacturers are based

(C) Underwood & Underwood, N. Y.

CRUDE RUBBER SAMPLES.

upon net cash in 10 days from the date of delivery on the dock or ex-warehouse. Terms between importers and dealers are cash less 10 days' interest at 6 per cent per annum.

LONDON METHOD.

Formerly all plantation rubber went to London and in the early days, the planters, or many of them, sent their product to

their London secretary, just as it was produced, all the grades being mixed together. The secretary turned it over to his special broker who had it assorted, classified, and the samples of the different grades displayed in his salesroom where intending buyers could examine them, take the catalog number, and pre-

(C) Underwood & Underwood, N. Y.

WEIGHING CRUDE RUBBER SHIPMENTS AT NEW YORK.

pare for the auction. At the auction each broker personally auctioned off his own lots as his turn came. Private sales were also made before the auction.

At the present time the same method is continued excepting that there are no auctions and it is all done by private tender.

When a consignment of spot rubber reaches the docks, each lot is examined, weighed, and classified according to color, thickness and quality. Samples weighing from one to five pounds are taken by experts, each sample being stamped by public officials. These samples, which represent the average quality of the lots, are placed in bags to be sent to the brokers' sales rooms. Intending purchasers have the right to go to the docks and examine the whole consignment, but as a matter of fact, they never do so, as the samples are absolutely reliable.

Sales are made for cash within fourteen days after the Wednesday following the day of the sale. Buyers, therefore, have their entire purchase in their factories before they make any payment. A considerable portion of the rubber traded in is sold on forward contracts for delivery within 3, 6, or 12 months, so that purchasers can be sure of having their rubber at a fixed price for a certain time ahead. Some of these forward contracts are free on board, the rubber going straight from the grower to the factory; other contracts specify London delivery. In either case, the Standard Qualities Committee of the London Rubber Trade Association is the arbiter in the case of any difference of opinion as to the quality of the shipments.

The London broker, in addition to accomplishing the sales, guarantees the credit of the buyer to whom he sells and actually handles the rubber, with the attendant expense, whereas the New York broker assumes no responsibility after the passing of the contract.

RUBBER DIVISION MEETING OF AMERICAN CHEMICAL SOCIETY.

The autumn meeting of the American Chemical Society will be held at Philadelphia, Pennsylvania, September 3-6, 1919, when the first meeting of the newly organized Rubber Division will also be held. Final arrangements for the program are not yet completed; however, the interest shown promises a very interesting meeting.

Balanced Packing-Box Construction.

THE INVESTIGATIONS of balanced packing-box construction and tests to determine box design conducted during the war by the Forest Products Laboratory¹ contributed in marked degree to the safe and economical movement of munitions and supplies to the American Expeditionary Forces. Immense monetary savings were effected by the correct construction of containers as to materials used, cargo space conserved, and reduction of loss by breakage of packages.

The methods employed to attain these results are now available for general commercial purposes through the services and publications of the Forest Products Laboratory, which continues to investigate the resources of forest products in their relation to many important industrial developments too numerous to mention.

IMPORTANCE OF BOX INDUSTRY.

The importance of the box industry is but little appreciated. United States Forest Service data shows that the manufacture of packing boxes, shooks, crates, crating, fruit and vegetable packages and baskets, is the second largest wood-consuming industry in the United States, and that in 1912, 11.6 per cent of all lumber produced in the country was converted into boxes.

There are innumerable special demands for boxes and crates, but on the whole it is the manufacturing industry and intensive fruit-raising and market-gardening which creates the demand for boxes.

than is necessary to balance the average strength in every other part. The data for designing such a box cannot be obtained from observation in actual commercial service, because the observer sees the box only after it has completely failed and consequently cannot measure the hazard which completes the failure. On the other hand, laboratory studies combine practical experience, which is a knowledge of the designs in use, of what lumber is available, and of box factory practices, with accurate scientific tests made on the package itself, packed as in actual service and subjected to strains that approximate actual transportation conditions.

TESTS TO DETERMINE A GOOD BOX.

Compression-along-an-edge test, as its name implies, is a steady and constantly increasing pressure (measured in pounds) applied along any edge and with the opposite edge diagonally through the box in direct line with the pressure exerted. The

corner-wise test is applied in the same way to any corner of the package with the opposite corner in a direct line with the pressure. These two tests measure the strength of the box in withstanding any external pressure and to a limited extent approximate the hazard of the lower tiers of boxes in a pile. By themselves these tests are insufficient to determine comparative weaknesses in the various factors that enter into properly balanced construction.

Another is the drop test, for comparing the strength of one box with that of another. The box is packed with the actual contents as in service and dropped from a predetermined height directly on the corner, which is a fall that occurs in actual service. The value of the conclusions is limited, however, because one failure runs so rapidly into another that the observer does not always get the true measure of the weaknesses.

DIAGONAL COMPRESSION TEST.

EXTERIOR VIEW OF 14-FOOT DRUM BOX-TESTING MACHINE.

INTERIOR VIEW OF DRUM, SHOWING PACKAGE CONSTRUCTION TEST.

WHAT IS A GOOD BOX?

A properly designed packing box has enough strength in each part for the intended purpose and no more strength in any part

The most practical method yet devised is the revolving drum

¹United States Department of Agriculture, Forest Service, Madison, Wisconsin. (In cooperation with the University of Wisconsin.)

test. The drum is a hexagon-sided machine and revolves slowly. The box is packed with the actual contents, as in commercial service, and placed in this drum. In the drum are arranged a series of hazards, which cause the box to follow a regular cycle of drops, falling upon sides, top, bottom, ends, edges, corners, and flat-wise upon a projection similar to the corner of another box. These drops simulate the usual hazards of transportation, excepting the heavy static pressure received by a box in the lower tiers of a pile, which is secured by means of the compression-on-edge test previously described.

As the box moves on from one drop to the next the observer notes the beginning of the failure of the weakest point in its construction and follows the development of that weakness until the box entirely fails and lets its contents out.

The weak feature of the box may be too few nails, nails of too short a length, nails driven in a crack and thus having no great holding power, or some other form of nail failure; and the tests clearly show this weakness. The material in the sides, top,

TESTING LAMP CONTAINERS IN SIX-FOOT DRUM.

or bottom may be too thin, so that the shocks of the falls pull the wood from the nails. The wood may split or break across the grain.

Any one of the numerous weaknesses of packing-box construction may be developed in this test until finally the observer is able to build up a box that is practically equally strong in every feature. Boxes are then built, packed, and tested until the presence of this balance in design is clearly demonstrated. Such a demonstration will show failures ultimately occurring in average proportion in nails pulling from the wood, wood pulling from the nails, splitting or breaking of ends, sides, tops or bottoms, and through the weaknesses of the species themselves.

AIDS IN BOX DESIGNING.

As a result of many box tests no general rules can be laid down, for the reason that each box must be built with reference not only to the external shocks it will have to endure, but also to the nature of the article it is to contain.

QUALITY AND CONDITION OF LUMBER.

Boxes should be manufactured from lumber which is sound, free from decay and dote, and well-seasoned. The average moisture content of the wood should be from 12 to 18 per cent, based on the weight after oven-drying.

The effect on the strength of the box caused by the moisture condition of the lumber and the change of moisture condition in storage is very marked, the strength relation showing a variation in the holding power of the nailing from 10 to 100 per cent.

INTERCHANGEABILITY OF SPECIES COMMONLY USED FOR BOXES.

The results of the drum tests have made it possible to divide the kinds of wood generally used in packing boxes into the four

groups shown in the following table. Thus, any wood in one group substituted for any other wood in the same group and built into a box of the same specifications would give practically the same results in commercial service.

APPROXIMATE AVERAGE WEIGHT OF VARIOUS SPECIES OF WOODS USED IN PACKING-BOXES.

WEIGHTS GIVEN IN POUNDS PER SQUARE INCH SURFACE MEASUREMENT FOR USUAL PACKING-BOX THICKNESS. SPECIES IN AIR-DRIED CONDITION, 12 TO 15 PER CENT MOISTURE CONTENT.

DETAILS OF CONSTRUCTION.

THICKNESS OF LUMBER.

Where woods in Groups I and II are 1/2-inch thick or less, woods in Groups III and IV can be 1/16-inch less in thickness; where woods in Groups I and II are more than 1/2-inch thick, and not more than 1-inch, woods in Groups III and IV can be 1/8-inch less in thickness.

WIDTHS OF LUMBER.

No piece less than 2 1/4 inches face width should be used in any part except cleats. Any part of a box which is 6 inches or less in width should be made in one piece.

JOINING.

All parts which are of two pieces or more should be tongued and grooved, except ends, which may be butt-jointed and fastened with not less than three corrugated fasteners, two driven from one side and one from the opposite side, or cleated. Cleats should be not less than two inches wide and the same thickness as the sides, tops and bottoms.

NAILS.

The holding power of cement-coated, plain and barbed nails was obtained by testing a standard seven-penny nail driven to a depth of one inch in dry wood and is given below.

Species of Wood.	Load in Pounds Per Nail.			
	Long-leaf Pine.	Basswood.	Beech.	
Cement-coated nails	225	133	430	
Plain nails	140	82	400	
Barbed nails	110	70	315	

The length of the nail rather than the gage of the wire is the principal factor in its holding power, and as nails split the wood it is desirable to use as small a gage as can be driven in nailing machines. Nails should be driven flush with the wood, and never be overdriven, as this often causes the heads to break the fiber of the wood under the heads, leaving no holding power in the wood. The evil effects of overdriving nails increases as

the material of the board is made thinner. This may be obviated in a measure by greater care in driving the nails.

Six-penny nails and smaller should be spaced not more than two inches apart when driven in the side grain of the end and not more than $1\frac{1}{4}$ inches when driven in the end grain. The spacing of nails in end construction should be increased from the above, $\frac{1}{4}$ inch for each penny over six.

American Society for Testing Materials.

Reports of Committee D-11 on Rubber Products and Committee D-13 on Rubber Textiles.

AT THE ANNUAL MEETING of the American Society for Testing Materials held in Atlantic City, New Jersey, June 24-27, reports were made by Committee D-11 on rubber belting, hose for pneumatic tools, and insulating tape, and by Committee D-13 on the rate of gain in tensile strength due to moistened absorption in rubber textiles. The proposed revisions of the tentative specifications follow:

PROPOSED REVISION OF TENTATIVE SPECIFICATIONS FOR RUBBER BELTING FOR POWER TRANSMISSION (D 53-18 T.)

The committee recommends that the following revisions be made in these specifications, and the specifications as revised continued as tentative:

- Section 8.—Change the length of sample of belting submitted for inspection from 36 to 30 inches.
- Add new Section 10 as follows:
 - The filler or wear strength of the cotton duck in the belting shall be determined as follows: A transverse strip $1\frac{1}{2}$ inches wide shall be cut from the belting and opened up into two various sizes of the belting. The filler shall be ravelled down to a width of 1 inch and tested in a fabric-testing machine, the minimum width of jaws of which is $1\frac{1}{2}$ inches, the distance between jaws, 10 inches, and the speed of separation of jaws, 20 inches per minute. The tensile strength shall be at least 175 pounds.
 - Change present Section 10 to Section 11, and change the length of specimens submitted for inspection from 36 to 30 inches.
 - Change present Section 11 to Section 12 and reword Paragraph (a) as follows:
 - (a) The friction test or adhesion between the plies shall be conducted in the following manner: Specimens, each 1 inch in width, two plies in thickness and at least 4 inches in length, shall be prepared in sufficient number to test the adhesion between all plies. These should be taken transversely for belting 4 inches and over in width, and longitudinally for lesser widths. The two plies shall be separated for a distance of about $1\frac{1}{2}$ inches and by means of these separated ends, the test specimen shall be mounted freely between the upper fixed pair of jaws and the lower pulling pair of jaws, the latter weighted to 18 pounds. The rate of separation under this test shall not be greater than 1 inch per minute.
- Omit present paragraphs (b) and (c) and add new paragraph (b) as follows:
 - (b) A suitable friction-testing machine where available may be used to make the above test, in which case the pull required to cause a stripping of 1 inch per minute shall not be less than 18 pounds.
- Change present Section 12 to Section 13, and reword Paragraph (c) as follows:
 - (c) The elongation at the breaking load shall be such that the original 2-inch gage length of the test specimen for the cover shall stretch to not less than 9 inches, and for the bedding to not less than 10 inches.

LEADER HOSE FOR USE WITH PNEUMATIC TOOLS.

SERIAL DESIGNATION: D-19T. ISSUED, 1919.

- (a) These specifications cover leader hose for air tools working at not more than 125 pounds pressure.
- The hose is of two classes:
 - (A) Braided leader hose has a reinforcement of three plies of braided cotton yarn between the inner tube and the outer rubber cover.
 - (B) Wrapped leader hose has a reinforcement of plies of cotton canvas between the inner rubber tube and the outer rubber cover.

1. MATERIALS.

- The hose shall consist of: (a) an inner rubber tube; (b) cloth-braided layers; (c) canvas plies; (d) an outer rubber cover; (e) a wire armor when specified.
- The inner rubber tube shall be smooth, uniform in quality, and thickness and free from injurious defects.
- (a) The reinforcement of braided leader hose shall consist of three plies of cotton braided layers evenly and firmly woven over the inner tube. Each layer shall be well impregnated with a rubber compound suitable for the required service.
- (b) The reinforcement of wrapped leader hose shall consist of cotton canvas cut on a 45-degree bias and applied evenly and firmly over the inner tube. Each ply shall be well frictioned on both sides with rubber compound.
- (c) The cotton shall be as free from unsightly defects, dirt, knots, lumps, and irregularities of twist as is consistent with the best manufacturing practice.

(b) The reinforcement shall be sufficiently strong to enable the hose to successfully withstand the hydrostatic pressure test, yet at the same time be soft and pliable.

(c) The rubber cover shall be uniform in quality and thickness, and free from injurious defects.

(d) When specified, the hose shall be given an extra covering of armor of galvanized steel wire 7/32 by 3/64-inch, wrapped with $\frac{1}{4}$ -inch space between adjacent wires.

II. PHYSICAL PROPERTIES AND TESTS.

7. Where applicable, references are made below to the Standard Methods for Testing of Cotton Rubber-Lined Hose (Serial Designation; D 15b) of the American Society for Testing Materials.

8. The testing of the hose and samples shall be as defined in Section 19 of Standard Methods D 15.

9. Prior to the hydrostatic test specified in Section 12 (b), a section of hose 16 inches long shall be cut at any place from each test length and subjected to the following tests:

10. The adhesive quality of the rubber impregnation binding the plies together shall be determined in the case of braided leader hose by suspending a 20-pound weight from the separated end of a ply having a 1-inch section, cut longitudinally from the 16-inch sample described in Section 9.

In the case of wrapped leader hose it shall be determined by suspending a 20-pound weight from the separated end of the duck of a 1-inch ring cut from the 16-inch sample described in Section 9, the force being applied radially.

In both cases the rate of separation of the plies shall not be greater than 1 inch per minute.

11. (a) The tests of tube and cover shall be conducted in accordance with Sections 18, 19, 20, 22, 23, 24 and 25 of the Standard Methods D 15.

(b) The breaking load shall be such that the original 2-inch gage length of the test specimens for both the tube and cover shall stretch to not less than 11 inches.

(c) The method of conducting the hydrostatic pressure tests shall be in accordance with Section 26 of Standard Methods D 15.

(d) Each length of hose shall be subjected to a proof pressure test of 250 pounds per square inch for five minutes to expose imperfections.

On armored hose this test shall be made after the removal of the armor.

(e) From each lot of ten lengths or less of hose inspected, one length shall be further subjected to a pressure test of 800 pounds per square inch for 10 minutes, which it shall withstand without bursting. On large orders the number of tests may be reduced to not less than three at the option of the inspector representing the purchaser.

III. STANDARD DIMENSIONS AND WEIGHTS.

13. Unless otherwise specified, the hose shall be furnished in 10-foot lengths, which shall weigh not more than 4 pounds. The ends of each length shall be uncapped and without fittings.

14. (a) The minimum tube and cover thickness shall be as follows:

Internal Diameter of Hose, Inch. Thickness, Inch. Thickness, Inch.

7/16 3/32 1/16

(b) The gage of tube and cover shall be measured with the braid embedded in the rubber.

IV. MARKING.

15. Each length of hose shall have inlaid in rubber, midway between the ends, a brand showing the name of the manufacturer, the month and year of manufacture, the trade name of the hose and the legend "Leader 125 lb. A.S.T.M. Specifications."

V. INSPECTION AND REJECTION.

16. (a) The manufacturer shall notify the purchaser sufficiently in advance of the completion of the hose to permit of arrangements for inspection.

(b) The manufacturer shall afford the inspector representing the purchaser, without charge, all reasonable facilities to satisfy him that the hose is made in accordance with these specifications.

The tests and inspections shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be so conducted as not to interfere unnecessarily with the operation of the manufacturer.

The purchaser may make the tests to govern the acceptance or rejection of the hose in his own laboratory or elsewhere. Such tests, however, shall be made at the expense of the purchaser.

Each sample of hose shall be preserved for two weeks from the date of the test report. In case of dissatisfaction with the results of the tests, the manufacturer may make claim for a rehearing within that time.

"Proceedings," American Society for Testing Materials, Volume XXIII, Part 1, page 676 (1918).

TENTATIVE SPECIFICATIONS FOR ADHESIVE INSULATING TAPE.

SERIAL DESIGNATION: D-19 T. ISSUED, 1919.

1. These specifications cover a friction tape composed of cotton sheeting impregnated with an adhesive insulating compound.

I. MANUFACTURE.

2. The cotton sheeting layer shall be made from a sheeting evenly and firmly woven of good cotton and be free from unsightly defects, knots, lumps and irregularities of twist as is consistent with the best manufacturing practice. The threads shall run in straight lines without waviness so as to reduce to a minimum the raveling of the cloth when cut into tape.

3. The frictioning compound shall be an adhesive and insulating compound practically free from free sulphur (not over 0.05 per cent) or other substances which would have a deteriorating effect on copper or other metals or on the fabric.

4. The fabric shall be thoroughly impregnated and evenly covered on both sides with the frictioning compound.

5. The thickness of the tape shall be not less than 0.013 nor more than 0.017-inch, when measured with a rubber spring micrometer with 0.4-inch diameter foot.

6. The compound shall adhere firmly to the fabric and shall not pull away from the fabric so as to leave bare spots when adjacent thicknesses of the tape are separated.

II. PHYSICAL PROPERTIES AND TESTS.

7. When the tape is held before a strong light, the number of pin holes noted per linear yard of tape, 3/4-inch wide, shall not exceed two.

8. The tensile strength per 1/2-inch width shall be not less than 30 pounds. The initial distance between the jaws of the testing machine shall be 12 inches, and the rate of separation of the jaws shall be 20 inches per minute.

9. When wrapped on a clean, smooth copper rod and baked at 100 degrees C. for 16 hours, the compound shall not discolor the copper.

10. (a) The specimen of the friction coat of compound between the plies shall be such that when a strip of tape 3 feet long and 3/4-inch wide is taken from a roll and wound upon a 1-inch mandrel under tension of 7 1/2 pounds at the rate of 30 inches per minute the weight of 3 pounds shall not cause the plies to separate at a greater rate than 30 inches per minute. (b) After a strip has been exposed to dry heat at 100 degrees C. for 18 hours and then cooled to room temperature, a test specimen shall withstand the test prescribed in the Paragraph (a), except that the weight applied to unwind the tape shall be 1 pound instead of 3 pounds.

11. The test for dielectric strength shall be made as follows: the tape shall be spirally wound with one-third lap on a smooth metal rod, 1 inch in diameter, for a distance of 6 inches. Two inches in the center shall be covered with tin foil and bound down securely with tape, and an alternating potential of 1000 volts, of a frequency of not over 65 cycles, shall be applied for five minutes between the metal rod and the tin foil without puncture.

12. One 1/2-pound roll for each 250 rolls shall be selected at random for the various tests. At least two feet of the outer layers shall be removed and one specimen taken for each test. If the tape fails in any one test, two additional specimens shall be taken. If the tape fails in either of these two additional tests, the material shall be rejected.

III. STANDARD WEIGHT, DIMENSIONS AND VARIATIONS.

13. The net weight of the tape, 3/4-inch wide, shall be not less than 8 ounces per roll, exclusive of a wrapping, and box.

14. The length of 3/4-inch tape shall be not less than 55 yards per pound.

15. The width shall not vary from that specified more than ± 0.03 inch.

IV. PACKING AND MARKING.

16. Each roll shall be packed in oiled paper or metal foil and enclosed in a suitable box. The wrapping shall be secure and shall thoroughly protect the contents.

17. Each box shall be marked with the name of the manufacturer or trade mark, and the nominal width and weight of the tape.

V. INSPECTION.

18. The tape shall be tested and inspected within four weeks of date of delivery.

VARIATION IN STRENGTH OF TEXTILES AT VARIOUS MOISTURE REGAINS, WITH RELATION TO THE WEIGHT OF THE FABRIC.*

From practical laboratory experiments it has long been known that the rate of gain in tensile strength due to moisture absorption in various textiles bears a very direct relation to the weight of the fabric. While very heavy fabrics and those woven closely are slow in reaching their full regain, the increase in strength is very great. On the other hand, light fabrics of a gauze-like nature obtain their regains quickly and show but little increase in strength from this source. It is therefore manifestly incorrect to assume a standard rate of increase for all weights of textiles. In order to investigate this subject the chairman tested a variety of fabrics, ranging from a very open cheese-cloth weighing about 1 1/2 ounce per square yard up to the heaviest obtainable duck, having a weight of about 50 ounces per square yard.

The fabrics were tested in groups of eight or ten specimens each at various regains, passing from a bone-dry condition at one end of the scale to that at which all the moisture possible had been absorbed from an atmosphere having a relative humidity of 80 per cent. The moisture content was determined in each case by weighing on analytical balances before and after drying in an electric oven at a temperature of 220 degrees F.

The results are plotted in Figure 1, and show to the same scale the wide range in strength increase with the various weights of fabric. In all cases strip specimens were used measured to 1 1/2 inches wide and ravelled accurately to 1 inch. The distance between jaws was 3 inches in all cases and the speed of the moving jaw 12 inches per minute. While weigh-

FIG. 1. VARIATION IN TENSILE STRENGTH IN TEXTILES DUE TO MOISTURE.

ing, the moist specimens were in all cases enclosed in air-tight containers, so that the moisture could not vary. The following is the detail of the tests:

FABRIC A.—An open cheese cloth of ordinary grade cotton 40 warp and 32 filling threads per inch, weighing bone dry 1.45 ounces per square yard or, at a regain of 6 per cent, 1.54 ounces.

Moisture, per cent..... 0 5.37 10.49

Average tensile strength, pounds..... 17.0 19.8 21.8

FABRIC B.—30-inch 7-ounce Osnaburg. A very good standard fabric of this class, 40 warp by 30 filling threads per inch. The bone-dry weight was 7.64 ounces per sq. yard, and at 6 per cent regain, 8.10 ounces.

Moisture, per cent..... 0 4.76 6.87 10.88

Average tensile strength, pounds..... 43.6 57.8 67.4 71.9

FABRIC C.—Mercerized cotton airplane wing fabric. Normal weight 4 ounces per square yard; 3/80" yarn, with 68 threads per inch of width in both warp and filling.

The plot for this filling is taken from a paper, "The Effect of Moisture upon the Strength of Aircraft Fabrics," presented by the chairman at the June, 1918, meeting of the Society.

FABRIC D.—Cotton bag sheeting 48 by 48, 2.85-yard goods 36 inches wide. This cloth weighed bone dry 5.17 ounces per square yard and, at 6 per cent regain, 5.48 ounces per square yard.

Moisture, per cent..... 0 4.76 6.87 10.88

Average tensile strength, pounds..... 54.3 69.3 73.0 83.3

FABRIC E.—30-inch 7-ounce Osnaburg. Exceptionally clean. The bone-dry weight was 8.1 ounces per square yard, and at 6 per cent regain, 8.60 ounces.

Moisture, per cent..... 0 4.76 6.87 10.88

Average tensile strength, pounds..... 56.1 72.1 85.3 93.1

FABRIC F.—Standard 11/23" by 11/23" square woven tire fabric, made of carded Egyptian cotton, 17 1/2 ounces per square yard, under normal conditions.

The plot for this fabric was originally derived by Messrs. Yeaton and Panettiere in the Textile Laboratory at the Massachusetts Institute of Technology. The plot was also presented by the author of the paper to which reference has just been made.

FABRIC G.—A moderately heavy duck used in the manufacture of stitched canvas belts. The warp threads are 6 ply 26 per inch and the filling 5 ply 16 per inch. Bone-dry the canvas weighed 27.5 oz. per sq. yd. and, at 6 per cent regain, 29.1 ounces.

Moisture, per cent..... 0 6.21 9.79

Average tensile strength, pounds..... 194 330 373

TABLE I. STRENGTH INCREASE IN VARIOUS FABRICS FOR VARIOUS MOISTURE REGAINS.

Fabric.	Maximum Regain, Per Cent.	Rate of Increase in Per Cent of Dry Strength for Each Per Cent of Moisture.	Weight at 6 Per Cent Regain, Oz. Per Sq. Yd.
A—Cheese-cloth	10.40	2.69	1.54
B—Osnaburg	10.88	5.98	8.10
C—Wing fabric	10.33	15.2	4.00
D—Sheeting	10.88	4.91	5.48
E—Osnaburg	10.88	6.06	8.60
F—Tire fabric	9.00	9.67	11.1
G—Belt duck	9.70	9.53	29.1
H—Heavy duck	8.22	17.12	49.34

*Proceedings, American Society for Testing Materials, Volume XXIII, Part I, page 389 (1918)

*From Report of Committee D-13 on Textile Materials.

TABLE II.—"CORRECTED" RATES OF STRENGTH INCREASE.

Fabric	Weight at 6 1/2 Per Cent Regain, Oz. Per Sq. Yd.	Correction Rate.
A—Cheese-cloth	1.54	0.57
B—Osnaburg	8.10	3.00
C—Wing fabric	4.00	1.48
D—Sheeting	5.48	2.03
E—Osnaburg	8.60	3.18
F—Tire fabric	17.3	6.40
G—Belt duck	29.1	10.77
H—Heavy duck	49.34	18.26

FABRIC H.—A very heavy closely woven canvas. There were 19 threads per inch in the warp, 13 ply. The filling was made up of 15 threads per inch, 14 ply. Bone dry the canvas weighed 46.55 ounces per square yard and, at 6 per cent regain, 49.34 ounces.

Moisture, per cent.	0	5.28	8.22
Average tensile strength, pounds.	204	381	491

The straight line plots in Figure 1 show that the strength increase in every case is fairly uniform and at the rates indicated in Table I.

FIG. 2.—RATE OF INCREASE IN TENSILE STRENGTH WITH REGAIN TO WEIGHT OF FABRIC.

The plot of Figure 2 shows the rate of increase in relation to the weight of the fabric. Any expression or formula, therefore, to be used to correct apparent strengths for the moisture present must embody the weight of the fabric. The rate of increase in strength runs by approximately a straight line from 2.69 per cent for 1.54-ounce fabrics to 17.12 per cent for 49.34-ounce duck. The rate of this increase is very nearly 0.37 per cent per ounce of fabric weight.

Therefore, there is for every weight of fabric a "correction rate" equal to 0.37 multiplied by its ordinary weight in ounces per square yard. For the fabrics given above this will be as shown in Table II.

Thus to correct any cotton fabric for moisture present and

FIG. 3. TENSILE STRENGTH OF FABRICS CORRECTED FOR MOISTURE.

bring it to a condition of 6½ per cent standard regain, would require the use of a formula such as:

$$\text{Tensile Strength Corrected to Standard Moisture Regain of } 6\frac{1}{2}\text{ per cent} = \frac{\text{Tensile Strength from Machine Reading} \times [100 + (\text{Rate} \times 6.5)]}{100 + (\text{Rate} \times \text{Actual Regain at Test})}$$

$$100 + (\text{Rate} \times \text{Actual Regain at Test})$$

If the above formula be applied to all the preceding tests the plot of Figure 3 will be the result. This indicates a fair degree of uniformity in the results whatever the moisture content may be.

STEAM HOSE FOR CAR HEATING.

AT THE RECENT MEETING of the American Society for Testing Materials at Atlantic City, a paper on steam hose for car heating was presented by H. J. Force. The author describes briefly a method of manufacture for steam hose which will neither contract nor expand in service. He said:

When made from duck alone, steam hose has been found to contract to such an extent in service that in some cases it becomes uncoupled when passing around a short curve.

Again, the failure of steam hose in many cases has been traced directly to the excessive expansion which takes place after the hose has been in service for some time. This expansion frequently results in the hose blowing off from the coupling, requiring the use of a special clamp to hold the hose on the coupling.

After making a series of tests, it was decided to build a hose of duck with a heavy friction, and then one or more layers of braiding. If made from duck alone, hose will expand excessively. It is impracticable to make it from braiding alone, but with a combination of duck and braiding a very satisfactory grade of steam hose can be produced which will show no contraction in length and no expansion in diameter under the most severe service conditions.

Four constructions of hose were tested, each, however, with two plies of braiding over the duck plies with intervening rubber layers for anchoring the braiding. All hose was steamed to bursting, ten hours a day at 60 pounds pressure. Under this test one series of hose showed an average life in eight samples of 960 hours, the minimum being 700 and maximum 1,535 hours. In this series the number of plies of duck was increased from two to three, and this apparently had the effect of nearly doubling the life of the hose.

The detailed construction was as follows: Tube, regular specification steam hose 5/32-inch thick; 3 ply, 23 ounces per square yard with heavy coat of special steam-resisting friction; first ply of gum to anchor braiding, 1/16-inch thick, regular specification, steam-resisting; first ply of braiding, number 8/3 yarn in 5 by 5 strands; second ply of gum to anchor braiding, 1/32-inch thick, regular specification, steam-resisting; second ply of braiding same as the first ply; outside cover, 1/32-inch thick, regular specification, steam-resisting.

The author concludes:

1. That steam hose should be made of a composition of duck and braid.
2. That machine-made tubes should not be used, and that tubing of three-ply calender should in every case be used in hose to be subjected to any considerable temperature.

J. P. DEVINE CO. PLANT ADDITIONS.

Increased business during the past four years has compelled the J. P. Devine Co., manufacturer of vacuum-drying and evaporating apparatus and chemical apparatus, to build several additions to its great plant at Buffalo, New York. One of these, constructed of steel and brick with the most improved light and ventilating system, 30 by 100 feet, and just completed, houses the vacuum-pump assembly department; another, 90 by 100 feet, of the same material and general plan, in course of construction, enlarges the general assembling department. The foundations have been laid and the steel construction is proceeding for a third addition, a new foundry, 90 by 225 feet, equipped throughout with new machinery, giving greatly increased facilities for casting large commercial units. The total investment represented in these plant additions when fully equipped will amount to \$200,000.

What the Rubber Chemists Are Doing.

QUANTITATIVE TESTING OF RAIN-PROOF AND WATERPROOF CLOTH.

THE AUTHORS, Geoffrey Martin and James Wood, preface their paper by noting that the tests given are all well known in the trade, but as not much appears to have been published on the subject the methods described may be of interest to chemists who are called upon to examine cloth in regard to its waterproof quality.

Among the chief waterproofing processes may be mentioned the following:

1. With aluminum acetate. The fabric is immersed in a solution of aluminum acetate, squeezed and dried, aluminum oxide being deposited in the fiber. Fabrics thus waterproofed are porous and permeable to air. They are not strictly waterproof, and consequently are sometimes described as shower-proof or rainproof.
2. With gelatine, glue, isinglass, casein, etc., followed by treatment with a solution of alum, tannin, etc. Here again the goods are usually not absolutely impermeable to water.
3. With paraffine and other waxes. Articles treated in this way are usually impermeable to water.
4. With india rubber.
5. With oil. A mixture of raw and boiled linseed oil mixed with coloring matter, resin and other materials is spread in thin layers on the fabric, which is dried between successive applications. Oiled silks, oil-skins, etc., impervious to water and air, are thus prepared.
6. With ammoniacal cupric oxide. The "Wellesden" fabrics are waterproofed by this process.

DETERMINATION OF WATERPROOF VALUE.

THE DROP TEST. This is the War Office test and is especially valuable in that it furnishes a fairly-accurate numerical value of the degree of waterproofing. It reproduces more or less exactly the actual conditions to which a cloth is subjected in practice, imitating the natural fall of rain.

The method of carrying out the test is shown in the illustration. The sheet of cloth to be tested is laid upon a sheet of white blotting paper which in turn rests upon a sheet of plate glass, supported by a frame at an angle of 45 degrees. The cloth and blotting paper are fixed in position by strips of lead about an inch wide, bent at the end and laid over the cloth. Beneath the plate glass is a horizontal mirror.

Water is dropped from the burette onto the cloth about five feet below. By means of the cock the flow of the water is kept at 20 drops per minute. This is continued until the water passes through the waterproofed cloth and stains the blotting paper below. By viewing through the mirror from behind, the exact moment at which the stain appears can be determined and the number of drops required to produce this result is noted.

There is a considerable variation between the minimum and maximum number of drops required for penetration, but the average for a set of tests (20 trials per one half square foot) seems characteristic for any given piece of cloth. To pass the War Office test, an average of 60 drops is required. This is

considerably in excess of that usually needed in civilian garments.

The drop test is repeated on samples of the same cloth after each of the following treatments:

1. The cloth should be rinsed three or four times in cold water, dried, and tested again. A more severe test is to soak the cloth in cold water for 24 hours, dry, and then again test. A properly waterproofed cloth should not show much variation when treated in this manner.
2. The cloth should be covered with a damp cloth, ironed, and again be subjected to the drop test. It is still better to blow steam through it. The object of this test is to be sure that the waterproofing is of such nature as to resist the treatment to which the cloth will be subjected in the tailor's hands.

FABRICS PROOFED WITH RUBBER.

In the case of fabrics proofed with india rubber, the War Office specifies the composition of the proofing material. Thus, the material for proofing coats with vulcanized india rubber mixings must contain: mineral matter, not more than 41 per cent; sulphur not more than three per cent; india rubber not less than 56 per cent on the average, and no single coat may contain less than 54 per cent.

In the case of cyclists' waterproof capes, a different composition may be used for the proofing. The mineral matter must not exceed 52 per cent, sulphur three per cent (the free sulphur in this to be not more than one per cent). The rubber must not be less than 45 per cent on the average, and no single garment may contain less than 43 per cent. Civilian garments may consist of different qualities from these, which represent a very high class of waterproofing.

ANALYSIS OF RUBBER PROOFING.

MINERAL MATTER. A part of the sample is ignited and the weight of ash determined. Due corrections are made for oxidation to sulphates. When antimony sulphide and copper are present these should be estimated in the usual way. The mineral matter used for coloring the proofing of cyclists' capes usually consists of zinc oxide and litharge. Small additions of other ingredients such as are generally recognized as having a beneficial influence are officially recognized. The presence of calcium carbonate and magnesium carbonate is often prohibited in War Office contracts.

Sulphur is estimated in the usual way as barium sulphate, oxidation being generally effected by nitric acid and potassium chlorate. From a determination of the amount of antimony and other metals present as sulphide in the preliminary operation, a correction for the amount of sulphur combined with antimony and other metals can be made.

Free sulphur is regarded as the sulphur extracted by boiling acetone. The substance is extracted by boiling acetone for about one hour, the acetone evaporated, the residue oxidized, and the amount of free sulphur determined as barium sulphate.

Organic matter extracted by acetone is the difference between total acetone extract and free sulphur.

ALCOHOLIC POTASH EXTRACT. The amount of organic matter dissolved by boiling the acetone-extracted sample with alcoholic potash is estimated as follows:

The acetone-extracted rubber is dried and boiled for eight hours with a solution of alcoholic potash (56 grains caustic potash in 500 cc. of alcohol). The solution is poured into a dish, the rubber washed twice with alcohol and boiled two or three times with water, the washings added, and the alcohol distilled off and recovered. The residue is evaporated, washed into a separating funnel, acidified with hydrochloric acid, and the fatty acids extracted with successive portions of ether. The ether is

DROP TEST FOR
WATERPROOF
FABRICS.

* "Journal of the Society of Chemical Industry," April 15, 1918, page 84T.

distilled off and the residue dried to constant weight in the water oven.

The rubber residue left after boiling with alcoholic potash is washed free from potash by water, dried to constant weight in the water oven, and cooled in *vacuo*. The ash and sulphur in the dried residue are then estimated and thence the weight of organic matter in the residue is calculated. This weight is deducted from the weight of organic matter in the residue after extraction with acetone (obtained by deduction of ash and combined sulphur) and from the difference the loss of organic matter by extraction with alcoholic potash per 100 parts of rubber is calculated.

The latex-rubber proofing should be free from grit and large size particles. In the case of capes a three-inch square of material should have at least 0.13 grams of proofing between the two fabrics

THIOGEN PROCESS OF MAKING SULPHUR.

The thioген process of making sulphur consists essentially in the treatment of sulphur dioxide gas, from any source, with a hydrocarbon gas in the presence of a basic sulphide catalytic material. Any form of hydrocarbon gas or reducing gas may be used, the result in any case being sulphur vapor, carbon dioxide and water vapor. The so-called wet thioген process was tried out under the direct supervision of the United States Bureau of Mines in 1915, and the results published in Bulletin 113 of that Bureau.

In brief, it was determined that sulphur could undoubtedly be produced by this process at an estimated cost of about \$12 per ton. By adaptation of modern commercial practice in the concentration of the sulphur-dioxide gas from weaker gases, before reducing this gas to elemental sulphur, by the action of the reducing gases not only is the size of the installation for a given capacity very much reduced but the oxygen content of the gas is entirely removed, thereby effecting a great reduction in the amount of reducing material necessary.

Under the most favorable conditions the cost of producing sulphur by the improved process is now estimated at \$5 per ton.

DETERMINATION OF SULPHUR IN VULCANIZED RUBBER.

The following method for determining sulphur in vulcanized rubber, by H. P. Stevens, is abstracted from "The Analyst," volume 43 (1918), page 377.

About 0.5 grams of the sample is digested with 20 cc. of nitric acid (specific gravity 1.42) and 0.5 grams of potassium chlorate. The liquid is then boiled for two or three hours beneath a reflux condenser, subsequently evaporated to dryness in a dish after the addition of three grams of pure magnesium nitrate. The residue is cautiously heated over a flame, the presence of the magnesium salt moderating the combustion, and any unburnt carbon is destroyed by digestion with nitric acid and potassium chlorate, and the excess of acid evaporated.

After the addition of 10 cc. of strong hydrochloric acid, the dish is covered with a watch glass and gently heated until red fumes cease to appear. The liquid is then diluted, filtered, made up to 300 cc., and heated to boiling on a hot plate. The sulphuric acid is precipitated by the addition of 5 cc. of ten per cent barium chloride solution, and the precipitate allowed to stand over night before filtration.

BRITISH USE OF NITER CAKE IN RUBBER RECLAMATION.

The following information on the use of niter cake in reclaiming unvulcanized rubber is derived from a report by Consul Ross E. Holaday, Manchester, England, in "Commerce Reports" (March 15, 1919).

In reclaiming unvulcanized waste rubber by the acid process a solution is made up by dissolving niter cake in hot water, which gives about a ten per cent content of sulphuric acid. As it is

necessary to have a 15 to 20 per cent solution of sulphuric acid, Manchester reclaimers bring this up to strength by using commercial sulphuric acid. In this way they are enabled to use about 50 per cent niter cake in the treatment of waste rubber by the acid process.

During the war sulphuric acid was available for use in England only on a permit issued by the Ministry of Munitions and it was not possible to use a straight sulphuric acid solution without the use of niter cake. By careful handling and thorough washing it has been found that niter cake can be used with a considerable degree of safety.

WATERPROOFING DRAWINGS.

For the purpose of rendering drawings waterproof to be used in damp localities, mines, etc., J. S. Carpenter recommends in "Engineering News," September 20, 1918, a solution of pure unvulcanized caoutchouc in benzene. The solution is diluted sufficiently with benzene to yield a thin liquid that will spread well under a brush. With this liquid the drawing is coated on both sides. A thicker solution or cement of crude rubber is used to stick together parts of large drawings. The same solution may also be used for cleaning soiled drawings, the deposited film of rubber being rolled up and used as an eraser.

SYNTHETIC CAOUTCHOUC.

The "Journal of the Society of Chemical Industry," March 31, 1919, gives the following abstract of an article by C. Duisberg, in the "Elektrochemische Zeitschrift" ("Electrochemical Journal"), 1918, volume 24, pages 369-372.

Synthetic rubber from dimethylbutadiene (methylisoprene) as first made on a commercial scale was very susceptible to oxidation and combined very slowly with sulphur. These difficulties were overcome by the addition of organic bases (especially piperidine and similar substances, and in this way hard rubber equal in strength to that made from natural rubber and with an electrical resistance about 20 per cent higher, has been made.

The production of soft vulcanized rubber from the synthetic product has not been equally successful. Leather-like products are usually obtained and although the elasticity can be improved by addition of dimethylaniline and other substances, the material does not work well on the rolls, does not vulcanize satisfactorily, and is inferior in "nerve" to vulcanized rubber made from the natural product.

CHEMICAL PATENTS. THE UNITED STATES.

LEATHER SUBSTITUTES. A permanently fibrous substitute for leather, comprising a short length fiber, selected sheet Ceylon rubber, gum Concho, Pontianak, magnesia, red oxide of iron, and sulphur, the whole being vulcanized. (John D. Prince, Boston, Massachusetts. United States patent No. 1,305,621.)

PHENOLIC CONDENSATION PRODUCT AND PROCESS. A fusible product of para-cresol and a substance containing a mobile methylene group. The product fuses at temperature above 115 degrees C. (Leo H. Bakeland, Yonkers, New York, assignor to General Bakelite Co., New York City. United States patent No. 1,306,681.)

PROCESS FOR TREATING LATEX AND PRODUCT. The process comprises rendering the nitrogenous matter contained in a mass of latex insoluble, subjecting the mass to vacuum evaporation and adding a vulcanizing agent. (Edward Mark Slocum, Medan, Sumatra, Dutch East Indies, assignor to General Rubber Co., New York City. United States patent No. 1,306,838.)

METHOD OF WATERPROOFING FABRICS. Textile fabrics and wearing apparel are treated with paraffine wax in conjunction with petrolatum and a selenium-treated Chinese wood oil. (Herbert P. Pearson, assignor to Pearson Products Corporation, both of New York City. United States patent No. 1,307,373.)

THE DOMINION OF CANADA.

LEATHER SUBSTITUTE AND PROCESS. This consists in forming a matted fiber sheet, saturating and combining with it a binding agent composed of rubber, balata, fish glue, silicate of soda, sulphur and linseed oil, drying the sheet and compressing it. (Roland B. Respass, New York City. Canadian patent No. 191,418.)

RUBBER SUBSTITUTE AND PROCESS. Glutinated vegetable proteid substances are treated with a phenol, an oxidizing oil, an active methylene compound and an alkali, and the mass finally vulcanized. (Sadakichi Satow, Tokio, Japan. Canadian patent No. 191,428.)

THE UNITED KINGDOM.

RECLAIMING RUBBER. Rubber waste is finely ground and mixed with a rubber solution in the proportion of 2½ to 3 pounds of new rubber to each hundred of old, the solvent being gasoline or carbon tetrachloride. The mass is reground, after which the solvent and any contained moisture are removed as far as possible, the temperature being kept below the vulcanizing point, employing a partial vacuum if necessary. Molding and vulcanization are effected with or without the addition of sulphur which, when employed, is preferably dissolved in the rubber solvent. (J. Porzel, 199 Glenwood avenue, Buffalo, New York. British patent No. 124,887.)

COMPOSITION FOR COATING FABRICS. This consists of rubber and aluminum hydrates, with or without other ingredients, forming a non-inflammable coating. Example of proportions: 25 parts rubber, 60 parts aluminum hydrate, 7 parts asbestos, 1½ to 6 parts litharge and 1 part sulphur. This mixture is softened in coal-tar naphtha and used to coat fabric which may be first treated to render it fireproof, and the coating may be vulcanized in a steam vulcanizer. (W. H. Perkin, Waynflete; J. H. Mandelberg and J. Mandelberg & Co., Pendleton, Manchester. British patent No. 125,622.)

VULCANIZING ACCELERATOR. Caustic alkali is dissolved in an organic compound (other than glycerol or glycol) of predominant hydroxylic character, such as butyl or amyl alcohol or phenol. The compounds in question are limited to those that are fluid at the ordinary temperatures or are fusible at about 120 degrees C. (Dunlop Rubber Co., 14 Regent street, Westminster, and D. F. Twiss, Royal road, Sutton, Coldfield. British patent No. 125,696.)

THE REPUBLIC OF FRANCE.

ACCELERATORS. New agents for accelerating the vulcanization of caoutchouc and method of their production. (S. J. Peachey, Heaton, Mersey, near Manchester, England. French patent No. 490,897.)

HOLLAND.

ACCELERATING VULCANIZATION OF RUBBER. Para-nitrosodimethylaniline is added as the accelerating agent. (S. J. Peachey, Heaton, Mersey, near Manchester, England. Holland patent No. 2,829, March 15, 1919.)

OTHER CHEMICAL PATENTS.

THE UNITED KINGDOM.

APPENDIX TO ABRIDGMENTS OF SPECIFICATIONS (1915).

- N**O. 5,915. The incorporation of coloring matter in solution with the rubber of balloon fabrics to guard against deleterious action by actinic rays of light. (Not yet accepted.) R. Wheatley and North British Rubber Co., Castle Mills, Fountainbridge, Edinburgh.
- 13,689. The coloring of one or more of the intermediate plies as well as the outer one of the gas-tight membrane of a balloon fabric to guard against the deleterious action of light. (Not yet accepted.) W. A. Williams and North British Rubber Co., Castle Mills, Fountainbridge, Edinburgh.
- 13,690. A compound fabric for balloons of the type described in Specification 7130/02, consisting of two or more plies of similarly dyed material of identical weave and yarns. (Not yet accepted.) W. A. Williams and North British Rubber Co., Castle Mills, Fountainbridge, Edinburgh.

LABORATORY APPARATUS.

INSURING TIGHT CONNECTIONS BETWEEN GLASS AND RUBBER TUBING.

A SIMPLE AND EFFECTIVE DEVICE for insuring tight connections between glass and rubber tubing is described by C. C. Kepling in "The Journal of Industrial and Engineering Chemistry," August, 1918, page 631.

CONNECTION BETWEEN GLASS AND RUBBER TUBING.

turned as shown at A.

Cord is better than copper wire for this purpose because it distributes the force more uniformly throughout its length. This mode of attachment may be dismantled without pliers or other tools.

CLEANSING FILTER CRUCIBLES.

An effective method of cleansing alundum filtering crucibles by reverse washing is clearly shown in the accompanying illustration for which we are indebted to the Norton Company, Worcester, Massachusetts.

FILTER CRUCIBLE CLEANSING.

for which we are indebted to the Norton Company, Worcester, Massachusetts.

FILTERING CRUCIBLE.

Alundum filtering devices are especially adapted to routine laboratory work where suction is available because of the rapidity with which filtration can be made. They will hold the finest precipitated substance and are particularly adapted to organic work where they need only to be heated over a burner to be cleansed. In addition to the usual forms of crucibles, cones, and dishes, alundum filters are made in special shapes, such as disks, plates, tubes, etc.

A novel and effective way of supporting a filtering crucible so that the entire filtering area is acted upon by the suction is shown in the illustration. The apparatus was designed and used first by G. L. Spencer of the Cuban-American Sugar Co. (Norton Co., Worcester, Massachusetts.)

FILTERING DEVICE.

COMPOUND FOR FROSTING AND ETCHING GLASS.

Diffusilene is the name given to a new liquid compound which imparts a smooth satin-like frosted finish to glass surfaces. The glass becomes uniformly and permanently etched wherever the liquid is applied, complete chemical action taking place in about three minutes. It is applied by dipping or by brush and is practically harmless to hands or clothing. (Standard Scientific Co., 70 Fifth avenue, New York City.)

"CRUDE RUBBER AND COMPOUNDING INGREDIENTS" and "RUBBER MACHINERY," by Henry C. Pearson, should be in the library of every progressive rubber man.

New Machines and Appliances.

VACUUM-DRYING, IMPREGNATING, AND SOLVENT RECOVERY APPARATUS.

THIS APPARATUS has been specially designed for impregnating tire fabrics, belting and hose duck, and other fabrics; drying after impregnating, and recovery of the volatile solvent employed.

The complete operation takes place under vacuum. The material is first dried by passing it from the top roller to the bottom roller between the heating tables. The solvent is then admitted to the chamber and thoroughly impregnates the material owing to the air having been entirely expelled. The material is then rewound on to the top roller, passing between rollers to squeeze out surplus solvent, and afterwards between the heating tables to thoroughly dry it.

The vapor from the drying chamber is drawn through a

MACHINE FOR VACUUM-DRYING AND SOLVENT RECOVERY.

multitubular condenser by means of a vacuum pump, and the condensed solvent is collected in the receiver.

Details of construction vary according to the materials to be treated, and the solvent used. (Francis Shaw & Co., Limited, Bradford, Manchester, England.)

OIL-WIPER FOR SELF-OILING BEARINGS.

The use of an efficient oil-wiper on bearings, particularly heavy ones, results in a saving of oil, labor and machinery repairs. Such devices are well adapted to rubber mill practice.

OIL-WIPER FOR BEARINGS.

tended to a convenient point in the groove at the end of the bearing or to the housing at the end of the bearing. There is a wiper placed at each end of the bearing.

These wipers are equally useful for all self-oiling bearings, whether plain, roller or ball. It is said that on a test run of four months on ten bearings, each transmitting 250 horsepower, one gallon of oil was required for replacement on all ten bearings. (Industrial Products Co., 1024 Penobscot Building, Detroit, Michigan.)

BEAD-MAKING MACHINE.

The growing popularity of straight-side tires has stimulated the invention of labor-saving machinery to meet the tire manufacturers' requirements. The in-extensible beads used on all straight-side tires are built up on an annular wire core, and the machine shown in the accompanying illustration is especially designed for the purpose of making this bead-core.

The wire is fed from a stock-reel to an expansion-head, whereby any size of bead from 31 by 4 inches to 38 by 5½ inches may be formed. The machine is equipped with a direct motor-drive and starting switch. (Gillette Rubber Co., Eau Claire, Wisconsin.)

WIRE-BEAD MACHINE.

THE W-S-M HYDRAULIC RIMMING-PRESS.

ACCORDING to the old method used in the manufacture of cord tires, the air-bag rings were drawn together by hand-operated bolts that held them together—a very tedious process.

PRESS FOR SETTING AIR-BAG RINGS.

The demand for a small but simple press for doing this work has resulted in the machine here illustrated. By using this press the rings are quickly brought together ready to receive the bolts, no mechanical knowledge being necessary.

The cylinder, ram, and platens

are of heavy semi-steel and the cylinder and base are cast in one piece. The cylinder is outside packed with a U-leather ring-packing having a flax core and held in place by a gland which can be easily removed.

The ram cap or lower platen and the upper platen are spider-shaped to enable the operator to tighten up the bolts on the rings easily after they have been forced together. The upper

platen is supported on heavy steel rods and acts as the upper frame of the press.

The distance in the clear between platens when the lower one is down is 14 inches, while between the rods it is 45½ inches. (The Wellman-Seaver-Morgan Co., Cleveland, Ohio.)

HIGH-DUTY BELT-FASTENERS.

The requirements of conveyor service, elevator belts and heavy transmission duty at moderate speeds have been considered in the design of this belt fastener. It gives an evenly balanced joint

of exceptional tensile strength, combined with smoothness on both sides.

The squared ends of the belt are butted tightly together and the required number of top

plates, with the round holes, are spaced evenly across the belt with approximately one-half inch between each plate, and the bolt holes marked and punched one-sixteenth inch back from the corresponding marked positions on the belt.

The square-seated plates are placed on the pulley side and the square-head bolts inserted in the holes, the round countersunk plate being used on the reverse side to receive the special cone-shaped nuts.

After the parts are properly assembled the nuts are screwed down tightly and evenly with a special socket wrench. After a few days the nuts should again be tightened. The bolt ends on conveyor belts should be cut off and the ends smoothed down. (Flexible Steel Lacing Co., 522 South Clinton street, Chicago, Illinois.)

MACHINERY PATENTS.

BATTERY-JAR PRESS-VULCANIZERS.

THIS MACHINE exerts pressure simultaneously and in all directions upon the several faces of the battery-jar being molded, which is afterwards cured in the same machine. Referring to

BATTERY-JAR MOLDING AND VULCANIZING PRESS.

plates and the top plate of the outer mold. The bell-shaped cover is then lowered and locked to the base. The waste pipe of the cylinder is left open so that the piston may be pushed up by the rising mold.

Pressure is then turned into the cylinder and the platen with the mold thereon is elevated, the result being that a heavy molding pressure is exerted, causing the edges, sides and bottom

walls of the battery-jar to be fully compacted and molded. Steam is then turned into the interior of the vulcanizing chamber and, circulating around the mold, vulcanizes the jar. (John R. Gammeter, Akron, Ohio, assignor to The B. F. Goodrich Co., New York City, United States patent No. 1,306,001.)

A TUBING MACHINE OF NEW DESIGN.

A tubing machine of novel design is shown here, Figure 1 being a sectional elevation on the line 1-1 of Figure 2 and Figure 2 is a sectional plan on the line 2-2 of Figure 1.

The method of operation is as follows:

The extrusion rollers *b* and the feed rollers *f* are revolved in the directions indicated by the arrows in Figure 1. The rubber which it is desired to extrude is first formed into strips of a suitable width and thickness to introduce between the feed rollers *f*.

By means of the adjusting screw the feed rollers are adjusted so as to pass forward a sufficient quan-

A BRITISH TUBER.

quantity of material to fill entirely the spaces between the teeth b^1 of the rollers b .

As the extrusion rollers revolve the material is carried around the periphery of the rollers until it reaches the point at which the teeth b^1 interlock.

The teeth are so shaped that the material is then forced out of the spaces in a thoroughly masticated condition, and it is thus deposited in and forced along the extrusion chamber and through the extrusion opening between the core c' and the die d' on to the cable which is drawn through the sleeve c'' in the ordinary way. (John Stratton of Bowden and Ernest Alexander Claremont of High Legh, England. United States patent No. 1,302,484.)

RUBBER SHEET-FORMING AND CURING APPARATUS.

Vulcanized rubber sheets are produced by pressure between converging travelling metal belts which are progressively steam-heated so that the temperature is increased until the vulcanization point is reached near the delivery end of the bands.

The belts 19, 20 are carried by vertically adjustable power-driven rollers 9, 10 and by idler rollers 17, 18 capable of both vertical and horizontal adjustment. Positively driven pressure-rollers 13, 14 capable of horizontal adjustment are provided to engage the belts.

Below and above the belts 19, 20, respectively, are platens 4 and 6, divided into chambers which are supplied with steam through pipes controlled by hand or pressure-operated valves. Steam first enters the compartments *a* so that the temperature increases from the point at which the rubber is delivered from a vertically-adjustable spreader *S* to the delivery end of the

machine where vulcanization is effected. Weighted scrapers 21, 22 serve to free the rubber sheet from the belts. (J. Porzel, 199

SHEET-FORMING AND VULCANIZING MACHINE.

490,382. Utilization of pneumatic tire casings for making lounging shoes of all kinds. V. C. Thénaut and L. Meliorat.

THE EWALD TIRE RETREADER.

That two worn casings, properly stapled together with the machine here pictured, will give from 1,000 to 3,000 miles of

TIRE-STAPLING MACHINE.

service, is of interest to tire dealers, repair men and tire users generally. The operation is extremely simple. Having two worn tires of the same size, cut the treads from the best one and slip it over the other casing. Insert a staple in the holder and push it all the way down, then place the tire over the machine table, setting the gauge so that the staples will be three-eighths of an inch from the outer casing edge. A forward movement of the hand-lever forces the staple through the casings and clinches it. This operation is repeated around the tire on both sides, setting the staples about one inch apart. A three-quarter-inch reliner strip of gummed fabric is then placed over the staples and the tire is ready for the road. (Romort Manufacturing Co., Oakfield, Wisconsin.)

NEW ZEALAND RUBBER MANUFACTURING COMPANY.

The New Zealand Rubber Products, Ltd., 181 Featherston street, Wellington, New Zealand, has been formed, with a capital of £100,000, for the manufacture of various kinds of rubber goods. Samples of the rubber goods made by this company were recently shown at Auckland.

AT THE ROYAL SHOW, CARDIFF.

The India Rubber, Gutta Percha, and Telegraph Works Co., Silvertown, Essex, exhibited its pneumatic-tire-making machine in operation at the recent show of the Royal Agricultural Society at Cardiff, June 24-28, 1919.

In addition, the Palmer Tyre, Limited, was the only other tire manufacturer that exhibited. The two companies showed airplane landing-wheel tires, and motor-vehicle tires with ribbed and studded treads.

New Goods and Specialties.

BALLOON ACCESSORIES OF RUBBER.

THE EXIGENCIES OF THE WAR resulted in the development of balloons as aids to the Army and Navy in a thoroughly practical way. Concentrated effort and the application of the knowledge of rubber and its possibilities by the large rubber manufacturers, even though their aeronautical experience was limited, resulted in wonderful achievements. One of the former obstacles to the practical use of the balloon was the inability to control its movements. Modern inventive genius has overcome this in several different ways, applicable to the different types of balloon.

THE GAMMETER VALVE.

Balloons in the early days could not be better controlled because no means had been devised for regulating the supply of gas used for inflation. Hydrogen gas, the lightest known, which weighed only one-fifth as much as air, is used for inflating balloons. Great care must be taken to preserve uniform pressure. When a balloon ascends or descends and passes from one atmospheric stratum to another, the outside air pressure decreases and the hydrogen gas within the balloon expands correspondingly. Some means must be available for counterbalancing this.

In the recent war a valve was devised which accomplished this purpose. Called the Gammeter valve, from the name of the man who invented it, the device regulates automatically the pressure of gas within

the balloon, releasing enough gas to insure proper stabilization. When greater inflation is afterward required, the gas already released cannot be replaced. Resort has been made to a series of secondary balloons called balloons, constructed within the balloon proper, which are filled with air by a blower when required. These, together with the Gammeter valve, permit the regulation of ascent and descent. The accompanying illustration shows two views of the valve and the way in which it is inserted in a balloon.

AIRPLANE-WHEEL WINDSHIELD.

Rubber tires on airplane-wheels proved to be just as great a necessity as on automobiles and just as efficient but for the fact that the wheel offered a small amount of resistance to the air passing through its spokes. In these days of exact scientific calculation of ultimately important effects, even this slight resistance must be reckoned with. Accordingly, a windshield for airplane wheels was devised, shown in the lower left-hand corner of this page. This windshield is made of rubber and can be readily adjusted or removed from the wheel, as desired or required.

This shield is so constructed that the air particles glance off with as little interference as possible with the revolution of the wheel. Many of Uncle Sam's training planes, bombing machines, and reconnaissance planes were equipped with these rubber-tired wheels.

AIRPLANE BUMPER CORD.

In order to minimize the shocks of landing in an airplane, some

device was needed to provide more play or spring in the mounting of the frame-work on the axle, and this spring must be so mounted as to prevent the frame-work from touching the ground.

Experiments in this direction led to the development of bumper cord, which is now in universal use. It consists of many small strands of rubber, covered with two jackets of cotton thread woven in just the right way. The cord is very supple and

exceptionally strong. By its use, the frame-work of an airplane is practically swung to the axle, and much the same result is produced as is effected by the spring in the corresponding place in an automobile.

This provides a considerable degree of safety for the aviator in neutralizing landing shocks. A photograph of a section of this cord is reproduced herewith. (The B. F. Goodrich Co., Akron, Ohio.)

GAMMETER VALVE AND BALLOON EQUIPPED THEREWITH.

GOODRICH BUMPER CORD.

COLD-PACK PROCESS JAR-RUBBERS.

Two new brands of jar rubbers intended to be used in canning fruits and vegetables by the cold-pack process have recently been produced. This process requires jar-rubbers that will withstand the effect of a considerable degree of heat and which, therefore, must be made of a high quality of rubber. One of these brands is known as the "Usco

Kold Pak." (United States Rubber Co., New York City.) The other, on which the trade-mark has just been patented, is called the "AllPack." (Acme Rubber Manufacturing Co., Trenton, New Jersey.)

UNSINKABLE RUBBER MAIL-POUCH.

An aviator's mail-pouch, unsinkable and watertight has recently been put on the market. It is made of black rubberized material, with high-gravity pliable rubber composition base which keeps the pouch upright in water. A kapok lining provides buoyancy. The pouch is 16 inches high, 14 inches wide, and 3 inches deep at the base, weighing about 5 pounds. (Safety-at-Sea Corp., 1358 Broadway, New York City.)

GOODRICH AIRPLANE WHEEL AND WINDSHIELD.

AVIATOR'S MAIL-POUCH.

THE "GOOD LUCK" JAR-RINGS.

In the successful preserving of fruits and vegetables, the jar-ring plays a most important part. On its ability to make and maintain a perfectly air-tight seal depends the success.

"GOOD LUCK" JAR-RINGS.

A brand of red rubber jar-rings which has a very widely extended sale, has filled every requirement and stood every test established. The rings fit the standard types of fruit-jars, are made of a high-grade compound, and are packed by the dozen in attractive cartons which are sealed air-tight before leaving the factory. The cut shows the package in which this particular brand of jar-rings is sold. (The Boston Woven Hose & Rubber Co., Cambridge, Mass.)

A SHAVING OUTFIT "ALL-IN-ONE."

Many men who shave themselves will appreciate the shaving convenience illustrated below. A metal case contains, in one piece, a shaving brush, shaving cream, and talcum powder. The brush itself is of good quality of bristles vulcanized in rubber, having a ferrule which screws on the handle. In this ferrule is a tube which connects with the compartment next to the brush, containing soap or shaving cream, and permits the cream to pass through into the bristles. When the brush is removed, the

THE "ALL-IN-ONE" SHAVING BRUSH.

cream compartment can be filled easily. The other half of the handle is a container for talcum powder, arranged on the telescope principle in such a way that it acts as the piston for forcing the shaving cream through the tube into the brush. On the end of the powder compartment is a perforated screw-cap so shaped that the whole device may be stood upright on this cap when desired. The metal parts of the "All-in-One" shaving brush, as this novelty is called, are made of aluminum and holds sufficient material for thirty-five shaves. (All-in-One Brush Co., Bloomington, Illinois.)

AN EASILY ATTACHED RUBBER HEEL.

A new type of rubber heel has recently been put on the market which permits easy and speedy attachment. It is manufactured by modern methods necessary for the production of high-grade rubber heels.

The "Beaded Tip" rubber heel is concave-convex in shape, with a suction back and central nailing space which facilitates attachment to boots or shoes. Besides, there is a liberal allowance for trimming so that the heel may be fitted to a leather one of any shape. Distribution is through recognized jobbers. (United Lace & Braid Manufacturing Co., Providence, Rhode Island.)

"BEADED TIP" RUBBER HEEL.

AN ENGLISH DEVICE FOR WEARING FLOWERS IN THE BUTTONHOLE or on the corsage takes the form of a nipple or tiny cloth-covered rubber bottle to hold water and prevent the wet stems of flowers from coming into contact with the gown. (Rubber Growers' Assn., London.)

PAT FNDG
"SMOKES."

A NEW CIGARETTE CASE.

A high-grade pocket-case for holding cigarettes has appeared, which has a rubber lining to protect the contents from moisture. This case, shown in the accompanying illustration, provides space for thirty cigarettes, in two separate pockets which fold together and are held in place in convenient pocket size by a flap which snaps down with two fasteners. The case itself is made of grosgrain moire silk, in olive-drab. (Crown Suspender Co., 836 Broadway, New York City.)

"STRAIGHT-LEG"
GARTER.

A BOON FOR THE BOW-LEGGED MAN.

Somebody has recognized the predicament of the bow-legged man who, through no fault of his own, so often makes a ridiculous appearance when he most desires to look dignified and normal. A band of elastic which goes around the leg just above the knee forms the foundation for the device. From this extend downward two pieces of non-elastic tape, one attaching to the sock. The other is connected with the sock-supporting one by four strips of silver-finished tool steel, slightly weighted. When the wearer stands, the steel strips are in a horizontal position, holding out the second tape and preventing the trousers from following the curve of a bowed leg. When the wearer is running, sitting down, etc., the steel strips swing back into perpendicular position against the inner fabric strip. This prevents any bulging of the trousers. (S-L Garter Co., Dayton, Ohio.)

A BATHING BAG.

A rubberized bathing bag known as the "Jiffy-Lock," is one of the newest bathing accessories. The bag or case itself is made of double-texture rubberized fabric of heavy quality, in four sizes. The feature of the case is its fastening. This is a device on which a patent has been applied for, taking the form of two metal laces down the edges of the opening, which are opened and closed by the sliding of a cord with a convenient ball on the end. The bag comes in blue, khaki, and black and has a hand-size strap for carrying, on one end. When the case is empty it folds flat and when filled is square at the ends. (The Jiffy Lock Co., 20 West 20th street, New York City.)

"JIFFY-LOCK" BATHING BAG.

Rubber Sundries Manufacturers' Division of the Rubber Association.

A WAY BACK IN 1898 a few manufacturers of druggists' and stationers' rubber sundries met at the office of The B. F. Goodrich Co. in New York City, and discussed the possibility of forming a trade association "to bring the members of this industry into closer touch and to insure cooperation between them for their mutual benefit, upon the basis of honor and good will."

Resulting from this preliminary gathering, a meeting was held on September 9 of that year, at the Fifth Avenue Hotel in New York, at which the Rubber Sundries Manufacturers' Association was organized and the following officers were elected:

H. C. Corson, president, The B. F. Goodrich Co., Akron, Ohio; Rhodes Lockwood, vice-president, Davidson Rubber Co., Boston, Massachusetts; Fred H. Jones, treasurer, Tyer Rubber Co., Andover, Massachusetts; E. E. Huber, secretary, Eberhard Faber Rubber Co., Brooklyn, New York.

EXECUTIVE COMMITTEE: G. F. Hodgman, Hodgman Rubber Co., Tuckahoe, New York; Joseph Davol, Davol Rubber Co., Providence, Rhode Island; G. M. Allerton, The Seamless Rub-

ber Co., New Haven, Connecticut; H. C. Burton, Parker, Stearns & Sutton, Brooklyn, New York.

ber Co., New Haven, Connecticut; H. C. Burton, Parker, Stearns & Sutton, Brooklyn, New York.

Each year an annual banquet was held in the spring. In the fall came the annual meeting, at which routine business was transacted and officers were elected. The third annual meeting, held October 3, 1901, was attended by only ten members, and owing to the apparent indifference shown by the absent members, it was deemed advisable to disband the organization.

By 1903, however, it was felt that there was need for some such association, and after some preliminary work, a meeting of sundries manufacturers was held April 3, at the Fifth Avenue Hotel, which was attended

CHARLES J. DAVOL,
Chairman.

H. A. BAUMAN,
Vice-Chairman.

E. E. HUBER,

S. H. JONES,

W. H. BALCH,

W. S. DAVISON,

A. W. WARREN.

Executive Committee of the Rubber Sundries Manufacturers' Division.

ber Co., New Haven, Connecticut; H. C. Burton, Parker, Stearns & Sutton, Brooklyn, New York.

Besides these, there were present, as charter members of the Association: F. T. Carleton, Tyer Rubber Co., Andover, Massachusetts; G. F. Simpson, Ideal Rubber Co., Brooklyn, New York; G. W. Frost and James Kipp, Goodyear Rubber Co., New York City; C. Van Vliet, Goodyear's India Rubber Glove Manufacturing Co., Naugatuck, Connecticut; J. C. Hardman and J. Hardman, Riverside Rubber Co., Belleville, New Jersey; J. W. Kelley and A. T. Bell, The B. F. Goodrich Co., Akron, Ohio; H. H. Shepard, National Rubber Co., Providence, Rhode Island; R. D. Pierce, Mechanical Rubber Co., Cleveland, Ohio; W. G. Brewer, Mattson Rubber Co., Lodi, New Jersey.

At this meeting a motion was made that each member present a list of his customers which he deemed worthy of special consideration, these lists to be combined and acted upon by the

by Messrs. Burton, Hodgman, Hardman, Lockwood, Jones, Allerton and Huber, of the old association, with the following: H. E. Raymond, The B. F. Goodrich Co., Akron, Ohio; G. B. Hodgman, Hodgman Rubber Co., Tuckahoe, New York; G. W. Front, Goodyear Rubber Co., New York City, and A. C. Eggers, Goodyear's India Rubber Glove Manufacturing Co., Naugatuck, Connecticut.

A constitution was adopted, and the following officers elected: Joseph Davol, president; H. H. Shepard, vice-president; F. H. Jones, treasurer; E. E. Huber, secretary. EXECUTIVE COMMITTEE: G. F. Hodgman, H. E. Raymond, F. H. Jones, E. E. Menges, A. C. Burton, Joseph Davol and E. E. Huber.

Committees were appointed to prepare reports on "Dating and Cash Discounts," "Payment of Freight on Deliveries to Customers," "Inequality of List Prices," and "Indiscriminate Returns of Goods to Manufacturers."

Thus the new, or the revived association started off with important trade customs to be considered, and at subsequent meetings new questions were debated, other trade abuses eliminated, new members were admitted, and a flourishing, active, efficient association resulted.

In October, 1912, the association was incorporated under the laws of Connecticut, and the old association was dissolved at a meeting the following January. Among the important actions of the organization was the adoption of an "Official Association Guarantee to the Trade," the defeat of "House Bill No. 578," State of Georgia, requiring the stamp of date and year of manufacture on rubber goods offered for sale in that state; the standardization of invalid rings; the adoption of a credit-experience bureau; the establishment of a price exchange bureau, besides the good work of George B. Hodgman as representative of the association before the Senate Finance Committee on Tariff, whereby the tariff on druggists' sundries was reduced from 35 per cent to 15 per cent. Later actions include measures to prevent sales of sundries where it was suspected they would be smuggled into Germany, and measures taken to eliminate unnecessary sizes and styles of goods.

At the annual meeting, April 9, 1914, President Hodgman addressed the members informally, suggesting that the organization become a division of The Rubber Association of America, and at the meeting held January 13, 1915, a vote was passed to that effect, the same taking effect at the annual meeting, April 8, with Russell Parker, chairman; Charles J. Davol, vice-chairman, and H. S. Vorhis, treasurer and secretary.

Activities of The Rubber Association, Inc.

DURING THE PAST MONTH communications have been sent to firm members concerning Federal excise tax matters, standardizing catalog sizes, and a circular respecting the importation of German dyes.

FEDERAL EXCISE TAXES RELATING TO CERTAIN INDIRECT SALES.

NEW YORK, June 30, 1919.

To firm members of the Rubber Association of America, Inc.:

Under date of May 15 the following inquiry was submitted to the Commissioner of Internal Revenue:

Sales of articles mentioned in Section 900, Subdivisions 1 and 2, when made direct by the manufacturer thereof, are, in certain cases, on presentation of proper proof exempt from tax. This is true in the case of:

- (a) Sales to a state or political subdivision thereof.
- (b) Sales of parts and accessories for trailers.
- (c) Sales for export.
- (d) Sales to a manufacturer of automotive vehicles for use by him in the manufacture or production of new cars, etc.

Where, in accordance with usual established methods of distribution, the article in question, after passing through the hands of a jobber or dealer or other legitimate intermediary, reaches a class of consumers, such as a state government, or a particular use, such as an accessory for a trailer, or an ultimate disposition, such as a sale for export, should not the manufacturer of the article, having paid a tax on the sale by him, and having passed the tax on to the intermediary, be permitted, upon the receipt of proper proof of subsequent disposition, to refund to the intermediary, and in turn take credit from the government of the amount of the tax paid.

Under date of June 13 the Commissioner of Internal Revenue replied to such inquiry as follows:

Reference is made to your letter of May 15, 1919, relative to Regulations 47, relating to (a) sales to a state or political subdivision thereof; (b) sales of parts and accessories for trailers; (c) sales for export; (d) sales to a manufacturer of automotive vehicles for use by him in the manufacture or production of new cars.

This office has given very careful consideration to your suggestions with reference to modifying the afore-mentioned regulations and believes that the regulations in their present form are correct and that no further change should be made.

The tax in question is a tax on sales by the manufacturer of the article and it will be noted from the above that the exemptions of certain sales by the manufacturer from the tax apply

In each of the twenty-one years since its inception, the organization has held an annual banquet at one or another leading hotel in New York City, noted for the elegance and excellent taste shown in every detail. At these gatherings business is taboo, and rarely are outsiders invited, nor are there any prepared addresses, such remarks as are made being impromptu, and, generally, professional talent is secured for entertainment. These dinners have continued since the organization has been merged with The Rubber Association, and detailed reports of these carefully planned functions have appeared in THE INDIA RUBBER WORLD.

The present officers of the division are: C. J. Davol, chairman, Davol Rubber Co.; H. A. Bauman, vice-chairman, The B. F. Goodrich Co.; A. L. Viles, secretary and general manager, The Rubber Association of America, Inc.

EXECUTIVE COMMITTEE: C. J. Davol, Davol Rubber Co.; S. H. Jones, U. S. Rubber Co., Goodyear Glove Division; H. A. Bauman, The B. F. Goodrich Co.; W. H. Balch, Faultless Rubber Co.; E. E. Huber, Eberhard Faber Rubber Co.; A. W. Warren, Hodgman Rubber Co.; W. S. Davison, Miller Rubber Co.

The present membership is composed of the following companies: American Hard Rubber Co., Canton Rubber Co., Davol Rubber Co., Easthampton Rubber Thread Co., Empire Rubber & Tire Corp., Eberhard Faber Rubber Co., Faultless Rubber Co., The B. F. Goodrich Co., U. S. Rubber Co., Goodyear Glove Division, Hodgman Rubber Co., Miller Rubber Co., Parker, Stearns & Co., Rubber Products Co., Revere Rubber Co., Seamless Rubber Co., Tyer Rubber Co., Whitall-Tatum Co.

only in the cases where the sale is made by the manufacturer of the article. For instance, in the case of a sale by a manufacturer to a dealer, who, in turn, sells the article either

- (a) to a state or political subdivision thereof,
- (b) for use on trailers,
- (c) for export, or
- (d) to a manufacturer of automotive vehicles for use by him in the manufacture or production of new automotive vehicles,

even if such dealer furnishes the manufacturer of the articles sold proof that the dealer has so sold the article, the manufacturer of the article cannot obtain a refund or take credit for any tax paid to the Government or which has been attached to the original sale by the manufacturer of the article.

THE SECRETARY.

STANDARD CATALOGS.

NEW YORK, July 3, 1919.

To firm members of The Rubber Association of America, Inc.:

This has reference to my letter of November 8, having to do with the propaganda being carried on in certain quarters, particularly by the National Association of Purchasing Agents and the National Retail Hardware Association for the adoption by commercial business organizations of a standard catalog size which would be 7 1/2 by 10 1/2 inches or its approximate half size, 5 1/2 by 7 1/2 inches.

As a matter of further information in this connection, I enclose copy of a pamphlet entitled "Underlying Principles of the National Standard Catalog Size," prepared by the Standardization Committee of the National Association of Purchasing Agents.

A. L. VILES, General Manager.

EXECUTIVE COMMITTEE MEETING.

The Executive Committee met on July 11, 1919, after luncheon, at the Union League Club, New York City.

Those present were H. E. Sawyer, B. G. Work, George B. Hodgman, J. A. Lambert, W. J. Kelly and General Manager Viles.

Following the disposition of routine matters, questions of moment were discussed and definite action taken, the most important being the appointment of William C. Cox, vice-president of the Guaranty Trust Co., as treasurer of the Rubber Association.

IMPORTATION OF GERMAN DYES.

NEW YORK, July 17, 1919.

To the firm members of The Rubber Association of America, Inc.:

There has been received under date of July 15, from the War Trade Board, Washington, a copy of the enclosed circular having to do with the importation of German dyes for the use of manufacturers in this country. The War Trade Board has urgently requested that they be furnished with a list of the members of this Association who are users of dyes in order that the Board may obtain information as to their needs direct from them. It is particularly emphasized that the information thus obtained will be treated confidentially and the individual response of manufacturers will not be disclosed.

Will you not, therefore, in compliance with this request respond immediately with the advice to this office as to whether or not you are interested in the use of dyes to the end that the interests of our manufacturers in this direction may properly be taken care of.

A. L. VILES, General Manager.

FEDERAL EXCISE TAX—RECENT RULINGS—FROM THE DEPARTMENT OF INTERNAL REVENUE.

NEW YORK, July 24, 1919.

To the firm members of The Rubber Association of America, Inc.:

Under date of June 10, the Department issued additional regulations known as Treasury Decision 2860.

RECORDS TO BE KEPT BY MANUFACTURERS.

Treasury Decision 2860 provides that the person responsible for the return and payment of the tax under Section 900 of the Revenue Act shall keep such records and memoranda as will clearly show the amounts of sales of taxable articles for each month, and that the tax may be computed upon the gross amount of taxable sales during the month for which the return is made.

RESALE OF PARTS AND ACCESSORIES BY MANUFACTURER.

Treasury Decision 2860 also provides that when an automobile manufacturer prior to issuance of Regulations 47 (May 1, 1919), billed as a separate item and collected tax upon the resale of parts to dealers, and where it is impracticable to adjust the tax in accordance with Regulations 47, the total amount of the tax collected shall be paid to the tax collector. The manufacture of parts which are resold by the manufacturer of motor vehicles will be exempt from tax upon such sales, provided he has on file a certificate from the automobile manufacturer to the effect that the parts purchased by such manufacturer on or after February 25 and prior to May 1 had either been used in the manufacture of new cars or will be so used, or that the tax upon such parts therefor sold by the automobile manufacturer will be paid directly to the collector. This ruling allows the manufacturer of motor vehicles to return direct to the collector the tax on tires and parts purchased between February 25 and May 1 and resold otherwise than as original equipment by the motor vehicle manufacturer. This privilege is not extended beyond April 30.

REPAIR MATERIALS.

The Rubber Association has been advised that in a letter signed by Deputy Commissioner Walker, addressed to a member of the Association, it is held that unvulcanized sheet rubber, liquid rubber vulcanizing cement and friction fabric sold in bulk are not taxable although primarily designed for the special purpose of being used to repair tires, either as a small sectional repair or as a complete retread, and although sold to shop repair men who repair tires for car owners or who rebuild tires for owners or for resale. The sale of such articles, however, when sold in packages or containers as repair parts for tires or inner tubes for motor vehicles, is taxable. It is the interpretation of the Rubber Association that by "sales in bulk" is meant sales in such quantities as are usually made to repair men, and that by "sales in packages or containers" is meant sales in packages or containers of such sizes as are usually sold to owners of motor vehicles for repairs by them.

REFUND ON ACCOUNT OF PRICE DECLINE.

The Rubber Association is informed that in a letter of recent date signed by Commissioner Roper and addressed to a member of the Association, it is held that no credit can be taken by a manufacturer on account of a refund of tax made by him to a customer on account of a decline in the price of articles previously sold. It is stated where an article which has once been the subject of a sale and as to which the tax of 5 per cent of the sales price has been paid or is attached by operation of law, no refund or remission can be made by reason of a subsequent readjustment or reduction in the price of such articles. Several of the members of the Association have expressed a belief that the ruling does not conform to the manifest intent of the law, and that the Department will recede from this interpretation. The Rubber Association has no opinion upon

this subject, and each member should act as in his judgment is proper.

INSULATED WIRE NOT TAXABLE.

The Rubber Association is also advised that in a recent letter by the Department of Internal Revenue, it is held that the sale of insulated wire, although suitable for general wiring of motor vehicles, is not taxable. It is the opinion of the Rubber Association that this ruling is meant to apply to all insulated wire except that which is commercially known as "assembly cables." By "assembly cables" is meant an assembly of wires cut to length and bound together for use on motor vehicles. It is the opinion of the Association that the sale by the manufacturer of such wire when so cut to length and bound together, is taxable.

A. L. VILES, General Manager.

TREASURER OF THE RUBBER ASSOCIATION.

WILLIAM C. COX, the recently appointed treasurer of The Rubber Association of America, Inc., succeeding H. S. Vorhis, resigned, has been a vice-president of the Guaranty Trust Co. of New York since 1912, when the Standard Trust Co., of which he was an organizer and secretary, was merged with the Guaranty company. In July, 1918, he was commissioned a captain in the Sanitary Corps of the National Army and assumed charge of the funds at the Medical Supply Depot in New York City, a work for which his assignment to the trust department of the Guaranty organization well fitted him. After the signing of the armistice he returned to the Guaranty Trust Co. and is now located at the company's Fifth Avenue office.

(C) Underwood & Underwood, N. Y.
WILLIAM C. COX.

The Rubber Association is fortunate in securing the services of Mr. Cox, and his appointment is in line with the larger activities of that organization, which have become such that the duties of a secretary-treasurer were too onerous.

NEW FREIGHT RATING ON CRUDE RUBBER SHIPMENTS.

During the past eight years the official classification ratings on crude rubber shipments by rail have been in dispute, and numerous complaints against the leading railroads have lately been lodged with the Interstate Commerce Commission by The Goodyear Tire & Rubber Co., McGraw Tire & Rubber Co., Racine Auto Tire Co., La Crosse Rubber Mills Co., Kelly-Springfield Tire Co., Batavia Rubber Co., and the Northeastern Ohio Rubber Shippers' Association, an organization of fifteen rubber companies. These complaints attacked as unreasonable and unduly prejudicial the ratings of second-class, less-than-carloads, and carloads, minimum weight 36,000 pounds, and asked that ratings be established as follows: carloads, fourth class; less than carloads, third class. Later a fifth-class rating was asked on carload shipments with a minimum weight of 40,000 pounds.

The complaints were consolidated and heard upon a single record, and in the decision rendered June 2, 1919, it was found that the present second-class rating on less-than-carload shipments of crude rubber had not been shown to be unreasonable, but the railroads were ordered on or before October 15, 1919, to adopt on carload lots a rate not in excess of fourth class, with a minimum weight of 40,000 pounds.

BUY WAR SAVINGS STAMPS—BUILD FOR AMERICAN PROSPERITY and your own success.

RUBBER INDUSTRIES ATHLETIC LEAGUE.

THIS ORGANIZATION of the office employees of the rubber companies in New York City is now in a flourishing condition which promises to continue, thanks to the diligent work of its officers.

Plans for an outing are in the making and this promises to be an affair of large proportions, as some 5,000 persons are employed in the offices of New York rubber companies.

The baseball competition, however, takes first place among the activities of the League. Excellent teams have been organized by the Sterling, Kelly-Springfield, Goodyear, United States, Globe, Firestone, Goodrich and Ajax men and real progress is being made. The players are gradually becoming acquainted with inside plays and before the season is over some very interesting games will undoubtedly be played. Several of the teams have been greatly assisted by well-known ball players now in the rubber industry, notably Jack Kleinow, a former "Yankee," and Dan McEnery, a New York player, respectively coach and pitcher of the United States team, and Max Halker, former Cleveland pitcher, of the Kelly-Springfield team.

Several trophies to be presented at the end of the season to the best teams and players have been donated and will be shown in the display windows of the various member companies. The handsome sterling silver trophy cup given by THE INDIA RUBBER WORLD, which will go to the team finishing the season in first place, is shown by the accompanying illustration. It stands 19 1/4 inches in height on its ebony base and depicts the landing of Columbus in 1492 and his discovery of the Indians playing ball. A pennant will also be awarded, the gift of the Kelly-Springfield Tire Co. Another trophy cup, donated by Baker, Murray & Imbrie, Inc., will be presented to the team finishing next best. A dozen watch fobs, offered by A. G. Spalding & Bros., are to be awarded to the best twelve individual players.

Firms ship on consignment or act as forwarding agents. Very little rubber is shipped on their own account. A considerable part of the rubber exported from Corumba is received from Puerto Suarez, Bolivia.

There are no local indications that enemy firms are taking steps to extend their sphere of influence amongst the rubber gatherers. The rubber from the privately-owned plantations is obtained by the plantation owners. A small quantity is obtained from private persons who work on some plantations.

In the Brazilian district, of which Corumba is the outlet, all firms interested in the trade are Brazilian with one exception

(an Italian firm). In the Bolivian district the owners are Bolivian, British, and German.

No stock of rubber is held at Corumba; it is always shipped by the first available boat after its arrival from Cuyaba or Caceres.

Only a very small proportion of the Brazilian rubber shipped from Corumba is "Pará." Pará rubber is grown in the North of Matto Grosso, but is shipped via the Amazon.

The Brazilian shipments from Corumba are of the coagulated (smoked) variety known under the general name of "seringa" (*Hevea brasiliensis*) and sub-classified as "fina," "entrefina," and "sernamby." From 8 to 10 per cent of the total quantity shipped from Corumba is known as "mangaba."

The plantations in Brazil, of which Corumba is the outlet, are situated in the valleys of the rivers Arinos, Juruema, Tapajoz, and their many affluents. No information is available as to the localities.

PUERTO SUAREZ.

Exports of rubber from the Puerto Suarez district during the years 1912-17 have been as follows:

1912	metric tons	182
1913	metric tons	104
1914	metric tons	164
1915	metric tons	219
1916	metric tons	214
1917	metric tons	185

In Bolivia the barter system largely prevails, and the firms which obtain their rubber in this manner have usually imported their supplies of merchandise direct from Europe or the United States. Since the institution of the Statutory List enemy firms in Bolivia have, to some extent, through subterfuge, obtained supplies from Brazil.

The Bolivian rubber shipped through Corumba consists of 90 per cent Pará and 10 per cent sernamby.

The bulk of the Bolivian rubber exported through Puerto Suarez and Corumba is grown in the Department of Santa Cruz, in the Province of Nuño de Chavez. The forests are situated about 500 miles from Suarez. ("Board of Trade Journal," London.)

When you buy W. S. S. you do not give—you receive.

INDIA RUBBER WORLD BASEBALL TROPHY CUP.

RUBBER FROM CORUMBA (BRAZIL) AND PUERTO SUAREZ (BOLIVIA).

CORUMBA.

THE BRITISH VICE-CONSUL reports that exports of rubber from the Corumba district during the years 1912-18 have been as follows:

1912kilos	680,364	1915	349,178
1913	554,387	1916kilos	418,219
1914	534,213	1917	291,652
	1918			317,435	

News of the American Rubber Industry.

DIVIDENDS.

THE AMERICAN CHICLE CO., New York City, declared a dividend of one per cent, payable August 1, on stock of record July 21, 1919.

The Eagle-Picher Lead Co., Chicago, Illinois, declared a quarterly dividend of one and one-half per cent, payable July 15, on preferred stock of record June 5, 1919.

The B. F. Goodrich Co., Akron, Ohio, has declared its quarterly dividend of \$1 per share, payable August 15, on stock of record August 5, 1919.

The Kelly-Springfield Tire Co., New York City, declared a quarterly cash dividend of \$1 per share and a quarterly dividend of three per cent, payable in common stock, both payable August 1, on common stock of record July 17, 1919.

The Keystone Tire and Rubber Co., Inc., New York City, has declared a stock dividend of fifteen per cent, payable September 15, on stock of record September 2, 1919.

The McLean Tire and Rubber Co., East Liverpool, Ohio, declared a dividend of two per cent, payable on preferred stock as of July 1, 1919.

The Needham Tire Co., Charles River, Massachusetts, has declared its regular semi-annual dividend of three and one-half per cent, payable August 1 on issued and outstanding preferred capital stock of record July 15, 1919.

The New Jersey Zinc Co., New York City, declared a quarterly dividend of four per cent, payable August 9, on stock of record July 31, and an extra dividend of two per cent, payable July 10, on stock of record June 30, 1919.

The Pan-American Rubber Co., Milwaukee, Wisconsin, declared a dividend of three and one-half per cent, payable in stock on preferred stock of record June 30, 1919.

The Portage Rubber Co., Akron, Ohio, has declared a quarterly dividend of three per cent, payable August 15, on common stock of record August 5, 1919.

The Sewell Cushion Wheel Co., Detroit, Michigan, on June 1, 1919, declared and paid a dividend of seven per cent, on both common and preferred stock of record on that date.

The United States Rubber Co., New York City, declared a quarterly dividend of two per cent, payable July 31, on its first preferred stock of record July 15, 1919.

The van der Linde Rubber Co., Limited, Toronto, Ontario, has declared its regular semi-annual dividend of three and one-half per cent, payable August 1, 1919.

FINANCIAL NOTES.

The B. F. Goodrich Co., New York City, at a special meeting of its stockholders, held Thursday, June 26, 1919, authorized the increase of its capital stock from \$84,000,000 to \$109,000,000, the additional \$25,000,000 to consist of 7 per cent cumulative preferred stock like the present issue of outstanding preferred stock. Of this new issue, \$15,000,000, is to be offered pro rata to present stockholders, both common and preferred, at \$102 per share, plus accrued dividends at 7 per cent, dating from July 1, 1919.

The Keystone Tire and Rubber Co., Inc., New York City, has authorized the issuance of additional common capital stock of the company to stockholders of record July 21, 1919, at \$40 per share, in the ratio of one new share for each three shares already held. The company reports gross sales of \$5,570,120 for six months ended June 30, 1919, against \$3,000,672 for the same period in 1918 and \$1,658,494 in 1917. Gross business for the first half of this year is almost equal to total sales of \$6,172,291 of 1918. Before allowance for Federal taxes the net profits for the first six months of this year were \$725,935, compared with

\$442,404 for the corresponding period in 1918 and \$317,788 for 1917.

The recent offering of \$1,000,000 Hood Rubber Co. preferred stock was oversubscribed by about 25 per cent. This stock was the remainder of the \$5,000,000 preferred authorized in 1917, of which \$4,000,000 was issued in that year. The additional \$1,000,000 was recently offered to preferred stockholders at the rate of one share for every four held by them, and an opportunity was given the common stockholders to subscribe for any balance not taken by the preferred shareholders.

The New York Stock Exchange has admitted to dealings: Kelly Springfield Tire & Rubber Co. common and preferred rights and Keystone Tire & Rubber Co. rights.

The Fisk Rubber Co. of New York will redeem all of its outstanding first preferred and first preferred convertible stocks on the first day of August, 1919. Payment will be made upon said stocks at the office of the New England Trust Company, Boston, Massachusetts, at the rate of \$120 a share for the first preferred stock and at the rate of \$110 a share for the first preferred convertible stock.

There will be shortly offered \$600,000 worth of 7 per cent preferred stock of the Needham Tire Co., a Massachusetts corporation, at \$90 per share. This preferred stock is convertible into common stock at any time, par for par. The stock was offered to the public about the middle of July.

The Kelly-Springfield Tire Co., 15 Exchange Place, Jersey City, which was chartered in New Jersey in 1899, has filed a certificate at Trenton, New Jersey, showing that at a meeting of the majority of the stockholders of the concern it was decided to increase the capital stock from \$12,900,000 to \$20,900,000, of which \$3,900,300 will be 39,003 shares of 6 per cent cumulative preferred stock, par value, \$100; \$7,000,000 in 70,000 shares of 8 per cent preferred stock, par value \$100 and \$10,000,000 in 400,000 shares of common stock, par value, \$100.

The Hamilton Rubber Manufacturing Co., Trenton, New Jersey, has filed an amended certificate with the Secretary of State increasing its capital stock from \$300,000 to \$1,000,000. The increase was authorized at a meeting of the board of directors of the company held on July 9. George R. Cook is president and A. Boyd Cornell is secretary of the company.

THE REMEDY FOR PRICE-CUTTING.

In renewing its call upon Congress for the prompt passage of the Stephens Standard Price Bill, as amended, the Federal Trade Commission has shown a keen sense of the situation created by the Colgate decision of the Supreme Court.

The Colgate decision can be effective only in controlling retailers who buy directly from manufacturers. If a manufacturer sells to jobbers there is nothing to prevent the price-cutting retailer from securing goods through jobbers and continuing to snap his fingers at the manufacturer's standard price policy. The difficulties of manufacturers dealing exclusively with the jobbing trade are really increased by the decision because of the advantage which it gives to producers selling exclusively through retailers.

In offering to large manufacturers the tempting certainty of stabilizing their market by confining their distribution to retailers, the Colgate decision is a serious menace to every small manufacturer and wholesaler which can be removed only by remedial legislation such as the Stephens Bill which furnishes the machinery by which smaller manufacturers can secure the good will of distributors, wholesale and retail, and assure them a living profit.

FOR THE HEALTH OF THE WORKERS.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, takes particular interest in the welfare of its employees. Every worker after a year's service receives a \$300 insurance policy, which after two years is advanced to \$500, and automatically increases \$100 a year until a maximum of \$1,000 is reached.

An up-to-date hospital is maintained at the plant where registered nurses and a staff of physicians are subject to call

A UNIT OF THE PENNSYLVANIA RUBBER CO.'S HOSPITAL.

at all hours. There is an operating room, a first-aid room, a sterilizing room, and a ward with three beds. Any injury to a workman, however slight, must be attended to at the hospital, thus minimizing chances of infection or secondary complications.

The drinking water for the workers is filtered, sterilized, and then cooled and piped throughout the factory buildings.

TRADE NOTES.

The Republican Rubber Co., Kansas City, Missouri, a branch of the Republic Rubber Co., Youngstown, Ohio, has leased for ten years the two-story building at the corner of Nineteenth and McGee Streets, Kansas City. It is so constructed that additional stories can be added if necessary. This will be the district headquarters for the states of Nebraska, Kansas, Oklahoma and Western Missouri, including the sub-branch and territory at St. Louis. F. W. Osmun is district manager.

The BeSaw Tire & Rubber Co., Ardmore, Oklahoma, has sold its plant at Hartsville, Ohio, to the Monarch Rubber Co. and will center its operations at Ardmore, where it expects to begin the manufacture of high-grade tires early in the fall. At a special meeting of its stockholders on June 16, 1919, the classification of the company's stock was changed from \$500,000 to \$500,000 common and from \$500,000 to \$100,000 preferred. The newly elected officers and directors are S. A. Apple, president; Charles von Weise, vice-president; Mark Kirkpatrick, secretary-treasurer; Edward Galt and Frank S. Gates, directors.

The Brunswick-Balke-Collender Co., Chicago, Illinois, is building an addition to its tire factory at Muskegon, Michigan, to be devoted exclusively to the manufacture of its "Brunswick" cord tires.

The Fort Wayne Tire & Rubber Manufacturing Co., Fort Wayne, Indiana, has completed its new factory and installed the power plant. It is now installing the necessary machinery and equipment for the manufacture of automobile and truck tires and expects to begin manufacturing early in August. The electrical equipment is being furnished by the General Electric Co., Schenectady, New York, and the tire-building machinery

for both cord and fabric tires, all of which is motor-driven, by the Allen Machine Co., Erie, Pennsylvania, and the Williams Foundry & Machine Co., Akron, Ohio. The company will manufacture its tires under the trade-name "Wayne."

C. A. Braley and Albert Mebus, receivers of the Kansas City Tire & Rubber Corporation, Fourth and Central Streets, Kansas City, Missouri, announce that the company's plant at Chester, West Virginia, has been leased to the Cord Tire Co., which is now operating the same.

The International Toy Co., Eau Claire, Wisconsin, has contracted for the construction of one unit of its factory to be 60 by 200 feet. These units, three in all, will be of concrete substruction brick pilasters, four feet wide, and brick wall, four feet high, to windows, with steel sash for windows. The main building to be erected in front of these units will be crescent-shaped, to form a background for the children's playground which the company will feature as one of the attractions of the Northwest, supplying it with all kinds of amusement devices. The company, in addition to its rubber-tired express wagons for children, will manufacture kindergarten toys, coated with a preparation containing rubber which will injure neither the children nor their clothing.

The Akron, Tire Co., Inc., Long Island City, New York, expects soon to build a larger factory and is constantly improving its machinery. It already has added to its real estate holdings until it now owns an entire block. This company, incorporated under the laws of the state of New York in 1911, for the purpose, among other things, of making rebuilt automobile tires by a special process invented and patented by George E. Batcheller, treasurer of the concern, in 1915 increased its capital from the original \$5,000 to \$300,000. It now employs 100 men. The officers are William H. Batcheller, president; George E. Batcheller, treasurer, and Minnie G. Batcheller, secretary.

The Ray Tire & Rubber Co., 833 Rees Street, Chicago, Illinois, manufacturer of the Ray puncture-proof interliner for tires, is contemplating constructing additional plants at Birmingham, Alabama; one in Los Angeles or San Francisco; and one in the East, to take care of increased business.

The Perfection Tire & Rubber Co., Fort Madison, Iowa, is building a three-story addition to its plant, 100 by 200 feet, to cost approximately \$120,000. It is expected that it will be finished early in August.

The Triple Airless Tire Co., Manerville, Pennsylvania, expects to begin the operation of its new factory about August 1 for the manufacture of its specially designed tires. The officers of the company are A. M. Mateer, president; W. A. Iseman, vice-president, and A. C. Hileman, secretary-treasurer.

The Seamless Rubber Co., Inc., New Haven, Connecticut, is to build a new plant on the waterfront which will comprise a group of buildings covering an area 240 by 300 feet. There will be three five-story buildings, connected by one-story ones, and a large power house. It is expected that the plant will be completed by February, 1920, when the present one will be offered for sale.

The Gillette Rubber Co., Eau Claire, Wisconsin, is building a two-story brick and steel addition to its factory, which is nearly completed. The first floor will be devoted to the tire-building department and the second to repairing, fabric cutting and stock repairing.

The Syracuse Rubber Co., Inc., 301 Herald Building, Syracuse, New York, is building the first unit of its plant on its property on Thompson Road, East Syracuse. It will be of reinforced concrete, faced with brick, three stories high, with inside dimensions 60 by 200 feet. The incorporation of this company was noted in *THE INDIA RUBBER WORLD* June 1, 1919. The officers are E. R. Caldwell, president; Richard Byrne, vice-president; R. L. Caldwell, secretary; G. R. Loggie, treasurer and general manager; F. A. Shane and A. E. Wing, directors.

The Century Rubber Works, Chicago, Illinois, has secured

property in Clearing, Illinois, on which it will build a new plant at an early date. Although the Century company has previously manufactured Ford tires exclusively, it intends to make other sizes in the new plant.

The Quaker City Rubber Co., Philadelphia, Pennsylvania, is building a two-story addition to its factory at Wissinoming, which will add about 41,000 square feet of floor space to its plant. The structure will be fireproof, of brick and concrete, and will be devoted entirely to the manufacture of tires. The cost, including machinery and equipment, will be about \$250,000. In addition, the company intends to build a cord-tire treating structure, the location of which has not yet been decided upon. The new addition now being erected will include modern conveniences and appliances for the health, safety and general welfare of employees.

The Advance Rubber Co., 8th avenue, between 17th and 18th streets, Brooklyn, New York, is having plans approved by the Building Department for the erection of a building 200 by 130 feet, to cost probably in excess of \$50,000. The company will build both cord and fabric tires. This concern was incorporated in 1912 and recently increased its capital from \$150,000 to \$1,000,000.

The business of Meyer & Brown, New York City, crude rubber brokers, has been transferred to Meyer & Brown, Inc., a New York incorporation noted in another column in this issue. The management and control will remain the same.

The Belden Manufacturing Co., 23d street and Western avenue, Chicago, Illinois, manufacturer of "Beldenite" rubber-insulated wires and cables, fiber and bakelite sheets, rods, tubing, etc., is planning to build a four-story brick and concrete building, 90 by 160 feet, on the Van Buren street side of its property in the block bounded by Van Buren, Congress and 47th streets and the Outer Belt Line, on which it intends eventually to consolidate its manufacturing business. It is operating two one-story concrete mill buildings, erected during the last three years. The new structure will be known as No. 8. J. C. Belden is president of the company.

The Arrow Grip Manufacturing Co., Inc., Glens Falls, New York, manufacturer of nonskid chains and lifting jacks, is completing a new factory of the Austin type, to cost approximately \$100,000. It will be equipped with modern machinery. The company recently increased its capital stock from \$100,000 to \$500,000.

The Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, manufacturer of electric controlling devices, has opened an office at 905 Kresge Building, Detroit, Michigan, which is practically a branch of its Chicago office. H. S. Kinsley is in charge, assisted by C. W. Greenman and M. Dugliss, all of whom were formerly in the Chicago office. Mr. Kinsley was formerly with the engineering department of the Milwaukee plant.

The Cutler-Hammer Manufacturing Co. has recently built a two-story addition to its factory at 12th street and St. Paul avenue, Milwaukee, Wisconsin, to be used for the manufacture of a new compensator intended to be used for starting squirrel-cage motors, for all commercial voltages.

The Parker Collapsible Rim Corporation has removed its offices to 605 Westminster Building, Chicago, Illinois. At the recent annual meeting the concern reorganized and elected a new board of directors. J. W. Hunt is president and W. H. Sicking, general manager.

At a meeting of the directors of the Motor and Accessory Manufacturers' Association it was decided to postpone the usual midsummer convention until autumn, the date to be announced later.

E. O. Floyd has been appointed general sales manager of the Rossendale-Reddaway Belting & Hose Co., Newark, New Jersey, to take effect August 1, 1919.

Royer S. Hardy, crude rubber broker, 82 Beaver street, New York City, announces that he has formed with William Mac-

Arthur, formerly vice-president of J. T. Johnstone & Co., Inc., the partnership of Hardy & MacArthur, to deal in crude rubber and kindred products, and will open an Akron office at Central Savings & Trust building, Akron, Ohio.

The Keystone Tire & Rubber Co., Inc., New York City, now control 134 stores and expect to have 250 branches in operation by the first of the year. The cooperative store system originated with the Keystone company that operates a chain of stores extending from Maine to California and from Washington to Panama.

Smith-Serrell Co., Inc., maker of flexible and rigid shaft couplings, has changed its name to Smith and Serrell.

A DIRECTOR OF THE UNITED STATES RUBBER CO.

BY THE ELECTION OF Frank A. Vanderlip to that body, the United States Rubber Co. has materially strengthened its already efficient board of directors. Mr. Vanderlip is too well

known in financial and commercial circles to need any introduction, yet his entrance into the rubber industry makes it appropriate to record some facts regarding his wonderful career, rising from a country machine shop to become one of the highest financial authorities of the day.

He was born in Aurora, Illinois, November 17, 1864, and after a commercial education, found work in a machine shop, meanwhile spending his evenings in mastering stenography. He then took a year's course at the University of Illinois, at Champaign, that state, specializing on finance and political economy.

FRANK A. VANDERLIP.

He joined the staff of the "Chicago Tribune," reporting financial affairs, supplementing his education by attending lectures at the University of Chicago. Later he was made financial editor of the "Tribune." He bought an interest in "The Economist," in 1894, serving as associate editor until 1897.

In that year Lyman J. Gage was appointed Secretary of the Treasury of the United States of America, and he took Mr. Vanderlip to Washington as his private secretary. Three months later the latter was appointed Assistant Secretary, in which position he showed his rare qualifications by organizing the Treasury forces for work on the loan needed by the Government to build up our Army and Navy for the Spanish war.

After four years in the United States Treasury, he resigned to become vice-president of the National City Bank of New York City, the largest institution of its kind in America. He was a delegate to the International Conference of Commerce and Industry at Ostend, Belgium, in 1902, and made an extended tour of Europe, studying financial and commercial conditions of Great Britain and the continental nations. In 1909 he succeeded to the presidency of the National City Bank, a position he resigned last June.

During the period when this country was at war Mr. Vanderlip devoted his entire energies to assist Secretary McAdoo in the Liberty Loan campaigns of that period. After the armistice he made another trip of observation to Europe. He is prominent in many financial and philanthropic organizations, has written many important articles and several books on financial subjects, and has delivered addresses before many prominent commercial associations. His home is at Scarborough-on-the-Hudson, New York.

A TEXAS TIRE MAN.

BORN IN SOUTHERN ILLINOIS IN 1887, Cassell De Hibbs was reared on a farm until he was 17 years of age. His constant tinkering with the farming implements convinced his parents that he would make a better mechanic than farmer, and he was apprenticed to a carriage builder, who put him through a rigid course of training in forging, body making, top making, painting and upholstering, and he became an expert carriage maker.

CASSELL DE HIBBS.

About the time his apprenticeship was finished he decided to seek his fortune in Texas, and in 1907 he found employment in a carriage shop in Dublin of that state. Here he saw for the first time a motorcycle, and his inventive ingenuity being aroused, he secured a bicycle, and in a short time was touring the roads on his own motorcycle, his supply of gasoline in varnish cans strapped to the machine.

Forecasting the substitution of motor-propelled for horse-driven vehicles, he decided to interest himself with the coming important industry, and after about a year in Dublin, he proceeded to Fort Worth, Texas, and began to study rubber with the same thoroughness he had previously given to the carriage business.

His first experiments were repairing tires, and while so doing he invented, patented and manufactured various section molds, tube-repairing machines, and repairman's tools that are in wide use to-day. He then turned his attention to devising a way to manufacture automobile tires, using tires to work from that had been damaged beyond repair. He invented a machine to strip tires layer by layer, another machine to rebuild them, adjustable molds, and a process of curing that turns out a finished tire.

Mr. Hibbs' latest venture is the creation of an up-to-date plant for the manufacture of new tires, in which he will utilize several of his inventions.

PERSONAL MENTION.

At a meeting of the Board of Directors of the United States Rubber Co., New York City, held July 2, 1919, Frank A. Vanderlip, until recently president of the National City Bank, New York City, was elected a director of the rubber company in place of William S. Kies, resigned. Mr. Kies is vice-president of the American International Corporation and will devote his entire attention to its business in South America, from which he has just returned after five months' absence in that territory.

Paul Elbogen, formerly in charge of the Akron (Ohio) office of Fred Stern & Co., New York City, crude rubber importers, has been transferred to the New York office as manager.

J. C. Witwer, until recently assistant superintendent in charge of production of the International India Rubber Corporation, South Bend, Indiana, has been promoted to the position of factory manager.

Bartlett J. Smith has been appointed Eastern district manager for the International India Rubber Corporation, South Bend, Indiana, with headquarters in New York City.

R. B. Parker has been promoted from the position of assistant manager to that of branch manager of the Philadelphia (Penn-

sylvania) office of the Brander Rubber & Tire Co., Rutherford, New Jersey. He succeeds E. J. Smullen, who resigned to go into the automobile agency business in Chester, Pennsylvania.

F. I. Reynolds, formerly sales manager of pneumatic tires for the United States Tire Co., has joined the Keystone Tire & Rubber Co., Inc., New York City, as sales manager. Mr. Reynolds had been sales manager of the Diamond Rubber Co. previous to its absorption by the B. F. Goodrich Co. and was at one time connected with the Dupont Powder Co., Wilmington, Delaware.

NEW INCORPORATIONS.

Add-A-Tire & Supply Corp., July 12 (New York), \$100,000. S. J. Ciacuch, C. Johnson, W. Miskowiak—all of Buffalo, New York. Principal office, Buffalo, New York. To manufacture auto tires and other accessories.

Amco Hidden Tire Co., Ltd., May 26 (Canada), \$3,000,000. T. H. Rieder, president; Hugo Wellein, treasurer; S. L. Leflury, secretary. Principal office, 1221 Mount Royal avenue, East, Montreal, Canada. To manufacture automobile tires.

Arnold Rubber Co., The, June 4 (Ohio), \$100,000. G. Hopkinson, president; H. W. Arnold, vice-president and general manager; C. W. Ayer, secretary and treasurer; J. H. Smith, director and chief chemist—all of Akron, Ohio; H. Hopkinson, director and attorney, Boston, Massachusetts. Principal office, Ravenna, Ohio. To manufacture heels, soles, and molded goods.

Atlas Tire & Rubber Co., Inc., July 15 (New York), \$3,000. D. D. Deutsch, J. L. Diamond, S. Rabinowitz—all of 1789 Broadway, New York City. To manufacture tires, etc.

Ashland Tire & Rubber Co., May 15 (Ohio), \$100,000. I. Fickel, president; C. C. Wyner, vice-president; A. A. Fickel, secretary and treasurer. Principal office, Union Building, Cleveland, Ohio. To manufacture inner tubes and other rubber products.

Better Wear Tire Co., June 30 (Delaware), \$100,000. T. L. Croteau, P. B. Drew, H. W. Knox—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To repair and manufacture tires and tubes.

Bolster Tire Sales Corp., June 30 (New York), \$25,000. A. G. Bolster, J. A. Griffin, both of Syracuse; P. C. Wheeler, Cincinnati—both in New York. Principal office, Syracuse, New York. To deal in auto tires, accessories, etc.

Collapsible Rim Corp., June 27 (Delaware), \$150,000. S. W. Dill, P. B. Drew, H. E. Knox—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture and deal in collapsible automobile wheel rims and all accessories.

Cooperative Vulcanizing Co., Inc., The, May 2 (Ohio), \$5,000. C. C. Clem, president and manager; V. B. DuVall, vice-president; E. W. Mink, secretary and treasurer; J. W. Lem and J. M. Saum, directors—all of Dayton, Ohio. Principal office, 12 Warren street, Dayton, Ohio. To buy and sell automobile tires and accessories.

Delton Manufacturing Co., July 7 (Delaware), \$100,000. T. L. Croteau, H. E. Knox, S. E. Dill—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To deal in manufactured products made from gums, rubber, etc.

Dreyfus Tire Works, Inc., June 24 (New York), \$1,000. W. Auerbach, 252 Greene avenue; C. Auerbach, 1767 Bushwick avenue, both of Brooklyn; B. Auerbach, 699 Jackson avenue, Bronx, both in New York. Principal office, Brooklyn, New York. To deal in tires and supplies.

Duplex Cushion Tire Co., May 31 (California), \$1,000,000. B. F. and W. A. Coons, F. O. Meyers, G. H. Woodruff. Principal office, 620 Merchants National Bank Building, Los Angeles, California. To deal in automobile supplies and rubber goods.

Esenkay Co. of Detroit, Inc., May 12 (Michigan), \$10,000. J. C. Reeves, president; 50 Watson street; W. T. Forrest, secretary and treasurer; Merrick avenue; N. C. Reeves, secretary and treasurer, 50 Watson street—all of Detroit, Michigan. Principal office, 872 Woodward avenue, Detroit, Michigan. To promote sale of "Esenkay" tire.

Faber, Inc., A. W. July 5 (New Jersey), \$150,000. A. Macmillan, 411 Passaic avenue; S. Kaufman, 334 Belmont avenue; J. T. Elliot, 801 Mount Prospect avenue—all of Newark, New Jersey. Principal office, 41 Dickerson street, Newark, New Jersey. Agents in charge, R. J. Metzler. To buy, produce, sell and deal in all kinds of rubber.

Gaulbes' Tire Co., Inc., July 23 (New York), \$5,000. S. Rabinowitz, 1 Jacobs, S. Bernheim—all of 1765 Broadway, New York City. To manufacture tires.

Gold Medal Tire and Rubber Co., April 23 (Oklahoma), \$10,000. A. B. and M. Unger and M. R. Cohen—all of Muskogee, Oklahoma. Principal office, Muskogee, Oklahoma. To manufacture, buy, and sell tires for automobiles, etc.

Heilman Co., Frederick, March 25 (Delaware), \$100,000. L. E. O'Brien, Crystal Annex; H. G. O'Hara, 29 Sell street; L. O. Shipp, Main street—all of Johnstown, Pennsylvania. Principal office, Johnstown, Pennsylvania. To manufacture and sell "Man-Heel" automatic inhalers.

Heisey Tire and Rubber Co., The, April 15 (Ohio), \$50,000. C. F. Hake, Jr., president; W. J. Howard, vice-president; H. C. Heisey, secretary and general manager; H. A. Jackson, treasurer; L. A. Heisey, director—all of Cincinnati, Ohio. Principal office, Eighth avenue and Broadway, Cincinnati, Ohio. To buy, sell, and deal in rubber tires and tubes.

Hill Bros. Co., June 12 (Massachusetts), \$80,000. L. T. Hill, president; Hudson, N. J. Hill, vice-president; 1301 Commerce street, Trenton, N. J. C. B. Hill, secretary and treasurer, Hudson—both in Massachusetts. Principal office, 120 Central street, Hudson, Massachusetts. To manufacture machine made rubber goods.

Illinois Savold Tire Co., July 9 (Delaware), \$2,000,000. T. L. Croteau, P. B. Drew, H. E. Knox—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture and deal in all kinds of tires.

Jacobs Tire & Rubber Corp., June 25 (Delaware), \$1,000,000. P. B. Drew, H. F. Knox, S. E. Dill—all of Wilmington, Delaware. Delaware

agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture, buy, sell and deal in rubber.

Jones Nevers Lensen Rubber Heel Corp., July 3 (Delaware), \$200,000. J. J. Jones, 368 West 29th street; I. R. Walker, C. T. Hesser, both of 116 West 39th street—all of New York City. To manufacture, sell, and deal in rubber heels, etc.

Logan Tire Co. of America, Inc., July 8 (Delaware), \$500,000. F. R. Hansell, Philadelphia, Pennsylvania; E. M. MacFarland, J. V. Pimm, both of Camden, New Jersey. Delaware agent, Corporation Guarantee & Trust Co., 927 Land Title Building, Philadelphia, Pennsylvania. To manufacture, buy, and deal in rubber tires and rubber goods.

McCormick & Co., Inc., The L. P., July 26 (New York), \$60,000. L. P. McCormick, 225 West 86th street; L. G. Haas, W. P. Muller, both of 2 Rector street—all of New York City. To manufacture rubber products.

Mercer Tire Corp., July 14 (New York), \$10,000. T. H. Montgomery, principal; F. E. Judd, secretary. Corporation Guarantee & Trust Co., 927 Land Title Building, Philadelphia, Pennsylvania. To manufacture tires.

Meyer & Brown, Inc., July 1 (New York), \$1,500,000. O. Meyer, Hartsdale, N. Y.; H. Brown, New Rochelle, N. Y.; S. S. Sirock, 19 West 73rd street, New York City—all in New York. To manufacture rubber products.

Michigan Savold Tire Co., June 24 (Delaware), \$2,000,000. S. E. Dill, P. B. Drew, H. E. Knox—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To rebuild, manufacture, and deal in tires of all kinds.

Missouri Savold Tire Co., June 24 (Delaware), \$2,000,000. S. E. Dill, P. B. Drew, H. E. Knox—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture and deal in tires of all kinds.

Mount Royal Rubber Co., Ltd., May 23 (Canada), \$500,000. T. H. Rieder, D. L. McGibbon, S. J. Lefebvre, C. H. Ancrum, W. E. Congherty—all of Montreal, Canada. To manufacture, sell, and deal in rubber goods.

Nocem Rubber Corp., July 7 (New York), \$125,000. S. M. Lazarus, 106 Haven avenue; A. L. Mezin, 31 West 103rd street, both of New York City. A. M. Burman, 390 Baskin avenue, Brooklyn, New York. To manufacture rubber.

North Western Tire Corp., July 15 (New York), \$25,000. J. Jacobs, S. Bernheim, W. Loewenthal—all of 1877 Broadway, New York City. To manufacture tires.

Northern Rubber Co., Ltd., The, January 14 (Canada), \$500,000. F. E. Jartidge, president; A. F. Dwyer, secretary. Principal office, corner of Allison and Metcalf streets, Guelph, Ontario, Canada. To manufacture rubber footwear.

Oklahoma Tire & Rubber Manufacturing Co., June 3 (Oklahoma), \$1,000,000. E. L. Jones, R. Rogers, E. J. Baxter—all of Tulsa, Oklahoma. Principal office, Tulsa, Oklahoma. To deal in rubber, etc.

Penn-Ohio Tire Distributor Co., The, May 20 (Ohio), \$10,000. A. F. Butterfield, president; H. F. Toedtman and C. S. Goby, vice-presidents; R. C. Healy, secretary; A. W. Gillespie, treasurer; C. S. Goby, director—all of Cleveland, Ohio. Principal office, 6523 Euclid avenue, Cleveland, Ohio. To distribute Braender tires.

Peifect Rubber Co., The, June 19 (Ohio), \$100,000. C. H. Vogle, president; E. O. Townsend, vice-president; J. M. Pittney, secretary and general manager; W. M. Berling, treasurer. Principal office, 1000 Broadway; L. C. Chase and A. C. Moore, directors. Principal office, Mansfield, Ohio. To manufacture rubber tires, hot-water bags, etc.

Perfection Tire & Supply Co., Inc., February 1 (Illinois), \$10,000. C. E. Peterson, president; F. E. Anderson, vice-president; L. V. Anderson, secretary and treasurer; E. L. Pettit, sales manager. Principal office, 1309 Fifth avenue, Moline, Illinois. To deal in tires, tubes and auto supplies.

Provo Tire Co., Inc., July 7 (New York), \$4,000. R. J. and N. Provo—all of Syracuse, New York. Principal office, Syracuse, New York. To manufacture tires.

Queensboro Tire Co., Inc., July 9 (New York), \$50,000. C. G. Stone, 447 Second avenue, Mount Vernon; J. L. Faria, 1002 Grand avenue, New York City; J. J. Tanzola, 162 Eighth street, Brooklyn—all in New York. To deal in tires.

Rambler Rubber Co., Inc., July 17 (New York), \$500. E. R. Dodge, D. Nicholson, H. Spingarn—all of 61 Broadway, New York City. To manufacture tires.

Royal Webbing Co., Inc., July 7 (New York), \$15,000. H. Kropf, 1428 Park avenue; M. Kropf, 844 Whitlock avenue, both of New York City; J. Kargel, 50 South 54 street, Corona, Long Island—all in New York. To manufacture elastic goods, etc.

Rubber Limb Co. of New York, Inc., The, July 17 (New York), \$5,000. I. H. and J. Rosenberg, both of 42 West 72nd street; J. J. Frey, 125 West 92nd street—all of New York City. To manufacture rubber limbs.

Rubber Products & Machinery Co., March 6 (California), \$75,000. J. C. Stodwell, president; A. T. Sackett, vice-president; C. G. Sackett, secretary. Principal office, 225 East Ninth street, Los Angeles, California. To manufacture tire repair materials, machinery, tools, equipment, etc.

Rubber Products Corp., June 12 (Delaware), \$500,000. G. H. Dowsey, president, 60 Wall street; E. Parson, vice-president, 66 Broadway; L. E. Wears, 60 Wall street—all of New York City. Principal office, 60 Wall street, New York City. To manufacture inner tubes and mechanical rubber goods.

Security Signal Sales Corp., July 7 (Delaware), \$100,000. E. F. Edelbrock, J. F. Malloy, M. M. Lacey—all of Wilmington, Delaware. To manufacture and sell rubber goods. Principal office, Wilmington, Delaware. To purchase, sell, and dispose of automobile articles and accessories.

Snap-On Tread & Tire Co., Inc., July 3 (Delaware), \$1,000,000. C. A. Cole, Hackensack, N. J.; A. Van Vorhis, 1085 Union street, Jersey City; A. A. Oakley, 428 River—all in New Jersey. Delaware agent, Registrar & Transfer Co., 900 Market street, Wilmington, Delaware. To manufacture, buy, sell and deal in tires.

Standard Rubber Co., Inc., July 30 (New Jersey), \$125,000. F. A. and B. Elshoff, 68 Gates avenue, Montclair; C. H. Morrell, 978 Broad street, Newark—all in New Jersey. Principal office, 400 Billorell avenue, Newark, New Jersey. Agent in New York, J. A. Hines. To buy, manufacture, sell and deal in all kinds of rubber.

Steinbit Tire Co., Inc., July 11 (New York), \$25,000. E. and N. Stein, both of 36 Edgerton street; M. G. Ellenbogen, 19 Berkshire street—all of

Rochester, New York. Principal office, Rochester, New York. To manufacture tires.

Tinsley's Economy Tire Co., Inc., June 26 (New York), \$10,000. J. Jacobs, S. Bernheim, W. Loewenthal—all of 1877 Broadway, New York City. To manufacture tires.

Tire Life Co., Inc., July 7 (New York), \$100,000. A. H. Higgins, 61 Broadway, New York City; R. H. Martin and F. Roffe, both of Kelly Building, Long Island City, New York. To manufacture tires, etc.

Tire Sales Co., July 8 (Delaware), \$100,000. F. R. Hansell, Philadelphia, Pennsylvania; E. M. MacFarland, J. V. Pimm, both of Camden, New Jersey. Delaware agent, Corporation Guarantee & Trust Co., 927 Land Title Building, Philadelphia, Pennsylvania. To manufacture, buy, sell, and deal in rubber tires and rubber goods.

Triplex Tire Corp., July 10 (New York), \$250,000. J. and G. Martin, both of 105 West 52nd street; J. E. Ankus, 299 Broadway—all of New York City. To manufacture tires.

United States Rubber & Latex Co., Inc., June 27 (Delaware), \$1,000,000. M. L. Rogers, L. A. Irwin, W. G. Singer—all of Wilmington, Delaware. Delaware agent, Delaware Registration Trust Co., 900 Market street, Wilmington, Delaware. To plant, cultivate, and grow rubber trees, and to manufacture and deal in rubber and the by-products thereof.

Zenith Tire & Rubber Co., July 7 (Delaware), \$100,000. E. E. McClopd, 722 Citizens Building; M. R. Jordan, Society for Savings Building; J. L. Francis, 719 Citizens Building—all of Cleveland, Ohio. Delaware agent, Colonial Charter Co., 927 Market street, Wilmington, Delaware. To manufacture and deal in tires of all kinds.

INCORPORATIONS NOTED.

The Kelley Tire & Rubber Co., 962 Chapel street, Connecticut, which was incorporated under the laws of Delaware on February 7, 1919, is capitalized at \$1,000,000, to market pneumatic tires and inner tubes. The officers are Edward J. Kelley, president; Charles H. Bortell, Jr., vice-president and treasurer, and Harry F. Gilg, director.

The Simplicity Wheel Co., Grand Rapids, Michigan, was incorporated under the laws of Michigan in February, 1917, to sell "Simplicity" demountable wheel attachments. The incorporators and officers are F. B. Raymond, president; F. W. French, vice-president; George Clapperton, secretary and treasurer; Elmer H. Grey and Dr. Louis Barth.

The Armstrong Tire & Vulcanizing Co., 1336 Michigan avenue, Chicago, Illinois, was incorporated by M. Klienmann and others at \$20,000, on December 28, 1918, to manufacture, buy, sell, build and repair automobile tires, tubes, etc., and acquire patents, etc.

The Independent Airless Tire Co., Independence, Missouri, was incorporated at \$75,000 on October 2, 1918, to manufacture automobile tires. It has built a stone structure 75 by 100 feet, with full basement, on the Missouri Pacific Railroad, with switch-spur, and is completing the installation of machinery. It expects to start manufacturing as soon as this is finished. The officers are J. E. Bridges, president; Eben Miller, vice-president; E. C. Harrington, secretary, and W. C. Bridges, treasurer.

MICHELIN EMPLOYEES INSURED IN CELEBRATION OF PEACE.

In recognition of their loyalty, and in celebration of the signing of peace, the employees of the Michelin Tire Co., Milltown, New Jersey, have each received, without cost or physical examination, a paid-up insurance policy covering their lives for varying sums, depending on their years of service with the company. Hereafter every new employee will be insured upon the completion of his first six months of continuous service. The amounts range from \$200 for six months' employment to \$1,200 for ten years and over.

In announcing this liberal policy, J. Hauvette-Michelin, vice-president of the company, mentions with pride the faithful work of Michelin operatives on war orders for tires and gas-masks, and of their patriotic support in the various Liberty Loan, Red Cross and other war drives.

The world-wide Michelin organization of which the American company is a part, also has reason to be proud of its contribution to the Allied armies in the great war. Collectively the various Michelin companies gave 3,333 men, 511 of whom lost their lives. No less than 690 Michelin employees received decorations during the war, twelve officers out of this number having been made "Chevaliers de la Légion d'Honneur," while twenty-nine received the military medal.

CANADIAN NOTES.

THE AMES HOLDEN TIRE CO., LIMITED, 1221 Mount Royal Avenue East, Montreal, Quebec, has been incorporated by letters patent of the Dominion of Canada to manufacture automobile tires. The authorized capital is \$3,000,000, of which \$2,000,000 has been issued and fully paid up. The company will build its plant at Kitchener, Ontario. The officers are Talmon H. Kieder, president; Hugo Wellein, treasurer, and S. J. LeHuray, secretary. The directors include the above and D. Lorne McGibbon, Sir Herbert Ames, Major L. L. Anthes, Walter T. Barrie, J. C. Breithaupt, Hon. Nathaniel Curry, Hon. C. P. Beaubien, K. C.; William Mulock, Jr., Hon. Wallace Nesbitt, K. C., and Thomas H. Lane.

The Goodyear Tire & Rubber Co. of Canada, Limited, Toronto, Ontario, has under construction two additions to its pneumatic tire plant, one 100 by 100 feet and the other 60 by 120 feet, both four stories and basement. In addition, a large warehouse is being built in Regina, Saskatchewan, on which work has just been begun. It is expected that all these buildings will be completed before the first of the year.

The K. & S. Canadian Tire & Rubber Co., Limited, Toronto, Ontario, manufacturer of molded rubber sundries, intends to double the capacity of its plant and add dipped goods to the lines now being manufactured. A new building will be put up for the purpose. In addition, the company will erect a tire plant, 80 by 185 feet, three stories high, of fireproof construction. Both buildings will be on the company's property at Weston, Ontario, and machinery for equipping them will be purchased later. The tire plant is planned for a capacity of 1,000 tires and 2,000 tubes daily.

OAK TIRE & RUBBER CO. ENLARGEMENT.

The Oak Tire & Rubber Co., Toronto, Ontario, will considerably increase its output by the addition of new machinery. In the spring it was turning out 1,200 inner tubes and 150 casings daily, but by this addition will have a capacity of 250 casings. The success of the enterprise, now only about 20 months old, is due chiefly to the energy of Frank D. Law, the managing director, who in nine months organized the company, secured the capital (in war times, be it observed) of \$400,000, purchased and installed the machinery and started production, closing the first year with a net profit of over \$32,000.

FRANK D. LAW

The factory is under the supervision of Walter Smith, formerly of Gutta Percha & Rubber, Ltd., Toronto, Canada. Walter Seward, of the Dreadnaught Tire & Rubber Co., Baltimore, Maryland, is a director and as consulting superintendent visits the factory at Oakville each month.

A CANADIAN INDUSTRIAL MUSEUM.

Connected with Laval University, Montreal, Canada, is a Faculty of Commerce, and as an annex to this is the Commercial and Industrial Museum of Montreal which has for its object imparting to Canadian merchants and manufacturers information for the advancement of their business. The museum is housed in an imposing building in which samples will be displayed of all the natural and manufactured products of the world, and as far as possible, exhibits showing the different stages of manufacture, modes of packing, etc., with labels giving explanatory information.

Commercial information concerning Canadian and foreign markets is afforded exhibitors who will also have access to the

commercial library. Exhibits are solicited from rubber manufacturers, both Canadian and foreign, for this permanent industrial exposition, which is open to all visitors free of charge.

RUBBER GROWING TO BE SHOWN IN MOTION PICTURES.

A motion picture chronicle embracing all the details of the growing and harvesting of rubber in Sumatra will be the object of an expedition to be started soon by Harry Levey, manager of the Industrial Department of the Universal Film Manufacturing Co., New York City, under the auspices of one of the largest manufacturers of rubber products in the world.

When completed this series of pictures will stand as the first and only visualized and comprehensive survey of this end of the rubber industry in existence. The film will be given a nation-wide distribution as an educational feature.

THE LESSON OF THE DIRIGIBLE DISASTER.

The terrible accident to the Goodyear dirigible balloon in Chicago, resulting from the fall of the whole blazing machine into a bank building and the explosion of the fuel tank, the whole catastrophe causing 12 deaths, grimly emphasizes as nothing before has done the need of strict government supervision of aircraft and air transportation of all kinds. Complete and unvarying safety has not yet been attained for any kind of travel, but the hazards of aerial travel are the greatest known and all reasonable means should be taken to minimize them, and especially to safeguard the public on the ground below. Nothing should ever be done to hamper or discourage the fullest development of the science of aerial navigation, for its value in many directions has been fully demonstrated, but the right kind of regulations need not do that.

Already air pilots of every sort must be licensed, and thinking persons agree that comprehensive Federal laws governing flying of all kinds are essential to the common good. Reasonable laws would provide for intelligent supervision of both the persons and vehicles engaged in aerial navigation; would prohibit flights over cities and prescribe flight altitudes over less populous districts; would provide landing places for both airplanes and dirigibles on the outskirts of large cities; and would prohibit the use of aircraft for circus purposes to give thrills to the public.

There is also another point worthy of consideration. Strict navigation laws prevent anarchy on the seas, and the time is coming when similar laws will be needed to prevent it in the air.

NEW JERSEY SAVOLD TIRE CO.

The New Jersey Savold Tire Co. has been formed to operate in New Jersey under the Savold process for rebuilding used automobile tires. L. R. Pest is president; A. J. Davis, vice-president, and R. K. Underhill, secretary and treasurer. The New Jersey plant is located at 235-249 Elizabeth street, Newark, and has a daily capacity of 400 tires. The company is capitalized at \$2,000,000, par value \$20 per share, under New Jersey laws. Other Savold stations will be established in Atlantic City, Trenton, Camden, Jersey City and other cities and the company will eventually have a daily capacity of 1,000 tires.

OLD DENTAL RUBBER FOR IMITATION CORAL.

New methods of salvaging and utilizing rubber scrap of every kind are frequently coming to light, some on a large scale, others of more interest than moment. As an instance of the latter sort, a young man is working his way across the country and making a neat living besides by buying discarded false teeth from house to house. This itinerant buyer sorts out the platinum pins—the chief prize—to be resold for platinum. Any gold or silver is next broken off, the false teeth being shattered to release it. The plate itself, or dental gum, which remains is sold as quantity warrants to the makers of imitation coral.

THE RUBBER TRADE IN OHIO.

By Our Regular Correspondent.

AKRON NOTES.

IN THE COURSE OF THE RECENT PROCEEDINGS BEFORE THE INTERSTATE Commerce Commission relative to revision of the crude rubber freight classification ratings, it was asserted that 30,000 different articles made of rubber are now produced in the city of Akron, representing in value more than 40 per cent of the annual production of rubber articles in this country and requiring in their manufacture one-fourth of the world's supply of crude rubber and one-half of the amount imported by the United States. In that city alone nearly 70 per cent of the automobile tires made in the United States are produced. Over 60,000 persons are employed in the rubber factories of northeastern Ohio, and because of their rapid expansion the population of Akron, for example, has increased from 70,000 in 1910, to 158,000; Canton from 50,000 to 75,000; and Youngstown from 80,000 to 120,000.

* * *

C. E. Cook, for many years a member of The B. F. Goodrich Rubber Co. organization, first at Akron, Ohio, with the mechanical goods department, and later as Pacific Coast manager, with headquarters at San Francisco, and for the last two years located at Akron, Ohio, in connection with branch operating work, has been made sales manager of mechanical goods, for that company.

C. E. COOK.

His long and varied experience with the Goodrich organization fits him for the larger responsibilities his new position entails, and he is receiving the congratulations of his friends in the trade.

* * *

The employees of The B. F. Goodrich Co. are to have an athletic field at Liberty Park. The announcement was made by A. B. Jones, second vice-president and director of plant administration, at the victory dinner in honor of the Goodrich track team, thrice winner of Akron's industrial athletic meet.

What is said to be the largest swimming pool in the world is being built at Summit Beach Park, Akron. It is 80 by 100 feet, and from 30 inches to 11 feet deep, with four diving boards and a 20-foot steel tower. John R. Gammeter, inventor of rubber machinery, is president of the Akron Natatorium Co., owner of the pool.

* * *

The Mohawk Rubber Co., Akron, is completing its new factory building, in the form of a new wing to house portions of the cord-tire building and curing departments. The company has just opened a new branch at Dallas, Texas.

* * *

Teams of girls from Goodrich, Firestone, Miller, and Goodyear are planning to organize baseball nines for a fall series, to contest for the city title. Goodrich and Goodyear each have two teams practicing.

* * *

The General Tire & Rubber Co., Akron, has added what it claims to be the most effective vulcanizing department in the tire industry. Instead of the usual "pit," with the vulcanizers sunk in the ground, the vulcanizers extend from the first floor to the ceiling—20 feet—and their tops are accessible from the second floor, where the men can work in a temperature no higher than in other parts of the factory. This floor is well ventilated, the story being 24 feet high in the clear. Twenty-one vulcanizers will be installed, having a capacity of 3,000 tires per day. A traveling crane, electrically propelled and operated, will handle all molds and cores.

This company's new three-story plant extension will be used for tube and curing rooms. It is built of concrete and is said to have cost \$150,000.

* * *

John B. Tuttle, until recently research chemist for the Firestone Tire & Rubber Co., Akron, has been appointed chief chemist of Plant No. 2. He is succeeded by Norman A. Shepard.

A. Huetter, founder of the Premier Rubber & Insulation Co., Dayton, Ohio, has resigned his position as vice-president and general manager and disposed of his holdings in that concern to accept a position in the industrial engineering department of the Firestone Tire & Rubber Co., Akron.

Boxing and wrestling smokers will start at Firestone after Labor Day, at least three being planned for the season. An athletic carnival for both men and women will also be held during the fall and winter season.

* * *

The Phoenix Rubber Co., Akron, at its recent stockholders' annual meeting, elected the same directors and officers, but added to its board of directors Joseph Dangel, superintendent of the American Hard Rubber Co., and Morris E. Mason, secretary of the Mohawk Rubber Co.

The company plans to spend over \$250,000 in new buildings to be built at an early date, for the manufacture of tires and mechanical rubber goods of all kinds. E. C. Deibel is president; Theodore Krumeich, vice-president; E. F. Krumeich, treasurer; S. G. Rigdon, secretary and general manager, and J. G. Bretson, factory superintendent.

* * *

H. H. McCloskey has been made second assistant treasurer of The Goodyear Tire & Rubber Co., Akron. He has been with the company since 1902, during which time he has been cashier since 1910.

The Goodyear Tire & Rubber Co., Akron, operates four busses equipped with pneumatic cord tires, between the factory and Goodyear Heights, its employees' community. In one month 125,000 passengers were carried. The fare is 3½ cents. Two additional busses are to be put on the route.

The Goodyear Tire & Rubber Co., Akron, has met the problem of instructing salesmen on the road by sending to them week-end traveling sales schools. Class-room work covers policy, product and salesmanship, with reference to tires, accessories and mechanical goods. The company publishes, among other house-organs, "The Triangle," intended for the salesmen only and held confidential by them.

CLEVELAND NOTES.

The district sales managers of The McGraw Tire & Rubber Co., Cleveland, Ohio, held an important meeting at the home office in that city June 20 to 23, at which plans were formulated covering the immediate broadening of the field of distribution of this company's products. The McGraw company recently increased its guarantee on fabric tires from 5,000 to 6,000 miles and also established an 8,000-mile guarantee on cord tires and 10,000 miles on their "Standard Profile" and "HiTread" truck tires, and much new business is anticipated.

* * *

The Ideal Tire & Rubber Co., Cleveland, is having plans drawn for the first additions to its factory, to take care of increased business.

* * *

The D. & M. Cord Tire Co., Cleveland, will build a three-story factory unit of the E-shaped type, 80 by 225 feet, of reinforced concrete and brick, on the property which it secured from the Board of Trade of Warren, Ohio. It is expected that construction will begin late in August and that the factory will be ready for operation in December. Walter E. Myers is president and Walter R. Denman, secretary and general manager.

Kent E. Lyman has sold The Aetna Rubber Co., Cleveland, to a syndicate, which has increased the capital stock to \$150,000 and will continue the business under the same name. In addition to electricians' and acid gloves, a line of hard and soft molded rubber goods will be added.

* * *

The McElrath Tire & Rubber Co., Cleveland, formerly the McElrath Truck Tire Co., has increased its capital from \$15,000 to \$515,000 and will build and equip a factory near Cleveland for the manufacture of cord and solid tires, specializing in truck and Ford sizes. R. P. McElrath is president of the company and the headquarters are in Cleveland.

* * *

The A. G. Watt Co., Park Building, Cleveland, has been appointed mid-western representatives and sales agents for Hummel & Robinson, New York City, manufacturers and importers of chemicals and dry colors for the paint, varnish and rubber trades. Mr. Watt was formerly connected with E. M. & F. Waldo, New York City.

The A. G. Watt Co. has also been appointed sole selling agents for Cleveland, Detroit and vicinity for the products of J. S. & W. R. Eakins, color manufacturers, Brooklyn, New York.

MISCELLANEOUS OHIO NOTES.

The Mason Tire & Rubber Co., Kent, Ohio, in competition with other rubber companies, has been awarded the contract for the supply of all kinds of tires for government mail-trucks, etc., from July 1 to December 31, 1919.

Work will begin August 1, 1919, on the factory additions of the Mason Tire & Rubber Co., which are to be devoted to solid-tire construction.

F. E. Schmeidel, paymaster of The Mason Tire & Rubber Co., Kent, Ohio, is candidate for Mayor of that city, heading the ticket of the Republican Club, of which he is president.

The Mason band made its first public appearance July 4, 1919, when it furnished the music for the celebration at Uniontown, Ohio.

* * *

The McNaull Tire Co., Toledo, Ohio, has removed its sales and executive offices from the Ohio Building to 1023 Nicholas Building.

* * *

The McLean Tire & Rubber Co., East Liverpool, Ohio, has completed a one-story warehouse, 40 by 100 feet, which will enable it to increase its production considerably.

* * *

The Faultless Rubber Co., Ashland, Ohio, has awarded the contract for another extension to its plant, to be used in the manufacture of hard rubber, sponges and balls.

* * *

The Ashland Tire Co. has been organized at Ashland, Ohio, by Jacob Fickel, president; J. C. Weyher, secretary, and A. A. Fickel, Cleveland, treasurer. A plant will be constructed within a few months on a tract of land of considerable size, and plans are already being drawn.

* * *

J. C. Heifner, Ashland, Ohio, has opened a factory for the manufacture of storage and galvanized dipping tanks, cooling tanks, cement cans, etc., for the rubber trade. The building is 50 by 80 feet, three stories high and is being equipped with modern machinery, which will permit the making of equipment to specifications.

* * *

The Erie Tire & Rubber Co., Sandusky, Ohio, has awarded a contract for a heater-room building, and will build further additions at an early date.

* * *

The Arnold Rubber Co., Ravenna, Ohio, recently incorporated for the manufacture of heels, soles and molded goods, has elected

the following officers: George Hopkinson, president; C. W. Arnold, secretary and treasurer; H. W. Arnold, vice-president and managing director. J. H. Smith is a director and chief chemist. All are Akron men.

* * *

The Heisey Tire and Rubber Co., southeast corner of Eighth avenue and Broadway, Cincinnati, Ohio, has taken over the agency for the Oldfield tire in that district and will handle Oldfield products exclusively. Charles F. Hake, Jr., is president. The company is a new incorporation.

* * *

The Central Rubber Co., Inc., Defiance, Ohio, is installing additional machinery for the manufacture of reclaimed rubber. It is also equipped to handle all grades of scrap rubber.

* * *

The Columbus Climax Rubber Co., 417 Citizens Bank Building, Columbus, Ohio, is operating its factory at Huntington, West Virginia, manufacturing standard inner tubes.

* * *

The Perfect Rubber Co. has purchased a site for a rubber factory at Mansfield, Ohio, for the manufacture of rubber toys, hot-water bags and bottles, balls, druggists' sundries, etc. The company was incorporated June 19, 1919, for \$100,000 fully paid up. The officers are: C. H. Voegelé, president; E. O. Townsend, vice-president; J. M. Pittney, secretary and general manager; F. M. Bushnell, treasurer, and J. S. Heil, general sales manager. The above are also directors, besides L. C. Chase and A. C. Moore. Mr. Pittney was formerly efficiency engineer for the Faultless Rubber Co.

* * *

The Hydraulic Press Manufacturing Co., Mount Gilead, Ohio, is constructing an up-to-date foundry building and installing equipment. It also plans to double its office and engineering department space.

* * *

The Monarch Rubber Co., Canton, Ohio, has begun work on its new factory, to be built at Hartville, Ohio.

* * *

The Rubber Products Co., Barbertown, Ohio, makers of "Stronghold" tires and tubes, have announced a new manufacturing program which will double their output within 30 to 60 days.

THE GOODRICH CHIEF CHEMIST.

GEORGE OENSLAGER began his professional career as chemist of the paper mills of the well-known firm of S. D. Warren & Co., at Westbrook, Maine. After ten years in the paper industry he became chemist of the Diamond Rubber Co. at Akron, Ohio. When the Diamond was taken over by the Goodrich company Mr. Oenslager was appointed chief chemist of The B. F. Goodrich Co., which important position he still fills.

GEORGE OENSLAGER.

Mr. Oenslager is a native of Harrisburg, Pennsylvania, and was born September 25, 1873, graduating at Harvard University in 1894.

In addition to being director of chemical laboratories of The B. F. Goodrich Co., Mr. Oenslager is a member of the Operating Committee of the plant. He is also an active member of the American Chemical Society and the American Institute of Chemical Engineers.

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

THE BOSTON SHOE STYLE SHOW, held in this city four days in the middle of July, was in every way superior to its predecessors. It occurred in Symphony Hall, which was arranged for the occasion by the erection of booths for the various exhibits, a silver screen for motion pictures, and a runway down the middle of the hall, along which promenade the thirty or more young ladies of more than ordinary pulchritude, who wore stunning, up-to-date costumes, with appropriate footwear. At the end of the runway was a revolving pedestal, on which each model, in graceful pose, was exhibited, thus giving ample opportunity for observation of the costumes and footwear.

The only rubber exhibits were those of the Foster Rubber Co., Boston, maker of the Cat's Paw rubber heels and soles, and the Cambridge Rubber Co., which has recently added to its products a line of rubber-soled footwear.

Orchestral music and organ recitals were given, and motion pictures showed the progress of shoe manufacture from the primitive sandal down to the latest product of the twentieth-century shoe factory. A number of ladies competed for a prize for the most nearly perfect foot, based on the measurements of the foot of the Venus of Milo.

The show was well attended, and at each of its evening sessions some prominent speaker made a short address. Each day it was in charge of a different organization, namely, manufacturers, travelers, merchants and tanners. Shoe buyers were present from every part of the United States.

* * *

Mention was made last month of the acquisition of a new general manager and a new secretary by the Mayflower Rubber Works Co., South Braintree, Massachusetts. George E. Jean-dreux, the general manager, was for 21 years with the New Jersey Car Spring & Rubber Co., Jersey City, New Jersey, where, under the leadership of John J. Fields, the president, he acquired a knowledge and experience of the mechanical rubber business which aptly fits him for his new position. He retired from the secretaryship of the New Jersey company soon after Mr. Fields relinquished his interest in that organization, and now has accepted the above-mentioned position with the Mayflower company. With him he brought Richard K. Fields, son of the former president, who becomes secretary of the Mayflower organization.

Another change is the recent appointment of A. D. Lamont as factory superintendent. He comes from the Davol Rubber Co., where for a number of years he was superintendent.

It is reported that the Mayflower company is planning to enter a new field of manufacturing within a short time, but it is not yet ready to announce its plans in this connection.

* * *

Walter M. Farwell, who has been located on Devonshire street for over 25 years as agent for mechanical rubber goods manufacturers, terminated his connection with the Acme Rubber Manufacturing Co., Trenton, New Jersey, and is now New England agent for the Hamilton Rubber Manufacturing Co., of Trenton, carrying its line of mechanical goods and automobile tubes.

Mr. Farwell's experience in the rubber business is interesting. He started as a boy with the late C. S. Knowles, who represented the Star Rubber Co. Twenty-five years ago Mr. Farwell became agent for the Empire Rubber Manufacturing Co., the successor to the Star Rubber Co. George R. Cook was in control of the Empire company, and nine years later, when Mr. Cook was president of the Acme Rubber Manufacturing Co., Mr. Farwell transferred his fealty to the latter company, which he has represented for 16 years. Mr. Cook is now

president of the Hamilton Rubber Manufacturing Co., of Trenton, New Jersey, and Mr. Farwell now becomes the New England agent for that concern, which manufactures a line of mechanicals suitable to the trade which Mr. Farwell covers.

* * *

A two-team baseball league, composed of the women workers of The Fisk Rubber Co., Chicopee Falls, Massachusetts, has been organized. Nine games are to be played, the first being played on July 1. One team is recruited from the office force, the other from the factory. Individual cups will be awarded to all girls who play in at least five games.

Lockers for the girls, where they may keep their uniforms and other equipment, a shower bath and everything to help the girls make their league a really big success have been planned by the Fisk Social and Athletic Association, which is doing so much to promote the welfare of the workers. This association held an industrial track and field meet July 4.

* * *

The Needham Tire Co., Charles River, Massachusetts, is building an extensive addition to its plant at Needham, which is expected to be completed and in active operation in a month or six weeks. This enlargement will increase the capacity nearly or quite 300 per cent. The company owns 16 acres of land and water power rights at Charles River Station and manufactures a line of tires which stands high in the market. It also produces a line of fiber soles and rubber heels, which branch of the business is increasing.

* * *

Hill Bros. Co., Hudson, Massachusetts, recently incorporated to make men's welt shoes and deal in leather, rubber, etc., expects to install machinery early in August and shortly afterward begin operations in its new 340-foot one-story factory. Lawson T. Hill, the president, was formerly with Lewis A. Crossett, Inc., and Thos. H. Logan Co. The vice-president, George A. Hill, has been with the W. H. McElwain Co. for the last seven years, three in the factories and four as Pacific Coast representative. Clark B. Hill is secretary.

* * *

The Owen Tire Co., 177 Portland street, Boston, which was incorporated at \$40,000 in 1917, has recently increased its capital to \$250,000. The company operates the Tire Construction Co. and fifteen other retail stores in the New England States, four of them under the name of G. H. McNamara Tire Co., a New Hampshire corporation, and four under the name of Bell Auto Supply Co., a Massachusetts corporation. The officers of the Owen Tire Co. are W. R. D. Owen, president; A. Palder, treasurer, and John E. Crowley, clerk.

The Worcester Tire & Rubber Co., Inc., 14 Harding street, Worcester, Massachusetts, has opened a second store at 681 Main street. Both have the exclusive agency for Worcester County for Keystone, National Speedway and Batavia tires. L. M. Cahn is president of the company.

* * *

Miss K. Brown, shoe manufacturer's agent, London, England, who has been in this country for two or three months, making her headquarters in Boston, sailed for England late last month, after securing the agency for several lines of footwear made in the United States. She will be European agent for the introduction of the footholds manufactured for the Batterman Rubber Co., Boston. She says there is no great demand for rubbers (galoshes) for women in British cities, though the light-weight, foldable footholds are in large demand, and she expects to secure a large trade for these goods, which will come into direct competition with other makes of American-made rubber footwear already introduced.

A corporation has been formed to take over the rubber sole and heel business of the late C. J. Bailey. It is named the Bailey Rubber Heel Co., Inc., with offices at 52 Chauncy street. M. Shuman is president and D. F. Rice, treasurer. This company has purchased the patent rights and trade-marks for the "Monkey Grip Won't Slip" rubber heels and soles, which will be manufactured in black, tan and white rubber. The heels and soles have been described in THE INDIA RUBBER WORLD and are well known in the footwear trade.

* * *

Herbert T. Mason, recently with The Goodyear Tire & Rubber Co., is now treasurer, sales manager and director of the Quabaug Rubber Co., North Brookfield, this state. This company is doing some extensive advertising of its "Armortred" soles and heels.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE RUBBER MANUFACTURING PLANTS throughout Rhode Island are being operated on a capacity basis, so far as the help situation will permit, although not to the full facilities of the factories. The shorter week—practically all of the concerns being operated on the 48-hours schedule—and the scarcity of desirable help continuing to be serious handicaps to the manufacturers.

With the easement from night and day work resulting from the closing of government contracts the factories for the first time in more than four years are returning to a nearer approach to normal conditions. One evidence of this is to be seen in the general shutdowns announced for the annual overhauling of machinery, alteration, improvement and renovation of plants, inventory of stocks and vacations of the employees.

The Woonsocket Rubber Co. has announced a shut-down of two weeks at the Woonsocket and Millville plants. The last day of work at each mill was on Thursday, July 31, and the first day's work following the vacation will be on Monday, August 18. The two plants employ about 2,500 operatives, 1,700 at the Alice and 800 at the Millville factory. During the vacation period repairs will be made at each plant.

The factory of the National India Rubber Co. at Bristol has closed down its shoe divisions for a summer vacation, the last day for making up shoes being July 31, and operations will be resumed on Monday, August 18. While the mill is closed improvements are being made.

* * *

The annual announcement of the assessments for the year upon the corporate excess of manufacturing, commercial, and miscellaneous corporations in Rhode Island were made about the middle of the month by the State Tax Commissioners. The figures present an interesting study of business conditions and show that the total valuation of corporate excess in the state for the year is \$270,366,059.22. In the list of corporations that have a corporate excess of \$10,000 or more are the following that are connected, directly or indirectly, with the rubber industry: American Multiple Fabric Co., \$128,399; American Wringer Co., \$1,061,936; Anchor Webbing Co., \$175,289; Atlantic Tubing Co., \$199,290; Blackstone Tire & Rubber Co., Inc., \$42,136; Bourn Rubber Co., \$230,335; Broadway Tire Exchange, Inc., \$30,577; Collyer Insulated Wire Co., \$405,056; Davol Rubber Co., \$220,569; Everlastik, Inc. (Boston), \$351,081; The Fisk Rubber Co. of New York (Chicopee Falls, Massachusetts), \$37,600; Glendale Elastic Fabric Co. (Easthampton, Massachusetts), \$18,200; Goodby-Rankin Co., \$99,840; The B. F. Goodrich Rubber Co. (Akron, Ohio), \$254,510; Good Tire & Rubber Co. (Boston, Massachusetts), \$204,798; Hamilton Web Co., \$246,291; Hayward Rubber Co., Inc., \$14,716; the Hill & Lacroix Co. (Cranston), \$215,880; Hope Rubber Co., \$56,724; Hope Webbing Co. (Pawtucket), \$1,592,510; Mechanical Fabric Co., \$543,867; Narragansett Rubber Co. (Bristol), \$137,136;

National India Rubber Co. (Bristol), \$1,891,236; O'Bannon Corporation (Boston), \$1,303,762; Phillips Wire Co., \$2,264,042; Revere Rubber Co., \$834,627; Shannock Narrow Fabric Co., \$90,460; Sterling Tire Corporation (Rutherford, New Jersey), \$45,828; Tubular Woven Fabric Co., \$120,307; United States Rubber Co. (New York), \$2,045,574; United States Tire Co. (New York), \$81,341; Washburn Wire Co., \$2,103,344; Woonsocket Rubber Co. (Woonsocket), \$499,898.

* * *

At the Revere Rubber Co., where the new 48-hour-week schedule has been in operation for more than a month, the management announces that it is very gratifying to note that the production has increased rather than diminished with greater concentration of efforts on the part of the workers since the company, when the working hours were curtailed, saw to it that the wage schedule was adjusted so that the income of the operatives would in no way suffer from the lessening of the working hours. In fact, the wages of all piece and day workers were raised about 12 per cent and a comparison, after the first month under the new schedules, shows that the factory force is making as much and in many cases more than they did under the old 54 or 55-hour schedule.

* * *

About the first of last month 75 of the salesmen of the branch stores of the United States Rubber Co., with a number of officials of the United States Rubber Co., spent a day studying the problems of rubber footwear manufacture at the factory of the National India Rubber Co. at Bristol. They were entertained by officials of the National company during their stay in Bristol, the only drawback being the cold and rainy weather.

The visiting salesmen were met at the depot by a delegation from the National office and escorted to the factory, where the forenoon was spent inspecting the making of shoes in detail from beginning to the end. Luncheon was served at noon, after which the young women of the company's office were partners for the salesmen at the short season of dancing to music by the factory orchestra.

About 2 o'clock automobiles conveyed the visitors on a tour of Ferry Hill, overlooking Mount Hope Bay, and the farm of Colonel Samuel P. Colt, at Pappasquash. Here the party inspected the big cattle barns with their herds of blooded stock. Returning, the visiting Westerners assembled at the Hotel Belvedere, where the salesmen listened to instructive talks by A. W. Lawrence and W. F. Enright, on fabric footwear and rubber shoes, respectively.

Different groups of the men who visited Bristol had been attending schools of salesmanship at the Boston Rubber Shoe Co., Malden, Massachusetts; The Goodyear's Metallic Rubber Shoe Co., Naugatuck, Connecticut; the L. Candee Co., New Haven, Connecticut; the American Rubber Shoe Co., Cambridge, Massachusetts, and Woonsocket Rubber Co., Woonsocket, during the preceding two weeks, and those who were billeted in the latter city presented a large silver loving-cup, engraved with the names of the donors, to George Schlosser, general manager. The cup is for the management of the Woonsocket Rubber Co., in recognition of the kindness bestowed on the salesmen during their stay in that city. Mr. Schlosser responded with a short address of thanks.

After the Regent talk a sumptuous dinner was served at the Belvedere, the dining room being elaborately decorated with flags, while in the hallway was a large banner, reading, "Welcome Salesmen." The large picture over the mantel was drawn by William Doran, and illustrated a group of salesmen on the beach admiring fabric shoes on the feet of a sand bathing-nymph. Led by the orchestra, the party sang popular and patriotic songs and three cheers were given for "Mine Host" Morrissey.

At 6 o'clock, despite the bad weather, a large number of the visitors embarked on the chartered steamer "Sagamore"

for a sail to Providence. On the steamer the orchestra furnished the accompaniment for singing, and "End-Men" Birt-whistle and Holt made a hit with selections from the National India Rubber Co. minstrels. Arriving in Providence, many of the party went to a theater, where reservations had been made, while others took late trains for home.

Ralph W. Holt, assistant to the General Manager, who had the local arrangements in charge, is to be congratulated on the success of the efforts of his committee.

The Woonsocket Rubber Co. has commenced the erection of a new two-story brick building at the plant of the Alice Mill, on Fairmount street, Woonsocket, to be used as an office building wherein will be concentrated all the executive and administrative offices. The new building will be 62 by 100 feet and will have an ell of one-story, 20 by 10 feet.

The loss sustained by the fire in the topping room of the shoe department at the National India Rubber Co., at Bristol, some weeks ago, has been adjusted by insurance inspectors from Boston and New York. They visited the plant, made a complete survey of the department where the fire was and computed the insurance on the stock and other material that was damaged by fire, smoke and water.

The second annual outing of the employees of the Davol Rubber Co. was held last month at Palace Gardens, near Rocky Point, and was attended by 600 employees and friends of the concern. A luncheon was served at noon and the clam-bake enjoyed at 3 o'clock. An athletic program, consisting of a three-legged race, a ladies' potato race, men's potato race, ladies' egg race, men's shoe race, ladies' 50-yard dash, men's 100-yard dash and a baseball game between the married and single men, featured the outing. The married men won the ball game by a score of 5 to 3. After the athletic events dancing was enjoyed, an orchestra furnishing music.

The Lynn Rubber Manufacturing Co., at Warren, Rhode Island, is doing an increasing business, and many shipments of rubber accessories to boots and shoes are being turned out. The company is now increasing its output of rubber heels and other boot and shoe accessories to such an extent that the factory may be operated night and day.

The partnership between George Cetenich and George Eukers, doing business as the George Eukers Tire Co., 97 Empire street, Providence, has been dissolved. The affairs are being settled by George Cetenich.

The Newport Tire and Tube Exchange has removed into larger quarters at 195 Thames street, Newport.

Joseph Bergel, of Providence, has filed his statement that he is sole owner of the Pawtucket Tire Exchange, 36 North Union street, Pawtucket.

The Elliott Tire Service, 9 Blackstone street, Woonsocket, is being conducted by Horace W. Elliott, of that city.

The Federal Felting Co. has decided to double the size of its plant on Canal street, Westerly, Rhode Island.

The Revere Rubber Co. has been granted a permit by the Inspector of Buildings to construct a two-story addition to its Valley street plant, Providence. The addition will be 100 by 25 feet, constructed of brick, of the mill type of architecture.

The Bourn Rubber Co., Providence, has commenced extensive

alterations in its boiler house on Fuller street in order to increase the steam capacity of the plant.

The Woonsocket City Council has awarded a contract to the Fabric Hose Co., Boston, for 500 feet of loose-fabric hose and 500 feet of cement-covered hose, each at \$1.05 per linear foot, which was the lowest of three bids submitted.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

TRENTON RUBBER MANUFACTURERS report that the tire and tube trade is very good at the present time and they expect it to continue until cold weather sets in. Plants making rubber products other than tires and tubes report business as being fairly good. That Trenton rubber manufacturers are optimistic over the future is shown by the numerous plant additions contemplated and already under way. The Hamilton Rubber Co., Trenton, will erect a three-story steel and concrete addition, 75 feet square, to cost about \$20,000.

The Luzerne Rubber Co., Trenton, will erect a two-story factory building of brick, steel and metal sash, 75 by 50 feet, at a cost of \$13,000.

The Joseph Stokes Rubber Co., Trenton, is having erected a structural steel building, 100 by 50 feet, to cost \$8,500.

Herbert H. Coleman, of East Orange, New Jersey, president of the Delion Tire & Rubber Co., has returned from Europe with a large tire order from a French company that will keep the plant busy for some time.

Milton Cohn, formerly private secretary to John S. Broughton, president of the United & Globe Rubber Co., has been honorably discharged from the army and has been promoted to the position of traveling salesman for the United & Globe company.

The A. F. Updike Rubber Co., Trenton, has installed a vulcanizing department at its plant on East Front street.

Harry L. Boyer, manager of the Joseph Stokes Rubber Co., Trenton, has contributed \$100 towards the fund being raised for the family of a Trenton policeman who was slain. A number of other Trenton rubber men also gave to the fund.

The B. F. Goodrich Rubber Co., of Akron, Ohio has leased the six-story concrete and steel building at Park avenue and Fifteenth street, Hoboken. The building has 140,000 square feet of space and it is said that the rental for a term of years will aggregate more than \$500,000.

The Goodyear Tire & Rubber Co., Akron, Ohio, is having the four-story building at 500 Central avenue, Newark, New Jersey, altered extensively. The company will use it as a service station and main distributing branch. The improvements will cost \$15,000.

The Etablissements Bergougnan of Clermont-Ferrand, France, has recently purchased a fully equipped tire plant in Trenton, New Jersey, where the Bergougnan tire will be made. The French company is one of the oldest and best-known makers of automobile tires in Europe.

The Thermoid Rubber Co., Trenton, will build a new plant for the manufacture of tires, tubes, universal joints, rubber hose and other "Thermoid" products.

The Woven Steel Hose & Rubber Co., Trenton, is making molded air and water hose in long lengths. Horace B. Tobin is general manager of the company.

I. V. Jones, recently appointed superintendent of the Nearpara Rubber Co., Trenton, manufacturer of reclaimed rubber, has been connected with the rubber-reclaiming business since 1904, and was one of the first to develop a process for reclaiming auto tires. He was formerly master mechanic and chief engineer of the United & Globe Rubber Co., and previously was for a number of years factory manager for the Derby Rubber Co. The Nearpara company's plant is being remodeled and enlarged, and, when completed, will be a modern and up-to-date factory.

The John E. Thropp's Sons Co., Trenton, will build an addition of steel and brick, 63 by 320 feet, with 40-foot bay, covered by a 10-ton traveling crane, and a gallery 23 feet wide across one side and end. The cost is estimated at \$75,000. This expansion has been made necessary because of the increased business in the line of machines and mold equipment for manufacturing both automobile and truck tires. Some of the present equipment will be used in the new building in order to improve working conditions in the old.

The firm of A. W. Faber, Newark, New Jersey, by act of Congress, has been passed to the ownership of American inter-

B. Parsil, of Highland Park, Robert Montalvo, and Louis Kosma, superintendent of the Eckrcde Rubber Co., of Newark, are the interested parties. The company has leased temporary quarters in the Landsberg building in New Brunswick and will later erect a plant for manufacturing purposes.

The members of the clerical force of the Lambertville Rubber Co., Lambertville, New Jersey, held their annual outing recently at that place. Following the banquet dancing was enjoyed.

The heavy rains caused damage to the Empire and Joseph Stokes rubber mills, Trenton, during the latter part of July. Both mills are situated along Assanpink Creek and the stream became so high that the lower floors of the plants were flooded. Work in portions of both mills was temporarily abandoned.

PACIFIC COAST NOTES.

By Our Regular Correspondent.

THE OLDFIELD TIRE CO. of Los Angeles has appointed Hess & Sacket, Inc., local distributor of their product. The Oldfield Company will still maintain its warehouse on Los Angeles street to serve the distributors in this and other counties of Southern California and Arizona.

Grove Hill, one of the best known "road men" connected with the motor tire business of Southern California, has been added to the organization of the J. B. Wood Tire Co., distributor of Hewitt tires in Los Angeles.

The Sewell Cushion Wheel Co., Detroit, Michigan, is planning to open Pacific Coast factory branches in Portland, Los Angeles and San Francisco.

F. A. Seiberling, president of The Goodyear Tire & Rubber Co., Akron, Ohio, has arrived in Los Angeles to take the first steps in building the Goodyear plant which is to be erected at Ascot Park, just acquired for that purpose.

Trinidad E. Lacayo, Nicaraguan Consul in Los Angeles, believes that the logical source of raw rubber for this district is in Central America, particularly Nicaragua. "There are thousands, yes, hundreds of thousands of acres of wild rubber in Nicaragua, which should be gathered and brought to this port," says Señor Lacayo. "In 1916 we exported 200,000 kilos of rubber, worth \$256,000, to the United States alone. Those are the latest authentic figures I have, but the amount of rubber now exported, I should say, is worth nearly \$500,000 annually, and this is only a fraction of what we produce. Nicaragua, the largest of the Central American republics, has an area of nearly 50,000 square miles, and a population of only 800,000. American business men should send representatives there, as they are doing in other South American countries, and study conditions as they are." Señor Lacayo was native secretary in the Philippines for Governors Taft, Wood and General Funston, at the same time representing his country there.

"Cliff" Durant, millionaire sportsman, motor car manufacturer and automobile racing champion, has announced that plans have been completed for a speedway to be built in Los Angeles, and a duplicate to be built in San Francisco. Two races yearly are planned to be held at each course, and no purse less than \$15,000 will be offered. The Los Angeles and San Francisco courses will be owned by the California Speedway Association, which will be incorporated for \$250,000. The local courses will be a mile and a quarter with a minimum width of 70 feet.

ON THE BOARDWALK AT ATLANTIC CITY AFTER THE OUTING OF THE RUBBER ASSOCIATION AT ABERCORN. LEFT TO RIGHT—HENRY FREY, AL MYERS, HENRY FERA, JR., AND RICHARD WOLBERG.

ests and will be known as A. W. Faber, Inc. Henry Fera, Jr., will remain general manager, with the same business organization. The company intends to maintain the high quality of its products and improve them wherever possible.

The Clark & Stebor Rubber Co., Inc., 709 Berkman street, Plainfield, New Jersey, recently incorporated to manufacture inner tubes, tire repair patches, etc., with a capital of \$300,000, has purchased the building at 332-334 Leland avenue for its factory and expects to be in operation in about two months. The officers are Lester P. Clark, president, and Anthony L. Stebor, Jr., inventors and patentees of the C. & S. patch in the United States, Canada, Great Britain and France, and W. G. Crossley, secretary and treasurer.

The Acorn Rubber Co., New Brunswick, New Jersey, has been organized for the purpose of manufacturing high quality automobile tubes and to engage in the vulcanizing business. R.

They will be of the triple-radius type permitting unlimited speeds in the long straight aways, and allowing for averages of better than 100 miles an hour.

* * *

The B. F. Wade Tire & Rubber Co., Los Angeles, is now manufacturing 400 blow-out shoes and 120 reliners a day at its factory and plans to double these figures in a very short time.

* * *

Fred S. Wilson, vice-president and Pacific Coast manager of the Thermoid Rubber Co., Trenton, New Jersey, is back at his office in Los Angeles after a serious illness of five months, during which he transacted most of his business from his bedside. He plans a visit to the factory during August and will take with him several of his coast representatives.

* * *

The Portland Rubber Mills, Portland, Oregon, are building a new concrete factory, 200 by 75 feet, to cost approximately \$100,000. Mechanical rubber goods, heels and soles are the lines in which the concern is expanding. It also does a jobbing business in mechanical rubber goods and leather belting. A branch store is operated in Seattle. The officers are H. C. Huntington, president and manager; M. E. Reed, secretary and treasurer; Henry L. Corbett, E. B. MacNaughton and C. E. McCulloch, directors.

* * *

The Universal Tire Filler Co., Portland, Oregon, has found it necessary to increase its manufacturing facilities. A new plant for manufacturing fillers has recently been started in Vancouver, British Columbia. The installing station of the Universal Tire Filler Co. at Seattle, Washington, has been purchased outright by a syndicate of business men in that city and the Seattle force, with G. M. Fife as manager, will take charge of the company's operations at Vancouver.

The company will soon begin operations in the Middle West, probably locating at Indianapolis, Indiana. Frank A. Hager, general manager, G. W. German, local manager, and G. H. Gossett, superintendent, will supervise the erection of the plant, which will supply the Middle West and eastern trade.

* * *

C. B. Clarke has been appointed retail distributor of United States tires and products in Portland, Oregon, succeeding C. E. Hamilton. For the past four years Mr. Clarke has been superintendent of the Portland Gas & Coke Co.'s garage.

* * *

Joseph G. Howell and Martin F. Swift of the Pacific Tire & Rubber Co., Portland, Oregon, will handle the Canton cord, and Blackstone fabric tires for that territory. Fred Hawley, one of the best known tire salesmen of Portland has joined the organization.

* * *

The Washington Tire & Rubber Co., Spokane, Washington, manufacturer of "Evergreen" tires and tubes, is making a tire of solid black tread and side-wall construction in millimeter sizes, with an extra ply of fabric. It also contemplates undertaking the reclaiming of rubber in the near future. Spokane is fast developing as a rubber manufacturing center of the Northwest, in addition to being the location of branch organizations of several of the large eastern rubber manufacturers. The Washington Tire & Rubber Co. expects to increase its facilities to take care of its share of western business. The officers of the company are: A. G. Hanauer, president; H. S. Burdick, treasurer; R. C. Babbitt, sales director; and E. E. Harding, manager of production.

* * *

Harry Schwartz, for eleven years with Charles T. Wilson Co., Inc., New York City, crude rubber importer, resigned in February last and has started in business as a crude rubber broker

at 131 Grand Trunk Dock, Seattle, Washington. A specialty is made of serving Pacific Coast manufacturers in a buying capacity, as well as inspecting crude rubber qualities for some of the leading eastern importers and manufacturers.

THERMOID'S PACIFIC COAST MANAGER.

FRED S. WILSON, vice-president and Pacific Coast manager of the Thermoid Rubber Co., Trenton, New Jersey, has been associated with the Stokes interests for 25 years, having entered the bicycle-tire department as an apprentice and subsequently been made foreman of it. After two years there he was placed in the sales department, traveling through eastern New York and Pennsylvania. Having served in that capacity for a few years, he was then made advertising and sales manager, which position he held for some time.

FRED S. WILSON.

When the company decided to reach out for Western business Mr. Wilson took Chicago and the Middle West as his field of operations, and, having firmly established the business in that territory and become a leading factor in the Middle Western trade, he moved to the Coast, opening one branch and then another as the Coast business developed.

The Thermoid company now maintains branches at San Francisco and Seattle, which are under the personal direction of Mr. Wilson. By having an officer of the company located on the Coast it keeps its extensive trade in close touch with the management.

LONG-FIBER ASBESTOS FROM CALIFORNIA.

The American Asbestos Products Co., San Francisco, California, plans to erect a mill with a working capacity of 400 tons daily, twenty times its present output. Its asbestos-bearing

PLANT OF THE AMERICAN ASBESTOS PRODUCTS CO.

property consists of 600 acres of land on the banks of the Stanislaus River, 150 miles east of San Francisco, and it is estimated to contain millions of tons of the mineral, which runs high in quality, the fiber varying in length from one-half to one inch, suitable for spinning, while the short fiber and screenings are suitable for stucco, cement, and other purposes. The officers of the company are J. A. Voorhees, president; J. N. Morrison, vice-president; and Dr. F. P. Reed, secretary and treasurer.

THE GOODYEAR PACIFIC COAST FACTORY.

THIS ANNOUNCEMENT by The Goodyear Tire & Rubber Co., Akron, Ohio, of its decision to erect a \$4,000,000 rubber manufacturing plant and a \$1,500,000 cotton mill in Los Angeles, California, is the most important industrial development in years on the Pacific Coast. All the preliminary details have been settled, the deeds have been placed in escrow for the large tract of land that has been acquired and ground has already been broken for the new enterprise. It is planned to have the plant in actual operation by next March.

The rubber company is capitalized at \$20,000,000 and the Pacific Cotton Mills Co. at \$5,000,000. Ascot Park in Los Angeles, famous for its many automobile races, was acquired by the company as the site for the rubber factory and additional acreage in the vicinity, amounting in all to 480 acres, was also purchased. The rubber plant will have a capacity of 3,000 tires a day, an annual business approximating \$15,000,000, and will employ 1,500 operatives.

The cotton mills, according to the present plans, will have 33,000 spindles, a capacity of 75,000 pounds of cord fabric and 75,000 pounds of woven fabric, an annual business of \$7,500,000, and will employ 1,200 operatives. It is planned to eventually expand both industries to four times the above capacities. The management of the company, in announcing its future plans, is looking forward not only to the increase in the demand for

automobile tires but also to the probable increase in the demand for many products requiring rubber and cotton.

In addition to the manufacturing plants the company will erect an industrial city, laying out a large area to be known as Goodyear Park, for a community settlement for its employees.

A tract of 160 acres has been set aside for the homes of the workmen. Landscape architects will supervise the improvement of the grounds with boulevards, trees, shrubbery, lawns, etc., and 800 fine houses will be built. The employees are to be permitted to purchase the houses on the instalment plan in payments of about the same amount as rent. No cheap houses will be built, and they will be varied in their style of architecture to make the general appearance of the district more attractive.

Very practical were the reasons that induced F. A. Seiberling, president of The Goodyear Tire & Rubber Co., and the other officers to take this epochal step. California and Arizona produce Egyptian and Pima cotton, and these long-staple varieties, with their superior tensile strength, are essential in the manufacture of high-grade automobile tires and other rubber products. The world's greatest rubber-producing districts are located in the Far East, and crude rubber can be brought across the Pacific to Los Angeles in ships flying the flag of the United States. Superior climatic conditions and freedom from labor troubles are cogent reasons for the coming of the great plant to Los Angeles.

PLAN OF THE GOODYEAR PLANT IN LOS ANGELES AND PORTRAIT OF F. A. SEIBERLING, PRESIDENT.

GOOD ROADS MOVEMENT IN CALIFORNIA.

The passage of the \$40,000,000 bond issue in California for the expansion of the state highway system, by a vote of more than 7 to 1, is an event of the greatest importance, not only to motorists, tire users and tire manufacturers, but to the good roads movement in general throughout the United States. California's highway system is already one of the best in the country, as the immense number of automobiles, stages and trucks in that state testify, but the construction of new highways will lead to the development of sections which have hitherto been inaccessible. Other states will undoubtedly follow the example of California, and a tremendous impetus to road building all over this country will be the result.

The present system of good roads in California makes it a territory where tires give unusual mileages. Tire performances which would be considered phenomenal elsewhere are common there. It is estimated that good roads extend the life of a tire by one-fifth. Figuring the cost of the average set of tires at \$100, and placing the average life of a set of casings at one year, then a saving of \$20 a year per car in tire cost may be attributed to good roads.

There are approximately 350,000 cars in use in California at present. A saving of \$20 a car per year on tires would mean \$7,000,000 saved in tire wear alone to California motorists. This saving would wipe out the entire bond issue in less than six years. The present year promises to be a banner year for good roads.

"DUNLOP 1919 GROOVED" NON-SKID TREAD.

The Dunlop Rubber Co., Limited, London, England, is producing a new non-skid tread design which is said to be highly effective as well as durable, due to the fact that the bulk of the tread rubber is placed along the line of greatest wear. This pattern is to be supplied on all future orders for grooved tires as fast as stocks become available.

NEW DUTCH TIRE FACTORY.

As a consequence of war conditions, making difficult the importation of tires into Holland, a new company called the Rubberfabrik "Vredestein," has been organized at Loosduinen, near the Hague, to manufacture pneumatic tires.

FRENCH IMPORT DUTY ON AUTOMOBILE TIRES.

Effective after July 12, 1919, automobile pneumatic tires, casings and inner tubes, imported into France from the United States are subject to a surtax of 10 per cent ad valorem in addition to the import duty of \$13.13 per hundred pounds net weight.

Under the minimum tariff, which applies to imports from the United Kingdom and certain other countries, the present rate is \$8.75 per hundred pounds plus 5 per cent ad valorem. Under a recent ruling automobile tires had been dutiable at the rate of 70 per cent ad valorem, together with automobiles weighing less than 2,500 kilos (5,509 pounds), and parts for the same, and this rate continues to apply to other parts when intended for automobiles weighing less than 2,500 kilos.

The Mid-West Rubber Manufacturers' Association.

JOHN W. MAGUIRE,
President.

JOHN T. CHRISTIE,
Vice-President.

PRESTON E. ROBERTS,
Secretary-Director.

A. V. CONRAD,
Treasurer.

C. WRIGHT.

B. B. FELIX.

MARSHALL D. WILBUR.

W. W. TODD,
Assistant Secretary.

OFFICERS AND DIRECTORS OF THE MID-WEST RUBBER MANUFACTURERS' ASSOCIATION.

THE MID-WEST RUBBER MANUFACTURERS' ASSOCIATION, organized some months ago with headquarters at Chicago, has already demonstrated the power and advantages of association effort when rightly directed. The monthly meetings are well attended, and, judging from the earnest discussions, the various members are striving to secure as much important information as possible concerning the problems that relate to the industry.

That there are many problems to be solved in the near future is a matter upon which all are agreed, and, as the industry is comparatively new in the Middle and Western States, the organization of this new association was a commendable move on the part of the manufacturers of that section.

Locating the association headquarters at Chicago makes it possible for the various members to attend the monthly meetings without incurring a great deal of traveling expenses. Most of the middle and Western manufacturers purchase much of their supplies in Chicago and hence meetings of the association can be attended and other business matters transacted on the same trip.

The idea of forming a Mid-Western association was evolved by John W. Maguire, general manager of the rubber department of the Brunswick-Balke-Collender Co. Mr. Maguire believed such an organization was necessary to represent the rubber manufacturers of that vast territory west of the Ohio river, and he found no difficulty in gaining other enthusiasts to the cause. Within the short space of three months the idea had developed into an active organization, with offices in the McCormick building and an efficient and enthusiastic management in charge.

It is probable that some manufacturers who have become identified with the rubber industry during the past two years do not fully appreciate the functions and importance of association endeavors. The fact that in practically every line of manufacture and in nearly every field of enterprise men have seen fit to form associations to protect and advance their combined interests is, in itself, conclusive evidence that the utility of associations is generally recognized. When governed by enthusiastic officials, and when energy and intelligence dominates, a manufacturers' association can frequently find means to bridge difficult chasms

which would greatly perplex an individual manufacturer if left to himself.

The Mid-West Rubber Manufacturers' Association has started its first year with a strong organization of officials and directors. Each seems anxious to further the power and importance of the Association and is willing to lend his time and ability to the cause. Various features of advantage will be developed by the officials in charge and the members will, without doubt, fully recognize and appreciate what is being accomplished in their behalf when they realize the results of the association's endeavors.

The following are the officers and directors for the ensuing year: John W. Maguire, president; John T. Christie, vice-president; Preston E. Roberts, secretary; W. W. Todd, assistant secretary; A. V. Conrad, treasurer; directors, John W. Maguire, chairman, the Brunswick-Balke-Collender Co.; John T. Christie, Hawkeye Tire & Rubber Co.; Preston E. Roberts, Perfection Tire & Rubber Co.; A. V. Conrad, Kokomo Rubber Co.; Marshall D. Wilber, Palmer Tire & Rubber Co.; C. Wrigley, Racine Auto Tire Co., and B. B. Felix, Featheredge Rubber Co.

NATIONAL ASSOCIATION OF WASTE MATERIAL DEALERS, CLASSIFICATION FOR SCRAP RUBBER.

CIRCULAR E.

THIS STANDARD OF PACKING was adopted by the Scrap Rubber Division and approved by the Executive Committee of the Association on June 17, 1919, to be effective from July 1, 1919, to July 1, 1920, at which date a new circular will be issued.

All goods bought or sold under the following specifications are understood to consist only of domestic or Canadian manufacture, unless otherwise stipulated. All grades of scrap rubber shall be bought and paid for net weight, mill weights to govern, and no allowance for bagging or covering of any kind shall be made, nor shall the same be returned to the seller.

DELIVERY.

A.—All shipments of scrap rubber must be contained in bags, bales, bundles or other suitable containers, and if shipped loose a charge of 1/4 cent per pound shall be made for extra handling, except automobile tires and railroad hose which may be shipped loose.

B.—1. A car load, unless otherwise specified, shall consist of fifteen tons. 2. A ton when applied to domestic stock shall mean 2,000 pounds. A ton when applied to foreign stock shall mean 2,240 pounds.

C.—Shipments direct to a mill shall consist of not less than 2,000 pounds. Otherwise a charge of 1/2 cent per pound shall be made.

D.—All scrap rubber of foreign manufacture shall be bought C. I. F. port of entry as per weight determined by sworn weigher's certificate, seller to bear expense of weighing, and shall be subject to same conditions as govern purchases of domestic manufacture.

REJECTIONS.

E.—Upon his request all objections shall be returnable to the seller within thirty days from the time notice of rejection is received by him and upon payment by him of 1/2 cent per pound to cover cost of sorting and rebaling. If shipping instructions are not furnished within the above mentioned thirty days the purchaser shall be at liberty to make such disposition of the material as he may see fit. The above does not apply if rejected material is purchased by the buyer.

F.—When shipments are made direct to a mill each grade of scrap rubber must be packed separately, and if not so packed a handling charge of 1/2 cent per pound will be made.

G.—All scrap rubber must be dry and free from dirt. All scrap received may be dried by the buyer, such shipments to be paid for on the dry weight as ascertained.

H.—A purchase contract shall not be considered filled until the full quantity within 2 1/2 per cent, more or less net weight shall have been received. All rejections to be placed within thirty days of the date of notice of rejection to the shipper.

EMBARGO.

I.—If through embargo a delivery cannot be made at the time specified the contract shall remain valid and shall be completed immediately on the lifting of the embargo, and terms of said contract shall not be changed. Notice of embargo must be served by seller.

Code words appear in italics.

1.—RUBBER BOOTS AND SHOES (*Acce*). The deliveries of rubber boots and shoes must consist of rubber boots and shoes of domestic Canadian manufacture. Red, white, tan, and fancy colored shoes are not a good delivery. They must be dry and free from dirt. All cloth top shoes, trimmed or untrimmed, and soles or heels of rubber boots and shoes from which the uppers have been removed shall not be accepted as a good delivery.

1.—(a) COLORED RUBBER BOOTS AND SHOES. All rubber boots

and shoes which are not black must be packed and sold separately, the grading and packing to conform to Article 1.

2.—TRIMMED ARCTICS (*Band*). Must be closely trimmed and free of leather.

(a)—UNTRIMMED ARCTICS. Must be free from leather.

3.—TRIMMED TENNIS SHOES (*Clam*). Must be black; closely trimmed; free from molded soles and leather.

(a)—UNTRIMMED TENNIS SHOES. Must be free from leather and molded soles.

4.—STANDARD MIXED GRAY AUTO TIRES (*Dirk*). Must be free from the following: All jet black tires, unguaranteed tires, heavy beaded tires, non-pneumatic or filled tires. Must not contain any hard, oxidized, burnt, single tube, motorcycle, stripped or badly worn tires, not tires containing leather or metal.

4.—(a)—JET BLACK AUTO TIRES. Must be free from all gray tires, unguaranteed tires, heavy beaded tires, non-pneumatic or filled tires. Must not contain any hard, oxidized, burnt, single tube, motorcycle, stripped or badly worn tires nor tires containing leather or metal.

5.—UNGUARANTEED TIRES (*Earl*). Must be free from heavy beaded tires, hard or oxidized, stripped, badly worn, and tires with leather and metal.

6.—HEAVY BEADED TIRES (*Farm*). Must be free from hard or oxidized tires, stripped, badly worn and tires with leather and metal.

7.—BAILY WORK TIRES (*Game*). Must be free from hard or oxidized tires, heavy beaded and tires with leather and iron. A reasonable proportion of the tread must be on the tires.

7.—(a)—STRIPPED TIRES. Must be free from hard or oxidized tires, heavy beaded and tires with leather and iron.

8.—No. 1 GRAY AUTO TIRE PEELINGS (*Hawk*). Must be free from cloth, metal, leather and jet black peelings.

8.—(a)—No. 1 JET BLACK PEELINGS. Must be free from gray peelings, cloth, metal and leather.

9.—3/4 CRY AUTO TIRE PEELINGS (*Iced*). Must consist of peelings from auto tire treads only and must be free from leather, metal, stripped auto tire fabric and jet black peelings; also free of beadless auto tire stock from which fabric has been pulled, known as Dykes or Dykes peelings.

10.—BICYCLE TIRES (*Jade*). Must be free from hard or oxidized tires, wire and beaded tires. 11.—RED WAGON AND CAB TIRES (*Kite*). Must be free from metal, alloy carriage and cushion tires.

12.—SOLID MOTOR TRUCK TIRES (*Lamp*). Tires must be 2 1/2 inches or over in diameter. Must be free from metal and tires with hard backs and fiber bases.

13.—CROOKER'S HOSE (*Mark*). Must be free from metal, hard or oxidized hose and steam hose.

14.—GARDEN HOSE (*Nail*). Must be 1/2 inch or over in diameter and free from metal, rags, rope and cotton-covered hose.

15.—LARGE HOSE (*Oven*). Large hoses must be one inch or over in diameter. Must be free from metal, rags, rope, hard or oxidized hose and all cotton covered hose.

16.—COTTON-COVERED FIRE HOSE (*Park*). Must be rubber-lined and free from hard or oxidized hose.

17.—1 AUTO INNER TUBES (*Quiz*). Must be strictly pure gum, free floating tubes, free from crusty tubes, cloth, metal, red and cloth patches.

18.—No. 2 AUTO INNER TUBES (*Race*). (Known as Compound Tubes.) Must be standard tubes, free from crusty tubes, cloth, metal, red and cloth patches.

19.—No. 1 BICYCLE INNER TUBES (*Salt*). Must be strictly pure gum, free floating tubes, free from crusty tubes, cloth, metal, red and cloth patches.

20.—No. 2 BICYCLE INNER TUBES (*Train*). (Known as compound Tubes.) Must be standard tubes, free from crusty tubes, cloth, metal, red and cloth patches.

21.—RED AUTO INNER TUBES (*Utz*). Must be standard tubes, free from punctures, crusty tubes, cloth, metal and cloth patches.

22.—No. 1 WHITE RUBBER (*Vase*). Must consist of strictly clean white soft drugists' sundries and must be free from cloth and metal.

23.—No. 2 WHITE RUBBER (*Hard*). Must consist of white horse-shoe pads, white shoe buckles, white buckles and white buckles, cloth, crusty, hard or oxidized material, and white soles and heels.

24.—No. 3 WHITE RUBBER (*Haror*). Must consist of painted white rubber balls or toys from which the paint has been removed, and to be free from cloth, painted wainscoting, metal and hard or oxidized rubber.

No. 4 WHITE RUBBER. Must consist of white jar rings and be free from cloth, metal and hard or oxidized rubber.

25.—WHITE WRINGER RUBBER (*Hyen*). Must be strictly white soft free from yellow wringer rubber, hard or oxidized wringer rubber, cloth or metal.

26.—YELLOW WRINGER RUBBER (*Xray*). Must be free from cloth, metal and hard rubber.

27.—MIXED BLACK RUBBER (*Yabe*). Must be free from cloth, metal, crusty, hard or oxidized material, packing, stripped matting, tiling, baby carriage tires, soles and heels.

28.—MATTING AND PACKING (*Zero*). Must be free from Garlock, Crandall, and piston packing, belting and similar material, metal and hard or oxidized stock.

29.—No. 1 RED RUBBER (*Yess*). Must consist of soft red drugists' sundries, free from maroon, chocolate, and other dark shades, also free from cloth and metal.

30.—No. 2 RED RUBBER (*Yard*). Must consist of material such as red toys, balls, mechanical red. Must be free from jar-rings, packing, hard or oxidized rubber, cloth, metal, soles and heels, and maroon and chocolate material.

31.—RED PACKING (*Yarn*). Must be free from hard or oxidized rubber, cloth and metal and discolored rubber and free from graphite packing.

THE EDITOR'S BOOK TABLE.

COMMERCIAL OILS, VEGETABLE AND ANIMAL WITH SPECIAL Reference to Oriental Oils. By I. F. Laucks, B. S. M. S. First Edition, 1919. John Wiley & Sons, Inc., New York. Chapman & Hall, Limited, London. (Cloth, 4", x 7 1/2" inches, 138 pages.)

THIS valuable little book is intended primarily for the non-technical man in the oil trade. It gives the technical data and information required in every-day dealings in the oil trade, omitting more or less scientific matter.

The book contains four chapters; in the first, oils are classified according to Lewkowitsch, their general properties and physical and chemical characteristics briefly described, together with the preparation of oils and fats from their raw materials.

The second chapter is devoted to the detailed descriptions of the sources and characteristics of over sixty kinds of commercial oils, including vegetable, fish, marine and terrestrial animal oils, and waxes.

In the final chapter the uses of oils are briefly discussed and much interesting information is given. Reference is made to blown oils and the sulphurized oils used as rubber substitute; also to the less well-known fact that nitrated oils are used as rubber substitute.

The book concludes with a tabulation of the properties of many of the less common oils, weights per gallon of oil, etc., and a comprehensive index. It will be appreciated as a handy book of reference by the chemist as well as by the practical dealer in oils.

OFFICIAL REPORT OF THE SIXTH NATIONAL FOREIGN TRADE Convention. Issued by the Secretary of the National Foreign Trade Council, 1 Hanover Square, New York City. Octavo, 650 pages. Cloth. Price \$2.

Under the title of "Official Proceedings of the Sixth National Foreign Trade Convention," the National Foreign Trade Council has issued a text-book on foreign trade, replete with information, advice and suggestion. This volume is a stenographic report of the proceedings of the convention held in Chicago April 24-26, 1919.

Representing all parts of the world and all factors in foreign trade, from the production of raw material to the transportation of the finished article, the deliberations and conclusions of this gathering are entitled to the most serious consideration. Especially is this true of the final declaration of the convention, printed at the front of the volume, in which the conclusions of the convention are set forth in a comprehensive legislative program, the first of its kind definitely laid down by the business men of the country.

NEW TRADE PUBLICATIONS.

THE PUBLICATION OF HOUSE ORGANS OR EMPLOYEES' papers is a most helpful feature of welfare work. The "C.-H. Messenger," published "for all Cutler-Hammer employees" comes from the Milwaukee, Wisconsin, office of the manufacturing company of that name. The Independence Day issue, printed in red and blue, contains the names of nearly 300 employees who served their country during the war, and shows half-tone portraits of many of them. The little paper is replete with personal notes and factory news, besides contributions from the various branch offices of the Cutler-Hammer Manufacturing Co. in other cities.

* * *

"RUBBER LEAVES" COMES TO THIS OFFICE as a bound volume containing twelve numbers of a handsome little house-organ published by the London Rubber Co., Aberdeen, Scotland, for distribution to its customers. The earlier numbers contained eight pages, some of the later ones 12 pages of deckle-edge paper with heavy covers. There are timely hints to dealers, breezy business advice, information about rubber and rubber processes, sketchy stories with practical business points and advertisements of the specialties of the company, the whole artistically

printed, with illustrations in half-tone on glazed paper "tipped in." The volume is bound in half leather, and is well worth a place in the editorial library.

* * *

THE RUBBER PRODUCTS CO., BARBERTON, OHIO, IS SENDING OUT a large circular, which can be utilized as a window poster to advertise its "Stronghold" tires, one side being printed in large type for quick reading, and showing a half-tone cut of the tire at least half actual size. The other side shows the magnified structure of the tire, with appropriate diagrams, half-tones and explanation. Another section pictures and describes the inner tubes made by the company.

* * *

"WE WELCOME FAIR COMPETITION" IS THE TITLE OF A CIRCULAR issued by the Portable Machinery Co., Inc., Passaic, New Jersey. It tells how another firm is trying to market an imitation of the scoop conveyor and warns possible purchasers, as a suit for infringement of patent rights is now pending.

* * *

THE RUBBER DEPARTMENT OF R. T. VANDERBILT CO., 50 EAST 42nd street, New York City, is sending to rubber chemists, superintendents and purchasing agents, valuable information in loose-leaf note-book form.

* * *

BULLETIN No. 22, ISSUED BY WELLMAN-SEEVER-MORGAN CO., Cleveland, Ohio, comprises three charts giving the relations in any shaft between power, shaft diameter, torsional stress, and speed.

* * *

THE BUFFALO FOUNDRY & MACHINE CO., BUFFALO, NEW YORK, has published for distribution a concise 36-page "Popular History of the War," by Merton M. Miller, assistant editor of "The Buffalo Express." The booklet includes excellent maps of the various war fronts and a daily chronology, and is altogether worthy of preservation for ready reference.

* * *

GUTTA PERCHA & RUBBER, LIMITED, TORONTO, CANADA, HAS published a very neat little pamphlet picturing and describing the decorations of honor which have been and are being awarded by the British and French Governments for bravery, distinguished service or conspicuous gallantry during the Great War. Each is shown with the appropriate ribbons pictured in natural colors, while a history of the decoration, the requirements for its award and other facts are given. The company confines its advertising to a few pages at the beginning and end of the book. The publication is small enough to fit in the pocket, and is therefore convenient to identify such decorations, and gives information as to the reason for their award.

* * *

THE OAK TIRE & RUBBER CO., LIMITED, TORONTO, CANADA, SENDS OUT "The Story of the Royal Oak Tire" in handsome pamphlet form, illustrated with half-tone cuts, showing processes of manufacture. The full details of manufacture, from the crude rubber to the finished tire are described and pictured, the whole enclosed in a terra-cotta double cover, the outer one bearing the legend "Tougher than Oak," an outlined landscape and an embossed representation of the tire.

* * *

THE GOODYEAR TIRE & RUBBER CO., AKRON, OHIO, SENDS TO garage owners and tire dealers, a monthly paper entitled "Goodyear Tire News," and another, "The Goodyear—a Family Newspaper," to the branch office of the company and to the employees. The former gives news of Goodyear products, racing news, practical hints on tire repairing and for sale, wanted and business opportunity items. The news items are copiously illustrated with half-tones, and the paper is one which any tire dealer will appreciate.

The "Goodyear—a Family Newspaper"—is devoted to factory

news and matter of interest to members of the big Goodyear family. Both publications are well printed and filled with items of interest to its chosen line of readers.

THE BREEZE MANUFACTURING CO., NEWARK, NEW JERSEY, HAS published a catalog of its flexible metal hose, tubing and accessories, which contains a large amount of information, technical and commercial, of the manufacture, advantages and uses of metal over rubber for certain purposes. It shows the construction of its all-metal hose and tubing, and the method of combining the imperviousness of rubber with the strength of metal in the hose which contains both. In some of the latter, the spiral metal is so formed that the continuous joint is packed with rubber, in others a special rubber covers the metal hose, and this in turn is covered with duck, with an outside of woven cotton duck, while others have an inner tube of rubber, surrounded by the spiral metal covering. There are other forms, each pictured and described, as are also a large number of flexible shafts, couplings valves and accessories.

THE FIRST ISSUE OF THE "BULLETIN OF THE NATIONAL Association for the Protection of American Rights in Mexico" has appeared, dated July 1, 1919. It sets forth the origin and aims of this organization, contains much timely information regarding Mexican conditions, and echoes editorial voices throughout the United States, emphasizing the necessity for early Congressional action relative to the Mexican situation.

"THE DIGEST," THE MONTHLY ORGAN OF THE MOTOR AND Accessory Manufacturers' Association, came to hand last month in an enlarged form, new dress, and a new editorial policy, the dissemination of news and general information of importance and interest to the manufacturers of motors, parts and accessories for the automotive industry of the United States. Editor M. Lincoln Schuster is striking for a high ideal, and this initial number, under the new policy is evidence of real progress toward its attainment.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(722.) A manufacturer inquires concerning the nature of the cotton fiber used in composition rubber and fiber soles.

(723.) A request has been received for the addresses of golf-ball winding-machines.

(724.) Information is desired concerning a mealy white powder known as Ednoid.

(725.) A reader has inquired for the "Redmond" brand of tires.

(726.) A subscriber requests the addresses of manufacturers of tire flaps who are prepared to make immediate deliveries.

(727.) Information is desired as to who manufactures the Mather tire-building machine.

(728.) A subscriber requests information as to how brass valves may be cemented into air retainers.

(729.) The addresses of manufacturers of machines for punching holes for valve bases in tube are requested.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce or its district or cooperative officers. Request for each should be on a separate sheet, and state number.

(29,725.) The purchase and agency for the sale of bicycle parts, tires and accessories is desired by a wholesale firm in

France. Cash on receipt of merchandise. Correspondence in French.

(29,738.) Rubber, reclaimed rubber, chemicals, sheetings, hosiery, rubber machinery and rubber-makers' tools.

(29,812.) A firm in Australia desires to purchase an agency for accessories and tires. Terms, cash against documents or 90 per cent 120 days after sight; also consigned stock to be paid as sold.

(29,816.) A firm in Trinidad, with agents in this country, desires to be placed in touch with manufacturers and exporters of automobile tires and accessories; also cycle accessories.

(29,833.) Agencies are required by a firm in Brazil for the sale of tires and rubber goods. Correspondence in English.

(29,872.) A commercial agent from Norway, who is in the United States, desires to secure agencies for the sale in his country of rubber overshoes and all kinds of rubber goods.

(29,876.) The purchase of crude rubber is desired by a company in Norway. Cash against documents.

(29,881.) Large quantities of rubber heels are required by an importer in Belgium. Quotations c. i. f. Belgium port. Correspondence may be in English.

(29,886.) A merchant in Italy wishes to represent exporters of druggists' and surgical rubber sundries. Correspondence in Italian.

(29,931.) A merchant from France who is in this country desires to purchase rubber goods from manufacturers only for Roumania.

(29,948.) A firm in Persia desires to purchase rubber overshoes. Quotations should be given c. i. f. Persian port. Payment upon arrival of goods. Correspondence in French.

(29,956.) An importer in Switzerland desires to purchase rubber shoes. Quote c. i. f. Rotterdam or Genoa. Cash against documents. Correspondence in German.

(29,968.) A Belgian firm desires to purchase rubber shoes. Quote c. i. f. Antwerp. Cash against documents. Correspondence may be in English.

(29,984.) An American firm desires to secure from manufacturers of rubber machinery the sole agencies for Dutch East Indies. Cash against documents in the United States.

THE OBITUARY RECORD.

GENERAL SUPERINTENDENT OF WESTINGHOUSE SHOPS.

OSCAR OTTO, general superintendent of the Westinghouse Electric & Manufacturing Co. plant at Essington, Pennsylvania, died June 30, the result of an automobile accident three days previous.

He was born in Manitowoc, Wisconsin, January 2, 1859, and as a young man served an apprenticeship in the machine shops of the Chicago & Northwestern Railway, working at his trade in various Wisconsin cities, later going to the Northern Pacific Railroad shops in Tacoma, Washington, and the Oregon Short Line shops at Salt Lake City, Utah.

He came East in 1898 to superintend the shops of the Chicago & Northwestern Railway at Chicago, Illinois, which position he held until June, 1909, resigning to accept the position of general superintendent of the Westinghouse Machine Works at East Pittsburg, Pennsylvania. When this concern built its new plant at Essington he supervised the installation of the machinery there, and later, in February, 1918, was transferred to that plant as general superintendent. He is survived by his widow, a daughter and three brothers.

ALBERTA GLENN SUTHERLAND, WIFE OF HARRY S. VORHIS, formerly secretary of The Rubber Association, recently died at the home of her mother in Waltham, Massachusetts. Mrs. Vorhis was 30 years of age and had been an invalid for some time, having spent the past year at Saranac Lake, New York. To Mr. Vorhis the sympathy of his many friends in the trade is extended.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

IT IS NOW RECOGNIZED that the prognosticated rise of one shilling per pound in raw rubber on the ratification of peace is unlikely to occur. Owing to the large stocks in England, America, and Singapore it is evident that the demands of the Central Powers, large though they may be, can easily be met without undue pressure on the market, though it is expected that the price may go up three or four pence per pound. Of course things would have been different if the output had been stringently reduced, but with the large output not interfered with by the war the present level of prices was only to be expected.

With new rubber at 1s. 8½d. per pound and oil substitute up to 10d. per pound it is not surprising that there has been a lessened demand for the latter from such branches of the trade as are customarily large users. The position of the substitute trade will also not be rendered any easier by the reimposition of government control over oils, owing to the profiteering which has come into play since restrictions on trading were removed.

WATERPROOF CAP COVERS.

The proofing branch is now almost wholly occupied again on civilian work, new government orders having ceased. One question of the movement is the disposal of large quantities of special goods, such as waterproof cap covers, which the authorities evidently think it is not worth while putting into store. Considering the short time in which such goods were ever used by troops in active service it seems a pity that they were made to such high-class specifications; many of the manufacturers, I understand, advocated a lower quality as being quite good enough to answer the purpose required, but their representations appear to have been unavailing. As regards cap covers, there does not appear to be any public demand for them which would encourage a merchant to bid for those at disposal, and it would seem that their ultimate destination is the reclaimers' works. This sort of thing is not peculiar to the rubber trade, because we hear of metal goods and chemicals that appear to have no market but the scrap heap.

SOLVENT NAPHTHA.

The cessation of war work has resulted in a considerable fall in the price of solvent naphtha, present quotations being 1s. 10d. to 1s. 11d. per gallon. I note that the American figures for solvent naphtha and benzol have also been much reduced, and are now lower than they were. This was only to be expected considering the great increase in the output during the last five years. This fall in the price of solvent cannot be without its effect upon the various proposals with regard to the recovery of solvents in rubber works. It is well known that very little has been done in this way in the past because the matter is not so simple as it appears to be. The subsidiary advantage that it rendered the atmosphere of the spreading rooms much more pleasant for the war-people did not appeal with any force to manufacturers who held the opinion that the recovery plant could be worked only at a loss. Such a plant has, however, been adopted in several cases by card clothing manufacturers, the machinery having been put in thirty or, perhaps, forty years ago by the Liverpool firm of Siddley & Co., Limited, not now in existence.

These machines work with ether, and are of a type which is now chiefly found in tropical countries. The reason why the card-clothing manufacturers with their limited number of spreading machines were more attracted by solvent recovery plants than were the rubber proofers was because the refrigerating plant was also used for freezing the blocks for cut sheet and

for supplying cold water to the cutting machines. The actual recovery of naphtha does not exceed 30 per cent of the original naphtha used. Proposals, I hear, are now before the rubber trade in which a plant will be erected on a new system giving a guaranteed recovery of a higher figure, and the matter is therefore one worth careful consideration by the trade.

I do not know the details of artificial leather manufacture, and it may be that the process which is said to be giving satisfactory results in American artificial leather works may not work equally well in a rubber works. At any rate, after the stagnation of the last 30 years it is interesting to hear of the problem being resolutely tackled again and by those who express themselves as confident of its proving a financial success.

CABLE WORKS CHANGES HANDS.

The old-established insulated cable works of Connolly Brothers, Limited, Blackley Vale Mill, near Manchester, was sold at auction on June 17, 1919, as a going concern. The sale was by order of the High Court resulting from the action of Wood vs. The Company, 1911, and should have taken place some years ago. During the war, however, the concern has been profitably worked by a receiver and a great deal of government work has been carried out. At one time the firm bought its prepared rubber from rubber manufacturers, but at a later date, as in the case of other insulated wire firms, it installed its own rubber machinery. All of the buildings and plant were included in the sale, the stock to be taken over by the purchaser at the auctioneer's valuation, the probable figure for this being put by the auctioneer as somewhere in the neighborhood of £20,000.

With regard to the Vogelsang patents, which had been worked by the firm at a royalty amounting in recent years to about £1,000, it was stated that an arrangement had been made by which the purchaser of the works would have the benefit of the patents without any further payment of royalty. The rubber calenders and the Krupp lead-covering machine were singled out for special mention by the auctioneer, the latter being a machine of high merit which cannot be duplicated, and special reference was made to the enameling processes for which the company has long been noted and the details of which will pass into the purchaser's possession. Although there was a crowded attendance at the sale it was soon clear that the bidding was restricted to two, who raised the initial bid of £15,000 to £35,500, at which figure the concern was sold.

CALLENDER'S CABLE CO., LIMITED.

The annual report shows a profit on the last year's working of £134,968 compared with £121,784. The dividend of 12½ per cent is really the same as that of 25 per cent declared last year as the capital has been doubled by the distribution of bonus shares from the reserve. The report lays stress on the trading difficulties likely to be experienced, but is couched in an optimistic vein. The shareholders have nothing to complain of in the present report, though some of them expected to receive more. At the present quotation for the £5 shares, the return is 6¼ per cent.

GOVERNMENT OWNERSHIP.

The editorial under this heading in the June issue of THE INDIA RUBBER WORLD seems very apposite in these Bolshevistic days when everyone is wanting more money for doing less work, and labor is clamoring for the nationalization of this and that industry under the idea that all will be well if the private capitalist is done away with. One may be excused for referring to the topic because, in these parlous days, if you meet a man in the rubber trade, the conversation does not, as of old, run on tech-

nical matters, the markets and so on, but rather on labor problems and where they are going to land our past industrial position. There is no doubt that the borrowed money so lavishly paid by all the belligerents to war workers has had a very unsettling effect upon labor, and it seems to me that much more might have been done by speeches or the issue of free pamphlets to bring home to the people certain of the laws—if we may call them so—of economics.

The opinion is largely held that if a government can find at once as many millions as it wants for war time, it may as well go on doing so in peace time and let everybody be well off. Very little has been done to controvert such fallacious reasoning, and in general too much of the talking has been left to the labor agitator. I gather from the article referred to that nationalization of industries is being advocated in America, so we seem to be in the same boat, though America has this advantage that her labor does not make a fetish of restricted output such as is prevalent in this country.

BRITISH PETROLEUM.

It looks as if the petroleum requirement of the rubber trade will soon be satisfied from home stills. The large refinery of the Anglo-Persian Co. at Swansea is nearing completion, and there is a lot of excitement about the government borings in Derbyshire, where the oil is now flowing in quantity from one of the wells. This oil is not to be distilled in the local surroundings where it is obtained, but is to be sent to Scotland for treatment at the headquarters of the Scotch oil shale industry. As a solvent I may say that petroleum spirit has never been generally used in our rubber trade, preference having been given to coal-tar naphtha and shale naphtha which have always been available in quantity.

SYNTHETIC RESINS.

The paragraph on "Redmanol" in the June issue of THE INDIA RUBBER WORLD is of more interest to the rubber trade, more particularly the vulcanite branch, than is perhaps generally recognized. Since the first patents of Bakeland in 1909, a considerable amount of work has been done in America and Germany on synthetic resin and quite recently research has been devoted to the subject in England. Whether there are any patents that would withstand an action at law seems rather doubtful. There are now, however, a large number of processes based on the original Bakeland reaction of condensing phenol with formaldehyde. Redmanol, I gather, is formed from phenol and hexamethylene tetramine, and its physical properties appear to be of a high order.

The list of uses to which these synthetic resins will be put is undoubtedly destined to be far longer than is at present the case, although they have already replaced vulcanite in many of its applications to quite a large extent. It is a matter of scientific interest how very completely the phenol or carboic acid loses its distinguishing smell when it is converted into the hard resinous body. Under certain conditions of use, however, such as excessive heat and friction, the smell reasserts itself, and I have heard of complaints being made on account of this. Like rubber, these synthetic resins can be compounded with mineral matter or other inert organic matters though this has to be done before the material attains the condition in which it is described as being as hard as steel.

MISCELLANEOUS FOREIGN NOTES.

PIRELLI CABLE SHIP LOST.

ON JUNE 17 THE CABLE SHIP *Città di Milano*, formerly the property of Messrs. Pirelli, of Milan, Italy, and Southampton, England, struck a rock and sank in the Straits of Messina with a loss of twenty-six lives. Among the deaths reported are those of Italo Brunelli, general inspector of Italian Posts and Telegraphs; Professor Jona, one of the leading authorities in high-

tension work, and Signor Pinelli, of the Pirelli staff of experts. Through the prompt assistance of other vessels 101 of the crew were saved. When Italy entered the war the Government took over the Pirelli cableship, and at the time of the disaster Messrs. Pirelli had chartered her from the Italian Navy in order to lay a submarine cable for the Italian Government.

GERMAN SYNTHETIC RUBBER.

Early during the war period German manufacturers were overwhelmed with the call for batteries for submarines. The larger types required batteries of 220 cells of 4,500 hours' capacity, weighing 80 tons and costing about 250,000 marks. During 1917 there were placed in service 86 submarines, and in 1918, 10 to 14 under-sea boats were added monthly. With practically no crude rubber, the need was serious, but P. Bayer & Co. produced a synthetic rubber which successfully substituted the genuine gum in the manufacture of battery boxes. This firm produced about 150 tons monthly, at a cost of 37 marks per kilo (\$3.96 per pound).

The "Tagliche Rundschau" states that the Bavarian Postal Administration has been experimenting with tires of synthetic rubber on its post automobiles, and has pronounced the result satisfactory, as far as service is concerned, but that the cost of raw material is much higher than that of natural rubber. The material is manufactured in Bavaria exclusively by the electrochemical industry.

A RUBBER FACTORY IN CHINA.

The proposed rubber factory in China will use Malayan plantation rubber and Chinese cotton fabrics and manufacture rubber boots and shoes and hard and soft rubber sheets for electrical rubber goods. The manufacture of cycle and motor car tubes and tyres is contemplated.

CRUDE RUBBER STANDARDS BASED ON TECHNICAL EXAMINATION.

Regarding the pamphlet entitled "Conditions Governing Singapore Standard Qualities," issued by the Chamber of Commerce at Singapore, Dr. A. Van Rossem, director of the Netherlands Government Information Service, states that the following specifications are apparently based upon a superficial examination of the rubber.

18. First latex crepe shall be well prepared dry rubber of good quality, of even color, and free from all stains, spots or traces of oxidation.

19. F. A. O. ribbed smoked sheet shall be clean, tough rubber, free from mold, dampness, under or oversmoked sheets. Slight traces of air bubbles may be allowed, but at the discretion of the Standard Qualities Committee.

Those engaged in the examination of crude rubber on a technical basis have come to the conclusion that the quality of crude rubber cannot be judged by its outside appearance only; on the contrary, in many cases the quality of the rubber can be judged only by vulcanization experiments.

The best proof is that the producers in Java, Sumatra, and also the Federated Malay States, conduct rubber experiment stations to improve upon the manner of preparation by making technical examinations of the prepared product. Both the Central Rubber Station at Buitenzorg and the Department of Agriculture at Kuala Lumpur (Federated Malay States) possess a complete technical installation for the examination of rubber, while the General Experiment Station of the A. V. R. O. S. at Medan, Sumatra, is installing a laboratory for the benefit of the rubber plantations.

In this connection, a report from E. Baillaud, Secrétaire Général au Conseil d'Administration de l'Institut Colonial de Marseille, concerning the question how Marseilles could be made a first-class crude rubber port after the war, stated that one of the first steps to be taken is the establishment of a service for the technical examination of crude rubber.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED JUNE 3, 1919.

- N. O. 1,305,260. Valve for pneumatic tires, tanks, etc., utilizing air under pressure. L. T. Earnhart, assignor to Safety First Devices Co.—both of Indianapolis, Ind.
- 1,305,261. Valve for pneumatic tires, tanks, etc., utilizing air under pressure. C. B. Earnhart, assignor to Safety First Devices Co.—both of Indianapolis, Ind.
- 1,305,262. Valve for pneumatic tires, tanks, etc., utilizing air under pressure. C. B. Earnhart, assignor to Safety First Devices Co.—both of Indianapolis, Ind.
- 1,305,263. Valve for pneumatic tires, tanks, etc., utilizing air under pressure. C. B. Earnhart, assignor to Safety First Devices Co.—both of Indianapolis, Ind.
- 1,305,264. Valve for pneumatic tires, tanks, etc., utilizing air under pressure. C. B. Earnhart, assignor to Safety First Devices Co.—both of Indianapolis, Ind.
- 1,305,265. Valve for pneumatic tires, tanks, etc., utilizing air under pressure. C. B. Earnhart, assignor to Safety First Devices Co.—both of Indianapolis, Ind.
- 1,305,266. Valve for pneumatic tires, tanks, etc., utilizing air under pressure. C. B. Earnhart, assignor to Safety First Devices Co.—both of Indianapolis, Ind.
- 1,305,552. Reinforced pneumatic inner tube for tires. C. R. Rawdon and J. H. Heimstam, St. Louis, Mo.
- 1,305,622. Demountable rim for tires. R. W. Ashley, New York City, and J. H. Heimstam, St. Louis, Mo.
- 1,305,683. Demountable rims for tires for wheel chucks. R. W. Ashley, New York City, and J. H. Heimstam, St. Louis, Mo.
- 1,305,709. Fountain marking-brush. C. A. Garvey, Clayton, Mo.
- 1,305,812. Metal and rubber shoe-sole. E. E. Nambert, Attalla, Ala.
- 1,305,819. Resilient tire for trucks. R. McMiller, Portland, Ore.
- 1,305,820. Vehicle wheel with solid rubber tire. C. Macbeth, Birmingham, assignor to The Dunlop Rubber Co., Limited, Westminster, London—both in England.
- 1,305,867. Crutch tip. M. Atlas, Jacksonville, Fla.

ISSUED JUNE 10, 1919.

- 1,306,011. Automatic life-saving device. J. Horak, Chicago, Ill.
- 1,306,055. Automobile tire. W. C. Fleischer, Hackensack, Minn.
- 1,306,130. Inner tube. L. D. Tibbets, Clayton, Wash.
- 1,306,184. Syringe. H. S. Jones, Kansas City, Mo.
- 1,306,243. Woven cartridge-belt with elastic warp in front. W. Achtmeyer, Middletown, Conn.
- 1,306,245. Pressing cage for tire valves. J. A. Bowden, Los Angeles, Calif., assignor to A. Schrader's Son, Inc., New York City.
- 1,306,303. Mouth-piece for feeding-bottles. F. R. Graham-Yooll, Leith, Scotland.
- 1,306,344. Reinforced tire casing. A. H. Gruber, Evanston, Ill.
- 1,306,348. Separable gas-bag for airplane. J. N. Lewis, Detroit, Mich.
- 1,306,594. Fountain pen. A. L. Soverby, Canton, Mass.
- 1,306,654. Resilient vehicle wheel. J. G. Worsley, Chicago, Ill.
- 1,306,695. Valve-cap for automobile tires. T. D. Mulyear, Springfield, Mass.
- 1,306,515. Divisible rim for tires. J. C. Barker, London, Eng.
- 1,306,587. Pneumatic tire. L. H. Ferguson, assignor to Ferguson Tire Corp.—both of Ithaca, N. Y.

ISSUED JUNE 17, 1919.

- 1,306,724. Pneumatic tires with interliner. A. T. Schyllander, assignor of $\frac{1}{2}$ to C. E. Adamson—both of Toledo, O.
- 1,306,742. Resilient automobile fender with elastic covering. E. B. Bowling, Chicago, Ill.
- 1,306,787. Pneumatic mattress. M. G. Stevenson, Orange Lake, Fla.
- 1,306,800. Hose supporter. F. H. Childs, Stroud, Okla.
- 1,306,814. Demountable rim for tires. J. R. Hulcomb, New York City.
- 1,306,814. Dental syringe for cement. W. R. Howard, Newport, R. I. (Continuation of earlier applications.)
- 1,306,828. Demountable rim for tires. S. R. McKay, assignor to The McKay Co.—both of Cleveland, Ohio.
- 1,306,975. Demountable rim for tires. J. N. Foster, assignor of $\frac{1}{2}$ to H. Becker and $\frac{1}{2}$ to O. Nordwald—all of El Paso, Tex.
- 1,306,996. Shoe with vulcanizable midsole and outer soles. P. H. Brown, assignor to Appleby Rubber Co.—both of Hudson, Mass.
- 1,307,010. Elastic garment-fastener. C. W. Kinsman, New York City.
- 1,307,036. Pneumatic tire. H. Bretschler, assignor of $\frac{1}{2}$ to F. Spitzner—both of New York City.
- 1,307,123. Resilient tire. T. D. Hartog, St. Louis, Mo.
- 1,307,129. Hose clasp. E. Karadaghi, Chatham, N. J.
- 1,307,164. Resilient tire and adjustable rim. F. B. Turner, assignor of $\frac{1}{2}$ to L. W. Duval—both of Ocala, Fla.
- 1,307,190. Tire-repair device. F. B. Dunlap, assignor of $\frac{1}{2}$ to E. C. Stricker—both of Tulsa, Okla.
- 1,307,192. Pneumatic fountain pen. J. F. Gardner, Kansas City, Mo.
- 1,307,208. Tire with studs projecting through eyelets in tread when in mud on soft ground, retracting when on hard surface. W. E. Muniz, London, Eng.
- 1,307,212. Resilient wheel. M. Philipp, assignor to National Auto Wheels Co.—both of Worcester, Mass.
- 1,307,245. Valveless syringe. F. S. Dickinson, Rutherford, N. J.
- 1,307,267. Demountable rim for tires. L. H. Perlman, New York City.

ISSUED JUNE 24, 1919.

- 1,307,386. Film-holder for X-ray apparatus. H. F. Waite, Whitestone, Larchmont, N. Y.
- 1,307,423. Detachable rubber heel with reinforcing plate embedded in body portion. L. Smith, S. D. McKosker, and J. R. Simpson—all of End, Okla.
- 1,307,461. Demountable tire-rim with locking device. T. A. Smith, San José, Calif. (Continuation in part of previous application.)
- 1,307,473. Demountable split tire-rim. E. Baker, assignor to Universal Rim Co.—both of Chicago, Ill.

- 1,307,630. Fountain pen. W. A. Haskins, West Somerville, Mass.
- 1,307,720. Resilient tire. M. Freedman, Brookline, Mass.
- 1,307,731. Automobile tire. C. C. Gates, assignor by mesne assignments to The Gates Rubber Co.—both of Denver, Colo.
- 1,307,737. Metal-protected rubber heel. W. R. Hildebrand, Chicago, Ill.
- 1,307,769. Inner tube. F. E. Bessler, Akron, O.
- 1,307,770. Inner tube. F. E. Bessler, Akron, O.
- 1,307,782. Fountain pen with electric light. A. Lawres, Brooklyn, N. Y.
- 1,307,809. Cushion wheel. A. S. Duffes, Marlesham, Wis., and F. Mead, Chicago, Ill.
- 1,307,825. Pneumatic surf mattress. H. B. Marshall, Long Beach, Calif.
- 1,307,872. Cushion tire. W. R. Miller, Elizabeth, N. J.
- 1,307,921. Driving armor with waterproof outer skin. E. Nichoff, Brooklyn, N. Y. (Renewed March 21, 1919.)
- 1,307,922. One tip. A. O. Olafson, assignor of $\frac{1}{2}$ to G. A. Brockway—both of Scobey, Mont.
- 1,307,942. Foldable bath-tub. E. Volters, St. Louis, Mo.
- 1,307,944. Rubber dust cap for valve. R. O. Williams, Vicksburg, Mich.
- 1,307,980. Tire valve. H. P. Kraft, Ridgewood, N. J.
- 1,307,985. Rubber heel. J. S. Feden, New York City.
- 1,307,990. Cushion heel. E. D. Stallord, Baltimore, Md.

ISSUED JULY 1, 1919.

- 1,308,025. Elastic attachment for corsets. A. M. Anchorstar, New York City.
- 1,308,037. Tire valve and pressure gauge. J. Rueck, Oak Park, Ill.
- 1,308,053. Milking-machine teat-cap. R. B. Ishlow, St. Paul, Minn.
- 1,308,082. Milking machine teat-cap. W. H. and M. Koch, Independence, Ia.
- 1,308,097. Garment supporter. H. Moore, New York City.
- 1,308,268. Collapsible water-bucket, with handle. C. Wagner, Grantwood, N. J.; A. Hoemel, New York City, and C. J. Vican, Brooklyn, N. Y.
- 1,308,375. Parachute with inflatable expander. K. S. Satre, Hecla, S. D.
- 1,308,416. Cushion tire. C. H. Gunn, Emeryville, Calif.
- 1,308,427. Combined hot-water and douche bag, with transverse web portion. A. Laborde, New York City.
- 1,308,561. Life-preserving suit. B. C. Teeters, Ballchub, Minn.
- 1,308,616. Demountable rim for tires. E. J. Bergman, Vincennes, Ind.

THE DOMINION OF CANADA.

ISSUED JUNE 17, 1919.

- 150,956. Rubber pad for automobile pedals. G. H. Rives, New York City, U. S. A.
- 150,981. Typewriter eraser and means of attaching to typewriter. F. A. Johnson, University Place, Neb., U. S. A.

ISSUED JULY 1, 1919.

- 150,322. Suction cup. C. M. Wolcott, New York City, and S. and I. Myerberg, assignors of $\frac{1}{4}$ of the interest, both in Baltimore, Md.—all in U. S. A.

ISSUED JULY 8, 1919.

- 150,453. Blow-out patch. W. C. Wood, Minneapolis, Minn., U. S. A.
- 150,475. Demountable rim for tires. W. M. Butler, Calatoga, Calif., U. S. A.
- 150,478. Nut for bolts on tire-valves. A. Schrader's Son, Inc., New York City, assignee of H. P. Kraft, Ridgewood, N. J.—both in U. S. A.
- 150,491. Hoof-pad for horses, with lower tread portion of rubber. F. R. Button and G. W. Dunn, assignors of $\frac{1}{2}$ interest—both of Scranton, Pa., U. S. A.
- 150,495. Demountable rim for tires. I. D. Walter, assignor; J. Brinkerhoff, assignee of $\frac{8}{15}$; B. F. Cole, $\frac{1}{10}$; T. Flournoy and J. G. Grant, $\frac{1}{20}$ each. L. W. Grant and S. A. Latimer, $\frac{1}{50}$ each—all of Harrisburg, Ark.; and F. and H. C. Shaver, $\frac{1}{2}$ each, both of Nettleton, Ark.—all in U. S. A.

THE UNITED KINGDOM.

ISSUED JUNE 4, 1919.

- 124,699. Infant's outdoor garment, with removable waterproof pad. A. E. White, 88 Chancery Lane, London, Eng. (Venus Manufacturing Co., Boston Block, Minneapolis, Minn., U. S. A.)
- 124,746. Gutta precha-insulated joint-making packing. Société Anonyme Ateliers Otis-Pifre, 161 rue du Courcelles, Paris. (Not yet accepted.)
- Security bolts for tires, with heads of rubber compound, fabric and rubber, etc. G. W. Beldam, Brompton Lodge, Windmill Road, Ealing, and A. E. Kyal, Glamorgan House, Brentford—both in Middlesex.

ISSUED JUNE 12, 1919.

- 124,967. Rubber-lined hose coupling. F. Reddaway & Co., and J. Musket, Cheltenham street, Pendleton, Manchester.
- 125,078. Demountable rim for tires. C. F. Rubsam, 233 Broadway, New York City, U. S. A.
- 125,079. Pressure gate for tires. M. C. Schweinert, 226 Palisade avenue, West Hoboken, N. J., U. S. A. (Not yet accepted.)
- 125,080. Tire valve. H. P. Kraft, 219 Godwin avenue, Ridgewood, N. J., U. S. A. (Not yet accepted.)

ISSUED JULY 12, 1919.

- 125,193. Rubber button. A. Ryner, Parliament Mansions, Victoria street, London.
- 125,217. Joint-making packing. J. T. Croll, 25 Royal Exchange Square, Glasgow.

- 125,376. Detachable rubber heel. P. Mengarini, 13 via Cola di Rienzo, Roma, Italy.
- 125,384. Nut for use with tire-valves. H. P. Kraft, Godwin avenue, Ridgewood, N. J., U. S. A. (Not yet accepted.)

ISSUED JUNE 25, 1919.

- 125,502. Improvements in artificial limbs. T. B. Thompson and W. D. McKinnon, 30 Willott Road, Acton, Middlesex.
- 125,522. Drying tubes, employing elastic cord. R. A. Elton, Claremont, Clarendon Road, Putney, London.
- 125,571. Externally applied studs for boots, with rubber protector. H. T. Stephens, Tahoonia, Ferrisburgh, Essex, England.
- 125,582. Golf-practicing appliance. C. F. Smith, 2 Lafayette street, White Plains, N. Y., U. S. A. (Not yet accepted.)
- 125,638. Elastic diagrams for pressure-operated mechanism in recording instruments, etc. Aeronautical Instrument Co. and G. Brewer, 33 Chancery Lane, London.
- 125,704. Demountable rim for tires. J. Martin, 10-10 Argyle street, Glasgow.
- 125,731. Manometer with rubber sleeve, etc. M. Walker, School of Technology, Sackville street, Manchester, and A. E. L. Scars, Strafford, Harborough Road, Ashton-on-Mersey, Cheshire.
- 125,736. Improvement in neck of hot-water bottles, etc. A. D. Ingram, London India Rubber Works, Felsdale street, Hackney Wick, London.
- 125,737. Improvement in neck of hot-water bottles, etc. Same inventor as No. 125,736.
- 125,758. Improvement in socket for stopper of hot-water bottles, etc. Same inventor as Nos. 125,736 and 125,737.

NEW ZEALAND.

ISSUED MAY 29, 1919.

- 40,079. Milking-machine teat-cup. S. D. Sirfield, Pirongia, Waikato, N. Z.
- 41,362. Temporary bottle-stopper of vulcanized rubber. A. H. Thompson, 76 Pitt street, Sydney, N. S. W., assignee of G. C. Maas, Zenoni, Milroy avenue, and W. Young, "Wilma," Lenthall street—both of Kensington.

THE FRENCH REPUBLIC.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 489,964. (May 6, 1918.) Improvements in tractor wheels, etc. H. Austin.
- 489,990. (June 10, 1918.) Resilient wheel. R. Fukuda.
- 490,172. (March 26, 1917.) Extensible life-belt. H. Mathouillot.
- 490,194. (May 22, 1918.) Resilient wheel for vehicles. T. Smolka.
- 490,207. (May 22, 1918.) Improvements in split or demountable rims for wheels. I. C. York.
- 490,265. (May 25, 1918.) Improvements in tubes for pneumatic tires. C. R. Rawdon, J. H. Heitmann, and C. D. Hall.
- 20,728-487,766. (March 19, 1918.) First certificate of addition to the patent taken out November 27, 1917, for improvements in abdominal belts and similar articles. F. G. Baugatz.
- 490,313. (July 7, 1914.) Puncture-proof pneumatic tire. A. Allard.
- 490,387. (June 6, 1918.) Interchangeable rubber washer for shoe soles. P. H. M. Gavalda, 3 rue de Courcelles, Paris, France.
- 490,405. (June 7, 1918.) Valve for pneumatic tires. Société Michelin & Co.
- 490,418. (June 8, 1918.) Improvements in automobile tires. W. I. Varner.
- 490,438. (June 11, 1918.) Improvements in the joints of artificial limbs. D. W. Dorrance.
- 490,485. (June 13, 1918.) Improvements in artificial limbs. F. H. Critchley.
- 490,493. (June 14, 1918.) Device for forming air chambers in tires. P. Mandelli.

TRADE MARKS.

THE UNITED STATES.

- N. O. 10,319. Representation of a seal on a ribbon, bearing the monogram "MCS"—pneumatic tire and tube patches. Motor Car Supply Co., Chicago, Ill.
- 108,736. The word ALLFACE—fruit-jar rubbers. Acme Rubber Manufacturing Co., Trenton, N. J.
- 109,695. Representation of a colossal inflated red rubber life-belt inclosing the word JIFFY, above the words "THE CARTRIDGE DOES IT," and a girl in a bathing suit and a sailor leaning against opposite sides of the belt—life-belts of rubber, with a sealed compressed-air tube for charging. Jiffy Life Belt Manufacturing Corp., New York City.
- 111,974. The word BOOSTER—shoes, now made of leather. United States Rubber Co., New Brunswick, N. J., and New York City.
- 111,975. The word ROOCO—shoes, now made of leather. United States Rubber Co., New Brunswick, N. J., and New York City.
- 111,979. The words SPOT LIGHT—shoes, now made of leather. United States Rubber Co., New Brunswick, N. J., and New York City.
- 111,980. The word AUTOCAI—shoes, now made of leather. United States Rubber Co., New Brunswick, N. J., and New York City.
- 111,982. The word ELISE—shoes, now made of leather and a combination of leather and cloth. The United States Rubber Co., New Brunswick, N. J., and New York City.
- 112,034. The word WORKSTER—workers' clothing of fabric, fabric and rubber, etc. United States Rubber Co., New Brunswick, N. J., and New York City.
- 112,460. The word HAYES—men's, women's, and children's shoes, boots, and slippers, made of leather, suitable fabrics, rubber, or a combination of two or more of these materials. E. Hayes, Inc., New York City.
- 112,605. Representation of a school-house in silhouette, resting on a rectangle, the two superimposed on a circle—rubber erasers, etc.
- 113,785. The word DORO—belting, hose, and machinery packing. The Dormann-Rocher Co., Cincinnati, O.

- 114,516. Representation of a stencil inclosing the words AMERICAN ZINC L. & S. Co., AZO, LLL—zinc oxides for use as paint pigments. American Zinc, Lead & Smelting Co., Boston, Mass., and St. Louis, Mo.
- 114,517. Representation of a stencil inclosing the words AMERICAN ZINC L. & S. Co., AZO, LLL—zinc oxides for use as paint pigments. American Zinc, Lead & Smelting Co., Boston, Mass., and St. Louis, Mo.
- 114,520. Representation of a stencil inclosing the words AMERICAN ZINC L. & S. Co., AZO, ZZZ—zinc oxides for use as paint pigments. American Zinc, Lead & Smelting Co., Boston, Mass., and St. Louis, Mo.
- 114,831. The word RUSSELL within an oval—woven cartridge and other woven military belts. The Russell Manufacturing Co., Middleton, Conn.
- 116,062. The words HORSESHOE GOOD LUCK HEEL above representation of a horseshoe and the words RACINE AUTO TIRE CO.—molded rubber and composition cushion heels and heel lifts. Racine Auto Tire Co., Racine, Wis.
- 116,184. Representation of a denture bearing the words NATURAL GUMS—Dr. T. J. King—Clarence W. King, D. D. S., Inc., Boston, Mass.
- 116,840. The words LBS-STIK in fancy letters—fabric and rubber repair patches. Lbs-Stik Patch Manufacturing Co., Hamilton, O.
- 116,920. The word TEXSHED—waterproof textile fabrics. Eastern Finishing Works, Inc., Kenyon, R. I.
- 117,175. The words TIP TAP—nursing nipples, etc. Whittall Tatum Co., New York City.
- 117,113. The word PARATOL—waterproof textile fabrics. Eastern Finishing Works, Inc., Kenyon, R. I.
- 117,223. The word XLO—rubber tires and tubes. Excello Tire & Rubber Co., Philadelphia, Pa.
- 117,508. The word BRASSE—rubber lining. "Scandinavia" Belting, Limited, London, Eng.
- 117,729. Representation of the ship Mayflower—inner tubes and tires. Mayflower Rubber Works Co., Braintree, Mass.
- 117,731. Representation of the ship Mayflower—hot-water bottles, syringes, etc. Mayflower Rubber Works Co., Braintree, Mass.
- 117,732. The word MAYFLOWER—inner tubes and tires. Mayflower Rubber Works Co., Braintree, Mass.
- 117,734. The word MAYFLOWER—hot-water bottles, syringes, etc. Mayflower Rubber Works Co., Braintree, Mass.
- 117,873. The word EACO—rubber and composition soles and heels. Essex Rubber Co., Trenton, N. J.
- 117,988. The word RETARDAR quoted—waterproofing preparation for wearing apparel and textile fabrics. Pearsall Products Corp., New York City.
- 118,483. The word DOLPHIN—rubber garden hose. Simmons Hardware Co., St. Louis, Mo.

THE DOMINION OF CANADA.

- 24,393. The word SIKELASTIC—suspenders and garters. The Dominion Suspenders Co., Limited, Niagara Falls, Ont.
- 24,439. The words SHUR-ON—belting, hose, and packing; rubber and fabric interliners; friction cloth; tire putty; rubber paints; rubber and canvas footwear; weather stripping; rubberized sheeting; and rubber rolls. Dunlop Tire & Rubber Goods Co., Limited, Toronto, Ont.
- 24,448. The word SECURITY on representation of a tire—automobile tires and accessories. H. C. Hatch, Montreal, Que.
- 24,469. The words TIGER BRAND and the representation of a tiger's head in a circle—rubber footings, etc. Thos. Birckett & Son Co., Limited, Ottawa, Ont.
- 24,471. The word TRANSPORT—rubber tires and tubes. The Canadian Fairbairn & Morse Co., Limited, Toronto, Ont.
- 24,477. The word HUSH—chewing gum, etc. Frederick Webb Brooke, Toronto, Ont.

DESIGNS.

THE UNITED STATES.

- N. O. 53,410. Tire. Patented June 10, 1919. Term 14 years. L. R. Davis, assignor to Revere Rubber Co.—both of Providence, R. I.
- 53,426. Automobile wheel. Patented June 10, 1919. Term 14 years. W. J. P. Moore, New York City.

- 53,410. 53,427. 53,479.
- 53,427. Pneumatic tire. Patented June 10, 1919. Term 14 years. L. R. Renner, Akron, O., assignor to The B. F. Goodrich Co., New York City.
- 53,479. Tire or tire casing. Patented June 17, 1919. Term 3½ years. C. Wright, assignor to Racine Auto Tire Co.—both of Racine, Wis.

THE DOMINION OF CANADA.

- 4,591. Resilient semi-pneumatic wheel. Patented May 10, 1919. Joseph Monkhouse, Guelph, Ont.
- 4,602. Garter. Patented May 17, 1919. Kitchener Suspender Co., Limited, Kitchener, Ont.

THE FRENCH REPUBLIC.

- 5,751. Rubber heel. Patented January 16, 1919. H. Victor, 37 boulevard du Temple, Paris.
- 5,791. Vulcanized and calendered belting bearing the words ROMANS M. C. Co. Patented January 16, 1919. Manufacture de Couchoise de la Drôme, Romans, Drôme.

The Review of the Crude Rubber Market.

JULY WAS A QUIET MONTH in the crude rubber market, due to the apathy of both buyers and sellers to agree on prices. As visible supplies were ample and arrivals for the month promised to be unusually heavy the manufacturers were not interested, moreover, holders anticipated heavy buying on the resumption of trade with Germany. The failure of this movement together with the break in sterling exchange and a lack of demand depressed the market and prices weakened. Sellers, however, refused to make concessions in accord with the buyers' views and the market became dormant.

The following quotations indicate the price movement of plantation and South American Para rubber.

PLANTATION HEVEA: July 1, first latex crepe, spot 42½ cents; July-September, 43; October-December, 44½, and January-June, 1920, arrivals, 46 cents. July 24, first latex crepe, spot 40½ cents; August-September, 40¾; October-December, 43; January-June, 1920, arrivals, 45 cents.

July 1, ribbed smoked sheets, spot 41½ cents; July-September, 42½; October-December, 43½, and January-June, 1920, arrivals, 45 cents. July 24, ribbed smoked sheets, spot 39½ cents; August-September, 39¾; October-December, 42, and January-June, 1920, arrivals, 44 cents.

July 1, No. 1 amber crepe, spot 39 cents; August-December, 39½, and January-June, 1920, arrivals, 41½ cents. July 24, No. 1 amber crepe, spot 37 cents; August-December, 37, and January-June, 1920, arrivals, 39 cents.

July 1, No. 1 roll brown crepe, spot 30 cents; July-December, 31; and January-June, 1920, arrivals, 31½ cents. July 24, No. 1 roll brown crepe, spot 29½ cents; August-December, 29; and January-June, 1920, arrivals, 30 cents.

SOUTH AMERICAN PARÁ AND CAUCHO. July 1, spot prices were: upriver fine, 55; islands fine, 47½; upriver coarse, 32; islands coarse, 21, and Cameté coarse, 22 cents. July 24, spot prices on these sorts were: upriver fine, 54¾; islands fine, 48; upriver coarse, 32; islands coarse, 21, and Cameté coarse, 22 cents.

NEW YORK QUOTATIONS.

* Nominal.

RECLAIMED RUBBER.

The market has continued dull and featureless, which is expected at this time of the year when buying is usually confined to routine orders and occasional replacement lots. The preparations being made by footwear, insulated wire and mechanical goods factories for a good autumn business are favorable signs for reclaims. Prices have not changed.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert B. Bers, broker in crude rubber and commercial paper, No. 68 William street, New York City, advises as follows:

"During July the demand for paper has been light and mostly from out-of-town banks, the best rubber names going at 3 1/2 per cent to 5 1/4 per cent and those not so well known at 6 per cent."

WEEKLY RUBBER REPORT.

GLENNIE & CO., LIMITED, Singapore, report [June 5, 1919]:

At the weekly rubber auction which commenced yesterday there was a further demand for standard grades at prices which, on the average, show a slight decline. The top price for ribbed smoked sheet was 74 1/2 cents, paid for five lots only, but the bulk of this grade sold at 73 1/4 cents. Fine pale crepe sold up to 76 1/2 cents, a drop of 1 cent on the week. Old quality lots of sheet and crepe were readily taken up at last week's prices. Fine brown crepes were steady, while brown and dark crepes declined 1/2 cent. The quantity sold was 547 tons out of 853 tons catalogued.

The following is the course of values:

	In Singapore	per Pound.	per Pound in London.
Sheet, fine ribbed smoked.....	73 1/2 @	74 1/2 @	1/10 1/2 @
Sheet, good ribbed smoked.....	66 @	71 1/2 @	1/10 1/8 @
Sheet, plain smoked.....	60 @	70 1/2 @	1/10 1/8 @
Crepe, fine pale.....	59 @	70 1/2 @	2/0 @
Crepe, good pale.....	67 @	74 1/2 @	1/11 1/8 @
Crepe, fine brown.....	59 @	64 @	1/7 1/8 @
Crepe, good brown.....	53 @	58 @	1/7 1/8 @
Crepe, dark.....	42 @	52 1/2 @	1/4 1/8 @
Crepe, bark.....	57 1/2 @	43 @	1/1 1/8 @

FEDERATED MALAY STATES RUBBER EXPORTS.

It is stated by an official cablegram from Kuala Lumpur that 7,308 tons of plantation rubber were exported from the Federated Malay States in the month of May, against 7,114 tons in April and 5,851 tons in the corresponding month last year. The total export for five months of the present year was 43,623 tons, compared with 35,396 tons in 1918 and 35,467 tons in 1917. Comparative statistics are appended:

	1917.	1918.	1919.
January.....	5,995	7,388	7,163
February.....	7,250	6,820	10,809
March.....	7,068	7,709	10,679
April.....	5,955	7,428	7,664
May.....	7,179	5,851	7,308
Totals.....	33,467	35,396	43,623

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official cablegram from Singapore states that 15,845 tons of rubber were exported from Straits Settlements ports in the month of May, compared with 10,848 tons in April and 13,587 tons in the corresponding month last year. The total export for five months of the present year was 72,666 tons, compared with 35,665 tons in 1918 and 30,741 tons in 1917. Appended are the comparative statistics:

	1917.	1918.	1919.
January.....	3,562	4,302	14,404
February.....	6,495	2,334	15,661
March.....	8,209	8,858	20,908
April.....	6,163	6,584	10,848
May.....	6,282	13,587	15,845
Totals.....	30,741	35,665	72,666

Transshipments for month of May (1919), 2,132 tons.

THE MARKET FOR COTTON AND OTHER FABRICS.
NEW YORK.

Prices of American cotton have steadily risen during the past month, and on July 23, middling uplands, spot cotton reached 36.20 cents, compared to 29.49 cents last year. Later in the month the market weakened and quotations on July 28 were 35.15 cents. The strong position of American cotton is due to the poorest crop in many seasons, and the extraordinary world demand that is estimated to be 17,000,000 bales, while the estimated supply is 16,500,000 bales.

EGYPTIAN COTTON. The demand continues from abroad for the cotton still remaining in the hands of the Commission, and orders have been coming in freely. The steam-pressed stock shows a heavy shrinkage, and on June 13 stood at only 131,346

bales, including 18,694 bales of linters; the unpressed stock in the hands of the Commission is very small.

All desirable types have practically disappeared, and the demand is for types which spinners previously left severely alone. There is little doubt that the entire stocks of the Commission will be taken up by buyers and the carry-over at the end of the season will be small and composed principally of inferior cotton and linters. In Liverpool, prices continue to rise with the increased demand, and consignment cotton is finding ready buyers at full prices.

SEA ISLAND COTTON. The demand in Southern markets has been greatly in excess of the supply, and a few holders have sold on the higher markets. The general tendency, however, in view of the smallness of stocks and the universal demand, is to await future developments. The new Mead cotton being developed by the Bureau of Plant Industry to replace Sea Island cotton is giving promise of success.

DUCKS AND DRILLS. The buying interest in these materials has been active, and the mills appear to be well sold ahead. The market undertone has been strong and prices on all grades have advanced.

TIRE FABRICS. The demand for spot and future deliveries has been active, and consumers' inquiries have included deliveries for the first six months of 1920. Prices are higher.

Long-staple cotton is very scarce; however, the indications are that tire fabrics will be higher, due to a new cost basis, irrespective of the price of raw cotton. This is partly due to higher wages, as formerly cotton mills paid lower wages than most industries. The stoppage of immigration has eliminated this low-priced labor, so that the mills are now forced to compete for help

in the general labor market, which will eventually bring the scale of wages on a par with other industries and increase the production cost of tire fabrics.

NEW YORK QUOTATIONS.

JULY 26, 1919.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.**NEW YORK.**

PRONOUNCED STRENGTH and activity have characterized the base metal market during July. Lead and spelter have been in large demand and prices have advanced, resulting in a stronger market for lead pigments and zinc oxide.

Business in rubber chemicals and compounding ingredients has been fairly good for this time of the year, when the mills are not generally active. The indications point to an early resumption of contract business, due to the belief that production costs will be higher.

ANILINE OIL. The excellent domestic and foreign demand has resulted in increased prices, and producers predict a further advance.

BARYTES. The undertone has been firm, but to the active position of lithopone and the steady call from foreign sources. Prices have not changed.

BENZOL. The demand has been very active and visible supplies have been rapidly absorbed by foreign and domestic orders. Prices are firm and unchanged.

CARBON TETRACHLORIDE. There has been a surplus and a very quiet market, resulting in lower prices.

TIRE FABRICS

JENCKES SPINNING COMPANY

PAWTUCKET RHODE ISLAND

AKRON OFFICE
407 Peoples Savings & Trust
Co. Building.

DRY COLORS. There has been a steady improvement in this market and prices are steady, due to the increasing cost of production. Iron blues were weak and lower early in the month, but rallied later.

LITHARGE. The active call for red lead is reflected in the strong undertone in the market for litharge. Prices are firm and unchanged.

LITHIUM. This has been very active and producers are sold up to the end of the season. Prices are very firm and unchanged.

MAGNESIA.—Reports from California mines indicate a shortage of magnesia and a consequent higher schedule this autumn which will certainly influence Eastern prices of heavy calcined magnesia.

WHITING. The call for this material has been steady and producers have been able to supply the demand at unchanged prices.

ZINC OXIDE. All grades have been going well and leading producers announce there will be no price changes this year.

NEW YORK QUOTATIONS.

July 26, 1919.

Prices subject to change without notice.

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

BUSINESS IN THE RUBBER SCRAP MARKET has been of the midsummer variety with the demand centered on boots and shoes and tires for rebuilding. England has removed the embargo on rubber scrap and earlier in the past month there was a movement of inner tubes for export but the volume was small. The low prices ruling in crude rubber and the consequent apathy of the reclaimers are sufficient reasons for the quiet conditions in the rubber scrap market.

Circular E, the new standard of packing adopted by the Scrap Rubber Division on June 17, is printed elsewhere in this issue.

BOOTS AND SHOES. Excepting a few unfilled orders from reclaimers, the market for boots and shoes has been practically at a standstill. Quotations are nominally 8 1/4 cents delivered.

TIRES. These grades have been without interest other than the call for picked tires. A fair demand from reclaimers was reported during the month, but the movement subsided later.

INNER TUBES. Nothing of interest to report on tubes. The export demand that was noted about the middle of the month has apparently been satisfied.

QUOTATIONS FOR CARLOAD LOTS DELIVERED.

JULY 26, 1919.

Prices subject to change without notice.

SUBSCRIPTION: \$3.00 per year, \$1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, \$3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank draft. Post Office or Express money order on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**EUROPEAN ECONOMIC RECONSTRUCTION.**

THE EUROPEAN GOVERNMENTS have lost no time in taking up thoroughly and scientifically the question of economic reconstruction and are overlooking no opportunities to set on their feet the industries hardest hit by the war. Before the war was over the German Government had started active measures to protect its wholesale trade after the war and it has already determined to regulate that branch of commerce and industry pertaining to textile fibers, rubber and other articles. What this regulation will consist of is not exactly apparent at present, but it can safely be assumed it will be a supervision over the importation and distribution of the raw materials so that the Teutonic manufacturers will be in a position to compete on a basis of equality with those of other countries.

Despite the loathing for German methods bred by the war, it is apparent the world must trade with the German if for no other reason than to enable him to get the wherewithal to pay his bills for indemnity and reparation. Germany's financial situation is such that she must have credit in order to obtain the raw materials for the manufactured goods that will be sold back to the world

she tried to despoil. What security can be offered is problematical and remains to be seen. The prejudice against "made in Germany" is undoubtedly deep, natural and inevitable, but will probably prove to be not insurmountable, even in France and England, where it is stronger than it is here.

JAPANESE FOUNTAIN PENS—A FREE TRADE JOLT.

THE JAPANESE are now making fountain pens at a cost of 2 cents each and shipping them into this country, making their total cost with the Underwood tariff duty of 25 per cent added, 2½ cents apiece. If the thrifty retail dealer sells them at 50 cents each, he is making a very neat little return on his investment. But we have not seen any 50-cent fountain pens that we recall. Fountain pen manufacturers have seemed indifferent to the tariff duties that are collected upon foreign products and also to the general policy of protection. Skilled Japanese workmen are making articles of all kinds and receiving from 34 to 42 cents a day, about one-tenth of what American workmen receive. They are probably not as efficient as American workmen, and their products may not be as good, but they will be good enough to make a considerable dent in the sales of our goods, if the same ratio is preserved as that on fountain pens. If we find ourselves flooded with cheap goods of all kinds in the next few months, bearing the Nipponese stamp, our free trade friends may be kept busy explaining—to manufacturers, workmen and consumers.

FAKE RUBBER PROMOTER.

UNDER THE ALITERATIVE TITLE of "Pirates of Promotion," the "World's Work" has printed a list of the leading fake stock company promoters, together with a list of several hundred of the companies which they have floated in order to separate the American public from its hard-earned savings and Liberty Bonds. While oil and gold mining companies, of course, predominate, it cannot be overlooked that the list contains a large number of rubber concerns, plantation rubber companies, rubber substitutes companies and the like. The names of the promoters are some of them well known to the readers of the daily newspapers, generally in connection with a penitentiary sentence for use of the mails to defraud or violations of the Blue-Sky laws. In the preamble to this useful article the magazine states "that of all the oil produced in Oklahoma in 1917, the stock promoting companies had less than two-thousandths of one per cent. For every \$555 of capitalization only \$1 worth of oil was produced." Of the fourteen rubber concerns listed there are no figures as to the pounds of rubber or the value of the tires they have produced. It is perhaps gratifying to know that of all the hundreds of rubber and tire concerns there are in reality so few that are listed as fakes. The parting warning of the "World's Work" cannot be improved upon.

"As a parting word, we would say that the untrained investor should not depend on any list of pirates of promotion or on any law to protect him. His best protection is to know the methods of the pirates, and in actual investing to deal with houses of only the highest reputation. An ounce of investigation may save a ton of loss and worry. And the new investor should always remember that the only one who stands a chance of getting rich quick in the promotion game is the pirate of promotion."

STANDARD CATALOG SIZES.

OF INTEREST AND IMPORTANCE to the rubber manufacturing trade is the movement that has been started by the National Association of Purchasing Agents looking toward the establishment of a standard size of trade catalogs and invoice forms. Attention was called to the fact that after a careful investigation it was ascertained that catalogs in various lines of industries are made in 147 different sizes, running from 3 by 5 to 9¼ by 13¼ inches. It was urged that a standardization of these publications was emphatically necessary as to size, compilation and mechanical production. The purchasing agents formally adopted the size 7½ by 10½ inches for the trimmed page as the national standard of half sizes saddle-stitched so that they will open flat for filing.

From the standpoint of the printer and publisher it is pointed out that the standard size would give artistic proportions, prevent waste of paper by cutting the pages from the standard stock sheet, save presswork by permitting the printing of 16 and 32-page forms, economize space in the storage of type in galley racks, and render it much easier for filing and indexing.

All these are important matters and worthy of consideration. But the standpoint of the rubber manufacturer should not be overlooked. Thousands of dollars are spent annually by the big firms in producing catalogs of their various lines of goods which are an artistic treat and a delight to the eye. The displays of rubber articles are arranged in the most attractive form that highly paid staffs of advertising experts can devise. That these catalogs pay for themselves over and over is apparent, or rubber manufacturers would have found it to their interest to discontinue them. In footwear, for example, the United States Rubber Co. has for years used a standard size of its own, 4¼ by 8½ inches, in its announcements of rubber boots and shoes. The Apsley Rubber Co. announces its outing line of footwear in a neat booklet 6½ by 3½ inches. The Hood Rubber Co. finds its goods are well displayed in catalogs 6 by 3½ inches. Catalogs of druggists' rubber goods, specialties, and fine clothing generally run to larger sizes, sometimes approaching the proportions of a magazine.

Would such a revolution in the printing of rubber trade catalogs be worth the expense involved and would it not be a step toward the dead level of standardization of all advertising which would make the publications of

rubber manufacturers resemble the catalog of a mail-order house? And would it not be a step toward the destruction of individuality in salesmanship if pushed to its logical conclusion?

Special price lists for purchasing agents, of a type that is most convenient, will probably be supplied, but it is to be hoped that they will not supersede the more interesting and artistic trade catalogs. Standardization and uniformity have their merits, but can easily be carried too far. Standardization of purchasing agents in appearance, accessibility, office equipment and uniform would be a godsend to rubber goods salesmen, yet, we doubt its adoption.

The movement recently instituted by this association to adopt standard forms for invoices, purchase orders, acknowledgments, and notices of shipments, has much to commend it and seems likely to meet with the approval of most progressive firms.

MAKING OVER DISABLED WORKMEN.

A MOVE IN THE RIGHT DIRECTION is that of The B. F. Goodrich Rubber Co., which long ago established a department for the rehabilitation of disabled workmen. The company has already succeeded in rendering most efficient aid to men injured in their own factories, by which they are assured of a good future by being taught to overcome their physical handicaps. Several men who have lost fingers, a hand or other members, which in the past would have absolutely incapacitated them for lucrative work, have been enabled to secure an education in other lines so that they are not only self-supporting, but in some instances are earning more money than they did before. The example of the Goodrich company is commended to other firms to follow, indeed is being followed by others, and with the return of the numerous soldiers injured in the war, the field of the rehabilitation department will be considerably broadened. In connection with the efforts the Government is making to assist its maimed soldiers, it can be made of the greatest benefit to the nation.

WOMEN WORKERS IN RUBBER.

HOW HAS THE RETURN of thousands of men from war service affected the thousands of women rubber workers who were employed primarily to meet war workers who were employed primarily to meet war emergency?

Some readjustments were inevitable, but indications point to the conclusion that women workers will be affected less seriously than casual thought might seem to indicate. Many women were employed who never worked before, and returned to the rôle of home-makers when their husbands, fathers and brothers returned from overseas. Many more, engaged in heavy work which they would not wish to follow through life, abandon it for lighter tasks yielding good compensation. Women are, however, employed more extensively in rubber mills than hitherto, and in more varied capacities, but on work requiring nimble fingers rather than strength.

German Ravages in the Rubber Factories of Northern France.

Special Correspondence

Just as soon as the armistice was signed a special correspondent of THE INDIA RUBBER WORLD was dispatched to the portions of the occupied territory in Northern France which were once rubber centers of importance. After much difficulty, owing to lack of transportation and housing, the story was secured and photographs taken. The record is of intense interest, not only historically but as bringing home to rubber manufacturers everywhere the losses suffered by a once prosperous portion of their own industry.

HOWEVER SYSTEMATIC AND IMPORTANT THE RAVAGES committed by the German armies in the rubber factories of Walloon and Flanders, they are nevertheless in no way to be compared with what the establishments situated in the north and northeast of France had to suffer—territories where the fighting was going on for nearly five years.

The ten departments invaded, where the firing line underwent ceaseless fluctuations during this long period, were those where the rubber industry was reaching an intense development, responding to the general need of the country as well as to the local demands of this district, the greatest industrial center in France.

In the departments invaded as early as August, 1914, and not evacuated until November, 1918, the Germans, anxious to destroy future competition from the first day of occupation, proceeded in the systematic destruction of the factories according to an elaborate plan laid out in advance, and of which the following are the details:

In February, 1916, the German General Staff instituted a thorough study of the French and Belgian industries in the occupied districts. It was a detailed inventory of more than 5,000 factories, for which 200 experts were specially recalled from the front. This report, which fell into French hands

after the German defeat, covers the most important industrial branches, from a technical as well as from an economic point of view. It describes the conditions under which the various industries exist; it exposes their relations with Germany and with the markets of the world; it gives, furthermore, a summary of the repercussions that will probably result for Germany from the destruction of certain branches of these industries.

Rubber goods manufacture, like all other branches of industry, was examined from the following triple point of view:

- 1—Its position at the time of the invasion.
- 2—Its position resulting from the damages sustained, at the time of the investigation.
- 3—The profit that the German industry could derive from its disappearance and from the destruction of its factories.

The damages found by the German experts are divided into

two classes and are placed under the following headings:

- 1—Damages caused directly by the operations of war.
- 2—Damages resulting from the proceedings of the German authorities.

The report, in reality, constitutes an avowal of the thieves and destroyers themselves that the German campaign was, in the words of Premier Clémenceau, "a thorough and well-calculated conspiracy with the view of exterminating France industrially and commercially as well as militarily."

How the Germans inflicted damages upon the Belgian rubber industry aggregating one hundred million francs has already been recounted in detail in THE INDIA RUBBER WORLD of June 1, 1919.

Eliminating the means of production by removing the machinery from the various factories, of both Belgium and Northern France, they assured themselves, in case of complete victory, of outlets where no one could compete against them.

The shameless theft of raw material from the factories enabled them to enlarge, without expense, their means of production. The carrying away of raw materials of all kinds, requisitioned or simply stolen, increased their stocks without any new expenditure and allowed them to decrease their cost prices.

In the regions which the front has successively occupied, and on the ever-changing line of Halenbourg the ravages have been still more important. In the departments subjected to the caprices of the *Kommandanturs*, supplies and crude materials have disappeared, but, empty as they may be, none the less the factory buildings remain standing, and with energy can still be reequipped easily enough and set working, as was done in the case of the Englebert Works at Liège.

On the firing line it was altogether different, because, not only the supplies had disappeared, but also, as the accompanying photographs show, the buildings themselves, subjected to the attacks of shells of every caliber, have disappeared.

Of cities like Soissons, St. Quentin, Wailly, Lens, Ham, Albert, nothing is left; everything has been pulled down; and there are accumulations of bricks and burnt stones, which merely indicate the places where heretofore progressive cities and flourish-

POST-CARD SENT BY GERMAN SOLDIERS TO THE DIRECTOR OF A TIRE DUCK FACTORY AT BOUSIÈRES, SHOWING THEIR WORK OF DESTRUCTION.

me industries could be found and from which thousands of people made their living.

Wherever the German has passed, even the grass no longer grows, and the very ground, poisoned by toxic gas, ploughed to

PRESS-ROOM AT SOISSONS.

the depths by mines and torpedoes, is as sterile as the dunes of Sahara. It is the country of the dead.

It is unfortunate that the world, and particularly, perhaps, the United States, knows so little about this; and one would never grow weary of repeating the story.

Numerous were the rubber factories erected in these devastated regions, which to-day find themselves stricken from the industrial list through the systematic destructions of the Germans. In the Aisne district the important Boinet Works, founded by Mr. Lefeburé, one of the oldest rubber men, who made a specialty of waterproof fabrics and gloves, has entirely disappeared, and nothing remains. The same is the case with the two rubber factory factories, that of Lefrant & Co., at Ham, and the one founded at Chauny by the well-known American engineer, Lufbery, a relative of the ace of the Lafayette Escadrille.

The two great Wolber factories at Wailly and Soissons, to which we will refer presently, have also disappeared, and those of Destrieux, at Pont Marcy, were partly destroyed. Others more fortunate have been only partly dismantled, but all those whose

BOILER-ROOM AT SOISSONS.

names follow have seen their machinery and raw material vanish; if, in some cases, the walls remain standing, all trace of industrial order has disappeared; the water pipes and smoke stacks have been smashed, the tall chimneys torn down, the foundations of the boiler settings and machinery dynamited.

Such is the case with the Bouchery Works at Croix, Bans à Lhowne, the very important factories of the Colonial Rubber Co. at Prouvy Thiant and those of the Société des Constructions Electriques du Nord et de l'Est, at Jeumont; with the Englebert factories at Givet, with Lefeburé at Pont Marcy, with Michel Jackson and La Royère at Halluin, La Couturé at St. Quentin and with Butruillé and Masquelier, at Tournignier.

In the Lille and Roubaix regions the destructions have been less severe, but the supplies and raw materials have been just as carefully carried away and nothing remains but the empty buildings, which our victorious armies have retrieved. This was the lot of the Masuré establishments and the Coston factories at Roubaix, of the Place and Meurisse works at Lille and of that of Flament Frères at Solesmes.

It has not been possible until now to make up the balance sheet of the ravages committed by the Germans, which runs into millions and millions. An entire prosperous industry has been systematically ruined, and taking into consideration the immense material difficulties one has to contend with, such as shortage of labor, defective machines, scarcity of money and credit, one knows not how and when these terrible damages can ever be repaired.

Take the case of the Wolber factories, which were situated at Wailly and at Soissons. Among the French factories manufactur-

A PORTION OF THE WOLBER PLANT AT WAILLY.

ing pneumatics and inner tubes for bicycles and automobiles, they were considered among the most important and ranked with those of Michelin and Bergougnan. The area covered by the buildings exceeded 107,639 square feet; the surface of the boilers totaled 1,181 square feet; the motive force was 1,000 horse-power, the hydraulic force supplied by the river Aisne was the same. There were 60 vulcanizing presses in these factories, 25 mills, 8 autoclaves, 7 calenders, 7 spreading machines, and all the accessory equipment which 700 laborers would require—a large staff for France.

These factories were built scarcely fifteen years ago by Mr. Wolber, who was one of the pioneers of the pneumatic tire industry in France. There he had set up model workshops to enlarge his factory at Levallois, established in 1918, and which had become too small for its requirements. From 48,000 tires in the beginning, Levallois, in 1902, had succeeded in turning out 102,000, but could not produce more. The energetic manufacturer was delighted in the possession of this new and potential plant, which reflected the success of its products, and at that time was an evolution in the tire industry.

Under the active direction of Mr. Wolber the factories at Wailly and Soissons, previously described, progressed steadily each year. Building after building was added, new products were manufactured, and as a result the production exceeded 720,000 tires and as many inner tubes at the end of 1913. During

those years Wailly had been literally transformed. Light and airy houses had been built, providing homes for the specialists and workmen, and close by, at Mitry, in the smiling valley of Carreuux, Mr. Wolber had installed his private residence, surrounded by a beautiful park.

Very soon it was evident that Wailly was too small for the development of the Wolber factories, and in 1913 Mr. Wolber, foreseeing new manufactures, erected a factory of the most modern construction at Soissons. This was opened three months before the declaration of war.

At that time 900,000 tires and 900,000 inner tubes were being produced, and the new equipment made possible an annual production of up to 1,500,000 pneumatic tires and tubes. The war put a complete stop to the production of this important plant which the battle was destined to destroy.

It is a sad experience for one who wishes to ascertain the devastation wrought, as the correspondent of THE INDIA RUBBER WORLD has done!

A cruel journey along the Chemin des Dames, tragic and glorious, where they silently salute the heroic dead whose graves cover the Plateau de Craonne; a painful trip under the May sun; Soissons martyred, the city dead. What can we say about Wailly? The Wolber factories were its pride! Where are they?

ENGINE-ROOM AT WAILLY.

Destroyed from top to bottom, the fire, the shells, have twisted, smashed down, demolished everything.

At this distressing sight, this inextricable confusion, one forgets the material value of things and feels hatred boil within when thinking of this which was the center of work, this first-class factory with a big future and great promise, stopped when in full swing.

What remains of it all? Nothing, or nearly nothing.

Iron braces twisted and threatening! One can scarcely distinguish the long truss of the spreading room, nor the one for the construction of tire carcasses, nor that for inner tubes; their roofs blown off, riddled with shell holes, overthrown by bombs. All this is beyond words.

Let us leave Wailly in ruins, or rather that which once was Wailly, and go back to Soissons.

The Wolber factory has been cruelly damaged, but having been built after the American fashion of steel and reinforced concrete, it was better able to resist and still preserves the form of a building. The main structure has been hastily repaired and shelters at the present time an automobile park in the rear. The restoration of the building under the energetic supervision of Mr. Wolber, who wishes to work even in the midst of the ruins, is actually almost completed. The chimneys are torn down, the water system has disappeared, the buildings without roof or windows are riddled with bullets or shell splinters—these are only

injuries to material things, doubtless less painful than those done to human beings, but they will take as long to heal.

Returning by the broken road, looking at these distressing sights for a long time, we ask ourselves these questions:

THE WOLBER MANSION AT MITRY.

"What will the man do who has experienced such a disaster; who has seen go to pieces a business which it has taken him 30 years to build up?

"At the age of 50 is he going to leave things in the state of awaiting imminent but slow reparation? Hasn't this pioneer's energy become dull as the result of these undeserved misfortunes?"

Then we do not know Wolber! Crushed, but courageous, he has already set to work, aided by his son and son-in-law, by those among his associates who escaped the terrible war. While the war was going on, he erected a new factory at Lavallois, where he manufactured balloon fabrics, and there he has just started the manufacture of tires.

The plans for the reconstruction of Wailly and Soissons are finished and the works of restoration are beginning. New equipment, an improvement on the old, has been ordered and, as soon as received, will be installed and set going. New methods, such as the use of accelerators which the war has made known, will be employed.

PRESS-ROOM AT SOISSONS.

Wolber, always anxious to progress, does not want his regenerated factories to lack any improvement, and that is why he is sending his son, only just demobilized, to make a tour of investigation in the United States, where the rubber industry has reached its perfection.

This is one of the examples among thousands, of the energy with which France has endured the hard trials of the war, and

PNEUMATIC TUBE DEPARTMENT AT WAILLY.

of the efforts which have been made to rebuild an industry which the Germans believed they had killed.

RUBBER IN UNITED STATES COMMERCE.

NOTICEABLE EFFECTS of after-war readjustments are to be perceived in the official statistics of rubber imports and exports for the fiscal year ended June 30, 1919. The year's crude rubber imports were 402,471,531 pounds, value \$157,928,132; for the preceding year the imports were 389,599,015 pounds, value \$202,800,392; the increase in weight was 12,872,516 but the value fell off greatly, \$44,872,260.

In spite of the efforts of governments and planters' associations in the Far East and in Brazil to restrict exportation, the price went down. Much the greater part of the crude rubber (almost wholly plantation) comes from the Far East; the importation from the British East Indies, 272,119,890 pounds, is the largest on record, nearly 14,000,000 pounds more than last year, though it brought in \$30,000,000 less, while that from the Dutch East Indies, 39,467,761 pounds valued at only \$15,411,620, still falls far behind the record of 1917, 53,663,857 pounds. It seems clear that it is the demand of the United States that has influenced the direction taken by the Eastern product, rather than the fear of submarines.

The Brazilian contribution, 46,407,924 pounds, though an improvement on last year's 41,277,914 pounds, is still behind the 1917 record of 56,818,906 pounds; the price paid for it, \$14,744,409, shows less falling off than in the case of plantation rubber.

There was a marked falling off in the importation of allied rubbers and gums. Of balata 1,238,852 pounds, value \$593,633, was imported as against 2,449,881 pounds, value \$1,278,610, last year and 3,287,445 pounds in 1917. Of jelutong (Pontianak) the imports, free of duty, were 11,363,283 pounds, value \$1,199,216, while in 1917, when a duty was imposed, 23,376,389 pounds worth \$1,044,422 came in. On the other hand, gutta percha to the amount of 4,151,085 pounds and the value of \$710,510 was imported as compared with 1,151,312 pounds worth \$147,323 last year, while substitutes for rubber to the extent of 2,159,716 pounds, value \$301,479, came into the country; only the value for previous years is given, is \$136,438 in 1918 and \$39,815 in 1917. The importations of guayule fell off to 2,990,253 pounds, value \$761,060, from the 4,307,539 pounds worth \$1,341,095 in 1918.

Rubber scrap importations dropped again, being only 8,483,383 pounds as compared with 13,980,303 pounds in 1918 and 20,517,328 pounds in 1917.

The total imports of india rubber, gutta percha and allied gums were 422,414,904 pounds, value \$161,192,551, for the year; in 1918 the imports were 414,983,610 pounds, value \$206,542,236, and in 1917 they were 405,431,069 pounds, value \$194,688,303.

The value of exports of manufactured rubber goods for the year ending June 30, 1919, amounted to \$43,856,588 against \$33,343,181 in 1918 and \$31,105,075 in 1917; the increase over last year was \$10,511,407, rubber thus doing its share toward the phenomenal increase in American exports for 1919. For the month of June alone the exports were \$5,727,642 as compared with \$3,192,528 in 1918, an increase of \$2,535,114.

The value of automobile tires rose to \$22,630,200 from the \$13,977,671 of 1918, an increase of \$8,652,529. Exports to France jumped up to \$3,227,830 from the \$661,648 of 1918, which in turn had been a large increase from the \$425,322 of 1917. For the Latin-American countries the increase was also marked. Cuba took \$2,009,263 of tires compared with \$1,336,233 in 1918; Argentina, \$1,837,884 compared with \$1,649,840 of the year before; Mexico rose to \$1,001,233 in 1919 instead of \$777,984 in 1918 and Brazil to \$667,319 instead of \$455,102, while Chile took \$1,130,873 of American automobile tires, there being no official figures for the two years previous, as Chile was included in "other countries." Altogether Latin-America bought \$6,646,572 worth of automobile tires as compared with \$4,219,159 in 1918, and \$3,217,548 in 1917, an increase of \$2,427,413, the value of exports being over 50 per cent more than last year and more than double that of two years ago.

Exports to British possessions held their own, in spite of the strong British exertions to favor their own goods and to restrain American manufacturers, except in the case of Canada. For the United Kingdom itself the exports were \$832,492 as against \$618,071 last year; for Australia and New Zealand the figures were \$880,118 and \$884,503 against \$819,755 and \$946,804, respectively, in 1918. British India took \$47,856 as against \$416,411 in 1918 and British South Africa took \$620,732 as against \$693,065. For Canada, on the other hand, there was a drop from the \$1,776,518 of 1918 to only \$961,532. To great Britain, therefore, and her chief colonies and possessions, automobile tires made in the United States were exported in 1919 to the value of \$4,628,053, which, compared with the \$5,270,624 of 1918, shows a falling off of \$642,571; the falling off in Canada more than accounts for this.

The export of tires to the Philippines was \$1,412,929 as compared with \$863,727 in 1918; to the Dutch East Indies \$812,425 worth were sent in 1919 against \$347,912 in 1918, while "other countries" account for \$5,903,180 in 1919 as compared with \$2,530,337 in 1918 and \$1,591,623 in 1917.

Exports of belting, hose, and packing again increased very largely over those of the previous year, the figures being \$5,716,016 for 1919 as against \$4,578,396 in 1918 and \$3,532,384 in 1917, the million-dollar increase of 1918 being repeated and better in 1919. The rubber boot export which had risen to \$4,861,213 in 1918, dropped to \$1,607,412 in 1919, while rubber shoes rose to \$2,559,641 in 1919 from the \$913,128 of 1918; the decrease in this class of goods over last year is, therefore, \$1,508,288. The exports of insulated wire cables for the year ending June 30, 1919, amounted to \$8,683,304 worth, as compared with \$5,716,275 for 1918 and \$7,192,204 for 1917.

"ARE YOU EMPLOYING A DISABLED MAN?"

The Dunlop Rubber Co., Limited, Birmingham, England, is featuring this pertinent question at the bottom of its page advertisement in British trade journals.

THE DEPARTMENT OF COMMERCE gives notice that hereafter its annual tables will be for the calendar year, instead of the fiscal year ended June 30, as heretofore.

Peace Problems and Progress.

RUBBER MEN JOIN FARM COOPERATION MOVEMENT.

INDUSTRIAL LEADERS of New England, including men prominent in the rubber business, have recently organized the New England Farm and Food Foundation for the purpose of forcing down the cost of living by establishing closer cooperation between the farmer and the consumer.

The waste of food products under present systems, congestion of certain products in one market while other centers are suffering from a scarcity of the same article, and hoarding by profiteers are the particular evils upon which the foundation will center its efforts.

Cooperative buying will be introduced, and the foundation will assist such bodies as already exist along similar lines which in the past have been handicapped by lack of finances.

Farmers will be assisted in obtaining credit and other facilities; in organizing farmers' exchanges and other agencies, and in grading and standardizing the products of the farm. Young men will also be helped in obtaining an agricultural education.

The list of trustees of the foundation looks like a "Blue Book" of New England business leaders and includes M. M. Converse, president of the Converse Rubber Shoe Co., Malden, Massachusetts; Harry G. Fisk, treasurer of The Fisk Rubber Co., Chicopee Falls, Massachusetts; and Frederick C. Hood, treasurer of the Hood Rubber Co., Watertown, Mass.

AMERICAN CREDIT FOR EUROPEAN REHABILITATION.

In an article in the August issue of "Commerce Monthly," James S. Alexander, president of the National Bank of Commerce in New York, a director of the United States Rubber Co., and a member of the recently organized committee of bankers formed to work out ways and means to refinance Europe, clearly outlines the part which America must play in the rehabilitation overseas.

Stated in broad terms, the situation is, that Europe must have from the United States immense quantities of materials to rebuild and reit for a normally productive economic life. Europe's international banking situation is such that she cannot pay as she goes. Neither is her present productivity such as to enable her to pay for what she buys with what she produces. As a nation, therefore, we must both sell goods to Europe and supply her with the credit to make these purchases. This should be done, not with Government funds, but with private capital organized and administered on a semi-public basis with the approval of the United States Government so as to inspire the widespread confidence and participation of the investing public in the necessary bonds or debentures, each of which should be secured by the pool of everything collateral that Europe is able to offer.

From the selfish point of view of American interest as well as of that of humanity this is necessary in order to conserve our markets, to conserve our surplus, and to avert possible industrial depression. Moreover, the total market for the United States, in respect to all nations and all commodities, should be allocated for the common good, thus giving equal opportunity to strong and financially weak European nations and to large and small American firms during the reconstruction period.

A pool of Europe's needs can be met by a pool of America's resources through the agency of a great, centralized credit organization of banker's groups with adequate capital and the confidence and support of American business.

SAVINGS STAMPS IN LARGE DENOMINATIONS.

Thrifty Americans can now buy their Savings Stamps in denominations of \$100 and \$1,000. The new registered Treasury Savings Certificates are exactly the same security, on exactly the same basis with the same exemptions from taxation, and sold on exactly the same terms as the War Savings Stamps which

have become the popular investment of the small saver. Moreover, War Savings Stamps are now convertible into Treasury Savings Certificates.

The price of the new certificates is relatively the same as that of War Savings Stamps. The \$100 certificate was sold for a \$82.40 in January and the price increases 20 cents each month to December, 1919. The \$1,000 certificate sold for \$824 in January and the price increases \$20 each month until December. Treasury Certificates of this year's issue reach maturity January 1, 1924. Prior to that date they can be redeemed on ten days' notice for the cost plus 3 per cent interest.

STEEL TIRES ON SURRENDERED GERMAN TRUCKS.

For the benefit of the Government and the United States motor truck industry there is to be a research investigation of the 47 German trucks recently brought to the United States. It will be conducted under the joint auspices of the Society of Automotive Engineers, the National Automobile Chamber of Commerce, the Motor and Accessory Manufacturers' Association and the Motor Transport Corps of the Army. These trucks were selected from the 1250 turned over by Germany to the United States under the terms of the Armistice. They represent the best available samples of current German practice in truck construction and their study seems likely to prove of value. That most of them are fitted with steel tires again emphasizes the lack of rubber in Germany.

PROPOSED TARIFFS AFFECTING THE RUBBER TRADE.

Among the bills which have been introduced in Congress, and which are now before the Ways and Means Committee for consideration, are several tariff bills which are of interest to the rubber industry. These include bills providing for a tariff of 15 cents per unit (= 1 per cent) of sulphur in the short ton (2,000 pounds) of pyrite and all crude iron sulphide minerals, and on sulphur in whatever form not otherwise provided for, the same tariff per unit of sulphur content; on crude or manufactured barytes, \$10 per ton; barium sulphate, \$15 per ton, and on barium carbonate, binoxide, chloride and other barium compounds, \$20 per ton. On magnesite commercial ore, crushed or ground, 1/2-cent a pound; calcined, dead burned and grain, 3/4-cent a pound; magnesite brick, 3/4-cent per pound and 10 per cent ad valorem; on zinc in blocks, bricks or zinc dust, 1 1/2 cents per pound; in sheets, 1 3/4 cents per pound; sheets coated with nickel or other metal or solutions, 1 3/4 cents per pound, and worn-out zinc for remanufacture, 1 cent per pound. Zinc oxide and white pigment containing zinc, but no lead, if grained in oil, 1 3/4 cents per pound; zinc sulphide, 1 1/4 cents per pound; zinc chloride and sulphate, 1 cent per pound.

Coal-tar products to be divided into three groups: Group 1, free of duty; Group 2, a tariff of 40 per cent and 6 cents a pound, and Group 3, a duty of 45 per cent and 7 cents a pound.

Among the tariff bills already passed by the House, and now before the Senate, may be mentioned one placing a duty of 60 per cent ad valorem on glass and porcelain ware for laboratory purposes. Another places 45 per cent duty on philosophical, scientific, and laboratory instruments and appliances.

THE FEDERAL TRADE COMMISSION ON FOOTWEAR PRICES.

After a comprehensive and thorough investigation, the Federal Trade Commission has found that the high prices of shoes cannot be justified by underlying economic conditions. Packers, tanners, shoe manufacturers and retailers are all said to be taking excessive profits, all of which impose an intolerable burden upon the consumer. Few tanners, for example, who were content to earn 10 per cent on their invested capital in 1914 were found to average less than 20 per cent since 1916 or 1917,

and it is claimed that the profits of all other branches of the leather shoe industry show similar increases during and since the war. Suggestions to remedy the situation include rigid enforcement of the laws against monopolistic control of commodities, legislation forbidding producers of hides to engage in the tanning business, and the adoption of a scheme to acquaint the consumer with the manufacturer's selling price.

It is a significant and gratifying fact that in this arraignment the Federal Trade Commission has found it unnecessary to allude to footwear of any sort that is made in rubber mills. Rubber and fabric shoes with fibre soles and rubber heels were brought to a high degree of appearance, comfort and wearing quality at exactly the right time to be of great service to the public in combating the rising cost of living. For summer wear they solved the problem, and to the fact that selling prices have been kept as close to relatively low manufacturing costs as is consistent with a fair margin of profit may be attributed in large measure the success which has attended fibre-soled fabric shoes since their introduction only a few years ago.

GOVERNMENT RAW MATERIALS AND CHEMICALS FOR SALE.

The War Department, through the Director of Sales, announces the surplus stocks of materials, which will be offered for sale from time to time, generally under sealed proposals. The Raw Material and Scrap Section of the office of the Director of Sales, Munitions Building, Washington, District of Columbia, will furnish information concerning any of the materials listed as on hand July 10 in the schedule recently published.

This list includes 582 tons of rubber, 4,004 feet of rubber belting and 11,565 feet of rubber hose. Of metals and chemicals more or less in demand in the rubber industry may be mentioned: acetone, 56,748 pounds; acid, nitric, 42 per cent, 14,015,451 pounds; acid, hydrochloric, 20 per cent, 511,790 pounds; aluminum sulphate, commercial purity, 2,790 pounds; aluminum sulphate, 17 per cent, 13,600 pounds; carbon bisulphide, 2,000 gallons; carbon tetrachloride, 99 per cent pure, 10,500 pounds; glycerine, 100 pounds; lampblack, dry, 28 tons; lime, 48,163 pounds; nitre cake, 36,000 pounds; rosin, 125 tons; sulphur chloride, 2,619 tons; turpentine, crude, 9,670 gallons; zinc, 40,003 tons; zinc, sheet, 13 tons.

Besides these there are listed 109 tons of burlap, and 302,266 grommets, also 208 tons of grommets.

RUBBER AND ALLIED PROPERTIES SOLD BY THE ALIEN PROPERTY CUSTODIAN.

Definite official information has been received from the Alien Property Custodian regarding the disposal of the property of firms that are of interest to the rubber trade. Final disposal has been made in two cases:

Merck & Co.—Eight thousand shares of the stock of this company were offered for sale on May 9, 1919, for which the McKenna Corporation, of 60 Wall Street, New York City, bid the sum of \$3,750,000. This bid has been approved and the transaction closed.

Robert Soltan & Co.—Eight hundred fifty shares of the stock of this company were offered for sale on May 21, 1919, for which the Bishop Gutta Percha Co., 420 East 25th Street, New York City, bid the sum of \$208,000. This bid has been approved and the transaction closed.

In three other cases the property has been sold but the necessary formalities were not yet completed on August 14:

Schaeffer & Budenberg Manufacturing Co.—One thousand twenty shares of the stock were offered for sale on June 12, 1919, for which R. B. Phillips, of the American Steam Guage & Valve Manufacturing Co., Boston, Massachusetts, bid the sum of \$476,000. This bid has been approved, but final settlement has not yet been completed.

Polack Tyre & Rubber Co.—Two thousand ten shares of the stock of this company were offered for sale on June 17,

1919, for which Joseph Kaufman, 303 Jay Street, Brooklyn, New York, bid the sum of \$8,500. This bid has been approved, but final settlement has not yet been effected.

Roessler & Hasslacher Chemical Co.—Six thousand eighteen shares of the stock of this company were offered for sale on July 18, 1919, for which Coffin & Co., of 34 Pine Street, New York City, and the American Aniline Products, Inc., of 80 Fifth Avenue, New York City, bid the sum of \$3,039,090. As yet no action has been taken on this sale.

INTERESTING LETTERS FROM OUR READERS. RUBBER LEATHER.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—There is a rather interesting comparison of prices to be made which might influence our big rubber manufacturers to a new field of endeavor, and I call attention to the following:

Hemlock sole leather.....	\$0.59 per pound
Unriver fine Para rubber.....	.55 per pound
Ribbed smoked sheets rubber.....	.41 per pound

Perhaps my idea is a bit premature, but, nevertheless, I have the very definite belief that rubber manufacturers can produce leather substitute shoes in competition with the regular footwear, and with considerable profit to themselves.

The following are facts that are indisputable as regards rubber manufacture and footwear:

1. Machinery has already been developed for the production of footwear made of canvas, rubber and leather. Very little need be added to complete the necessary machinery for turning out a real shoe.

2. Rubber manufacturers are already producing, first, (A), sole "leather" and secondly, (B), "leather" for all sorts of hand baggage.

(A) The first is a stiff firm leather substitute that has already taken the place of real leather and has proved itself, in many ways, more advantageous.

(B) The second "leather" is a soft compound that would seem, by all appearances, to be an excellent substitute for shoe "uppers." It is durable, soft and pliable, and, in appearance, equals the best quality of leather.

3. Here then, already exist the two necessary materials for making a shoe. No doubt, the quality can be improved by further experimentation and compounding of rubber, balata, etc. Canvas interlining would lend a strength that leather could never have.

4. All the colors and shades of leather can easily be reproduced.

5. It is not even unlikely that many parts of the shoe can be molded, thereby saving a considerable labor expense that is impossible with leather.

Considering the above, do you not agree that, with a trifle of added experimentation, there is a very large new field of production open to the rubber manufacturer? With the price of shoes to-day, and considering the low cost of rubber by comparison, it would seem a most opportune time to start this new enterprise.

It might be said that the price of rubber, though low to-day, may advance beyond a point where shoe production would be profitable. But I do not believe that this need be a factor, and I base my belief, first, on the fact that rubber-tree growth is being increased yearly, and, secondly, leather production has reached its maximum if it is not already on the wane. Cattle require grazing land, and this is gradually being absorbed into farm land. Rubber-tree acreage, however, is not made otherwise useless because of the trees, but can also be profitably planted with other useful flora between the trees. There is every reason to believe that, in time, a substitute must be found for leather, and the best material for the purpose would seem to be rubber.

The idea has made me rather enthusiastic, and I hope that some manufacturer will find it equally practicable.

Sincerely yours,

New York City.

ALFRED C. EGGERS.

Crude Rubber Prices.¹

By Isador Lubin.

THE CRUDE RUBBER PRICE SITUATION.

OF ALL THE RAW MATERIALS consumed by modern industry, crude rubber is perhaps the only important staple which has not experienced an increase in price during the period of the world war; and this, in spite of the fact that the world's rubber consumption had increased from 101,000 tons in 1913 to approximately 230,000 tons in 1917. (See Table I.) During these five years the consumption of the United States rose from about 50,000 tons to 175,000 tons,² or in other words, from 50 to

TABLE I.—THE CONSUMPTION OF CRUDE RUBBER.³
[Long tons.]

	United States.	Great Britain.	France.	Germany.	Italy.	Total.
1910.....	42,210	20,455	3,799	13,775	1,301	85,440
1911.....	38,475	17,736	5,538	15,281	2,691	79,881
1912.....	32,964	18,724	4,653	15,643	3,872	75,836
1913.....	53,179	23,276	6,900	15,300	2,100	101,455
1914.....	61,251	18,549	4,601	11,000	4,000	99,800
1915.....	96,792	13,072	10,276	6,350	6,350	135,214
1916.....	116,477	16,760	14,685	3,300	8,552	169,474
1917.....	175,000	25,933	17,400	2,000	6,946	239,017

70 per cent of the world's total consumption. This was almost 50 per cent more than we used in 1916, twice as much as in 1915, and approximately three times as much as in 1914. In the same period France had increased her consumption some 10,000 tons;

while Italy in 1917 took 5,000 tons more crude rubber than in 1913.

How is the falling of prices during the past six years compatible with this vastly expanded consumption? The reply can be found only in an analysis of the situation in Germany and Russia and in the figures of the world's rubber production.

While the consuming countries of the world were taking increasing amounts of crude rubber, the plantations of the Far East were coming into a "bearing" condition. Production was keeping abreast of consumption, and even though the amount of crude rubber going into the manufacture of rubber products during this period increased 127 per cent, the world's production had grown by 147 per cent. (See Table II.) Thus, in spite of the unprecedented rise in consumption, a surplus of 20 per cent was created.

Prior to the outbreak of the war among the world's consumers of crude rubber. Indeed, she led the world in the manufacture of rubber toys, hard-rubber goods,

ocean cables, and rubber packings. Germany in 1913 imported as many as 15,500 tons of crude rubber, which comprised about 15 per cent of the world's production for that year. Shortly after the outbreak of hostilities rubber was declared contraband by England, and all possible pressure was exerted to prevent Germany from receiving any of this material. So stringent was the embargo of the Allies that the German imports were cut to 2,000 tons in 1917, and it is estimated that this amount had been further decreased in 1918 to less than 1,000 tons.

Russia in former years was also an important consumer of crude rubber. In 1916 her imports amounted to over 20,000 tons.⁴ The past two years, however, have witnessed a radical decline in Russian consumption—the result, no doubt, of economic disorders. In 1918 her imports were less than 2,000 tons.⁵

Had the consumption of Germany and Russia continued even at the pre-war rate, a rubber surplus would not, in all probability, have existed, and the trend of rubber prices would not doubt have been different.

The surplus of crude rubber, it should be borne in mind, was due entirely to the increased output of the plantations, which grew from 47,618 tons in 1913 to 204,000 in 1917. The production of Brazil remained relatively static in the interim, and that of other parts of the world decreased by some 43 per cent. Until 1913 Brazil had led the world in the output of crude rubber, but since then the production of the plantations has increased by leaps and bounds, until in 1917 it was five times that of Brazil. (See Fig. 1.)

TABLE II. THE WORLD PRODUCTION OF CRUDE RUBBER.⁶
[Long tons.]

Year.	Plantations.	Brazil.	Other grades.	Total.	Percentage of increase or decrease.

1917.....	204,348	39,370	13,258	256,976	27.4
1918 (estimated).....	240,000	38,000	12,000	290,000	12.8

THE RUBBER MARKET DURING THE WAR.

Although the price of crude rubber tended downward during the past six years, several instances, nevertheless, of temporary rises were experienced. Neither of the two leading types of

¹ From Price Bulletin No. 39, issued by the War Industries Board under the direction of Wesley C. Mitchell.

² This figure varies slightly from that given in Table I (see THE INDIA RUBBER WORLD, AUGUST 1, 1919, page 614), where the 1917 consumption of the United States is given as 157,000 tons. This discrepancy is to be explained by the difference which exists in the compilations of the United States Bureau of Foreign and Domestic Commerce as compared with those of the Rubber Association of America. The latter organization differentiates between the various types of rubber imported, and for purposes of weighing it was necessary to use their figures as given in the above-mentioned table. The figures of the Bureau of Foreign and Domestic Commerce represent all crude india rubber and are used in Table I of this article.

³ This includes all the important consuming countries of the world, with the exception of Russia, Japan, and Australia, the total consumption of which decreased from 25,000 tons in 1916 to 7,000 tons in 1918. Data from Memorandum on the Rubber Industry, op. cit., page 7.

⁴ THE INDIA RUBBER WORLD, March, 1919, page 333.

FIGURE 1. THE WORLD'S RUBBER PRODUCTION, 1910-1918.

Prior to the outbreak of the war among the world's consumers of crude rubber. Indeed, she led the world in the manufacture of rubber toys, hard-rubber goods,

a Prices from private firm, 1913 to 1917; 1918 prices from THE INDIA RUBBER WORLD. b Prices from THE INDIA RUBBER WORLD. c Prices from "New York Journal of Commerce."

^a Prices from private firm, 1990. ^b No prices quoted; interpolated.

rubber, however, underwent any sustained rise or fall from the prewar level which was in any way comparable to that prevalent

FIGURE 2—RELATIVE PRICES OF RUBBER: BRAZILIAN PARA UPRIVER FINE; PLANTATION HEVEA FIRST LATEX CREPE.—BY MONTHS, JANUARY, 1913, TO DECEMBER, 1918. (AVERAGE QUOTED PRICES, JULY, 1913, TO JUNE, 1914=100.)

lowest point ever experienced in the history of the industry. Its effect upon the price level in the years following is made evident in Figure 2. Here it will be noted that while the price of both types of rubber declined in 1913 in a more or less uniform manner, and that time the Pará variety remained slightly below and the plantation slightly above the 1913-14 market level.

This phenomenon is entirely the result of the abnormal decline of plantation prices in 1913 and shows the effect of this price fall on the pre-war level which is the base to which the war prices have been reduced.

The low level of crude rubber prices running throughout the period of the war was broken by important increases but twice—one rise reaching its peak at the end of 1915, and the other early in 1917. Crude rubber prices, like all others, of course, felt the effects of panicky conditions following the outbreak of the European war in August, 1914. With the resumption of activities in September, however, rubber prices returned to their normal level. Both rises mentioned above were common to all types of rubber and may be accounted for by more or less like reasons. Plantation rubber, however, also experienced a temporary increase in December, 1914. This was the result of the British embargo on shipments to this country. In October, 1914, Great Britain decreed that no shipments from her plantations in the Far East should be made to any port other than London. A

among other commodities. (See Fig. 2.) And in no case did rubber prices reach the level of early 1913.

The two important types of rubber—plantation first latex crepe and Pará upriver fine—declined sharply in price during 1913, the former experiencing a decrease of over 50 per cent during the first 10 months of the year.¹ This was due to the large output of plantation rubber,² which in 1913 was almost 20,000 tons larger than in any previous year.³

The abnormal decline in the price of the plantation variety brought rubber values down to the

supplemental decree in November prohibited all exports of crude rubber from any English port whatever. The announcement of this action, and the realization that its enforcement would cut the normal supply of the United States by approximately one-half, sent up some 30 per cent the price of what little rubber there was on the American market. This rise was short-lived, however, and the removal in January, 1917, of the embargo on shipments to the United States under a system of guaranties, brought plantation prices back to normal.

The first general rubber price rise was occasioned by the abnormal demand following the closing of the Suez and Panama Canals and by submarine activity in the Mediterranean. It was expected that the closing of these water routes would shut off supplies from the Far East, and the trade both in London and New York immediately proceeded to buy up whatever supplies were available. The rise early in 1917 was also purely speculative in character and may likewise be attributed to submarine activities.

An important factor which tended to keep rubber prices down during 1918 was the character of the import regulations of the War Trade Board. Rubber was one of the first commodities the import of which was licensed. This was due to the fact that there was great need for rubber by the Central Powers. On December 7, 1917, the War Trade Board issued regulations which provided for the licensing of imports, for the consigning of all imported rubber to the Rubber Association of America, and for the submission of guaranties by importers and manufacturers that they would not sell any rubber, directly or indirectly, to any country at war with the United States, or to any person, unless satisfied that there was no intention of exporting without an export license.

No restriction was placed on the amount of rubber that could be imported until May 8, 1918. The acuteness of the shipping situation then necessitated the reduction of the amount imported to the essential needs of the country. Accordingly, on May 8 the War Trade Board, after conferences with representatives of the rubber industry and the United States Shipping Board, restricted the quantity of rubber to be licensed for import during the three-month period, May, June, and July, to 25,000 long tons, which is at the rate of 100,000 long tons per year, or about two-thirds of the 1917 importations. Subsequently the War Trade Board virtually increased the amount to be licensed for import to 28,000 long tons (green basis) per quarter by ruling that the Brazilian imports should be allocated on a dry basis which allowed approximately 12 per cent for water content.

TABLE IV—VIRGIN AND RECLAIMED RUBBER REQUIRED FOR THE MANUFACTURE OF RUBBER GOODS
For delivery to the Army and Navy during the calendar year 1918.
Pounds.

	Virgin.	Reclaimed.

Total requirements	61,520,478	15,979,790

¹ See Signal Corps, and Tires and Tubes.

² Negligible.

³ Other Government requirements, that is, the Railroad Administration and the Emergency Fleet Corporation, together with the requirements of Allied nations for war purposes, are estimated to have brought the total monthly war requirements up to 3,150 per month.

¹ The January, 1913, price of \$1.10 may appear high when compared with the present price of crude rubber. But when it is remembered that rubber in May, 1911, only 19 months earlier, sold for as high as \$2.85, the story of rubber prices becomes even more interesting.

² During the first six months of 1913 there passed through the London auction over 11,000 tons of plantation rubber, as compared with about 7,000 for the corresponding period in 1912.

³ The slight decreases in American consumption is another factor worthy of consideration in this connection. The tariff discussion in 1913 and the fear of removal of duties on rubber goods were the cause of much apprehension in the rubber industry and tended to make American manufacturers conservative in their purchases. Then there was the strike in the rubber factories of Akron, where about 50 per cent of the rubber imported into the United States is consumed. It is estimated that during the period of idleness accompanying the strike some 3,000 tons of rubber which would under normal conditions have been consumed in Akron, remained on the market. And, finally, there should be remembered the flood of the Ohio River in 1913, with the destruction of rubber property and the necessary curtailment of manufacturing operations.

It was estimated that about 35 per cent of these imports would be required for the governmental needs, leaving 65,000 tons to be allocated to the trade for civilian consumption. (See Table IV.) Allocations were made to manufacturers on the basis of seven-sixteenths of their 1917 consumption, and each manufacturer was instructed to apply for an import certificate entitling him, or others in his behalf, to receive an import license for his respective share.

The preliminary negotiations leading to the cutting of imports were held in April and the anticipation by the trade of some form of restriction stimulated buying. Thus large contracts were entered into for the immediate shipment of rubber to the United States in order that stocks might be accumulated before the expected restrictions went into effect. (See Table V.) The restriction of May 8 did not apply to shipments which had left foreign ports prior to that date, and since the time required for transporting rubber from primary markets to the United States is considerable, the actual imports during May, June, and July were much greater than the specified 25,000 tons. In fact, 55,000 tons of rubber entered American ports during these three months. The uncommon size of these imports is to be accounted for entirely by the stimulated purchases of the preceding April.

TABLE V. SHIPMENTS OF RUBBER IN THE UNITED STATES IN 1918.
[LONG TONS.]

January 1—		
Held by importers.....	13,228	
Held by manufacturers.....	34,238	
Total stocks.....	47,466	
July 1—		
Held by importers.....	19,249	
Held by manufacturers.....	38,094	
Total stocks.....	57,343	
October 1—		
Held by importers.....	12,694	
Held by manufacturers.....	48,353	
Total stocks.....	61,047	

To prevent a speculative rise in rubber prices as a result of these restrictions, the War Trade Board on May 1 fixed the following maximum prices:

	Cents.
Para upriver fine.....	68
Plantation.....	63
First latex crepe.....	63
Smoked sheets, standard quality.....	62

These prices were supplemented on May 14 by maximum prices for other grades of crude rubber; while on May 29, June 13, July 2, and July 6, respectively, still further additions were

made.³² All prices were on the basis of c. i. f. New York.

The effect of the restrictions upon rubber prices soon became evident, and it later appeared that the fixing of maximum prices had been an unnecessary expedient. The curtailment of imports immediately made itself felt in the primary markets, where already the decreased consumption of other nations had had its effects. The further elimination of means of disposal naturally led to keen competition among the holders of the existing large stocks and prices tended to fall still further.

While the bulk of the market sales for rubber during the latter six months of 1918 was below the quoted maximum prices shown in Figure 2, a small amount of free rubber not subject to War Trade Board allocation which was still on the market was sold at a level distinctly higher than restricted rubber. It is interesting, also, to note that sales of allocated upriver fine Para rubber were made in September at 58 cents (maximum fixed price being 68 cents), while at the same time plantation first latex crepe sold for 37 cents (maximum fixed price being 63 cents).

This anomaly can be explained in part by the allocating to Brazil by the War Trade Board substantially as much rubber as to the plantations, although the production of the former is but one-sixth of the latter. There resulted, accordingly, a heavy overproduction of the plantation variety and keener bidding at plantation markets for the right to ship to American ports. It should be added also that the maintenance of relatively normal values by Brazilian rubber was in part to be accounted for by the stabilizing control over its price by the Bank of Brazil.

The amount of rubber to be licensed for import was changed on November 22 to 32,500 tons for the last quarter, an increase of 7,500 tons over the previous maximum. Restrictions as to the quantity of crude rubber which might be licensed for import from overseas were further modified on December 12. After that date licenses to import crude rubber from overseas were issued without limit as to quantity, provided applicants conformed with the existing regulations of the War Trade Board. Maximum prices and allocation features were also withdrawn at the same time, although consignments to The Rubber Association were still required and the usual guarantees demanded. That the withdrawal of these regulations had little effect upon crude rubber prices is made evident in Figure 2.

³² A full list of the types of rubber upon which prices were fixed, to which with the respective price for each, is presented in "Government Control Over Prices," Bulletin No. 3, War Industries Board.

Standards Recommended by the Tire and Rim Division of the S. A. E.¹

THE STANDARDS COMMITTEE OF THE S. A. E. held a meeting June 23, 1919, to pass on the work accomplished by the various divisions of the Society. The following report of the Tire and Rim Division has been approved by the Standards Committee, the Council, and the Society at the semi-annual meeting and is to be submitted to a letter ballot of the voting members before final adoption as standards of the Society.

SOLID TIRE SIZES.

This subject was presented at the February meeting of the Society, but was referred back to the Division pending further consideration by the National Automobile Chamber of Commerce and the Rubber Association of America. As these organizations have definitely adopted the following solid tire sizes, the Division recommends that these sizes be adopted by the Society.

¹From "The Journal of the Society of Automotive Engineers," August, 1919.

The complete table with metric equivalents follows:

Inches.	Mm.	Inches.	Mm.
32x3.....	75/660	36x6.....	150/762
34x3½.....	90/660	40x6.....	150/864
34x3¾.....	90/711	36x7.....	176/762
36x3.....	90/762	40x7.....	175/864
38x4.....	100/660	36x8.....	200/762
34x4.....	100/711	36x10.....	250/762
36x4.....	100/762	40x10.....	250/864
34x5.....	125/711	40x12.....	300/864
36x5.....	125/762	46x14.....	350/864
40x5.....	125/864		

In presenting this report, C. C. Carlton said that these sizes proposed for S. A. E. Standard are an amplification of those which were adopted previously by the Society and the War Industries Board. They were recommended by twenty members of the Tire and Rim Division and include only the present standard sizes and their metric equivalents.

CARRYING CAPACITY OF SOLID TIRES.

This subject has been before the Tire and Rim Division and the Truck Standards Division of the Society for some time, and progress has necessarily been slow as the subject is important from the viewpoints of legislation, truck manufacture and operation and tire manufacture.

The Tire and Rim Division has approved the following recommendation in the belief that it represents good engineering practice and presents it for adoption as S. A. E. Standard:

Solid Tire Width.	Up to and Including 36-in. Diameter, Pounds.	40-in. Diameter, Pounds.
3	1,900
3 1/2	2,300
4	2,500
4 1/2	2,500
5	3,500
6	3,500
7	4,200
8	5,200
10	7,000
12	9,500
14	11,500

In presenting this recommendation, Mr. Carlton said that many of those present would remember that when a recommendation on the subject of carrying capacity of solid tires was made by the Tire and Rim Division some years ago it was voted down at a society meeting after having been approved by the Standards Committee; that the last proposed standard is the result of 3 or 4 years of careful experimentation by the rubber companies, and that he believed it deserved the support of the Society; that every manufacturer of solid tires is now in favor of this table, and he hoped the proposal would be approved because it had been difficult to reach a compromise that everyone was satisfied with. As he understood the matter, the carrying capacities recommended in the Division report would be printed in the price-lists of all manufacturers of solid tires, and were in fact being so printed by most of them.

THE DISCUSSION.

L. R. DAVIS:—These are carrying capacities that we have been using for the past 2 years, except that we have a 3 1/4-inch size instead of 3 1/2.

C. C. CARLTON:—I would like to ask a question of the rubber men present. It is my understanding that solid tires will not be guaranteed for replacement by any manufacturer if they are subjected to greater carrying loads than those given in the report. Is that correct?

Mr. DAVIS:—That is correct.

RUSSELL HOOPES:—I was a member of the Division when we had the discussion years ago, and it seems to me, now that the tire companies have agreed on this, that it would be a pity not to put it through as an S. A. E. Standard.

SOLID TIRES FOR SINGLE AND DUAL WHEELS.

The Division recommends the following definite front and rear wheel application of the proposed solid tire sizes as supplementary to the proposed standard list of sizes:

TIRES FOR SINGLE WHEELS.

36x3	36x4
32x3 1/2	34x3
34x3 1/2	36x3
36x3 1/2	36x3
32x4	36x7
34x4	36x7

TIRES FOR DUAL WHEELS.

36x4	36x8 (Single tire fits 36x4 dual wheel)
36x5	36x10 (Single tire fits 36x5 dual wheel)
36x6	40x10 (Single tire fits 40x6 dual wheel)
40x6	40x12 (Single tire fits 40x6 dual wheel)
40x7	40x14 (Single tire fits 40x7 dual wheel)

Mr. Carlton explained that this "application" table includes the solid tire sizes recommended for standard. They are, however, classified in this table to indicate preferable installation for front and rear wheels. Such application would, he said,

work no hardship upon truck manufacturers and would greatly assist wheel makers who want standards to work to.

BASE BANDS FOR SOLID TIRES.

As the proposed solid tire standard includes a 3-inch size, the Division recommends that the 3-inch base band be included in the present S. A. E. Standard for base bands for solid tires.

STANDARD BASE BAND FOR SOLID TIRES.

Base Band Size	Limits		%Cor. rugations.							
	A	B	C	D	E	F	G	H		
3	23/32	3/4	1/32	5/16	16	0.181	2 20/32	3 1/2	5/64	
3 1/2	23/32	41/32	1/32	11/32	18	0.191	3 7/16	3 1/2	1/16	
4	25/32	41/32	1/32	3/8	20	0.196	3 1/2	4 1/2	9/128	
5	27/32	5/8	1/32	7/16	26	0.189	4 5/64	5 1/2	9/128	
6	27/32	6/8	1/32	7/16	32	0.185	5 5/64	6 1/2	9/128	
7	27/32	7/8	1/32	7/16	36	0.192	6 3/64	7 1/2	9/128	
8	7/8	8/8	3/64	7/16	40	0.196	7 27/32	8	5/64	
10	7/8	10/8	3/64	7/16	50	0.196	9 27/32	10	5/64	
12	7/8	12/8	3/64	7/16	60	0.197	11 27/32	12	5/64	
14	7/8	14/8	3/64	7/16	70	0.197	13 27/32	14	5/64	

Note.—The above values correspond to those adopted by the War Service Committee of the Rubber Industry of the U. S. A.

Chairman Bachman stated that at the annual meeting in February this list was adopted and that the proposed action contemplated adding only the dimensions for the 3-inch band size which corresponds to the 3-inch tire just approved.

SOLID TIRE AND WHEEL DIAMETERS, WHEEL CIRCUMFERENCES.

In the past there has been some confusion owing to the inclusion of general information in this standard. In view of this the Division has revised the standard so as to include data on the standard solid tire diameters only, and therefore recommends the following revised standard for adoption:

Nominal Outer Diameter of Tires.	Actual Diameter Over Steel Bands.	Actual Circumference Over Steel Bands.
In.	In.	In.
3	26	81 11/16
3 1/2	26	81 11/16
4	28	87 31/32
5	30	94 1/4
6	34	106 13/16

Mr. Carlton explained that this recommendation involves merely a revision of page 8, S. A. E. Handbook, Vol. 1, adding no new information and eliminating mention of sizes other than those now adopted as S. A. E. Standard.

SOLID TIRE SECTIONS.

The Division recommends that the 3-inch solid tire sectional area be included in the present standard so that it will conform to the proposed solid tire standard.

Solid Tire Widths, in.	Minimum Total Sectional Area of Rubber, Square Inches.
3	6.75
3 1/2	7.75
4	10.75
5	13.75
6	16.75
7	19.75
8	25.75
10	31.75
12	37.75

Note.—The above values correspond to those adopted by the Solid Tire Division, War Service Committee of the Rubber Industry of the U. S. A.

These figure circumscriptions are given with the tolerances neglected. The tolerances are shown at the bottom of page 84, S. A. E. Handbook, Vol. 1.

*Includes both hard and soft rubber.

The Manufacture of Rubber and Fabric Shoes.

India rubber is the great supplanter. Just as rubber hose displaced leather hose, the rubber boot the superheated brick, and the rubber tire that of wood and iron, so rubber and fabric shoes are winning against leather in the footwear field. In this crusade the so-called "Tennis" shoe was and is the entering wedge.

THE TENNIS SHOE, sand-shoe, or "sneaker," with its variants for yachting, gymnasium, basket-ball, etc., was for years a minor part of the rubber footwear business. It was not esteemed either by maker, marketer or user. Oftimes it was made of the cheapest materials, hastily thrown together and

It therefore has come about that "Keds" and their analogs, while they are still tennis shoes, show a vast improvement over their prototypes of the dry-heat days. A tennis shoe to-day, of the best type, has all of the lines of the best of leather footwear. It has a solid rubber heel, a counter that is generous and

DIEING OUT TENNIS TOPS.

DIEING OUT LEATHER INSOLES.

the product stored in bins by the retailer to be pawed over by the bargain hunters and the slip-shod.

For many years the bulk of the tennis goods showed black soles. This was simply because the old-time dry-heat compounds called for litharge to effect the cure, the heat being some seven hours. White soles were sometimes brought out by using zinc sulphide, and some very excellent tans were produced.

strong, and inside of the rubber outer sole is a fiber sole, in place of the time-honored rag-filler, and over this a leather inner sole and a kid heel-piece. The stitching, the lacings, the celluloid-covered eyelets, the finish, all are first-class and really elegant.

The fact is, the tennis shoe is to-day an important factor in the rubbershoe factory. Hence the laboratory has taken up the

STITCHING THE UPPERS.

CUTTING FOMINGS.

With the success of the pressure cure and the use of accelerators former handicaps were removed and a much more varied line of goods produced. The quality was also notably increased.

question of stocks and evolved for sole and heel those that are light and yet wear-resisters. For cements, thanks to mixed catalyzers, they have so far beaten the old "yellow

"cement" that the workmen would use soft soap as a sticker rather than return to it. In the handling of fabrics, drying, brushing, singeing, and often cravenetting, the greatest care is taken and the latest methods employed.

The beginning of tennis shoe making, next to the laboratory compounds, is the last making. Under expert designers maple lasts are evolved and turned out by thousands on automatic last lathes. Then pattern cutters design the patterns. For hand work they are of thin sheet metal or heavy cardboard; for dies they are of metal.

Aside from the regular equipment of rubber washers, vacuum dryers and mixers, are special soling calenders with engraved rolls for running the soles. There are also tubing machines for forcing heel stock and presses for forming and semi-vulcanizing heels.

MAKING THE UPPERS.

The manufacturer begins with cutting the fabric for the tops or uppers. This is accomplished by means of cutting dies of suitable shape for the various cloth parts. The fabric having been carefully arranged in the form of a slab about an inch thick, is

THE OPERATION OF LASTING.

drawn progressively through the power-cutting-press over a wooden cutting-block. The operator adjusts the proper die and by pressure on the foot-treadle of the machine stamps out with great rapidity and accuracy pieces of the required size and form.

The lower edges of the vamp or upper and its lining are united to the rubber sole in the finished shoe by rubber cement. Therefore these parts go to the cementers who apply the cement required. The work is regulated by the use of metal forms or patterns to locate properly the cement coating. This operation is a particular one from the standpoint of neatness as any spots of misapplied cement will show on the finished product as disfiguring indelible marks.

The cemented vamps and linings together with the other cloth pieces such as tongues, etc., are delivered to the stitching room, where, with power sewing-machines, women operators skilfully assemble and sew the parts together in the form of uppers, preparatory to the operation of lasting. The tongues are bound with tape and inserted, and by special machines the eyelets and facing studs are applied. The complete upper is then laced up on a lacing machine and is ready for delivery to the assembly room.

LEATHER AND RUBBER PARTS.

The leather inner sole is died out by cutting dies in a light power press, known as a clicking machine, operating with a quick slow controlled by a foot treadle.

CEMENTING AND DRYING CEMENT ON CONVEYOR BELTS.

The thin strip of rubber uniting the sole and upper all around the edge of the shoe, is called foxing. The rubber stock from which it is made comes to the cutting room in the form of a long sheet wound with a cotton liner on a roll, the cutter separates the liner from the rubber sheet and draws it over the cutting-block where, by means of a hand-die and raw-hide mallet, he cuts the foxing in curved forms and places it in cloth-leaved books for the maker's use.

DETAILS OF MAKING. LASTING.

In the assembly of parts the first operation is that of lasting the laced vamp tightly over the shoe last and attaching it over the

ATTACHING THE FOXING.

edges of the inner sole by the adhesion of its cemented edges. The sole at this stage of the process consists of two pieces, the inner part of leather cemented to a rubber and filler combination stiffening piece.

CEMENTING.

The lasted shoe is given a liberal coating of rubber cement, brush-spread over the bottom and allowed to dry thoroughly before the application of the rubber parts. By means of a conveyor belt, the uncemented shoes reach the cementer and leave

**ATTACHING THE OUTSOLE.**

him continuously, drying as they travel toward the next operation.

FOXING.

The finishing strip which encircles the shoe and receives the skived edge of the rubber sole is next put in place, together with a rubber toe piece, in case one is used. The work is sometimes called upping the shoe.

SOLE CUTTING.

The rubber stock for outer soles is run in sheet form by a special calender provided with a knurled roll to impress the design for sole and heel surface and trade-mark in the shank. In

**THE OPERATION OF ROLLING.**

the form of short sheets the calendered soling stock is fed through the sole-cutting machine by which the sole is cut with skived edges, the form and size being controlled by the particular sheet-metal pattern adjusted to the machine.

OUTSOLING.

A part of this operation is done by hand and a part by machinery. The rubber sole must be accurately placed as to width and length and is set as viewed from above. If hand-rolling only is practiced, the work of soling is all done by one operator using an ordinary hand-roller and a stitcher to turn up the skived edge of the sole and unite it perfectly to the foxing. Otherwise the shoe is taken to a rolling machine which rolls the sole and presses it down firmly.

For the work of rolling, automatic machines are used which, although complicated, are simple to handle. The worker sets the shoe in place, moves a switch, and the machine carries the shoe under heavy rollers and back again. Most machines are double so that the operator can set one shoe for each movement of travel. In this way an operator may roll as high as 30,000 to 40,000 shoes in one day.

EDGING.

In team work it is customary to employ a power edging machine which comprises a motor, a rubber hammer, and a steel

**STARTING WHITE TENNIS SHOES.**

edger. The machine is constructed so that the hammer is driven at a high speed with about a half-inch stroke. The operator holds the shoe up against the hammer and the action of the machine welds the sole down firmly. The edger works much like the hammer and the worker holds the shoe so that the sole is trimmed and the foxing stitched at the same time.

FINISHING.

Clean-finish white tennis shoes are sometimes dusted with starch. They are arranged on trays and placed in a chamber provided with means for carrying away the dust from the workers. Colored shoes receive a brush coat of special vulcanizing varnish on the soles.

CURING.

Vulcanizing is effected, as a rule, in pressure-cure vulcanizers. Following this come stripping off the lasts, inspection, tying, sorting, and boxing in cartons usually made on the premises.

DURING THE MONTH OF FEBRUARY, 1919, 745,906 POUNDS OF plantation rubber were exported from British North Borneo.

What the Rubber Chemists are Doing.

SYNTHESIS OF CAOUTCHOUC.

THE FOLLOWING ABSTRACT from the "Journal of the Society of Chemical Industry," volume 38, 428A, June 30, 1919, summarizes an article by H. Standing.¹ In polymerizing isoprene, compounds of the terpene series are simultaneously produced, in quantities varying with the conditions of polymerization, and these influence the character of the final product. Synthetic preparations, although very similar to the natural product, are not yet identical, as has been shown by Stemmig.²

In order to obtain a tougher synthetic rubber attempts have been made to mix the isoprene with styrol, linseed oil, and especially tung oil, but all the products are more or less sticky. The ordinary inorganic and organic peroxides, such as sodium peroxide and benzoyl peroxide, do not accelerate the polymerization to such an extent as pure oxygen, but, like ozone, are used in technical processes as catalysts. The varieties of rubber obtained by polymerizing butadiene and dimethyl-butadiene differ in character from the isoprene product, and methylcaoutchouc from dimethylbutadiene is now an important synthetic product in Germany. The yield of isoprene from oil of turpentine is increased by carrying out the process *in vacuo*.³ By using limonene instead of oil of turpentine the yield is increased from about 25 per cent to 65 per cent. Essential oils, however, cannot be obtained in sufficient quantity to be practicable sources of isoprene. The production of butadiene from phenol and of isoprene from cresol would be too expensive, while these substances are required for other purposes. Coke-oven gases are a cheaper source of benzene, and synthetic rubber has been successfully prepared in Germany by converting this benzene successively into cyclohexane, chlorocyclohexane, and tetrahydrobenzene, which, on heating, gives butadiene and ethylene. The amount of butadiene and isoprene in coal tar would only furnish a small fraction of the amount required, while the conversion of alcohol into butadiene would be too expensive, apart from the fact that the most favorable conditions for the reactions have yet to be discovered. If impure butadiene hydrocarbons are used sticky products are formed. American petroleum contains at least one per cent of a mixture of the three pentanes (boiling at 9, 30 and 38 degrees C.), which at the present time is practically a worthless constituent of the gases. About 370,000 tons per annum of these compounds would be available in the United States. It has been shown by Holt⁴ that they could be converted into isoprene, but this synthesis would be practicable only in America. Acetone prepared from acetylene was used in Germany during the war as the source of synthetic rubber. It was reduced by means of aluminum to pinacol, which was then converted into dimethyl-butadiene and dimethylcaoutchouc. The plant is capable of producing about two thousand tons of rubber per annum, but under normal conditions the process would be too expensive.

MECHANICAL COAGULATION OF RUBBER.

A current of air is passed over the surface of the warm latex, the temperature of which is raised either by applying heat at the bottom of the vessel or by preheating the air. In order to avoid the formation of a skin which would prevent the action of the air on the deeper layers of latex, the mass is kept stirred by rocking the vessel. The crêpe obtained from the final coagulum has a light color, and in quality appears comparable with rubber

prepared by the customary process of coagulation with acetic acid. ("Journal of the Society of Chemical Industry," May 31, 1919.)

EFFECT OF EXPOSURE TO WEATHER ON RUBBER GAS-MASK FABRICS.

A paper by G. St. J. Perrott and A. E. Plumb in "The Journal of Industrial and Engineering Chemistry," May, 1919, pages 438-443, reports the results of their investigations on the effect of exposure to weather on rubber gas-mask fabrics.

Fabrics of different manufacture and consisting of finely-woven cotton sheeting covered with a rubber layer from 0.01 to 0.025-inch thick, deteriorated very slowly over a period of 100 days. There was a general relation between the amount of acetone extract and the permeability, and deterioration was more rapid in the summer months than in winter. Fabrics exposed rubber side downwards showed no appreciable deterioration over the whole period; those exposed rubber side upwards, but shielded from ultra-violet light, deteriorated at about the same rate as those exposed to the direct rays of the sun. There was no apparent relation between the results of weather aging and an accelerated aging test at 130 degrees C. The tensile strength of all the fabrics decreased by 15 per cent during the exposure. Both the fabric and rubber rotted when exposed to high concentrations of phosgene for 15 hours. Analysis of the fabrics indicated that over 10 per cent of bitumen was undesirable and that as high as 20 per cent of carbon tended to preserve the fabric, especially when exposed to direct sunlight. Fabrics with a high percentage of gum (rubber) were more resistant than those containing a large amount of filler.

X-RAY EXAMINATIONS.

At a joint session of the Faraday and Röntgen Societies, April 29, 1919, in the rooms of the Royal Society, Burlington House, London, the subject of the examination of materials by X-rays was discussed from an engineering standpoint in a series of papers by noted authorities.

Quoting from abstracts of these papers:¹

It is now known for certain that X-rays are nothing but ordinary light waves of very small wave length. This fact explains their extraordinary property of penetrating all substances, more or less, and it also follows that, generally speaking, the smaller the wave length, the greater the penetrating power. It is therefore the production of the so-called "hard" rays, those of exceedingly small wave length, that principally interests the engineer. But such rays require a very high tension discharge to produce them, and this, coupled with the limitation which the intense local production of heat places in the way of making tubes which can absorb a great deal of energy, is the principal difficulty in the way of practical progress. Up to the present it is hardly a workshop proposition to examine more than an inch or two of steel (although it is claimed that 4 inches have been penetrated)—and even so, considerable exposure is necessary, some 250 seconds for 35 mm., but as much as 2,000 seconds for 40 mm., according to M. Pilon and Mr. Geoffrey Pearce.

The most powerful tubes at present used require a voltage of more than 100,000, and they absorb some 50 kw. It is therefore obvious that further progress will call for all the skill and knowledge at the disposal of the physicist and electrical engineer.

S. A. Pollock, of the British Post Office, stated that for the examination of soft materials like gutta percha, in which impurities were often introduced, and for discovering defects in the lead sheaths of underground cables, the method had been found extremely useful.

GERMAN EBONITE SUBSTITUTE.

A new ebonite substitute known as "Hornite" has been introduced by The Hornite Works Joint Stock Co., Düsseldorf, Germany. Hornite is prepared from industrial residues and in

¹ "Schweiz Chemische Zeitschrift," 1919, Volume I, pages 1-5, 28-33, 60-64.

⁴ "Journal of the Society of Chemical Industry," 1914, page 364.

¹ "The Electrical Review," June 6, 1919, page 679.

appearance and wearing qualities not only replaces ebonite, but, owing to its extraordinary cheapness and special qualities, may displace ebonite in the market. It may be used for practically every purpose for which ebonite is adapted. ("Electrical Review," London.)

ANALYSIS OF VULCANIZED RUBBER.

THE FOLLOWING METHODS for the analysis of vulcanized rubber are by J. A. S. Morrison in "The India Rubber Journal," June 21, 1919.

RUBBER RESINS.

Rasp the sample into small pieces, weigh out four grams, and extract with acetone in a Soxhlet extractor for two days. Dry the extract at 100 degrees C., and weigh. This extract contains rubber resins and free sulphur, the latter being estimated in the extract as described later. Total extract minus free sulphur gives rubber resins. Reserve the residue from the extraction for the determination of the rubber substitutes.

MINERAL MATTER.

One or two grams of the original sample is boiled with 50 cc. nitrobenzene in a flask fitted with an air reflux condenser; cool and wash into a 300-cc. tall beaker with a mixture of two volumes of sulphuric ether and one volume of ethyl alcohol; dilute to about 250 cc. with this mixture; stir and allow to stand over night to settle. Viscous deposits are due to insufficient ether, and more should be added if these occur. Filter the insoluble matter on a tared filter, dry and weigh. This gives organic matter insoluble in nitrobenzene plus mineral matter. The contents of the tared filter are washed with warm dilute hydrochloric acid. Wash the acid out with water, dry and weigh. Finally ash the paper and residue and weigh. Ash plus loss due to hydrochloric acid washing gives total mineral matter. The extraction with hydrochloric acid is to extract carbonates as such.

The difference between the total nitrobenzene residue on the tared filter and the total mineral matter gives the organic matter insoluble in nitrobenzene. Carbon, if used as a filling, will be included in this figure.

FREE SULPHUR.

Take acetone extract (rubber resins) in flask, moisten with water and cautiously add 25 cc. fuming nitric acid, cooling the flask in ice. Gently warm and finally digest on steam bath, using a funnel as cover. When action is complete wash into a porcelain dish with a few cc. of fuming nitric acid, and evaporate off all the acid. All the sulphur is now converted to sulphuric acid. Intimately mix the mass with five grams of a mixture of three parts sodium carbonate and two parts of potassium nitrate, moisten slightly with water and mix well. Cover with a large dish and heat over a low flame till white. Cool and take up with concentrated hydrochloric acid, evaporate to dryness twice to precipitate silica, and finally dissolve in dilute hydrochloric acid, filter and precipitate as barium sulphate. Filter, dry, weigh and calculate as free sulphur.

OXIDIZED OIL RUBBER SUBSTITUTES.

The residue from the acetone extraction in the determination of rubber resins is digested with 100 cc. of approximately half normal alcoholic potash for four hours at 60 to 70 degrees C. Pour off through a filter and digest residue twice with warm alcohol. Mix filtrate and alcoholic washings and evaporate nearly all the alcohol. Take up residue in a little cold water, transfer to a separatory funnel, acidify and remove fatty acids with ether. Evaporate ether extract to dryness and weigh. This gives fatty acids of oxidized oils, and is taken as the percentage of rubber substitutes.

VULCANIZED RUBBER.

This is obtained by subtracting the sum of the other determinations from 100.

TOTAL SULPHUR.

The method is the same as that described under free sulphur, except that the original rasped sample is used. The difference between total and free sulphur gives combined sulphur, but this is included in vulcanized rubber and seldom separately expressed.

Ash is often determined by ashing in a porcelain crucible, recarbonating with ammonium carbonate solution, and finally igniting at a gentle heat. The ash is generally lower than total mineral matter because some mineral matters do not recarbonate easily. Nevertheless it serves as a useful check on the figure for mineral matter.

CHEMICAL PATENTS.

PROCESS OF PRODUCING ISOPRENE. (O. Graul and G. Hanschke. United States patent No. 1,298,929.)

VULCANIZING RUBBER MIXTURE suitable for repairing punctures in tires, consists of crude rubber, one pound; gasoline, three pints; litharge or red lead, seven ounces; lead acetate, two ounces; sulphide of mercury, seven ounces; asphalt, three ounces, and sulphur, 2½ to five per cent of the weight of the rubber. (W. T. Hale, Dodge City, Kansas. United States patent No. 1,300,263.)

METHOD OF TREATING VULCANIZABLE PLASTICS by first applying an internal vacuum, and then vulcanizing under external heat and pressure, the vacuum being continued during that portion of the application of the vulcanizing temperature during which vapors or gases are given off by the rubber. (Raymond B. Price, Mishawaka, Indiana, assignor by mesne assignments to The Goodyear's Metallic Rubber Shoe Co., Naugatuck, Connecticut. United States patent No. 1,309,485.)

DECORATED RUBBER ARTICLES made by compounding a mass of unvulcanized rubber with a light sensitive material, forming the compound into the article desired, and subjecting the surface of the article to light rays conforming with the desired design, and then subjecting the article to heat. (Albert A. Somerville, Flushing, N. Y., assignor to New York Belting & Packing Co., New York City. United States patent No. 1,309,703.)

THE UNITED KINGDOM.

DEVULCANIZING WASTE RUBBER is effected by treatment with a vulcanizing accelerator in the presence of a reagent capable of removing the sulphur as it is liberated. Preferably, uncombined sulphur is first removed; the rubber should be in a finely divided state, for example, in solution; and no moisture should be present. A temperature of 170 to 180 degrees C. is preferable. Examples of accelerators used are aniline, piperidine and paramido-dimethyl-aniline. (D. Spence, Norwalk, Connecticut, U. S. A. British patent No. 126,397.)

SURGICAL DRESSINGS made up in the form of candles with wicks so that the material is readily melted and applied. The candles are coated with paraffined paper or with a solution of lacquer, wax, resin, cellulose acetate. Suitable additions to the paraffine are rubber or latex, antiseptics or medicaments. (P. Ehrhardt, 95 rue Jouffroy, Paris. British patent No. 126,501.)

VULCANIZATION ACCELERATORS. Double compounds of nitroso-dimethyl-aniline or its homologs with aromatic bases are used as accelerators in the vulcanization of rubber. Compounds containing two molecules of nitroso-dimethyl-aniline and one molecule of aniline, dimethyl-aniline, ortho-toluidine, diphenylamine, or alpha-naphthylamine are given by way of example. (J. F. B. van Hasselt, 92 Almondestraat, Rotterdam. British patent No. 126,606.)

CHLORINATING INDIA RUBBER. In the production of a substance for use as a substitute for celluloid, leather, or the like, by

treating a solution of rubber with chlorine, or bromine and chlorine, the rubber is dissolved in benzene or a homolog. Chlorine is passed through the solution until the rubber has taken up approximately twice its weight of chlorine. The presence of catalysts is avoided. The hydrochloric acid produced is removed by heating or neutralized, for example, by ammonia or lime. (H. M. Broadhurst and A. Lambie, Cunard Building, Liverpool; S. J. Peachey, 5 Yew Tree Road, Davenport, Stockport; and United Alkali Co., Cunard Building, Liverpool. British patent No. 127,481.)

OTHER CHEMICAL PATENTS.

THE FRENCH REPUBLIC.

- 485,621. Aromatic substitute for rubber. J. Fluit.
- 485,148. Isolar compound. E. von Vargyas.
- 485,778. Treating rubber and rubber substitutes. General Rubber Co.
- 485,297. Treating latex preparatory to vulcanization. General Rubber Co.
- 485,027. Regulating rubber of the like. General Rubber Co.

RUBBER DIVISION OF AMERICAN CHEMICAL SOCIETY.

THE first meeting of the newly organized Rubber Division of the American Chemical Society will be held in Philadelphia, Pennsylvania, September 4 and 5.

A large attendance is expected and in view of the very interesting program that has been provided, the meeting promises to be a most successful one. The following reports and papers will be read:

1. Report of the Executive Committee.
2. Report of the Secretary.
3. Report of the Fruit Jar-Ring Committee. I. J. Plumb, chairman.
4. Report of the Committee on Physical Testing. H. E. Simmons, chairman.
5. "A Method of Determining Permanent Set in Rubber Goods." E. L. Davies.
6. "A New Method for the Determination of Sulphur in Rubber Mixtures." G. D. Kratz, A. H. Flower and Cole Coughlin.
7. "The Extraction of Rubber Goods." S. W. Epstein and B. L. Gonyo.
8. "The Theory of Balloon Fabric Protection." John B. Tuttle.
9. "The Expansion of Rubber Compounds." C. W. Sanders-on.
10. "Volume Increase of Compounded Rubber Under Strain." H. F. Schuepel.
11. "The Determination of Cellulose in Rubber Goods." S. W. Epstein and B. L. Gonyo.
12. "The Variability of Crude Rubber." John B. Tuttle.
13. Symposium on the "Action of Accelerators during Vulcanization." Led by J. H. Scott.
14. "The Action of Certain Organic Accelerators in the Vulcanization of Rubber." G. D. Kratz, A. H. Flower and Cole Coughlin.
15. "Reactions of Accelerators during Vulcanization." C. W. Bedford and Winfield Scott.
16. "The Effect of Organic Accelerators on the Vulcanization Coefficient." D. F. Gramer.
17. "The Effect of Compounding Ingredients on the Physical Properties of Rubber." C. Olin North.
18. "Some Methods of Testing the Hardness of Vulcanized Rubber." H. P. Gurney.
19. Symposium on the "Testing of Pigments." Led by George Oenslager.
20. Contribution from M. M. Harrison and M. M. Kahn.
21. "The Manufacture and Use of Cismon Antimony." J. M. Bierer.
22. "Laboratory Apparatus." C. P. Fox.
23. "The Value of a Library to the Rubber Laboratory." H. E. Simmons.

FIFTH NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES.

The Fifth National Exposition of Chemical Industries will be held at Chicago, Illinois, Coliseum and First Regiment Armory, the week of September 22, 1919.

This will be the largest gathering of chemists in the United States since the war. The leading engineering and metallurgical societies of the country plan to hold meetings at which many interesting and important papers will be presented. There will be many new exhibitors in addition to all the former ones, covering the entire field of chemical industries.

"CRUDE RUBBER AND COMPOUNDING INGREDIENTS" AND "RUBBER MACHINERY," by Henry C. Pearson, should be in the library of every progressive rubber man.

LABORATORY APPARATUS.

QUIET EVAPORATION.

THE TENDENCY OF SOLUTIONS in beakers or flasks to bump on a hot plate may be obviated by substituting an oil bath for the plate. The containers should be immersed so that the oil of the bath will be at a higher level than that of the solution to be heated. The solution will thus be heated evenly and boil quietly as in the case of steam-jacketed kettles.—("The Chemist-Analyst.")

PINCH CLAMP.

The Day pinch clamp, shown in the illustration, can be placed on rubber tubing from the side without disconnecting the apparatus. It has a firm, strong grip, sufficient for all tubing up to $\frac{3}{8}$ -inch in diameter. The thumb grips are large and well located for effectiveness. This is said to be the only pinch clamp on the market that can be fastened on tubing without disconnecting the apparatus of which it is a part. (Central Scientific Co., 460 East Ohio street, Chicago, Illinois.)

DAY PINCH CLAMP.

WEIGHING BURETTE.

A simple weighing burette has been devised to avoid certain of the disadvantages of ordinary burettes, such as inaccuracy of bore, temperature variation, drainage, and difficulty of accurate reading. This instrument obviates all corrections and allows nearly as rapid work as the ordinary style, with accuracy limited only by the sensitiveness of the end-point.

To use the burette, turn up with the cock closed, so that the capillary is over the titrating vessel, and allow the heat of the hand to force the standard solution into the capillary. Then when the cock is opened the liquid will flow freely, and there will be no danger of loss through the cock. When near the end-point, the cock may be closed and the solution forced in drops by the heat of the hand.

A predetermined quantity of solution cannot be delivered without repeated weighings, but a little practice will enable the user to estimate the desired quantity within a few per cent. A 100-cc. flask with rubber stopper, cock, and capillary, weighs about 40 grams.—("The Journal of Industrial and Engineering Chemistry," July, 1919.)

WEIGHING BURETTE.

REMOVING PLUGS FROM STOP-CKOCKS.

An effective device for removing plugs from glass stop-cocks is here illustrated and described.

METHOD OF REMOVING STOP-CKOCK PLUGS.

With nothing but wood, the plug can easily be removed without damaging either barrel or plug.—("The Journal of Industrial and Engineering Chemistry," May, 1919.)

The common method of removing the stuck plug is to hammer gently on a small piece of wood placed on the plug, often resulting in the barrel being cracked, the plug chipped and breakage of important parts of complex apparatus. If, however, the steady pressure of an ordinary vise is exerted on the plug with the glass in contact

New Machines and Appliances.

C-H SOLENOID BRAKE, FOR RUBBER MILL DRIVE.

THE INSULATION of brakes and clutches on driving shafts for the instantaneous stopping of rubber mill machinery is now almost universal in the large rubber plants, and many of the smaller plants are employing this means of reducing the hazard assumed by workmen engaged at the mixing

C-H MAGNETIC CLUTCH BRAKE ON WASHER LINE.

rolls, washers, crackers and calenders. Electrically operated brakes and clutches have the advantage of remote control. This is a very important feature as it permits the releasing of these devices by switches located conveniently to the workmen.

A brake which is applied by gravity and released by an electro-magnet is especially desirable because it is positive in its operation. A band brake of this type consists of a cylindrical cast-iron shell enclosing a bobbin-wound coil, which when energized actuates a plunger. The brake band of woven asbestos lining is drawn taut by means of a weighted lever, which is

MAGNETIC BRAKE AND CLUTCH ARE OPERATED BY MOVEMENT OF CRADLE SWITCH OVER WASHERS.

attached to the solenoid plunger. When the lever is in its normal position, the brake is applied. Upon starting the motor the current energizes the solenoid, thus lifting the lever and releasing the brake. As no latches of any kind are used, there is no possibility of the brake failing to function. Any derange-

ment in the solenoid brake system causes the brake to be applied, thus resulting in a safe condition.

In a recent test a 200-h.-p., 590-r.p.m. motor driving three mills without load at full speed, was disengaged by a cut-off device, the brake and clutch being operated at the same time. A chronograph employed to measure the movement of the drive-roll periphery indicated only 4 inches subsequent to the operation of the cut-off device. The same test was repeated with the brake inoperative and the chronograph indicated a movement of 86 inches. When neither the brake nor clutch was used, the rolls traveled 376 inches, or about four revolutions. Under normal working conditions, with the mills loaded, the movement of the rolls will necessarily be still less than the minimum of 4 inches obtained in this test.

It is thus shown that although a clutch alone affords a large measure of protection, complete protection is impossible without the use of a brake. (The Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin.)

A NEW THREE-ROLL CALENDER.

The advantages claimed by the makers of this recently designed machine are that the calender, reducing gear, and motor are all mounted on a straight line bed-plate, the design is compact, and the reducing gear is mounted on roller bearings and provided with splash oiling system while the jack-shaft bearing is combined with the gear-reducing housing.

THE W-S-M CALENDER.

The calender frame is of the hollow cast-iron type and heavily ribbed. It is firmly tied across the top with two cast-iron separators and at the bottom with the cast-iron base plate. The rolls are cast iron with chilled face, finished all over and ground to size. They are cast hollow, bored out to insure uniform thickness, and ground concave and convex to suit their respective work. They are fitted with packing boxes for water connections and any or all of them can be removed without removing either frame from the base plate. Each roll is carried on cast-iron bearing shells lined with hard bearing bronze. The bearing bushings have large oil grooves and are lubricated from sight feed glass oil-cups mounted on the frame.

The calender is equipped with cut herringbone-gears throughout except the wind-up gears which are cut spur-gears.

The upper and lower rolls can be adjusted to any desired opening by a hand-wheel located on the side of the frame. It consists of a series of bevel and worm gears and screws that act directly on the bearing shells. Either end of either roll can be lowered or raised by engaging or disengaging the clutches

which form a part of the adjusting mechanism. A motor for raising or lowering the rolls can be placed on the calendar frame.

A friction-driven wind-up and friction-controlled let-off are mounted on the frame. This wind-up is driven through a train of cut spur-gears from the end of the rolls to the adjustable friction-clutch on the spindle. All of the gears are protected by cast-iron guards. The wind-up can be run in either direction by changing one of the spur-gears from one stud to another.

The calender is equipped with an adjustable knife holder with sufficient number of collars to perform all ordinary operations.

In the reducing gear cut herringbone-gears are used. The pinion is of forged high-carbon steel and is made in one piece with the shaft. The gear is a steel casting. The shafts are mounted on heavy-duty steel mill-type roller bearings and the gears are encased in a cast-iron oil-tight housing. The lower half of the housing carries the bearing.—(The Wellman-Seaver-Morgan Co., Cleveland, Ohio.)

THE BRADLEY STENCIL MACHINE.

The stencil machine here pictured is a device for the shipping department to save time and labor in the addressing of freight and express shipments.

On this machine, a consignee's name and address can be cut into a paper stencil in about 30 seconds. With this stencil, the average shipment can be marked in one-fifth the time consumed

MACHINE FOR CUTTING STENCILS.

by the average marker with a hand-brush. By laying the stencil on the box or carton, and then rubbing the brush over it, the name and address are left imprinted neatly and legibly on the surface of the package.

On account of its neatness, stenciling is considered an improvement over tagging or labeling. Because it is always legible and secure, the express and railroad companies recommend stenciling to obviate lost and delayed shipments. (Bradley Stencil Machine Co., St. Louis, Missouri.)

MILL ROLL TEMPERATURE CONTROL.

It is a well-known fact that rubber stock while being mixed on the rolls constantly builds up frictional heat, and if not controlled it will start vulcanization and result in burning the stock, making it unfit for use.

The regulator shown in the accompanying illustration automatically controls the temperature in mill rolls, and operates in the following manner:

The thermostatic element of the regulator is placed in the discharge line from the mill-roll, the diaphragm valve being placed on the inlet water line of the mill-roll. The regulator is of the type known as a reverse action regulator—that is, it functions when the temperature reaches a certain height, so

that through a direct-action diaphragm valve, an increasing flow of water will be admitted to the line going to the mill-roll, thus

bringing the temperature down. (Taylor Instrument Co., Rochester, New York.)

RUBBER-DUST COLLECTOR.

A new application of a well-known principle may be seen in the accompanying illustration that shows a blower being used for removing rubber dust from a tire-buffing machine.

The installation consists of a direct-connected volume blower set on a platform on the side wall. A duct runs from the inlet or exhaust side of the blower to two emery buffing wheels. These emery wheels are partly covered by a crescent-shaped hood, which catches the dust from the tire casing, draws it up into the blower, and discharges it into the cyclone dust collector. The rubber particles and grindings after entering the collector drop to the bottom through a pipe into a receptacle. (Ilg Electric Ventilating Co., Whiting and Wells streets, Chicago, Illinois.)

REMOVING DUST FROM TIRE BUFFER.

MACHINERY PATENTS.

CORD-FABRIC-FORMING MACHINE.

THE FABRIC-FORMING MACHINE here illustrated produces rubberized cord fabric for tire building by a method which eliminates the losses of economy inherent in the usual methods of cord-tire construction.

The machine is of such character that a spool of cord is placed at one point in the machine and in its course through the machine is impregnated with rubber, wound on a mandrel and receives a skim coating of rubber, applied over the cords formed upon the mandrel; then, this covering of rubberized and coated cords is cut on the bias into plies of width required for building a tire carcass.

The central unit of the machine includes a mandrel-driving mechanism, and a cord-impregnating, feeding, and tensioning mechanism for supplying the cord to the mandrel. A second unit consists of the mandrel-collecting and feeding mechanism. The third unit comprises the gum-wrapping and stripping mechanism.

In operation, the cord from the spool *D* passes through the cement pot *E*, through the vacuum-drying chamber *F*, around the tension *G* to a securing hook on the end of a mandrel *H* which is spirally grooved at a light pitch. The mandrel is rotated and the winding of the rubberized cord upon the mandrel commences. At this time the mandrel-loading mechanism is put in operation so that when the first mandrel is completely

MACHINE FOR MAKING TIRE-BUILDING FABRIC STRIPS.

wound, another one will be in the proper position to be next covered with the cord.

When the mandrel is nearly wound the free end of a gum strip *I* is attached to the end of the mandrel and the driving mechanism *J* thrown into operation. This causes the screw-threaded rail *K* to revolve slowly, and the gum-strip-applying mechanism to travel in opposite direction to that of the mandrel. The difference in speed compensates for the width of the gum strip, allowing sufficient lapping to cover the mandrel completely. At the completion of this operation the rotation of the mandrel is stopped and the operator then severs the cord at the junction of the two mandrels, fastening the ends around the securing hooks on the mandrels. The transferring cradle is then rocked, delivering the freshly covered mandrel into the stripping trough *L*. The machine is again started and the operation just described is repeated.

In the stripping trough the mandrel is stripped of its covering by means of a knife inserted into an appropriate groove. The operator slowly revolves the mandrel with one hand at the same time thrusts the knife forward in the groove with his other hand and severs the cords and fabric. He then deposits the severed fabric strip in any suitable stock take-up or rolling table. (Frank A. Seiberling, Akron, Ohio, assignor to The Goodyear Tire & Rubber Co., a corporation of Ohio. United States patent No. 1,309,424.)

THE EDITOR'S BOOK TABLE.

"TECHNICAL CHEMICAL ANALYSIS," BY R. H. H. AUNGST, INSTRUCTOR in Technical Chemistry, Pratt Institute, Brooklyn, New York. The Wiley Technical Series, J. M. Jameson, Editor. John Wiley & Sons, Inc., New York. (Paper, loose-leaf, 8 by 10 1/2 inches, 44 sheets.)

THIS publication constitutes a loose-leaf laboratory manual for students, and comprises methods for the technical chemical analysis of a variety of organic and inorganic products as coal, iron and steel, water, sugar, animal and vegetable oils, pigments, paints and rubber. In view of the practical importance of the subject the section devoted to the analysis of rubber might well be extended to include many more available analytic methods.

"BULLETIN DES CAOUTCHOUCS," INSTITUT COLONIAL DE MARSEILLE, FRANCE. H. LEBLANC & L. PIERRE, 40 rue des Grands-Augustins, Paris.

The "Bulletin des Caoutchoucs," of which two numbers have appeared to date, is one of several publications of the Institut Colonial de Marseille, France. The work of the Institute is comprised in special sections devoted respectively to cereals and starch-producing plants, grasses and caoutchouc. The chief of the caoutchouc section is G. Van Pelt, who discusses at length in Bulletin No. 1 the program of the section, and proposes in conclusion:

1. The establishment of laboratories on important plantations under the direction of specialists qualified to undertake the study of questions of interest concerning production, or at least have present on the ground a director experienced in the scientific culture and preparation of caoutchouc.
2. Continuous collaboration of the plantation technical service with special laboratories, official or otherwise, in the producing countries.
3. The establishment of a scientific evaluation service in place of the present empirical trade methods.
4. A scientific organization specializing in matters applying to the rubber industry.
5. Close collaboration of this scientific organization with the technical service for manufacture.

In demonstrating the advantages to be derived from the application of the above proposals the importance is repeatedly insisted upon of connecting all the various organizations working within its prescribed limits. This connection will permit all specialists to furnish a maximum of useful effort, and they will be kept continuously informed of the condition of the studies undertaken and the importance of the new problems to be investigated.

NEW TRADE PUBLICATIONS.

THE ARMSTRONG RUBBER COMPANY, INC., GARFIELD, NEW JERSEY, is sending out an interesting and instructive pamphlet, showing all the stages of the manufacture of its tires and inner tubes from receipt of the crude rubber to the shipment of the finished product. Each stage is illustrated with half-tone engravings, making a graphic exposition of the hand method of building tires. The book is handsomely printed in two colors, with an embossed cover, having a cut-out to show a half-tone of the finished tire.

* * *

F. C. MATHIESON & SONS, LONDON, ENGLAND, HAVE ISSUED Number 20 of their handbook, "Rubber Facts and Figures," under date of May, 1919, which gives in compact form the usual voluminous amount of information regarding the many British-owned rubber planting companies. The book is of value to the investor, giving facts regarding capital stock, area of land and number of trees, annual amount of rubber harvested, dividends paid, etc., and is of interest to the rubber trade generally as showing the steady increase in production of plantation rubber, its fluctuations of prices, costs, forward sales, etc.

THE RUBBER GROWERS' ASSOCIATION HAS PUBLISHED THE FIRST number of its "Bulletin," which is to be sent free to every member of the Association. There will be no advertisements. Besides papers on rubber supply, markets, and so forth, and the proceedings of the Association, the "Bulletin" prints a variety of scientific papers and articles relating to rubber in all its branches.

* * *

"TIRE TRADE JOURNAL." THIS IS A NEW AND INTERESTING publication from the press of The Gardner-Moffat Co., Inc., of New York. It carries some 20 pages of reading, 30 of advertising, and a very complete price list of standard makes of tires and tubes. In his excellent foreword the Editor outlines the broad field that the publication plans to cover. In brief, while the manufacturer of tires will be kept informed regarding new processes and machines, the tire dealer and repair man will also be posted in all that pertains to sales, distribution, and brought into close contact with the manufacturers.

The first issue is excellently gotten up and of much interest. Editor Pinto and his staff are to be congratulated.

* * *

THE MOTOR AND ACCESSORY MANUFACTURERS' ASSOCIATION issues its year book for 1919, at the end of the fifteenth year of the existence of the association. Besides the statement of the work done during the past year, the plans for the future and the formal records of the association, this issue contains interesting accounts of the war activities of the various sections of the association, with many portraits and sketches of officials.

* * *

A NEW CATALOG OF HYDRAULIC MACHINERY MANUFACTURED BY the Camden Iron Works, Camden, New Jersey, includes machines used in the manufacture of pneumatic and solid rubber tires, the heavy type of tire-applying presses used in garages, hydraulic presses for shoe sole and heel manufacture, heavy presses for making rubber hose, accumulators of all types, and steam or power pumps for all services.

* * *

FOREIGN TRADE SERIES NO. 1, ENTITLED "DISCUSSION OF AND Practice and Procedure under the Export Trade Act," has been published by the Federal Trade Commission, Washington, D. C., for the benefit of those desiring to co-operate in the development of American foreign trade through associations formed under the Webb-Pomerene law. The pamphlet contains many facts of importance to all firms doing an export business, including the text of the Webb law, sections of the amended Wilson Tariff Act, and of the Federal Trade Commission Act.

CUSTOMS APPRAISER'S DECISIONS.

No. 43178.—Protests 931667, etc., of The Rubber Association of America et al. (New York).

GUTTA PERCHA, GUTTA HANGKANG, GUTTA KATIAN, GUTTA TEWEH are certain gums, classified at 10 per cent ad valorem under paragraph 385, tariff act of 1913, are claimed free of duty as gutta percha under paragraph 502. Merchandise invoiced as gutta hangkang, gutta katian, gutta percha, and gutta teweh was held entitled to free entry under paragraph 502. G. A. 8194 (T. D. 37759), G. A. 8081 (T. D. 37284), and Abstracts 42908 and 42885 followed. (Treasury Decisions, Volume 36, No. 25, June 5, 1919.)

* * *

No. 43213.—Protest 930720 of Pitt & Scott (New York).

RUBBER RINGS.—Merchandise invoiced as "G. G. rings" classified as a manufacture of hard rubber at 25 per cent ad valorem under paragraph 369, tariff act of 1913, is claimed dutiable as a manufacture of india rubber or gutta percha at 10 per cent under paragraph 368. On the authority of Abstract 43008 the rubber rings in question were held dutiable under paragraph 368. (Treasury Decisions, Volume 36, No. 25, June 19, 1919.)

New Goods and Specialties.

WATERPROOFS IN ENGLAND.

MORE BRILLIANT COLORS and fancy designs are appearing in waterproof goods in London, apparently as a reaction from the gloom of the war. Ladies' waterproofs are being made, for instance, in black and white check with inset collar and belt; or in white with a deep sailor collar inset in black, with a deep blouse and cuffs also black; or in biscuit shades of fawn inset with navy-blue. Cashmeres, in subdued shades of Saxe blue, mauve, champagne, and mole are also seen. Other designs follow the "dazzle" idea.

For children, new designs are carried out in color schemes in which Saxe blue, Royal blue, purple, scarlet, rose-pink, and various shades of green are employed.

Many of the girls' coats have collars, belts and cuffs; cable-stitched or piped. Some are in raglan shape, single or double breasted, with contrasting trimmings, making the children's garments as smart as those of adults.

THE "INDIAN" TYPE WATERPROOF. DESIGNS FOR ENGLISH CHILDREN'S WATERPROOFS.

THE "APSOLE" OUTING SHOE.

A marked improvement in the manufacture of cloth-upper, rubber-soled footwear, of the so-called "tennis" variety is the elimination of the rubber foxing strip connecting the soles with the uppers, and use of a welt process, somewhat similar to the process used in factories making leather footwear.

The soles are of the "fiber" variety, made of a compound of rubber and fiber, and having greater durability than all-rubber soles, and the inner soles are of cork, insuring coolness and comfort. The result is a much more durable boot or shoe, and a far handsomer one, and as it is made on the latest fashionable last, this line is having such a demand from the trade as to greatly exceed the factory production. (Apsley Rubber Co., Hudson, Massachusetts.)

WEATHER PROOF VEST.

"PERFECTION" CAPE.

THE "PERFECTION" CAPE.

A new type of waterproof cape is made of Tyco silk, rubberized with Para rubber on one side, with smoked silk finish on the other. It is made in one piece and opens along the sides of the sleeves and body, where it fastens with snap buttons. It packs

8 by 4 by 1½ inches. (Athol Manufacturing Co., Athol, Massachusetts.)

"MURIEL APSOLE" SHOE.

"GASPRUF" TUBING.

A safe flexible tubing for conveying gas, and one in which gas may be left standing without fear of leakage is shown in the sectional view below. It consists of two tubings in one. An inner core of rubber-packed flexible galvanized steel is covered with a double jacket and with two coverings of gas-proof silk or silkaline. The steel core gives the strength necessary for durability and the composition jacket makes the tubing leak-

SECTIONAL VIEW OF "GASPRUF" TUBING.

proof and odor-proof. The rubber ends are corrugated on the inside, so as to hold firmly, and are indestructible and safe. (Atlantic Tubing Co., Providence, Rhode Island.)

"2 IN 1" TREAD FILLER.

A liquid rubber for treating cuts, bruises, and gashes in automobile and motorcycle casings comes in a convenient tube one by six inches. (Van Cleef Brothers, Chicago, Illinois.)

IN ATTACHING RUBBER HEELS TO BOOTS AND shoes, clincher nails are used, which are driven through metal washers. "Klean Kutt Kupp"-head rubber-heel nails, just placed on the market, have cup-shaped heads which hold and center the nail-set so that the nail can be driven straight. A center tap-point always clinches with a curl while the heads are flush with metal washers embedded in the heels. The shank corrugations are deeper than those on wire nails. (United Shoe Machinery Co., Boston, Massachusetts.)

"CLINCHER" TIRE.

A NEW "SLING-SHOT."

Now that autumn is near, the boys are interested in hunting and shooting, and the boy who cannot have a gun is always glad to have a sling-shot. The one illustrated is suitable for shooting at small game or at a target and is known as the "Zip-Zap." The handle is made of nicely finished metal and is strong and durable. The "sling" portions are made of a very good grade of elastic and have great strength and resiliency as well as durability. Every dealer knows how the possession of a toy like this creates the desire for one like it in other boys who see it, and when the first boy tells where he got his "Zip-Zap," his companions are likely to patronize that same store—and soon. (Automatic Rubber Co., Columbia, South Carolina.)

"ZIP-ZAP" SLING-SHOT.

AN INDUSTRIAL GAS-MASK

Built under the direction of a former executive of the Research Division of the Chemical Warfare Service of the Government, the gas-mask shown here gives the Army standard of gas protection—something never attained before in industrial gas-mask design. The points of particular practicability are: protection against a wide range of industrial gases, fumes, smokes, and dusts; comfort in wearing; clear vision through the eyepieces, made possible by the incoming air drying any moisture on them; quick adjustment; low breathing resistance; no nose-clip or mouth-piece, permitting speech unhindered; no handicap in wearing while at work; light weight; first class quality of materials used in its construction. The complete mask includes the face-piece, the interior of which is illustrated here, made of high-grade, heavy rubber covered on the outside with a protective layer of tough elastic fabric; a canister with connections and fittings; and a durable, light chest harness. The canister contains the materials for absorbing the gas, dust, fumes or smoke, and is replaceable when exhausted through use. The rubber face-piece rests easily against the face and gives both comfort and safety from leakage. (The Mine Safety Appliances Co., Gas Mask Department, Chamber of Commerce Building, Pittsburgh, Pennsylvania.)

"BURRELL" GAS-MASK.

The complete mask includes the face-piece, the interior of which is illustrated here, made of high-grade, heavy rubber covered on the outside with a protective layer of tough elastic fabric; a canister with connections and fittings; and a durable, light chest harness. The canister contains the materials for absorbing the gas, dust, fumes or smoke, and is replaceable when exhausted through use. The rubber face-piece rests easily against the face and gives both comfort and safety from leakage. (The Mine Safety Appliances Co., Gas Mask Department, Chamber of Commerce Building, Pittsburgh, Pennsylvania.)

ANOTHER PUNCTURELESS TIRE.

A tire that claims to eliminate the dangers of puncturing, as well as tire repair bills and the cost of extra tubes and casings comes from the West. It is composed of three layers of corded fabric with cushions of live rubber between and an outer tread of extra tough rubber. The stretchless cord belts distribute the shock vibration, while low-pressure air chambers in the rubber cushions, at regular intervals, give resiliency. (Lambert Tire & Rubber Co., Portland, Oregon.)

LAMBERT "TROUBLE-FREE" TIRE.

DUNLOP SELLS BALLS THROUGH PROFESSIONALS.

The Dunlop Rubber Co., Limited, Birmingham, England, is employing the novel sales policy this season of selling its golf balls through professional players exclusively, instead of through sporting goods dealers as well. Having introduced the "Dunlop" golf balls in this way, it was a logical procedure to confine their sale to the club professionals.

MEDICINE DROPPER.

A new style of medicine dropper is an improved form of the well-known combination of rubber bulb and glass tube. However, instead of the usual straight tube, this one has a bulb at the center. The point is glazed, and the rubber bulb is of the best quality. These droppers come packed twelve on a card for display purposes, and each card is, in turn, packed in a separate carton. This dropper is known as the "Maderite." (The Seamless Rubber Co., Inc., New Haven, Connecticut.)

"MADERITE" DROPPERS.

A SELF-PROPELLING NOZZLE.

The "Victory" self-propelling nozzle has recently been invented by John T. Burns, a workman employed by the Department of Sewers, New York City. The point of the nozzle permits a small stream of water, forced through at high pressure, to cut into any obstruction in the sewer and loosen portions of it. This device is extremely simple to operate and accomplishes results.

In the back part of the nozzle are holes through which some of the water is diverted and this tends to float or force the loosened part of the obstruction back to the sewer opening. The force of the water impels the nozzle forward at the same time

THE "VICTORY" SELF-PROPELLING NOZZLE.

that it forces the obstruction behind it, and pulling the hose with it. Sometimes the distance covered and cleared is as great as two hundred feet. (Sidney Sladden & Co., 1576 Woolworth Building, New York City.)

CATERPILLAR TIRE.

A new style of tire intended for use on heavy trucks is called the "Caterpillar," because it reaches out and grips the road, lets go without friction, and on release puts behind the point of road contact its full resilient force that in a measure overcomes the inertia of the wheel. The tire is applied by a hydraulic press. As shown in the accompanying illustration, the tire is cut into at regular intervals, the spaces alternating on the opposite edges of the outer surface. It is claimed that this tire is much easier on engine and chassis. (Kelly-Springfield Tire Co., 200 West 57th street, New York City.)

KELLY-SPRINGFIELD "CATERPILLAR" TIRE.

Six Years of Tire Production in the United States.

STATISTICS RECENTLY PUBLISHED by the National Automobile Chamber of Commerce, Inc., together with a few conservative estimates by THE INDIA RUBBER WORLD, show the remarkable growth of the rubber tire industry during the major part of the war period and the check placed upon its nominal development after the United States joined the conflict.

That the phenomenal growth of the United States tire output is due chiefly to the enormous and steadily increasing use of the automobile for both business and pleasure is indicated by the motor vehicle registration for recent years and the fact that about 2 per cent. of the product is being exported. The United States consumes practically its entire tire product.

AMERICAN MOTOR VEHICLE REGISTRATION.

Year	1913.	1914.	1915.	1916.	1917.	1918.
Cars	1,254,971	1,711,339	2,445,664	3,512,996	4,983,340	6,146,617

Assuming five tires per car as the average annual consumption the American demand for tires has grown from about 6,275,000 in 1913 to nearly 31,000,000 in 1918, or to nearly five times that of 1913.

AMERICAN TIRE AND TUBE PRODUCTION.

During the past six years the American tire and tube production, actual and estimated, has been as follows:

Year.	1913.	1914.	1915.	1916.	1917.	9 Months, 1918.
Casings, all sizes	16,588,000	18,983,000	12,840,000	18,564,957	25,840,656	16,196,196
Tubes under 6 inches	16,785,398	23,256,732	16,037,155

¹ Estimated.

It will be seen that the figures for 1917, the last whole year for which complete totals are given and the last year of unrestricted production, show an increase of nearly three times over the output for 1913. At an average of \$25 per tire the value of the 1917 product was about \$646,016,400.

AMERICAN CRUDE RUBBER CONSUMPTION FOR TIRES.

For the manufacture of the tires and tubes mentioned above the consumption of crude rubber was as follows:

	1917.	Nine Months, 1918.
Casings, under 6 inches, all weights	162,643,482	166,256,616
Tubes under 6 inches	35,704,446	24,377,986
Solid tires	25,083,073	38,634,236
Other tires and sundries	9,983,195	11,105,397
Totals	233,386,796	186,374,235

¹ Only the estimated total weights are available for the years 1913-1916. They are: 1913, 65,880,000 pounds; 1914, 89,830,000 pounds; 1915, 128,400,000 pounds; and 1916, 185,649,570 pounds.

In 1917 approximately 75 per cent of the rubber consumed in the United States was used for tires and tire sundries as against only 58 per cent of the crude rubber imports for the fiscal year 1913. The actual quantity of crude rubber used in 1917, the year in which tire production reached its highest mark, was fully 3½ times that for the year 1913.

AMERICAN TIRE DEMAND FOR ORIGINAL EQUIPMENT.

Statistics of motor vehicle production in the United States indicate the increasing number of pneumatic and solid tires required annually for original equipment.

MOTOR VEHICLE PRODUCTION.

Year.	Passenger Cars.	Motor Trucks.	Totals.
1913	161,300	23,500	485,000
1914	543,679	25,375	569,054
1915	818,618	74,000	892,618
1916	1,493,617	90,000	1,583,617
1917	1,740,792	138,137	1,868,947
1918	926,388	227,250	1,153,637

Only a cursory inspection of these figures is necessary to see how the production of passenger cars and correspondingly of pneumatic tires was curtailed by the war situation of 1918, and the production of trucks and solid tires stimulated. Truck tire production for original equipment showed continuous growth during the war period and in 1918 had increased over 8½ times more than the 1913 production. Pneumatic tire production for the original equipment of cars reached its highest figure for the year 1917, when it was nearly 3¼ times the 1913 output. It is seen, therefore, that while 1,940,000 tires sufficed for new equipment in 1913, no less than 7,475,776 were required in 1917, an increase of nearly three times. Although the greater volume of increase has been in pneumatic tires under 6 inches, the greater rate of increase has been in solid and large pneumatic tires for trucks.

TIRES IN USE IN THE UNITED STATES.

Of the 6,146,617 motor vehicles registered in the United States during the calendar year 1918, some 662,000 were trucks, so that

about 8½ times as many pneumatic tires under 6 inches as truck tires were in use last year, the number of each sort, exclusive of spares and replacements, being approximately 21,938,000 pneumatics and 2,648,000 truck tires. One additional tire per car would be a conservative estimate for spares and replacements, making the totals 27,423,000 pneumatics and 3,310,000 truck tires. With nearly 31,000,000 motor vehicles tires in use it is not surprising that some 12,000 vulcanizers are kept busy with repairs and retreading.

On the basis of 20 pounds of rubber average per car for regular equipment, and one-fourth of that extra for one spare per car,

153,665,425 pounds of rubber were being used last year in American tire casings alone, an amount equal to nearly 40 per cent of the United States crude rubber imports for the fiscal year ended June 30, 1918.

UNITED STATES TIRE EXPORTS.

Export business has become a considerable part of the American motor tire business as shown by the following statistics compiled by the Bureau of Foreign and Domestic Commerce:

AUTOMOBILE TIRE EXPORTS.

Exported to	1913.	1914.	1915.	1916.	1917.	1918.
Europe...	\$1,977,029	\$1,764,240	\$2,745,450	\$10,992,184	\$3,480,114	\$1,460,518
N. America	1,626,155	1,254,200	1,187,632	2,184,874	3,186,265	4,474,713
S. America	169,065	115,387	214,068	1,050,398	2,596,936	3,432,181
Asia	96,112	104,475	253,430	477,895	916,300	1,194,351
Oceania...	185,807	279,327	702,877	2,896,401	1,832,244	2,662,422
Africa...	17,952	27,940	39,813	334,475	424,342	733,286
Totals...	\$3,943,220	\$3,505,267	\$4,963,270	\$17,936,227	\$12,330,201	\$13,977,671

A study of these figures reveals several facts of interest, notably the continuous and remarkable growth of tire exports to South America, Asia and Africa. The average increase of busi-

ness in these three divisions was nearly 34 times, and this combined value in 1918 was 35 per cent more than the value of these exports in 1913. Exports to Oceania fell off in 1917, but the following year had nearly reached the high mark of 1916 and represented an increase of some 13 times the value of the 1913 exports. North American exports were adversely affected in 1914 and 1915, but thereafter steadily increased until in 1918 they had increased 175 per cent in value.

European exports have fluctuated greatly owing to the war. In 1914 they decreased a little, but increased considerably in 1915 and in 1916 jumped to more than five times their value in 1913, after which they declined steadily, the value of the 1918 shipments being only about 74 per cent of the 1913 value.

Total tire exports to all countries likewise fell off in 1914, but gained in 1915, jumped to about $4\frac{3}{4}$ times as much as in 1913 during 1916, dropped considerably in 1917, but showed a noticeable gain in 1918. It may be said, therefore, that except for the emergency year 1916, American automobile tire exports have shown a great and steady growth, the value of the 1918 foreign business having increased 254 per cent over that of 1913.

IT IS TO YOUR BEST INTEREST TO PUT LIBERTY BOND INTEREST IN War Savings Stamps.

THE "CONSCIENCE" OF MODERN INDUSTRY.

By G. T. Clayton.¹

AS MODERN BUSINESS ORGANIZATION increases in complexity, further division of responsibility and more closely defined delegation of authority must be extended or the management will become chaotic. It is being recognized more and more that one most important function in a well-organized industrial establishment is the responsibility of selection, placing, and advancement of workers. This is what we mean by the term "employment management."

Employment management goes further, however, than merely concerning itself with such selection, placement and promotion. It investigates, as part of the selection, the character, experience, and capacity of the applicant. It investigates for placement; and does not limit its investigation to the applicant. It sounds possibilities of openings for placement, and it employs every means to secure the comfort and safety of the worker and thus assists his advancement by giving him a quiet mind and an assured future.

The employment manager is really the conscience of modern industry in practical action. In the old days when employers had but few workers and themselves worked side by side with them, every worker was individually known to his boss; his idiosyncrasies were understood; his ambitions were appreciated because they were like to the boss's ambitions. But now when workers, numbered by the thousands, are employed by a collective boss who is a mere list of stockholders, living perhaps thousands of miles from the works and knowing the workers only as items of profit or loss on a ledger, some substitute for the old personal touch must be found or industry will become, first, a congeries of unrelated items in reports, and, finally, mere anarchy. If modern industry is to be well-knit; is to understand and accomplish its real purposes, it must cultivate its conscience—the employment manager.

The usual method of business organization unfortunately has so far failed to take in this function as a distinct part of factory control. The foreman should not be charged with the responsibility of selecting his gang. Good management does not require that he do so. Factory after factory has demonstrated that if the foreman's power includes that of sending back an unsatisfactory worker to the employment manager for removal and replacement, that is sufficient for purposes of discipline. But when it is considered that the cost of securing and training each worker ranges from \$10 to \$200, and averages probably more than \$60 each, a stupendous leak in the business which still clings to the antiquated foremanship hiring-and-firing method, is disclosed. Moreover, a competent employment management reduces industrial misunderstanding and friction quite noticeably. In these days, when every nerve must be strained to secure the highest possible output, no wise factory manager will ignore such a means of keeping the industrial peace.

Employment management differs from public employment service. Some employers have been limiting their employment management to the status of mere labor-recruiting agencies. That work should be left to an employment agency whose function is to find the labor and sift it in a preliminary way, offering those workers who seem likely to suit to the employment manager for his more intimate knowledge of the factory's needs, his more thorough methods of selection. The employment manager cannot be dispensed with in favor of the public employment agency any more than the public employment agency in this day of national need can be evaded. It is the plainest common sense to counsel that every industrial concern immediately secure the best possible employment manager and place upon him the authority and responsibility of a direct delegate from the highest command in the establishment. With any less authority, the employment manager is almost sure to fail.

¹Director, Training and Dilution Service, U. S. Department of Labor.

THE OBITUARY RECORD.

A PIONEER IN WIRE AND CABLE INSULATION.

HENRY A. REED, president of the Bishop Gutta Percha Co., of New York, died at his home in Newark, New Jersey, in his ninety-first year, on August 23, 1919. He was affected by the heat on July 4 and had been ill ever since. Mr. Reed was born in Carmel, New York, February 11, 1829. At 17 he began to teach school and to learn telegraphy, and in 1849 was put in charge of the telegraph office at Carmel, from which he was transferred to New York City and later to Poughkeepsie. There he established a bookstore also, which he kept up till 1876. Then he took up expert accounting and was employed by the Bishop Gutta Percha Works and became secretary in 1885, treasurer in 1893, and president in 1905, a position he retained until his death. Last spring the company celebrated at Newark his ninetieth birthday and at the same time the fiftieth birthday of his son, Henry D. Reed, vice-president of the company.

HENRY A. REED.

Mr. Reed was always interested in electrical science and its development. As he believed that rubber was better than gutta percha for insulation, except under water, he employed a competent engineer to design machinery to insulate wire and cables with rubber. He collaborated with the United States Light-House Board in 1887 in devising a system of lighting channels with electricity by buoys and range lights. In 1888 he designed the first high-tension cable to be used underground. He was first in America to test faults by the galvanometer.

Mr. Reed was one of the organizers of the Electric Club in New York. There he exhibited the first perfected phonograph made by Mr. Edison. He also helped to organize the Electric Trade Society and was a member of the American Institute of Electrical Engineers. He is survived by his widow, three sons and a daughter.

A FORMER WEBBING MANUFACTURER.

Horatio Nelson Starkey, an old-time elastic webbing manufacturer, died at Dedham, Massachusetts, August 16, 1919, aged 60 years. He was born in Attleboro, Massachusetts, and was the son of the late Henry C. Starkey, who was a pioneer in the elastic web business and with whom the son associated himself, afterwards succeeding him, having a factory in Chelsea, Massachusetts. His health failing, he retired from business about ten years ago. He leaves no near relatives.

ACTIVE IN RUBBER EXPLORATIONS.

Charles R. Lamson, prominent in the crude rubber trade ten or twenty years ago, died at a hospital in Beverly, Massachusetts, August 9.

Mr. Lamson was for several years stationed at Manaos, Brazil, as agent for Henry A. Gould, and later, did much exploring in Ecuador and Colombia, searching out new fields for the exploitation of crude rubber. In 1904 he was one of the party headed by Henry C. Pearson on a tour of investigation in Panama, an account of which appeared in THE INDIA RUBBER WORLD. In that series of articles he was known as "The Comodore."

In the spring of 1918, anxious to serve his country, he entered the service of the Food Administration at Washington and when that body ceased to exist he became Latin American trade ex-

pert for the United States Shipping Board, a position for which he was ably qualified by his South American acquaintance and experience.

He was taken ill in Washington early last month and arriving at his home at Beverly, was in such condition that he was taken to the hospital there, living only a few days. He leaves his widow, and one son, Charles W. Lamson, who served a year and a half in the great war with the 26th Division, returning last April.

SUBSTITUTE FOR EBONITE AND BAKELITE.

Ebonite in its various forms and kinds, such compositions as bakelite, wenjacite, gallalite, eburin, rivolite, pertinax, and the like, possess a great number of properties rendering them eminently suitable for the manufacture of a great many articles.

These materials may be divided into two large groups, namely, ebonite derived from rubber and phenolformaldehyde condensation products. A new Dutch process has recently been patented in England¹ for the manufacture of a cheap product, said to combine all the good qualities of the above-mentioned materials. The following example is given to illustrate the process:

Five parts resin and three parts paraffine are added in successive quantities and are melted in ten parts by weight of boiled linseed oil. To this twenty-five parts by weight of rubber waste in a finely divided state are added. The mixture is heated and stirred until the rubber is dissolved in the pulp. It is then allowed to cool, and a mixture of the following materials is added: eight parts sulphur, ten parts infusorial earth, ten parts bone-black, three parts magnesia, and fifty parts clay. The mixture is thoroughly intermingled by the aid of a heated roller mixing mill, sheeted on the calender, then, if required, put into the mold, pressed, and finally vulcanized for a period of two hours or less with the aid of steam.

It is stated to be possible to manufacture from rubber waste a hard kind of india rubber along these new lines that possesses all the good qualities of ebonite. It is a first-rate insulating material, and, according to experiment, it even surpasses considerably in dielectric strength the insulation-resistance properties of ebonite itself; it is not combustible; it may be made in every degree of hardness, indeed a degree of hardness may be given it that materially exceeds that of ebonite; it is elastic, and may be manufactured in such a way that after having been heated adequately it assumes the shape into which it is bent, which shape is retained after cooling. However, if desired, it may be caused not to become noticeably softer or more flexible. It is admirably adapted to be worked, as by planing, milling, drilling, pressing, sawing, burnishing and polishing. It may be made in every desired color, more conveniently than can ebonite, and, in contradistinction to the latter, it is proof against the influence of sunlight. Moreover, it resists the influence of cold and even of hot oil. It is practically insoluble and indifferent to acids, alkalis, and salts. Vulcanization may be effected either with or without the use of metal molds. ("The India Rubber Journal," February 8, 1919.)

FRENCH RUBBER ASSOCIATIONS.

The *Société Financière des Caoutchoucs*, which, until recently, was the only continental rubber trust that was modeled upon the British trusts, and handled the stocks of plantations in the Malay States and in the Dutch East Indies, has split in two. One portion holds to the old name, and has transferred its headquarters from Antwerp to Brussels, with offices in Paris at 74 rue Saint Lazare. The other portion has been incorporated under the name *Société Internationale de Plantations et de Finances*. (S. I. P. E. F.) A. Berthelot is president of the Financière, and E. Bunge of the S. I. P. E. F.

¹ British patent No. 118,270.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless, they are interesting not only in themselves, the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(730.) An inquiry has been received for the address of a concern which a year or two ago manufactured and put on the market a small instrument for determining the hardness and softness of rubber.

(731.) A reader requests information as to who manufactures an electrically heated mold press.

(732.) A subscriber asks for information about a cord-lined paper for wrapping tires.

(733.) The name and address of the company manufacturing the Mathern tire-wrapping machine is desired by a tire manufacturer.

(734.) An inquiry has been received for a machine for winding bicycle tape.

(735.) A reader asks the names and addresses of stationery rubber brokers who handle rubber bands in large quantities.

(736.) The names and addresses are desired of manufacturers of automobile, motorcycle, and bicycle valves such as are used for inner tubes in foreign countries.

(737.) Request is made for the names and addresses of manufacturers of rubber strips for joining the fabric strips used in tire building.

(738.) A foreign manufacturer requests the name and address of the manufacturer of a machine for making black-and-red striped tubing.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce or its district or cooperative officers. Request for each should be on a separate sheet, and state number.

(29,989.) An agent in Ireland desires to represent American manufacturers of rubber, mechanical and general lines, including tires.

(30,012.) A man in Mesopotamia, expecting to purchase if suitable, desires quotations f. o. b. American port, on up to fifty, fifteen-hundredweight autocar lorries with pneumatic tires and a proportion of spares.

(30,015.) A company in Switzerland wishes to secure the agency for the sale of rubber tires. Quote f. o. b. New York or c. i. f. French or Italian ports. Correspondence may be in English.

(30,017.) The representative of an English firm is in this country to secure agencies for the sale of rubber-making machinery.

(30,036.) A firm in Norway desires the agency for the sale of rubber and rubber goods. Quote c. i. f. Norwegian port. Correspondence may be in English.

(30,042.) The representative of an English firm is in this country and wishes to purchase and to secure the agency for the sale of rubber goods in Siberia.

(30,088.) The purchase and agency is desired by a man in Czechoslovakia for rubber tires, weight immaterial, millimeter dimensions 815 by 105, 820 by 120, 880 by 120, 895 by 120, 760 by 100, and 710 by 100, for touring cars and motor trucks. Two carloads are needed at once.

(30,118.) A manufacturing and wholesale firm in Sweden desires to purchase rubber, reclaimed rubber, rubber goods, machines, tools and appliances for facilitating preparatory as well as finishing processes of manufacturing plants for rubber goods.

(30,133.) The purchase and sole agency is desired by a firm in Czechoslovakia for the sale of rubber tires. Payment to be made in United States currency.

(30,134.) An importing firm in Sweden desires the purchase

of rubber footwear, on own account and on commission.

(30,216.) A wholesale dealer in the Netherlands desires to receive quotations from manufacturers for the purchase of rubber duck. Samples of the goods desired and may be examined at the Bureau or its district offices. (Refer to Miscellaneous Exhibit No. 207.) Correspondence may be in English.

(30,348.) The purchase is desired by a firm in Belgium of articles in India rubber. Quotations should be given c. i. f. Belgian ports. Terms cash or short term credit. Correspondence may be in French.

(30,393.) An importing company in India desires to come into direct touch with manufacturers of solid tires for busses and pneumatic tires for pleasure cars.

(30,406.) The representative of an automobile sales company in New Zealand is in the United States for a short time, and desires to secure an agency for the sale of rubber tires.

(30,411.) A firm in Spain desires to purchase balata belting. Correspondence may be in English.

(30,429.) An American who is established in France desires to secure agencies for the sale of tires.

(30,431.) A man from Denmark who is in the United States for a short time wishes to secure an agency for the sale of rubber shoes.

(30,445.) A merchant in South Africa desires to receive catalogs, prices and samples of fountain pens and druggists' sundries.

(30,446.) An importer in Switzerland desires to purchase and secure an agency for the sale of tires. Correspondence may be in English.

COLONEL COLT'S INVENTIVE ANCESTOR.

A BIT OF INTERESTING HISTORY centres about the old-time wood-cut here reproduced. It pictures 14-year-old Samuel Colt, for whom Colonel Samuel P. Colt was named. The boy is shown aboard ship fashioning a model of the revolver of which he was the inventor. Very adventurous and pre-

(An on a child's model.)

THE BOY COLT INVENTING THE REVOLVER.

cocious, he had run away to sea when only ten years old. After seeing the world and inventing the revolver, he returned home, secured patents and later founded the great fire-arm company that bore his name. Incidentally, during the Civil War he invented an insulating compound and did considerable in wire insulation.

PACIFIC-FAR EAST FREIGHT TARIFF NO. 16-D.

New rates for freights from Pacific ports to the Far East, namely Hongkong, Shanghai, Kobe, Yokohama and Manila, have been issued by the United States Shipping Board, effective August 15. Boots, shoes and rubbers are 45 cents per cubic foot; pneumatic tires, 31¼ cents; and solid tires 25 cents. Junk, including old rubber, \$1 per hundredweight or 50 cents per cubic foot.

Activities of The Rubber Association of America.

THE ACTIVITIES OF THE RUBBER ASSOCIATION were necessarily curtailed to some extent during the month of August because of the general midsummer dullness and vacations, resulting in difficulty to secure representation for the meetings.

ASSOCIATION HAS FREIGHT RATE EXPERT.

R. H. Goebel, who has had many years' service with joint freight rate and tariff organizations of the railroads, particularly in the East, has been secured by the Association as a freight rate expert. The Association will now be in a position to render assistance of an executive nature to its members in connection with freight traffic problems. These primarily relate to changes in rates and classifications involving maintenance of rate levels, and rate advances to members who have not felt justified in building up their own traffic organizations. This work may include analysis of rate conditions with respect to sales distribution and general information regarding traffic or transportation details.

DOCKETS FOR ALL DIVISION AND OTHER GENERAL MEETINGS.

A plan which was found to be very practicable and conducive to a more businesslike procedure in the meetings of the Traffic Division will be put in operation at future meetings of divisions of the Association.

It consists in the preparation of an informal typewritten docket of subjects requiring the attention of division meetings, covering as briefly as possible a statement of the matter involved. This plan makes it possible to conduct the meeting in a more orderly manner and enables members to take with them or have sent to them by the secretary after the meeting this summarized record of the subjects considered, which will be supplemental to the regular minutes that are mailed from the association office.

Furthermore, it will be of assistance to the association office in its endeavor to become of greater value to the industry by keeping closely in touch with the subjects in which the several divisions are interested.

To make this arrangement useful it is necessary that the association office be advised, prior to any meeting, of the subjects which members desire to have brought before the meeting for discussion, but it is not contemplated that only matters which are included in the informal docket will be given consideration because there will always be opportunity for the presentation of any matter of interest at the time of the meeting.

MEETING OF SPECIFICATION COMMITTEE OF OLD WAR SERVICE COMMITTEE.

A meeting of the Specification Committee of the old War Service Committee, of which Dr. Geer is chairman and N. S. Noble, Secretary, was held at the offices of The B. F. Goodrich Co. on August 8. Preliminary steps were taken toward organizing the Specification Committee as a permanent branch of the association in order to put it on a more substantial footing, as it was felt that there was a real field for the work it might do.

Positive action was taken with respect to the working out by the Specification Committee with the United States Railroad Administration and other departments of the Federal Government of standard specifications for certain items in the mechanical goods line.

"CLEARSKIN" RUBBER SPONGES.

Following the usual procedure which makes the office of the Rubber Association the medium for disseminating advice of this sort, The Miller Rubber Co., Akron, Ohio, has announced that it has registered at Washington the coined word "Clearskin," to be applied to rubber sponges of their manufacture.

ASSOCIATION'S TWENTIETH YEAR BOOK.

Work on the Association's Twentieth Year-Book is progressing as rapidly as possible. The publication is already long overdue as a result of a change in organization and other circumstances which could not be controlled.

ARBITRATIONS.

Only one arbitration proceeding was conducted during August, and that involved alleged non-fulfillment of contract conditions in respect to a specified time delivery. The arbitrators' award was in favor of the seller of the crude rubber and to the effect that the terms of the contract had been complied with.

MEETING OF RUBBER CLOTHING MANUFACTURERS' DIVISION.

A call has been issued for a meeting of the Rubber Clothing Manufacturers' Division at the Yale Club, New York City, September 4. The feeling is evident that the present state of affairs in the trade makes it desirable that the general situation be reviewed and an interesting meeting is looked for.

MEETING OF RUBBER RECLAIMERS' DIVISION.

An endeavor is being made by the officers of the Rubber Reclaimers' Division to arrange for a day's outing in connection with the next meeting of that division, which is contemplated for Tuesday, September 9. The proposal is to spend the day at one of the prominent Long Island Clubs, where the meeting might be held in the morning, upon arrival, and the remainder of the day spent at golf, tennis, bathing, etc., for which the facilities of the club are unusually fine. If, however, the outing idea is found to be impracticable, the meeting will be held September 9, at the Yale Club, New York City. A general discussion of trade conditions is contemplated.

MEETING OF PNEUMATIC TIRE MANUFACTURERS' DIVISION.

There is in contemplation a meeting of the Pneumatic Tire Manufacturers' Division to be held about the middle of September, but it is not yet possible to decide upon the date. There are an unusual number of important subjects involving trade principles and practices which will come before the division for consideration and the meeting will doubtless be an interesting one.

FEDERAL EXCISE TAX. RECENT RULINGS BY THE TREASURY DEPARTMENT.

NEW YORK, July 26, 1919.

To the firm members of the Rubber Association of America:

The following rulings have just been released by the Treasury Department:

TREASURY DECISION NO. 2893. APPROVED JULY 17, 1919.

(1) ARTICLES CONSIGNED TO RETAILER.—The last sentence of Article 8 of Regulations 47 is hereby amended to read as follows:

"Where a manufacturer consigns articles to a retailer, retaining ownership in them until they are disposed of by the retailer, the manufacturer must pay the tax upon the basis of the manufacturer's selling price on all goods sold to the retailer, as shown by reports to be procured by him monthly from the retailer."

(2) TIRES, INNER TUBES, PARTS, OR ACCESSORIES: Article 14 of Regulations 47 is supplemented by adding thereto the following:

"The words 'tires, inner tubes, parts, or accessories' shall be understood to embrace only such tires, inner tubes, parts, or accessories as have reached such a stage of manufacture that they constitute articles commonly or commercially known as 'tires, inner tubes, parts, or accessories,' and shall not be understood to embrace raw materials used in the manufacture of such articles. Unvulcanized sheet rubber, liquid vulcanizing, rubber cement, and friction fabrics are considered to be raw materials and are exempt from tax."

(4) PARTS OF ACCESSORIES.—Article 16 Regulations 47 is supplemented by adding thereto the following:

"Parts or accessories for automobile trucks, automobile wagons, other automobiles, or motor cycles primarily adaptable for use on or in connection therewith when sold for any other purpose are not taxable provided the purchaser files with his order a statement that such parts or accessories are to be used on or in connection with another article of commerce not embraced in or included in subdivision (1), (2), (3), of Section 900. For example, a self-starter primarily adaptable for use on an automobile, if sold to a manufacturer of motor boats, such manufacturer stating in his order that it is to be used in the manufacture of a motor boat and not upon an automobile, is not taxable."

TREASURY DECISION 2897. APPROVED JULY 22, 1919. TAX APPLIES TO SALES TO STATES OR POLITICAL SUB-DIVISIONS THEREOF.

To Collectors of Internal Revenue and Others Concerned:

Under an opinion of the Atty. Gen. (Technical) dated July 7, 1919, many factors, producers, and importers are declared to be subject to the excise tax imposed by Section 900 of the Revenue Act of 1918 upon sales made to a State or a political subdivision thereof except as provided in sub-division (10) of such section.

In accordance with the above opinion, manufacturers, producers, and importers are subject to excise tax under Section 900 of the Revenue Act of 1918, and Section 900 of the Revenue Act of 1918 upon all sales of taxable articles made to States or political subdivisions thereof except where specifically exempt from such tax upon such sales, as indicated in sub-division (10) of Section 900 of the Revenue Act of 1918. In addition to liability to tax under the above sections, manufacturers, producers, importers and vendors are held to be liable to tax upon all sales of taxable articles made to States or political subdivisions thereof under Section 313 of the Revenue Act of 1917, and under Sections 628, 902 and 903 of the Revenue Act of 1918, and lessors of positive motion picture films containing pictures ready for projection are subject to tax upon amounts received from the leasing of such films to States or political subdivisions thereof under Section 906 of the Revenue Act of 1918. Where an excise tax is imposed directly upon the vendor as under Sections 904 and 907 of the Revenue Act of 1918, sales to States or political subdivisions thereof are exempt from tax.

Article 10 of Regulations 47 is amended to read as follows:

Article 10—Sales to the Government or a state: The tax applies to articles enumerated in Section 900 when sold to the Government. Where, however, the Government supplies a manufacturer with all materials and parts, except a small portion furnished by the manufacturer under a contract stipulating that the manufacturer shall be guaranteed a certain profit, no tax is payable because the manufacturer does not sell the article. Articles manufactured in plants taken over and operated by the Government are not subject to the tax. The tax also applies to articles enumerated in this section, except to those manufactured under sub-division (10), when sold to a state or political subdivision

thereof even though they are to be paid for entirely out of public money and are to be used in carrying on governmental operations.

A. L. VILES, General Manager.

FEDERAL EXCISE TAX—TAXABILITY OF RADIATOR, AIR, PUMP AND GASOLINE HOSE, GENERATOR TUBING, BRAKE-BAND LININGS, AND PACKING.

New York, August 25, 1919.

To the firm members of The Rubber Association of America, Inc.:

The Rubber Association is advised that the following letter was recently sent out by the office of the Commissioner of Internal Revenue:

Replying to your letter regarding the taxability of radiator, air pump and gasoline hose, generator tubing, brake-band linings, and packing, under Section 900, Subdivision (3), of the Revenue Act of 1918:

Brake-band linings, packing and gasoline hose have been held not subject to tax as automobile parts or accessories under Section 900, Subdivision (3), of the Revenue Act of 1918. Generator tubing, and air pump and radiator hose are not subject to tax as automobile parts or accessories unless specially designed, cut to length, and equipped with fittings making the hose available only for use on or in connection with automobiles.

It will be noted that it is held in the above letter that the hose in question is not subject to the tax unless specially designed, cut to length, and equipped with fittings making the hose available only for use on or in connection with automobiles.

A. L. VILES, General Manager.

MANUFACTURERS WHO HAVE SIGNED THE AGREEMENT.

The following-named manufacturers, members of The Rubber Association of America, Inc., have signed the agreement to pay to the Association through importers the fee of 3 cents per hundredweight on all crude rubber purchased by them.

News of the American Rubber Industry.

DIVIDENDS.

THE American Zinc, Lead & Smelting Co., St. Louis, Missouri, and New York City, declared its regular quarterly dividend of \$1.50 per share, payable August 1, 1919, on preferred capital stock of record July 18, 1919.

The Brunswick-Balke-Collender Co., Chicago, Illinois, declared its regular quarterly dividend of one and three-quarters per cent, payable August 15 on stock of record July 25, 1919.

E. I. du Pont de Nemours & Co., Wilmington, Delaware, declared a dividend of one and one-half per cent, payable July 25 on its debenture stock of record July 10, 1919.

The General Electric Co., Schenectady, New York, has declared its quarterly dividend of two per cent, payable October 15 on stock of record September 15, 1919.

The B. F. Goodrich Co., Akron, Ohio, declared a quarterly dividend of \$1.75 per share, payable October 1 on preferred stock of record September 19, 1919.

The Goodyear Tire & Rubber Co., Akron, Ohio, declared its quarterly dividend of three per cent, payable September 1 on stock of record August 15, 1919.

The Hood Rubber Co., Watertown, Massachusetts, declared a quarterly dividend of \$1.75 per share, payable August 1 on preferred stock of record July 21, 1919.

The Manufactured Rubber Co., Philadelphia, Pennsylvania, declared its quarterly dividend of one and one-half per cent, payable July 28 on stock of record July 23, 1919.

FINANCIAL NOTES.

The B. F. Goodrich Co. has more than doubled the asset value of its common stock in three years, entirely from earnings. On December 31, 1918, total assets amounted to \$107,916,441. Deducting \$57,798,001 for good will and patents, \$16,770,900 current liabilities, \$8,347,540 reserves, etc., and \$25,000,000 preferred stock there remained \$33,321,986 balance of assets behind the common or more than \$55 a share. At the close of 1915 total assets were \$94,722,634. Good will and patents were then carried at \$58,219,992, current liabilities \$4,402,642, reserves, etc., \$4,100,000 and preferred stock \$28,000,000. Deducting these items there remained \$12,363,598 or about \$20 a share as the asset value of the \$60-000 common outstanding.

For the six months ended June 30 last, net profits after all charges but before federal taxes were \$7,700,000. For the corresponding period last year net profits before taxes were \$7,150,000. At the current rate, earnings for the full year would approximate \$15,500,000, which after preferred dividends would be equal to more than \$21 a share on common before taxes.

* * *

Firestone Tire & Rubber Co. is expected to show gross sales for the fiscal year ending October 31, 1919, of upwards of \$90,000,000, which would compare with \$75,801,000 for the 1917-1918 year.

Net profits after depreciation, but before Federal taxes, will probably approximate \$10,000,000, which would be equal to about \$27 a share on the 350,000 shares of common stock after preferred dividends. Firestone sales have come up from \$7,462,000 in 1910-1911.

* * *

The listing last month of The Fisk Rubber Co.'s shares on the New York Stock Exchange is a testimonial to the rapid advance in financial and industrial power of the Springfield company. Four years ago Fisk produced 1,000,000 tires and tubes a year. This year the production will be 2,000,000. In 1915 sales were \$16,203,283 and net profits \$1,791,579. Estimated sales for 1919 are \$45,000,000 and net profits, \$4,250,000. Including sales of the

Federal Rubber Co., subsidiary, the Fisk system should turn over \$60,000,000 this year.

* * *

Net earnings of the United States Rubber Co. for the six months from January 1st to June 30th, 1919, after deducting all interest charges and after allowing for depreciation, Federal taxes and reserves, were \$10,815,750.33.

* * *

Brunswick-Balke-Collender Co. reports sales for six months ended June 30, of \$10,061,375, against \$5,327,136 a year ago.

* * *

The Miller Rubber Co., Akron, Ohio, has just sold \$1,000,000 worth of preferred stock, and its directors recently passed a resolution approving the sale of approximately \$800,000 worth of common stock. This makes the total capitalization of the company as follows: First preferred, \$7,500,000; second preferred, \$3,000,000; and common, \$10,000,000.

MADISON TIRE AND RUBBER CO., INC.

The authorized capitalization of the Madison Tire & Rubber Co. will be \$2,000,000 eight per cent preferred stock (par value \$100) and 120,000 shares of common stock (of no par value). Of this there will presently be issued all of the preferred stock and 86,600 shares of the common. The preferred stock shares are convertible at option of the holder at any time until July 1, 1929, into common stock shares of the company, share for share, at par.

The company starts business with net assets of \$3,500,000 and plant capacity daily of 1,200 tires and 2,000 tubes.

In the distribution of its product the company will be represented in practically all important cities in the country.

The officers are: Rudolph A. Low, president; Theo. W. Bassett, vice-president; Max Loewenthal, treasurer; and Clarence H. Low, secretary.

RUBBER COMPANY SHARE QUOTATIONS.

United States Rubber Co., preferred		

FOUR YEARS OF INDUSTRIAL EXPANSION

During the four-year period from December 31, 1914, to December 31, 1918, the 104 leading American industrial companies, despite heavy expenditures for new construction and acquisitions, and record-breaking dividends, added a total of nearly \$2,000,000,000 to their working capital, most of it from surplus earnings.

This explains in large measure the material appreciation in the market value of industrial securities, yet many are still sell-

ing far below their respective intrinsic value based upon actual addition to asset value over the last four years.

Rubber and tire companies prospered during the war, and their expansion still continues. The B. F. Goodrich Co. increased its working capital from \$19,037,977 in 1914 to \$43,024,619 in 1918, a gain of 125 per cent, and the surplus after dividends was equivalent to \$55.24 a share. The Goodyear Tire & Rubber Co. increased its capital from \$10,724,323 to \$55,655,663, a gain of 418 per cent, and the surplus after dividends was equal to \$146.44 a share. The Kelly-Springfield Tire Co. increased its capital from \$2,435,491 to \$8,382,681, a gain of 224 per cent and added \$33.45 to the value of its common stock. The United States Rubber Co. increased its capital from \$41,423,828 to \$101,552,038, a gain of 145 per cent and added \$82.70 to the value of the common stock. A large part of the increase in assets of the foregoing companies was due to new financing.

Among allied trade firms there was also much expansion. The Corn Products Refining Co. increased its capital from \$8,996,186 to \$23,896,300, a gain of 166 per cent, and the surplus after dividends was \$32.60 per share of common stock. The E. I. du Pont de Nemours & Co. increased its capital from \$35,132,736 to \$186,001,738, a gain of 429 per cent, and added \$154.16 to the value of its common stock. The General Electric Co. increased its capital from \$104,624,462 to \$189,302,514, a gain of 81 per cent, and added \$28.62 to the value of its stock. The Westinghouse Electric & Manufacturing Co. increased its capital from \$32,605,769 to \$91,322,867, a gain of 180 per cent, but the value of its common stock sustained a deficit occasioned by payment of \$15,688,992 cash and stock common dividends.

PERSONAL MENTION.

J. K. Carr, who became vice-president and general manager of the B. C. Tillinghast Rubber Co., Inc., 236 Market street, Philadelphia, Pennsylvania, at the death of the late B. C. Tillinghast, and who has ever since endeavored to combine with his duties as salesman on the road those of managing the business, has now retired, after 29 years on the road, and will devote all his time to the management of the company, with which he has been connected for 39 years.

Charles Hess, Jr., salesman for the B. C. Tillinghast Rubber Co., Inc., Philadelphia, Pennsylvania, will replace J. K. Carr on the road.

John W. Higgins, for two years general foreman of the mechanical rubber goods department of The Federal Rubber Co. of Illinois, Cudahy, Wisconsin, has resigned to accept a position with the druggists' sundries department of The B. F. Goodrich Co., Akron, Ohio.

W. W. King and H. E. King of Typke & King, Limited, Mitcham, England, dealer in rubber-makers' chemicals, were in New York City recently.

H. S. Doty, formerly chief chemist of the Manhattan Rubber Co., and during the war a member of the Gas Defense Service, is now with Frazar & Co., New York City, as head of the chemical research department.

Orlando F. Weber has been elected president of the National Aniline & Chemical Co., succeeding William J. Matheson, who has been serving as chairman of the board of directors and president of the company since 1917 as a patriotic duty during the war, and has now accordingly resigned.

George B. Allan, Texas representative of the Yarnall-Waring Co., Philadelphia, Pennsylvania, who has been located at Houston, Texas, will hereafter make his headquarters in Dallas for the sale of "Wayway" fuel-saving specialties.

Harry D. Benner has been appointed manager of the accessory sales department of The Federal Rubber Co. of Illinois, Cudahy, Wisconsin.

Frank C. Risselt, formerly with the Cameron Machine Co.,

Brooklyn, New York, has become identified with the Spadone Machine Co., 126 Duane street, New York City, manufacturer of vertical bias cutters.

CHARLES J. DAVOL.

CHARLES JOSEPH DAVOL, the president and treasurer of the Davol Rubber Co., Providence, Rhode Island, is the son of the late Joseph Davol, who, in 1870, founded the great business now conducted by that corporation.

The subject of this sketch was born in Brooklyn, New York, April 14, 1868. He was educated in the public schools of Providence, and in preparation for a college course at Brown University, attended Mowry & Goff's Ensign and Classical School, graduating in the class of 1885. Meanwhile he abandoned the idea of a professional life, and, after several months of travel, entered his father's factory, where he worked his way through the various departments, thereby acquiring a thorough knowledge of the details of both the manufacturing and executive branches of the business, and was elected general manager.

He was close confidant and assistant of his father during the last ten years of the latter's life. At his father's death in 1909, he was elected president and treasurer, which offices he continues to hold. During the years he has had the management, the business has steadily grown, the plant has been greatly enlarged, its equipment thoroughly modernized and its scope of products widened until it is claimed that the concern is the largest manufacturer in the world of fine rubber surgical, dental, stationers' and druggists' sundries, and special articles used in many arts, crafts, and professions.

Mr. Davol is a man of varied activities. He is an ardent sportsman and dog fancier, and his estate, "Wildacres," at North Kingston, Rhode Island, is a fine shooting preserve. There also are the famous Wildacres Farm Kennels, noted for their pure strain of pointers, setters, and beagles. Mr. Davol is a member of the Pointer Club of America and the English Setter Club of America, the Agawam Hunt Club and the National Audubon Association of America.

He is an enthusiastic yachtsman, and near his estate, in the land-locked harbor at East Greenwich, Rhode Island, he maintains moorings for his palatial yacht "Paragon," of the power cruiser type. He is a member of no less than seven yacht clubs, namely, New York, Eastern, Boston, Larchmont, Rhode Island, Bristol, and East Greenwich.

He is fond of travel, and having made two voyages around the world, he is a member of the Circumnavigators' Club of New York, besides the Rocky Mountain Club and the National Geographic Society. As a descendant of early American settlers he is prominent in the Society of Mayflower Descendants, Society of Colonial Wars, Sons of the American Revolution and the Rhode Island Historical Society. His affiliations with business and local organizations include the Providence Athenaeum, the Commercial Club, the Economic Club, and the Rhode Island Hospital Corporation. Besides all these he is a life member of the Navy League of the United States and the American Defense Society and a member of the National Committee. He is a director of The Rubber Association of America, Inc., and chairman of the Rubber Sundries Division of that association.

CHARLES J. DAVOL.

TRADE NOTES.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, recently made for Fred Stone, the comedian, a set of tires bearing his autograph in bright red rubber on a jet-black tread.

The Continental Rubber Co., Erie, Pennsylvania, has sent out plans and specifications for a new power plant.

The Dryden Rubber Co., Chicago, Illinois, will build a new tire plant, to have an initial capacity of 1,000 tires and 1,000 tubes daily.

The M. & W. Tire Co., Inc., 1311 Woodward avenue, Detroit, Michigan, is incorporated in Michigan for the distribution of American-Akron tires, tubes, and sundries, wholesale and retail. The officers are: George J. Moebis, president; Herbert J. Woodall, vice-president; Charles J. Woodall, secretary and treasurer. The concern has a subsidiary known as The M. & W. Tire Repair Co., at 7 Harper avenue, Detroit, whose officers are: Herbert J. Woodall, president; George J. Moebis, vice-president; Charles E. Barton, secretary and treasurer. This subsidiary does repair work in general, in addition to selling standard makes of tires and tubes.

The Majestic Tire & Rubber Co., Indianapolis, Indiana, recently incorporated in Indiana, will manufacture a high-grade cord tire to be known as "Majestic" cord, and a high-grade tube. The officers of the company are: R. H. Syfers, president; E. B. Oscars, vice-president; O. C. Pantall, secretary-treasurer; J. B. Hilliard, superintendent and production manager. The company has increased its capital from \$100,000 to \$250,000.

The Independent Tire Co., Inc., St. Louis, Missouri, has opened a branch store under the same name, at 211 East Jefferson avenue, St. Louis, and has appointed Carl J. Reifler representative in that territory.

The Eastman Rubber Works, Inc., 213 West Fortieth street, New York City, has increased its capital from \$200,000 to \$500,000.

The Virginian Rubber Co., Charleston, West Virginia, recently incorporated in that state, will manufacture pneumatic cord tires known as the "Virginian," and dipped and pressed rubber goods. The officers are: A. A. Lilly, president; Houston G. Young, vice-president; and W. D. Guyer, secretary-treasurer. The company has purchased a factory site on the Kanawha river, comprising twelve acres of land, and is having plans and specifications drawn for both building and machinery. This is in the natural gas region, which offers an additional advantage.

The Latex Tire Co., Collins Block, Fond du Lac, Wisconsin, elected the following directors and officers at its first annual meeting: F. S. Dannenberg, president; J. T. Brofka, vice-president; J. T. Jones, secretary; and Orlando J. Kohl, treasurer; directors—T. W. Meiklejohn, J. T. Brofka, J. T. Jones, Grant Lambright, F. S. Dannenberg, Edward Yockey and Orlando J. Kohl. The factory site will be at East Scott and Main streets and building activities will start at once on a two-story structure.

The Evans Tire Co., Fort Wayne, Indiana, has incorporated The Evans Tire & Reliner Co., in that state, capitalized at \$100,000, to make inner liners and skived-edge boots for vulcanizing purposes, and rebuild tires by the Evans method. R. I. Evans is president and R. O. Beecroft, sales manager.

The Keystone Tire & Rubber Co., New York City, at its annual meeting of stockholders held August 1, 1919, reelected the following directors for the ensuing year: L. Walter Lissberger, Joel Jacobs, Sydney Bernheim, Nathan J. Miller, Julius Lichtenstein, Benjamin Lissberger, and Walter Loewenthal. At the organization meeting of the new board of directors, the officers of the company were also reelected, as follows: L. Walter Lissberger, president; Sydney Bernheim, vice-president; Joel Jacobs, treasurer; and Walter Loewenthal, secretary.

The Goodyear Cotton Mills, Inc., Killingly, Connecticut, is offering some of its cumulative preferred seven per cent stock to employees at \$100 per share, on the instalment plan at \$1 a week, and will allow new employees to subscribe at the time of entering the company's employ. Each employee who remains

with the company is to be allowed a bonus of three per cent yearly.

The Story Rubber Corp., until recently at 1328 Broadway, New York City, has removed to a store at Broadway and Sixty-sixth street, under a long lease. All communications should be directed to the new address.

The London Rubber Co., Pittsburgh, Pennsylvania, is to be incorporated in that state in conjunction with the present business of A. L. London & Sons, manufacturers of rain coats, rubber cloths, inner tubes, etc., to manufacture high-grade tires and tubes. The officers of the new company are: A. L. London, C. M. London and H. London.

The Mohegan Tube Co., Scott avenue and Meserole street, Brooklyn, New York, is building a one-story addition to its plant, to cost about \$75,000. New equipment is also being installed in some departments, and it is hoped that the company will be able to double its present capacity. The Mohegan company is now supplying the rubber trade with heavier gage seamless tubes instead of welded tubing.

The Standard Emarex Co., 208 South La Salle street, Chicago, Illinois, has discontinued its office at 185 Madison avenue, New York City.

The L. H. Butcher Co., Inc., 100 William street, New York City, has taken a long-term lease of the five-story and basement building at 239 Front street, where it will consolidate its office and storage facilities and be enabled to carry increased stocks of its color, mineral, and chemical specialties.

The Acme Belting Co. and the United & Globe Rubber Co. have removed their Chicago branch, under the management of Elmer E. Bast, to 23 North Franklin street, Chicago, Illinois.

The L. A. Dreyfus Co., Rosebank, Staten Island, New York, manufactures and refines rubbers and gums.

The Dunning & Boschert Press Co., Inc., Syracuse, New York, manufacturer of presses, pumps, valves, etc., has increased its capital stock from \$200,000 to \$300,000.

The Acushnet Process Co., Inc., 52 Vanderbilt avenue, New York City, has increased its capitalization by authorizing the issuance of \$195,000 worth of preferred stock to supply funds for increasing its capacity for reclaiming friction. It expects to double its capacity by the first of the year.

The Metal Hose & Tubing Co., Raymond and Tillary streets, Brooklyn, New York, has increased its capital from \$15,000 to \$300,000.

The Cupples Co., St. Louis, Missouri, will build extensive additions to its tire plant at the corner of Sixth and Spruce streets, according to plans drawn by the Osborn Engineering Co., Cleveland, Ohio.

CANADIAN NOTES.

The Canadian Consolidated Rubber Co., Limited, purposes to expend \$1,000,000 in extending the Dominion Tire Factory, at Kitchener, Ontario. Two large additions are being built, one at each end of the present structure. It is hoped to double production with the new facilities and space.

The Gregory Tire & Rubber Co., Limited, Vancouver, has been incorporated in British Columbia, at \$1,500,000 to manufacture tires, tubes and accessories, and will build a plant for this purpose. The officers are: J. A. Cunningham, president; Morton Gregory, vice-president; Frank Parsons, secretary; and S. A. Madge, treasurer.

N. S. Braden has been elected vice-president of the Canadian Westinghouse Co., Limited, Hamilton, Ontario. H. M. Bostwick succeeds him as sales manager.

J. I. Frank Anthes is establishing himself as a manufacturers' broker and agent for materials required by the rubber and leather shoe industries, his office being at 707 Drummond Building, Montreal, Quebec. Mr. Anthes has been connected with the Canadian Consolidated Rubber Co., Limited, ever since its establishment, in an executive capacity in its different footwear, mechanical, and tire factories.

UNITED STATES RUBBER CO. TO INCREASE CAPITAL STOCK.

AT A MEETING held August 7, 1919, the directors of the United States Rubber Company voted approval of several important recommendations of the chairman, Colonel Samuel P. Colt. A meeting of stockholders for ratification will be held at New Brunswick, New Jersey, September 9, 1919. Chief among the recommendations was an increase in the capital stock to \$100,000,000 first preferred, \$200,000,000 common, a total of \$300,000,000, and the retirement of the second preferred, the greater part of which has already been acquired by the company.

The present authorized capitalization is \$70,000,000 first preferred, \$10,000,000 second preferred, and \$40,000,000 common, a total of \$120,000,000. Of this there is now issued and outstanding \$63,022,100 first preferred, \$403,600 second preferred and \$30,000,000 common, a total of \$93,425,700.

During the past five years the capital stock has remained substantially the same, while the volume of business transacted by the company has been increased in round numbers as follows: \$83,000,000 in 1914; \$92,000,000 in 1915; \$126,000,000 in 1916; \$176,000,000 in 1917; \$215,000,000 in 1918.

The indebtedness of the company was funded in 1917 into long-term 5 per cent bonds. Surplus earnings for the years 1917 and 1918 were equivalent each year to about 30 per cent on the common stock, and the earnings for the first half of 1919 have been substantially the same as for the first half of 1918.

For the past two years the company has been unable to meet the demand for its tires, and notwithstanding the fact that its capacity has already been substantially increased, further construction has been authorized which will require in the neighborhood of \$15,000,000 for its completion, and which will double the present capacity.

As the amount of the present outstanding common stock compared with the property of the company is relatively small, it is proposed that \$36,000,000 of additional common stock be issued and offered to present common stockholders at par, in order to provide ample capital to meet the enlarged business of the company without the application of so large a proportion of earnings for that purpose as has been the case the past few years.

It is also recommended that dividends at the rate of 8 per cent per annum be paid upon the common stock beginning in October next, and further, that an extra distribution, either in stock or in cash, such as may be warranted under all conditions, be made early in 1920 to common stockholders.

The money to be obtained from the increased issue of stock will be used:

- (1) To pay off all current indebtedness that can be paid (certain accounts payable and acceptances will always exist).
- (2) For new construction planned and in process designed principally for the increase of the product of automobile and truck tires.
- (3) For extension of rubber plantations in the East, and to facilitate the carrying of stock under profit sharing for benefit of employees.

NEW INCORPORATIONS.

Ampurecord Tire Co. of New England, July 9 (Maine), \$200,000. D. O. Campello, president, and treasurer; W. D. Carlin, 501 State street, F. Arnold, secretary; E. E. Hall, clerk. Principal office, Bangorville, Maine. To manufacture and deal in rubber tires, tubes, etc.

Atlas Tire Co., August 13 (Delaware), \$100,000. H. E. Harper, W. C. Hildebrand, both of Zelenople; C. C. Meeder, Pittsburgh—all of Pennsylvania. Delaware agent, Capital Trust Co. of Delaware, Dover. Delaware. To manufacture, buy and sell automobile tires and tire accessories.

Bailey Rubber Heel Co., May 22 (Massachusetts), \$75,000. M. Shuman, 1435 Commonwealth avenue, Boston; W. Barkin, 501 State street, F. Whitrop; R. A. Jordan, 55 Saltonstall Road, Haverhill—all in Massachusetts. Principal office, 52 Chauncey street, Boston, Massachusetts. To manufacture, buy, and sell rubber heels and soles and rubber goods of all kinds.

Bergougan Rubber Corp., August 1 (Delaware), \$1,500,000. R. C. Bergougan, chairman of the board of directors; H. C. Coleman, president; J. Grouer, vice-president and secretary; W. Clapp, treasurer; M. Leon, general counsel. Principal office, Trenton, New Jersey. To manufacture and sell tires and other rubber products.

Cascade Tire & Rubber Co., June 7 (Ohio), \$1,000,000. J. W. Mart, president and general manager; F. M. Sharp, secretary and treasurer;

M. E. Nichols, M. Fleisher and F. E. Clyde, directors. Principal office, Cleveland, Ohio. To manufacture and sell tires and rubber goods.

Carroll Tire Co., July 28 (New Jersey), \$125,000. D. L. Powers, president, 911 Lackey avenue; H. P. Meador, secretary, 332 Mercer street—all of Trenton, New Jersey. Principal office, 26 West State street, Trenton, New Jersey. Agent in charge, M. G. Buchanan. To sell pneumatic tires and automobile accessories.

Chick Carter Co., July 25 (Massachusetts), \$35,000. B. Hochberg, 23 Johnson Road, Dorchester; A. I. Karpas, 451 Walnut avenue, Roxbury; S. Raymond, 235 Chestnut street, Chelsea—all of Massachusetts. Principal office, 235 Chestnut street, Chelsea, Massachusetts.

Forster Tire & Rubber Co., The May 18 (Ohio), \$1,000,000. H. Forster, president and treasurer; W. E. Davis, vice president and general manager; D. W. Davies, manager of sales; M. Schuller, E. F. Crites and W. A. Mink, directors. Principal office, Millersburg, Ohio. To manufacture tires.

Garber Tire & Rubber Co., Inc., August 6 (New York), \$30,000. S. and A. Newman, 44 West 54th street, New York City; M. G. Garber, Norris-town, Pennsylvania. To manufacture tires and rubber goods.

Hard Rubber Mills, Inc., July 14 (New Jersey), \$300,000. A. C. Doig, 159 West 10th street, L. Aldrich, 37 West 16th street, both of New York City; G. Maier, 516 58th street, Brooklyn, New York. Principal office, 1st of Ferris avenue, Trenton, New Jersey. To purchase, sell, and manufacture rubber.

Hazlett Tire Sales Co., Inc., August 15 (New York), \$15,000. J. L. Tobin, 32 Winter street; J. W. Becker, 296 Summer Place; F. L. Kuhn, 90 Cedar street—all of Buffalo, New York. Principal office, Buffalo, New York. To manufacture tires and tubes.

Inter-State Tire Corp., June 28 (New Jersey), \$125,000. W. E. Gilmore, 119 Prospect street; H. M. Friend, 345 South Arlington avenue, both of East Orange, New Jersey; J. E. Sargent, 1900 Lexington avenue, New York City. Principal office, 16-22 Lawrence street, Newark, New Jersey; agent in charge, H. M. Friend. To buy, sell, manufacture, and deal in automobile tires.

Kelley Tire Co., Inc., August 8 (Delaware), \$1,000,000. J. Kelley, 4243 North Main street; M. J. Brown, 17 South Eighth street; A. Potter, 2326 East Cambridge street—all of Philadelphia, Pennsylvania. Principal office, Suite 475, Drexel Building, Philadelphia, Pennsylvania. To carry on a rubber business.

Lincity Tire & Retread Co., The June 18 (Tennessee), \$20,000. W. M. Seifer, H. S. Willett, H. Goldstein, K. L. McKenzie, L. Goldstein. Principal office, Nashville, Tennessee. To deal in and retread tires.

Lyon Tire Co., January 30 (Illinois), \$5,000. F. H. Stewart and others. Principal office, 401 East Monroe street, Springfield, Illinois. To deal in automobile tires.

McGraw Tire & Rubber Export Co., Inc., August 8 (Delaware) authorized capital 1,000 shares without nominal or par value. T. L. Croteau; S. E. Lill; A. M. Hoover—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture and deal in tires and rubber goods of all kinds.

Madison Tire & Rubber Co., Inc., August 13 (New York), \$2,600,000. J. N. Belmont, 30 La Salle street, and H. and S. Belmont, 606 6th Ave., both of 31 Broadway—all of New York City. Principal office, 254 West 57th street, New York City.

Majestic Tire & Rubber Co., The April 24 (Indiana), \$250,000. R. H. Spivey, president; C. E. Owsen, vice-president; O. Fantall, secretary and treasurer; J. B. Hilliard, superintendent and production manager. Principal office, Indianapolis, Indiana. To manufacture cord tires and tubes.

Master Tire & Rubber Co., The August 2 (Ohio), \$300,000. W. B. Ruston, president and general manager; G. H. Witsman, vice-president and factory manager; F. C. Vail, secretary and sales manager; H. G. Egbert, treasurer and credit manager; R. N. Brumbaugh, attorney. Principal office, 906 Scawdwin Building, Dayton, Ohio. To manufacture cord tires.

Neark Tire & Rubber Corp., The July 30 (Delaware), \$1,000,000. M. L. Rogers, L. A. Irwin, W. G. Singer—all of Wilmington, Delaware. Delaware agent, Delaware Registration Trust Co., 900 Market street, Wilmington, Delaware. To manufacture, buy, and sell and deal in all kinds of rubber tires.

Oldham Rubber Tire Co., July 25 (Delaware), \$1,000,000. F. Giles, M. M. Lucey, L. N. Jennings—all of Wilmington, Delaware. Delaware agent, Colonial Charter Co., 927 Market street, Wilmington, Delaware. To manufacture, repair, vulcanize, and deal in all kinds of tires.

Owens Tire & Rubber Co., February 10 (South Carolina), \$25,000. W. C. Owen, president; C. Sell, vice-president and general manager. Principal office, 714 Flatiron Building, Atlanta, Georgia. To carry on the business of jobbing tires and accessories.

Pike Manufacturing Co., Inc., The August 6 (Delaware), \$100,000. C. B. Bishop, S. M. Fox, S. S. Bishop—all of Wilmington, Delaware. Delaware agent, Delaware Charter Co., 900 Market street, Wilmington, Delaware. To manufacture and deal in hose supporters.

Pliocor Rubber Co., Inc., August 13 (New York), \$50,000. R. J. Cronan, 50 Prospect Place; W. J. Brosnan, 146 West 74th street; D. Straus, 60 Wall street—all of New York City.

Pneumatic Rubber Heel Corp., July 21 (Delaware), \$1,250,000. R. A. Van Voorhis, 205 Union street, Jersey City, New Jersey; A. R. Oakley, Pearl River; W. E. Schiele, Jr., 51 Division avenue, Brooklyn—all in New York City. Delaware agent, Delaware Charter Co., 900 Market street, Wilmington, Delaware. To manufacture, purchase, and deal in rubber heels, tires, etc.

Pyramid Tire & Rubber Co., Inc., August 11 (New York), \$10,000. J. Jacobus S. Larnheim, W. Loewenthal—all of 1877 Broadway, New York City. To manufacture tires and tubes for automobiles.

Reber Rebuild Tire Co., August 6 (Delaware), \$30,000. T. L. Croteau; S. E. Lill; A. M. Hoover—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture, rebuild, retread, vulcanize, and repair rubber tires and tubes.

Rebuilt Tire Co., Inc., August 5 (New York), \$10,000. C. D. Nolen, 475 Fourteenth avenue, Long Island City; E. L. Blessington, 131 Fifteenth street, Brooklyn; J. G. Goshier, 407 West 10th avenue, Staten Island—all of New York. To manufacture tires and tubes.

Roussey-Centlivre Rubber Co., June 23 (Indiana), \$100,000. A. J. Roussey, Carl Centlivre, Charles Centlivre—all of Fort Wayne, Indiana. Principal office, 780 Broad street, Newark, New Jersey. Agent in charge, S. Knepp. To manufacture and sell tires, tubes and other rubber accessories for automobiles.

Rubber Products Finance Co., July 29 (New Jersey), \$100,000. S. M. Hollander, S. Knepp, N. M. Friglitman—all of Newark, New Jersey. Principal office, 780 Broad street, Newark, New Jersey. Agent in charge, S. Knepp. To manufacture and sell tires, tubes and other rubber accessories for automobiles.

Speedway Tire & Rubber Co., The, August 19 (Delaware), \$100,000. W. M. Nelson, Wardman Park Hotel; H. L. Clendening, 4037 New Hampshire avenue; W. F. Roche, The Arlington Hotel—all of Washington, D. C. Delaware agent, Delaware Registration & Incorporators' Co., 927 Market street, Wilmington, Delaware. To manufacture, repair, and sell rubber goods of every description.

Squares Tire & Rubber Co., Inc., August 7 (New York), \$250,000. C. Henry Squares, president, Condon H. Squares, secretary, both of Naugatuck, Connecticut; A. C. Squares, treasurer, Richmond Hill, Long Island, New York. Principal office, Room 208, Queens Plaza Court Building, Long Island City, New York. To manufacture high-grade tires and rubber goods.

Tan Lucello Rim Wheel Co., July 17 (Delaware), \$100,000. M. L. Dory, M. C. Kelly, S. L. Mackey—all of Wilmington, Delaware. Delaware agent, Delaware Charter Guarantee & Trust Co., Du Pont Building, Wilmington, Delaware. To manufacture automobile rims, wheels and accessories.

United Tire & Rubber Corp., August 7 (Delaware), \$500,000. H. H. Nesbit, W. G. Keck, W. F. Saltmarsh—all of Wilmington, Delaware. Delaware agent, U. L. Townsend, Jr., 509 Ford Building, Wilmington, Delaware. To manufacture, buy and sell tires.

Universal Wheel Corp., The, August 14 (Delaware), \$1,500,000. J. Hausmann, 210 West 44th street; H. Denton, 220 Audubon avenue; J. Newman, 251 West 89th street—all of New York City. Delaware agent, F. M. Walker, 901 Market street, Wilmington, Delaware. To manufacture and sell the wheel known as "Resilient" and to deal in tires, wheels, and other accessories for automobiles.

Vineyard Shoe Co., Inc., May 30 (New Jersey), \$20,000. G. D'Ippolito, president; L. D'Ippolito, vice-president; D. Gasper, treasurer and general manager; A. D'Ippolito, secretary. Principal office, Sixth street and Chestnut avenue, Vineland, New Jersey. Agent in charge, G. D'Ippolito. To manufacture rubber soles and heels.

Virginia Rubber Co., The, June 30 (West Virginia), \$1,200,000. A. A. Lilly, president; H. G. Young, vice-president; W. D. Guyer, secretary, and treasurer; A. J. Soben, W. A. Abmitt, M. J. Hopkins, J. S. Baister, W. L. Burruss, W. S. Johnson, W. C. Mitchell, V. E. Vining, directors. Principal office, 1110 Union Trust Building, Charleston, West Virginia. To manufacture pneumatic rubber tires and to manufacture dipped goods.

Washington Garter Corp., July 1 (New York), \$100,000. M. L. Margolis, M. M. DeSkind, both of 627 Broadway; L. Margolis, 1387 Clay avenue—all of New York City. To manufacture garters.

Whitcomb Tire & Rubber Co., July 24 (Delaware), \$100,000. M. C. Kelly, S. L. Mackey, J. D. Frock—all of Wilmington, Delaware. Delaware agent, Delaware Charter Guarantee & Trust Co., Du Pont Building, Wilmington, Delaware. To manufacture automobile tires.

BERGOUGNAN TIRES IN AMERICA.

French capitalists, owners of Etablissements Bergougnan, with factories in Clermont-Ferrand, France, Moscow, Russia, Turin and Italy have purchased the plant of the Delton Tire & Rubber Co., Trenton, New Jersey, the firm to be known as the Bergougnan Rubber Corporation, of Trenton. The company's office is at 49 West 64th street, New York city.

Plans for additions are rapidly going forward and forty acres of land have been purchased for new factory buildings.

RETURNS TO THE TIRE BUSINESS.

WILLIAM MACKONE MILNER, for several years connected with rubber trade publications, has resigned the editorship of "The Rubber Age and Tire News," and gone into the manufacture of motor tires.

Mr. Milner was born in Lafayette, Indiana, June 3, 1887, and there received his early education, but removing to Europe in his youth, he attended colleges in England and France. Having a command of several languages, he was first connected with a tourist agency in London, but resigned to become a salesman of automobile specialties, tires and mechanical rubber goods.

Returning to this country in 1914, he was for a time connected with the automobile and motor truck industry, and a year or so later he became a member of the editorial staff of THE INDIA RUBBER WORLD. Later, after a short time in the automobile business, he was assisted in establishing "The Rubber Age and Tire News," of which he became the editor.

He now becomes assistant general sales manager of the American branch of the Bergougnan Rubber Corporation, the well-known French tire manufacturing concern, which has acquired the plant of the Delton Tire & Rubber Co., at Trenton, New Jersey. Mr. Milner's duties will be largely the establishing of agencies and branch stores for the Bergougnan tires throughout the United States. His many friends in the trade wish him success in his new position.

W. M. MILNER.

A RECORD BELTING ORDER.

The largest single order for belting which has ever been shipped by The B. F. Goodrich Co., Akron, Ohio, was for the

A RECORD SHIPMENT OF GOODRICH BELTING.

Northern Central grain elevators at Canton, near Baltimore, Maryland, owned by the Pennsylvania Railroad Co. The shipment shown here on the traction trains leaving the factory, aggregated 44,594 feet of belting, approximately 8½ miles, and weighed about 131 tons.

"CRUDE RUBBER AND COMPOUNDING INGREDIENTS" AND "RUBBER MACHINERY," by Henry C. Pearson, should be in the library of every progressive rubber man.

TRENTON PLANT OF THE BERGOUGNAN RUBBER CORP.

The present plant is now turning out about 350 tires a day, and the capacity will be increased to 5,000 daily. Later the company plans to manufacture solid tires also.

The officers of the company are: Herbert H. Coleman, of East Orange, New Jersey, president; W. A. Clapp, East Orange, treasurer, and Jean Grenier, of Trenton, vice-president and general sales manager. The directors of the company, besides the officers, are: John E. Thropp and Peter D. Thropp, of Trenton, and Jules Berthier, L. Larrouze and Raymond Bergougnan, of Clermont-Ferrand, France.

THE RUBBER TRADE IN OHIO.

By Our Special Correspondent.

AKRON NOTES.

THE B. F. GOODRICH CO., Akron, has appointed F. O. Slutz manager of its railroad sales department, succeeding C. M. Woodruff, resigned. Mr. Slutz has been with the Goodrich company 18 years, the last ten of which has been in the mechanical sales department.

F. O. SLUTZ.

The B. F. Goodrich Co., Akron, has completed the last order for war balloons. During the war its balloon department produced seven balloons a day and employed about 1,300 people. The company also produced 14 dirigibles, 362 observation balloons and 13 supply balloons during the war.

The fourth annual outing of The B. F. Goodrich Co. will be held at Liberty Park, Akron, on Labor Day. The Goodrich band will furnish music and a program is being arranged for athletic events for both men and women, with suitable prizes for the winners.

The B. F. Goodrich Co., Akron, has suspended its Americanization classes for the four weeks ending September 5, the autumn opening being on Monday, September 8. Over 1,500 Goodrich employees have availed themselves of the opportunity to enroll in these classes during the last eight months.

Employees of The Miller Rubber Co., Akron, held their annual picnic at Summit Beach Park on August 2. Several thousand attended and the program of entertainment included speeches, games and other amusements.

Harvey S. Firestone, president of the Firestone Tire & Rubber Co., Firestone Park, Akron, spent the first three weeks in August in the Adirondacks with Thomas A. Edison, John Burroughs and Henry Ford, accompanied by his son, H. S. Firestone, Jr.

C. W. Seiberling, vice-president of The Goodyear Tire & Rubber Co., Akron, has offered a gold and bronze cup, 24 inches high, as a trophy to be presented to the Industrial League team winning the baseball championship of Akron this year.

CLEVELAND NOTES.

L. A. Llewellyn, for the last seven years Ohio salesman for the Republic Rubber Co., Youngstown, Ohio, has been appointed district manager of the Cleveland branch, with offices at 1745 Euclid avenue. The territory served by that branch includes the greater part of the State of Ohio. Mr. Llewellyn is an experienced rubber man, having spent many years in manufacturing previous to his association with the sales department of this company, and is well known in the territory mentioned.

L. A. LLEWELLYN.

The Cleveland Rubber Corp., Cleveland, has engaged A. H. Harris to take charge of its engineering work and organization of manufacturing. The Osborn Engineering Co. is preparing plans for the buildings and equipment for which contracts will be awarded shortly.

The Cleveland Osborn Manufacturing Co., Inc., Cleveland, is adding another story to its main building to increase the capacity of its molding machine department. The offices will be located

in the new story. An additional story is also being built on the brush factory, to which the brush stock room will be moved.

* * *

The Cleveland Rubber Mold Foundry & Machine Co., 406 Schofield Building, Cleveland, has purchased a plot of land on Warner Road, comprising approximately five acres, where it will build a plant of three units separated by fire walls. The foundry building will be 180 by 110 feet; the light machine shop, 180 by 100 feet; and the main machine shop, 220 by 160 feet, with a mezzanine floor above the side and east end bays.

MISCELLANEOUS OHIO NOTES.

The Mason Tire & Rubber Co., Kent, Ohio, has elected E. G. Tillotson, senior member of the firm of Tillotson & Wolcott of Cleveland, and W. R. Green, secretary of The Guardian Savings & Trust Co., Cleveland, to membership in the board of directors to succeed the late D. N. Mason and fill the vacancy caused by the resignation of M. B. Mason.

* * *

The Rubber Products Co., Barberton, Ohio, has appointed Glen Buck, Chicago, Ill., advertising agent. A campaign on "Stronghold" tires is being launched.

* * *

The Faultless Rubber Co., Ashland, Ohio, is conducting a national advertising campaign on its "Wearever" druggists' sundries.

* * *

The Knox Tire & Rubber Co., Mount Vernon, Ohio, capitalized at \$2,000,000, has a 20-acre factory site within one-half mile of the business section of the city and will build there a plant 100 by 225 feet, of concrete, steel, and brick. In addition to the main building there will be a power plant of the same construction. The site has a frontage on the Baltimore & Ohio railroad and the company possesses water rights from the Kokosing river. The officers are: B. E. Frantz, president; E. Scott Cannell, vice-president; F. D. Spencer, secretary and treasurer; C. B. Carpenter, sales manager; and V. V. Hendershot, superintendent. The Chamber of Commerce is backing the concern.

* * *

The Central Rubber Co., Inc., Defiance, Ohio, is now equipped to reclaim all grades of scrap rubber.

* * *

The Master Tire & Rubber Co., Dayton, Ohio, has been incorporated in that state to manufacture the "Master" cord tire. The officers are: William B. Ruston, president and general manager; George H. Witsaman, vice-president and factory manager; Frank C. Vail, secretary and sales manager; Harry G. Egbert, treasurer and credit manager. J. J. Black, formerly mechanical engineer and superintendent of The Dayton Rubber Manufacturing Co., has been engaged as chief engineer and factory superintendent.

* * *

The Owen Tire & Rubber Co., has installed a restaurant and cafeteria for its employes on the roof of its factory at Bedford, Ohio.

* * *

The Forster Tire & Rubber Co., Millersburg, Ohio, has increased its capital from \$200,000 to \$1,000,000. The officers are: Henry Forster, president and treasurer; W. E. Davis, vice-president and general manager; W. E. Davis, general manager, and M. S. Lower, superintendent.

* * *

The Cascade Tire & Rubber Co., Ravenna, Ohio, which incorporated in June for \$10,000, has increased its capital to \$1,000,000, under date of July 3, 1919. The officers are: J. W. Mart, president and general manager; F. M. Sharp, secretary and treasurer; M. E. Nichols, Milton Fleisher, and F. E. Clyde, directors. The company will manufacture cord and pneumatic

tires and inner tubes. The first factory unit will be built at an early date.

NORMAN A. SHEPARD, PH. D.

DR. NORMAN A. SHEPARD, who, as was mentioned in THE INDIA RUBBER WORLD last month as succeeding Dr. John B. Tuttle as research chemist at the Firestone Tire & Rubber Co.'s plant at Akron, Ohio, although a young man, is well known in the scientific world.

NORMAN A. SHEPARD.

He was born April 8, 1890, in New Haven, Connecticut, where he attended school, graduating from the high school in 1907 as valedictorian of his class. He then enrolled in the chemical course of the Sheffield Scientific School of Yale University, from which he graduated, with the degree of Ph. B., in 1910. He continued his study in the Graduate School of Yale for three years, majoring in organic chemistry under Professor Treat B. Johnson, who is recognized as an investigator of marked ability

in this subject. He was a member of the Yale faculty from 1910 to 1919, first as laboratory assistant and successively as assistant in instruction, instructor, and assistant professor, which office he resigned last July to accept his present position.

Dr. Shepard received his degree of Ph.D. in 1913, and three years previous to this he was elected a member of Sigma Xi, a national honorary organization of men and women interested in original scientific research.

Dr. Shepard has contributed several able articles to the "Journal of the American Chemical Society." During the recent war he was instructor in the Student Army Training Corps, and was detailed on research work on high explosives in connection with the government plant at Bound Brook, New Jersey. He is considered a worthy successor to Dr. Tuttle, who becomes chief chemist of the Firestone company.

MASON TIRE & RUBBER CO. EXPANDS.

Following the detailed announcement of the building of a mill to supply tire fabric, that appeared in THE INDIA RUBBER WORLD, April 1, 1919, comes the report that The Mason Tire & Rubber Co., Kent, Ohio, will double the capacity of its plant, contracts having been placed for two large additions. This, it is claimed, will place this company fifth in point of production among the tire manufacturers in the Akron district. This is the third time the capacity of the plant has been doubled in the last three years.

The establishment of the cotton fabrics mill, and the enlargement of the tire factory will require 500 additional employees, and to provide proper living conditions for them, The Mason Housing Co. was incorporated July 16, 1919, under the laws of Ohio, with a capital of \$100,000, to assist and encourage employees to own their own homes. The directors and officers of the company are the same as those of The Mason Tire & Rubber Co.

Two recent additions to the production list of the company are 40 by 8 pneumatic cord truck tires and 30 by 3½ cord tires.

EXPANSION IN GOODRICH PLANT OBLITERATES RUBBER BUILDINGS ERECTED 35 YEARS AGO.

The accompanying illustration shows leveling crews engaged in razing one of the Akron rubber industry's oldest land marks. The buildings in this group were the home of the American

Hard Rubber Co., for a number of years and were originally constructed by the Goodrich company about the year 1884. It was in these buildings that the Goodrich company first manufactured hard rubber products. Four years later the Goodrich Hard Rubber Co. was formed, the land, buildings and stock of the hard rubber department being transferred to the new company.

In 1898 the American Hard Rubber Co., a combination of several small companies, was organized, taking over the holdings of the Goodrich Hard Rubber Co. This new company retained possession of the buildings until last year, when they removed to their new quarters in East Akron.

A mammoth eight-story-and-basement building costing \$1,500,000 will replace all of the buildings in this group. In fact

REMOVING OLD GOODRICH LANDMARK.

from the standpoint of floor space it will be the largest building in Akron. The construction and equipment will be of the most modern type.

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

THE UNUSUAL MIDSUMMER QUIET of past years has not been so marked this season in the rubber trade here, though, to be sure, the footwear factories have been shut down for two or three weeks. Considerable new machinery has been installed, and more would have been added, but manufacturers of rubber-working machinery and appliances are sold up to capacity several months ahead. The tire business is naturally very brisk at this season, all manufacturers reporting good business, while many new enterprises in this field have started or are contemplated. Clothing people have had some labor troubles, but apparently these have been straightened out. Mechanical plants are busy. The reclaiming business is the one which is feeling the greatest absence of activity, due to the low price of crude rubber. Manufacturers prefer to use new rubber rather than reclaim at present rates, and the demand for the latter is little if any over 50 per cent of normal. This condition is reflected in the dullness of the waste rubber market, and dealers are carrying much larger than average stocks, with little demand for any scrap except inner tubes and boots and shoes.

September 1 is the usual date when the manufacturers of rubber footwear announce their prices for tennis shoes for the succeeding season. Higher prices are anticipated, and naturally so when the rise in values in all lines of merchandise is considered. Crude rubber, to be sure, has declined over 30 per cent, but the rubber cost in tennis footwear is but a small proportion of the total. With all other materials costing much more, and labor costs soaring, there is every reason to believe that the

new price lists will show material advances over last year's rates.

* * *

The Boston Woven Hose & Rubber Co. reports a remarkable call for jar-rings. Even though the normal wholesale season is over, the retail demand, now at its height, is being reflected by the reorders from wholesale distributors.

This company is building for completion and occupancy about October 1 a one-story brick and steel building, 165 by 50 feet, to be used for the manufacture of imitation leather. Considerable new equipment will be installed to double the present output. In addition to motor fabrics, material is being produced for baby-carriage manufacturers, handled in conjunction with the company's tire business; also imitation leathers for the shoe trade to which the company furnishes heels and soles.

* * *

George and Samuel Grow have formed the George Grow Tire Co. and purchased and equipped the plant of the C. C. C. Fire Hose Co. at Canton, Massachusetts. The manufacture of cord and fabric tires has been started with an output of 75 tires per day, which they expect to increase to 500 tires by next spring. The cord tires are all hand made, and machines are used in producing the fabric tires, all of the latter being oversize and containing one ply more of fabric than the standard.

George Grow will have charge of sales. The factory superintendent is L. J. McDonald, for twelve years with the Revere Rubber Co. and the Patterson Rubber Co., and for nearly five years with the Needham Tire Co., the last year as superintendent of the latter company's factory.

* * *

The Vaughn-Upton Co., manufacturer of fountain pens and hard-rubber pencil holders for the stationery trade, recently removed its plant from Causeway street to North Washington street, Boston. The present plant occupies the entire top floor of the Trade Building, is excellently lighted on three sides, and is laid out to facilitate manufacturing operations to the best advantage.

* * *

Seaver & Co., 120 Milk street, Boston, manufacturers of fine ivory and bone black, will be located at 3 Tremont Row, in the Olympia Building, after September 1, 1919.

* * *

The First National Bank, Boston, has purchased the Equitable Building on Milk street and the properties immediately adjoining at the rear, the total having an assessed valuation of almost \$2,000,000. The present buildings on the site will be torn down and a new one erected which will be one of the finest banking houses in the country.

* * *

Last month there was an auction sale in Boston of 43,000 pairs of hip rubber boots salvaged from the steamship *Port Hunter*, which was sunk off Long Island more than a year ago. The goods were owned by the Government, and despite the fact that they had lain for several months under water they were found in surprisingly good condition. The boots were offered in 500-pair lots, well sorted as to sizes, and no bidder was allowed to buy more than four lots. The lowest price at which they were sold was \$2.45 per pair, and the highest \$2.51. As the trade price of hip boots runs from \$4.50 to \$4.75, and these were specially heavy and sold to the Government at a much higher figure, the buyers must have considered them bargains.

* * *

Business at the Boston establishment of The E. F. Goodrich Rubber Co., of Akron, Ohio, was suspended on August 7, when the entire force participated in an outing at Nantasket Beach. The company assembled at the Goodrich Building, on Boylston street, and, headed by a band, marched to Rowe's Wharf. Arriving at the beach, a program of sports was offered by the general committee, of which F. T. Moore, New England man-

ager of the company, was chairman. Afterwards there was dancing in the hotel ballroom, visits to Paragon Park and other forms of entertainment.

One of the most interesting events was the fat men's race, which was won by Manager Moore, with W. H. Hickey second. There were no entrants in the fat girls' race, but a number responded when candidates were called out for "pleasingly plump girls." Miss T. G. Ribbs won first prize. There were three-legged races, pie-eating contest for the office boys, various dashes for men and girls and other events. The party returned to Boston on an evening boat.

* * *

Herbert T. Mason, recently with The Goodyear Tire & Rubber Co., Akron, Ohio, is now treasurer and sales manager of the Quabaug Rubber Co., North Brookfield, Massachusetts.

* * *

The Tyer Rubber Co., Andover, Massachusetts, is planning an extension of its welfare work and service to employees. This began by the employment in June of Mrs. E. A. Webster Cross, an American nurse, who had served for about three years with the British Army in England and France, and who for a considerable part of that time was engaged in the industrial service of the British Government for munition workers. During the first month Mrs. Cross has treated about 150 cases, and while the injuries were not in many cases of a serious nature, it is estimated that much real trouble has been avoided by prompt treatment, so that time has been saved both to the individual employee and to the company. Excellent hospital rooms are being fitted up in two of the buildings of the company.

In July an employment and service department was established under the direction of Ralph E. Nash, who has had several years experience in industrial service work overseas. He undertakes the work with no fixed plan, both he and the company feeling that whether or not his work follows the approved and accepted methods of this country or the more recent liberal English methods, depends quite as much upon the employee as upon the company. The introduction of such a department indicates the attitude of the company towards cooperation with its employees, to which it feels a hearty response will be accorded.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE MONTH OF AUGUST has in a great measure been a reconstructive one for the manufacturers of rubber goods in Rhode Island, as it has been the first period in nearly four years when there has been so near a complete cessation of production. In consequence of the long period of continuous operation, an unusual amount of overhauling and repairing of the machinery and other equipment of the several plants has been necessary to bring them back to the normal standard. Renovations, rearrangements, extensions and the erection of several additions have been among the activities noted at the various concerns.

The help situation continues to harass the manufacturers, with but little hope of any immediate relief. The abnormal wages paid to laborers during the war by industries that were engaged on governmental contracts attracted hundreds of employees, and few have returned to their regular vocations. It is safe to say that the manufacturers of rubber goods in this city and vicinity could immediately place at least 1,000 employees in their various departments.

* * *

The plant of the National India Rubber Co. at Bristol, which closed down July 31 for two weeks, did not resume operations at the date expected, but was idle for an additional week because of the tie-ups occasioned by the strike on the railroad system. It was not until the 25th that the first of the departments started up, and a week later before all departments were in operation.

During the shut-down the gum-room building in the central part of the factory was raised from two stories to three in

height, thus materially increasing the capacity of the department. General work was done in practically every part of the plant and the factory put in exceptionally good condition.

The National India Rubber Co. has ordered a bronze honor roll tablet to be placed in front of its plant at Bristol, listing the names of those who were in its employ at the time they entered the service of the United States during the World War. The list is in the hands of Andrew W. Anthony, Industrial Relations Manager, who has 237 names on the roll, three of whom are in the list of deaths. When completed, the tablet is to be unveiled and dedicated with appropriate exercises.

The maintenance department of the National India Rubber Co. enjoyed its annual outing and clam-bake on the afternoon of August 10 on the shores of Narragansett Bay at Bristol. Games were played, including baseball.

Laurence S. Greenwell, in charge of the Planning Department of the National India Rubber Co., and Robert Ford, of the same department, during their two weeks' vacation hiked through southern Rhode Island and eastern Connecticut, camping in the woods or fields, using specially adapted sleeping bags.

During their vacation in August, Joseph A. Kennedy, superintendent of the Tubular Woven Fabric Co., of Pawtucket, and J. O. Lindsley, assistant superintendent, captured on a mackerel hook a shark weighing between 500 and 600 pounds. The shark put up an exciting fight and it was nearly two hours before he was landed at the side of the boat.

The first annual outing of the Foremen's Council of the Woonsocket Rubber Co., which comprises the Alice Mill at Woonsocket and the Millville plant and the Lawrence felt mill, was held Saturday afternoon, August 16, at the Warwick Club on Narragansett Bay. About 130 foremen and guests were present and enjoyed the luncheon and clam-bake. A program of track events and a baseball game among the members was much enjoyed. The party went to Warwick in two special cars. Among the invited guests were Myron H. Clark, Arthur Reeves, Henry C. Wagner, George Schlosser, William H. Schlosser, Waldo E. Kelly, Thomas F. Rogers, B. J. McLaughlin, Eugene Reilly, William T. Aldrich, Herman Fahrenholz, Walter R. Williams, William Kehlthau, Clarence H. Guild, Arthur A. Spencer, Michael J. Bowes and Otto Koerner.

The sale of the Globe Yarn Mills at Fall River, which was announced early in the month, was of more than ordinary interest in textile and rubber circles in this State. The purchaser was the Connecticut Mills Co., of Danielson, Connecticut. This property is the last of the cotton yarn manufacturing plants formerly owned and operated by the New England Cotton Yarn Co., which continued until the present time to hold the controlling interests. The revenue tax stamps attached to the deed of sale indicate that the purchasing price for the property was about \$760,000.

The Globe Yarn Co. is capitalized at \$1,000,000, of which \$500,000 is 7 per cent accumulated preferred stock and \$500,000 common stock, and operates 54,000 spindles, producing hosiery yarns and thread. Extensive changes in equipment will be necessary, as the new corporation plans to make yarns for tire fabrics.

Saturday, August 2, about 500 employees of the Goodyear Cotton Co., of Danielson, Connecticut, held their annual outing at Crescent Park on the east shore of Narragansett Bay. They were conveyed in automobiles and motor trucks and were accompanied by the company's band.

Over 1,200 lads and lassies from the Revere Rubber Co.'s plant, Valley street, Providence, attended the fourth annual outing on Saturday, July 26, at Lake Pearl, near Wrentham, Massa-

chusetts. The party left the Union Station at 8:45 in the morning in two special trains, arriving at Lake Pearl soon after 10 o'clock. A fine dinner, bathing, boating, dancing, and field sports were features of the program. The success of the outing was due entirely to the employees of the firm, headed by an executive committee, of which Miss Odeal Okell was chairman and D. K. MacDonald, secretary, assisted by A. W. Waite, O. H. Carr, F. D. Mills and A. N. Smith.

The Bourn Rubber Co., Warren street, Providence, is running steadily on large contracts for rubber shoes, with encouraging prospects for an indefinite period, although hampered by the handicap of a scarcity of help. Superintendent F. W. Foote has found it exceedingly difficult to obtain female help, notwithstanding repeated offers of better wages than ever before offered for similar work.

The new refrigerator building that was recently erected on the ground of the O'Bannon Corp., at the former plant of the International Rubber Co., at West Barrington, has been completed and placed in operation. The company reports an increasing demand for the rubberized goods that it is producing for use in automobile and carriage tops.

Samuel Fish and Nathan Siegalman have purchased the Supreme Tire & Vulcanizing Co., at 318 Smith street, Providence, heretofore conducted by William and Isador Cohen.

Ellery Merritt, chief electrician, and William Wood, assistant electrician, of the Millville Mill of the Woonsocket Rubber Co., have been spending a month's vacation at the Panther House, Moosehead Lake, Maine.

The What Cheer Tire Co., 3 Claverick street, Providence, is owned by Frederick A. Gaumer and George Cetenich, according to their statement filed with the City Clerk's office.

The Narragansett Tire Co., 146 Bellevue avenue, Newport, is being operated by the Fulton Tire Supply Co., of Boston, with Israel Smith as resident manager.

Hyman Abrams and Harry Gordon are conducting the Arc Vulcanizing Co., 385 Canal street, Providence.

The local branch of the Firestone Tire & Rubber Co. is now at 18 Snow street, Providence. H. J. Aitken is manager.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

THE THERMOID RUBBER Co. has purchased a tract of land, 375 by 946 feet, along the Pennsylvania railroad as a site for a new factory to cost about \$300,000, and which will give employment to 600 workers. William J. B. Stokes, president of the Thermoïd company, says that the concern now has engineers at work on preliminary plans for the proposed structure and that it is the desire to have the construction begun early in the fall. The new plant will be of steel and concrete and equipped with tire machinery of the latest type.

The employees of the Ajax Rubber Co., Inc., Trenton, with their families, held an outing at Springdale Park recently. Carl Dibbel, night superintendent of the Ajax plant, was chairman of the committee in charge.

The Fineburg Auto Tire & Accessory Co., Trenton, has purchased the carriage factory of Lewis W. Reeder on South Warren street, where solid-tire presses have been installed. Day and night service will now be given. Several thousand dollars'

worth of additional machinery will be installed at the plant and Mr. Reeder will be manager.

* * *

The Hamilton Rubber Manufacturing Co., Trenton, has added a three-story extension to its plant, which will provide about 12,000 additional square feet of floor space. The company has just installed a complete department for the manufacture of high-grade molded garden hose.

* * *

The Puritan Rubber Co., successor to the Panther Rubber Co., Trenton, has filed articles of incorporation in the office of the Secretary of State. The new company will occupy the Panther plant on Perrine avenue, and manufacture rubber heels, soles, and similar articles. Associated with the new company are, Frank Bernstein, William Bernstein, Miah Marcus and Tobias Gordon, who is the Trenton agent of the new firm. The Puritan company is capitalized at \$250,000, of which \$80,000 is paid in.

* * *

Trenton rubber manufacturers find enjoyment in different diversions during the summer months. John A. Lambert plays golf at the Trenton Country Club; Howard C. Whitehead cruises in his yacht; John S. Broughton takes frequent trips to the seashore resorts; Horace B. Tobin enjoys fishing at Forked River; Charles H. Semple is now on an extended motor trip through the New England states; Robert J. Stokes spends the summer months with his family in the Pocono Mountains; A. Boyd Cornell motors when he is not playing golf at the Trenton Country Club; Clifford H. Oakley is also a devotee to golf; Bruce Bedford spends a few weeks each summer with his family at Wilkes-Barre, Pennsylvania, and William J. B. Stokes enjoys motoring and golf.

* * *

The Brighton Mills, Passaic, New Jersey, manufacturer of cotton fabrics, has let contracts for Unit No. 2 at its Allwood plant, to be a duplicate of Unit No. 1 with the exception that the equipment will include particularly machinery for increasing the output of cord tire fabric. It is expected that the new plant will be in operation by January 1, 1920.

* * *

The Overland Tire Co., Newark, New Jersey, has purchased a plot on Cortland street and will erect a one-story plant covering about 35,000 square feet at a cost of about \$100,000. The plant will be used for making new tires and rebuilding used ones. John D. Olwell is president and James A. Whitman secretary and treasurer of the company.

OVERLAND RUBBER CO. BECOMES STANWOOD RUBBER CO.

The Overland Rubber Co., Newark, New Jersey, which, by the way, is not a subsidiary of the Willys-Knight interests, has re-incorporated as the Stanwood Rubber Co., with an authorized capital stock of \$3,000,000 preferred and 500,000 shares of common stock without par value. The change of name has been made in order to avoid confusion with other companies including the name "Overland" in their corporate titles, with none of which it has any connection. The Stanwood Rubber Co. has purchased the plant of the Militor Corp., at Newark, New Jersey, in which it is installing equipment for the manufacture of "Stanwood" tires and tubes at an early date. Orders for machinery and equipment are being placed, including that for the power-house. The officers of the company are Charles E. Barker, president; Edward Hutchens, vice-president and engineer; R. B. Gillette, secretary and treasurer; S. P. Woodard, chairman board of directors.

PACIFIC COAST NOTES.

ELMAR S. FIRESTONE, manager of the Los Angeles branch of the Firestone Tire & Rubber Co., has been in Akron attending a conference of the factory branch managers.

F. P. Harrington, manager of the accessory department of the Miller Rubber Co., Akron, Ohio, on his recent coast trip appointed the International Sales Co. of Los Angeles, distributors of the Miller Ad-on-a-Tire in Los Angeles and the southern part of the state.

* * *

The Ehman Tire & Rubber Co. of California has opened offices at 742 South Olive street, Los Angeles, for the distribution of Ehman fabric tires. The local representatives are E. F. Riley, H. S. Turner and C. P. Turner. Mr. Riley was at one time in the tire business in Pasadena while Mr. Turner is a Los Angeles pioneer in the tire business.

* * *

The B. F. Goodrich Rubber Co. in its campaign to increase the interest in touring in California has this year distributed approximately 250,000 route maps through the state. The peak of travel was reached during August when motorists from all over the United States applied to its various bureaus for information. A large number of tourists made the trip to the East by way of the Midland or Arrowhead trails to Salt Lake City, thence along the Lincoln highway, while others took the route via the Santa Fe Trail, taking in the scenic spots, such as the Grand Canyon of the Colorado and the Rocky Mountain resorts.

* * *

The Rubber Products Co., Barbenton, Ohio, manufacturers of Stronghold tires and tubes, has entered the Southern California field. The company plans to limit dealers' territory in order to provide more secure protection of their trade. The B. & B. Tire & Supply Co. on South Main street has been appointed Los Angeles representative. At the head of the Pacific Coast organization of the Rubber Products Co. is Edward Slosson, formerly with the Firestone Tire & Rubber Co.'s motorcycle tire department. He will make his headquarters in San Francisco, leaving B. W. Cunningham in charge in Los Angeles.

* * *

Edwin M. Fowler & Co., Los Angeles, cotton dealers, are projecting a tire fabric plant which will be equipped to utilize its own waste.

* * *

The San Francisco branch of the Mohawk Rubber Co., Akron, Ohio, has practically doubled its facilities to take care of increased business. W. G. Fitzgerald, formerly Kentucky representative of the company, is in charge.

* * *

M. B. Rapp, San Francisco, has left for Akron, Ohio, to put the finishing touches to his education as a tire salesman for the Granfield-Boston Tire & Supply Co., distributors for Diamond cords and fabrics and Goodrich solid tires. He is well known as a hand-ball player and all around athlete.

* * *

P. H. Lyon of San Francisco, secretary of the Chanslor Lyons Co., distributor for Lee tires, has just returned from a trip to the Lee factories at Conshohocton, Pennsylvania.

* * *

The energy with which the Firestone Tire & Rubber Co. is pushing its "ship-by-truck" movement is attested by the thousands of celluloid buttons, papers of matches and watch fobs on which is shown a large truck wheel, across the face of which are the words in script "Ship-by-Trucks." The recent parade held in Oakland was a huge success.

* * *

Munnell-Sherrill Co., 40 First street, Portland, Oregon, a tire jobbing house, has been appointed a distributor of Mohawk tires and will carry a large enough stock to facilitate prompt shipments in the Northwest.

The Oregon Tire Co., 61 First street, Portland, Oregon, has been assigned the Portland territory for McGraw tires.

* * *

The Deaton Tire Co. of Seattle has been appointed agent for the distribution of the Oldfield Tires for Kings County and has opened a salesroom at 1211 Pine street.

* * *

The Rubber Service Co., 1023 East Pike street, Seattle, Washington, has been appointed distributor for the Mohawk tire and will carry a large stock of casings and tubes.

* * *

The Jensen-King-Byrd Co., 320 Riverside avenue, Spokane, Washington, has been appointed distributor of Mohawk tires in its territory and will carry a complete stock.

* * *

Pacific Coast representatives in Congress have been especially active in promoting the National Highways movement and many of the two score bills before that body have been sponsored by the statesmen from the Western slope. It is interesting to note in analyzing the proposed road measures that the demand comes from all sections of the United States, showing that the movement for national highways is a genuine growth and that the road question has passed beyond the sectional stage.

NEW ERA FOR INDUSTRY IN SOUTHERN CALIFORNIA.

WHEN FRANK A. SEIBERLING, president of The Goodyear Tire & Rubber Co., drove the first pick into the ground on the site of the great rubber plant to be erected in Los Angeles, he gave an impetus to a project which is a result of the free industrial policy of that city. Whether other eastern manufacturers will follow in his footsteps and take advantage of the

and shipped back to the coast. The cotton grown in the Salt river valley is carried in cars to Goodyear, Connecticut, and from there to the plant at Akron where it is manufactured into product and shipped back to the Pacific Coast. In other words, the two main factors loop across the United States, in railroad transportation, making an unnecessary and wasteful cost. That is sufficient justification to bring us to the coast.

"By a process of elimination we got down finally to Los Angeles. The main factors in a rubber factory are cheap fuel, an abundance of water and cheap power. You must have transportation facilities for gathering raw materials and for distributing your product. All these factors should be as nearly ideal as you can get them.

"When we came to survey the coast we found that Los Angeles had the cheapest power on the Pacific Coast where used in large quantities and that Los Angeles had the only supply of fresh water sufficient for our needs."

Regarding the advantages of the company's plan in establishing a system of homes for working men in connection with the new plant, Mr. Seiberling said:

"Our workmen have all the comforts that I have in my home without the frills and the burdens. A workman working in our factory receives wages as high as are paid in the art anywhere. What more can he ask for?

"What has that done for us? It has established conditions in the factory and given us a body of men that have an interest in our business, that have their future in it; and they are not thinking of Bolshevism, I. W. W.-ism, or the other isms.

"The policy of getting workmen, heads of families, men of character, to buy the homes that we build, will be continued in Los Angeles. We shall assist them in every degree in our power to have them acquire homes that will be sold on long payments and easy terms. As the result we believe that we will obtain the same conditions in Los Angeles as we have in Akron."

President Seiberling predicts the greatest future development for Imperial valley cotton.

"This year, California and Arizona will produce 150,000 bales of the best cotton produced. Less than 5,000 bales is made up here on the Pacific Coast. When the Goodyear cotton mill is running its 33,000 spindles in Los Angeles you will then be making but one three-hundredths of the cotton used in this country. You have one-twentieth of the population living and consuming cotton products on the Pacific slope, that is using the cotton of 1,500,000 spindles. So, you see the opportunity you have for developing cotton mills to manufacture the cotton which is grown here, instead of shipping it East and then sending it back in manufactured form."

The plans of the Goodyear plant have so far developed that it has now been decided to produce 7,500 instead of 3,000 tires daily. The cotton mills will have 33,000 spindles instead of 22,000. A giant aeronautic plant will also be built as part of the Goodyear establishment.

The ceremony of the ground breaking brought a large number of Goodyear officials and prominent citizens of Los Angeles to the site at Ascot Park. In the party which assembled, including Mr. Seiberling, were Paul W. Litchfield, F. L. Landon, C. Slusser, D. J. Koorce, William Hunkin, George Bellis, Henry K. O'Melveny, W. H. Daum, George C. Griffin, W. A. Quine, M. E. Morris, R. G. Kreidler and John Breen.

MOTOR AND ACCESSORY MANUFACTURERS' ASSOCIATION MEETING.

The Motor and Accessory Manufacturers' Association will hold a convention September 11 and 12 at the Hotel Lafayette, Buffalo, New York. Although this will be primarily a credit convention, subjects of importance to the entire automotive industry will be discussed.

BREAKING GROUND FOR THE GOODYEAR DEVELOPMENT AT LOS ANGELES.

opportunities that Los Angeles offers for growth untrammelled by the interference of labor agitators, remains to be seen.

"We chose Los Angeles," said Mr. Seiberling, "because we thought that here was not only an adequate supply of labor, but an adequate supply of free labor capable of being trained into the skillful occupations that are required in our industry. That was one of the controlling factors in our decision."

Summarizing the reasons for building a Goodyear plant on the Pacific Coast, and for selecting Los Angeles as the site, Mr. Seiberling continued:

"We are handling, from Akron, business on this coast approximating \$13,000,000 annually. The raw materials from which it is made are crude rubber and cotton, the two main factors. The rubber comes from the Far East to these western shores, is transported by cars to Akron, manufactured into product,

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE SHORTER WEEK AND PRODUCTION.

AT THE ANNUAL MEETING of the National Joint Industrial Council for the Rubber Trade, held in Manchester on July 9, 1919, Mr. J. T. Goudie was reelected chairman on the suggestion of the operatives, notwithstanding the fact that, according to the constitution, it was the right of the latter to elect a new chairman. The operatives said they were grateful to Mr. Goudie for his constant courtesy and for the impartial way in which he had administered the business of the council. It will be interesting to see if this action of the rubber workers is copied in any other of the various industrial councils. The most important feature of Mr. Goudie's address was in reference to the 47-hour week. He assured the operatives that the employers are in no way opposed to shorter hours and higher wages, but he emphasized the vital necessity for a full production. The fullest possible output is necessary in order to cope with the competition which, keen at present, is likely to become even more severe in the near future. He made the suggestion that both sides should appoint special subcommittees to consider this matter. This is a really important subject and it is agitating the minds of employers in most branches of industry. It is no good thinking the fact that the shorter working week means a decreased output, a more unfortunate state of affairs when order books are well filled. Nor do I think that a remedy will be easily found by appeals to the operatives. The British workman will not readily change his acquired habit of turning out so much work in a given time. The policy of hustle, which I believe is not unknown in America, does not appeal to him, and I am afraid that the economic interests of the country generally do not come up for much consideration. From what employers in the Rubber Trade tell me, I gather that they are not at all hopeful of increasing output except in the way of doing by machinery what has hitherto been done largely by hand, and it would mean that there is plenty of scope for the exercise of ingenuity in bringing about the transition from hand to machine work in departments of the industry in which manual labor has hitherto ruled supreme.

Although the trade generally has plenty of business on hand, both for home and foreign account, we seem to be continually held up by labor troubles of one sort or another.

THE COAL SITUATION.

At the time of writing the coal strike in Yorkshire has caused many textile concerns to shut down. The temporary closing of the works of the Bradford Dyes' Association has caused a stoppage of the delivery of certain classes of textiles urgently wanted by the Manchester proofing works. Then there is the 6s. per ton addition to the cost of coal, which the rubber manufacturers say will have to be passed on to the purchaser of goods. With regard to this item of cost in manufactures generally, it will probably turn out that it will be made the occasion, or the excuse, for a larger addition to the price of finished goods than is necessary or warranted.

There must be borne in mind not only the additional cost of the coal used as such, but also the higher price of electric power now so largely used in rubber works. Further, the increased metallurgists' and engineers' cost will be duly passed on to the buyers of machinery, which will now cost more.

It is quite possible that the increase in manufacturing costs may improve the rate of organic accelerators, as the point of the largest output in a given time will be of greater importance. Otherwise, the high price of the accelerators, which cost from

two to three shillings per pound, as against so many pence for sulphur, has been against their more extended use.

PATENTS AND DESIGNS BILL.

One of the principal objects of the new Patents and Designs Bill now being considered, is to prevent foreign patents received in this country being exploited mainly in the interests of the country of their origin.

PROOFING CASE SETTLED.

The action listed at the Manchester July Assizes, *Quas-Cohen v. Ferguson, Shiers & Co.*, was settled on terms after being brought into court. The plaintiffs, *Quas-Cohen & Wilks*, waterproof garment manufacturers of Cheetham, Manchester, and *Ferguson, Shiers & Co.*, of Failsworth, Manchester, rubber proofers, for breach of contract and damage caused to certain cloth by defective proofing. The case was concerned with a contract which the plaintiff obtained in 1917 for the supply of 100,000 military ground sheets, the manufacture of some of which was arranged with the defendants. Of the goods proofed by the defendants, however, 4,000 were rejected in expert examination as not being properly vulcanized and they remained on this plaintiff's hands as practically useless. Shortly after the case was opened an agreement was come to whereby judgment was entered for the plaintiff for £1,375, the rejected goods to remain in the plaintiff's possession.

It may, perhaps, be mentioned that the defendants are a distinct firm from A. O. Ferguson & Co., Limited, which carries on a similar business in the same neighborhood.

INQUESTS ON FIRES.

Under the City of London Fire Inquest Act of 1868, it is compulsory to hold coroner's inquests into the cause of factory fires, although outside London no enquiries are held unless fatalities have been recorded. In view of several large fires which have recently occurred in the north of England, it has been suggested that the London system might be extended with advantage to the country, or that, at any rate, the American system of having a fire marshal in manufacturing towns. The general rule in our towns is to state that the cause of the fire is unknown and it is rarely that any officials desire a proper investigation into the circumstances. In the earlier days of the war several fires occurred in our rubber works, but there is nothing on record by which the experience gained could be utilized by others as a help to preventive measures. The common remark that the fire was caused by defective insulation is resented by cable makers, and spontaneous combustion is frequently adduced to cover carelessness. It is, I believe, generally accepted that fires in proofing works are more common with petroleum spirit than with coal tar naphtha, but I doubt if it is generally recognized that the cause is due to the greater facility with which the former solvent becomes electrically charged and capable of ignition by a spark caused by friction. With regard to the general question of the loss caused by fires, it is not enough nowadays to assert that the loss is covered by insurance. There is the present difficulty of replacing damaged machinery, to say nothing of the higher price which has to be paid. All things considered, then, it would seem that fire inquests should be far more general, and the valuable information which would be obtained could be summarized in handy form for the guidance of others engaged in similar industries.

NEW CORPORATIONS.

Mr. Alfred Smith, of Excelsior Works, Clayton, Manchester, manufacturers of rubber substitute, reclaimed rubber and

rubber chemicals, has converted his business into a private limited company, the directorate consisting of himself and his two sons. The capital is £80,000. The firm has considerably enlarged its business in recent years and has established agencies in a number of foreign countries, the New York City address being 98 Maiden Lane.

The United Kingdom Dental Manufacturing Co., Limited, has been registered with a capital of £200,000,000, the registered office being at 167 Oxford street, London. This is an American concern, the directors including W. L. Smith, of Pittsburgh, and T. G. McCann, of Philadelphia. Although we have in England the well-known firm of Claudius Ash, Sons & Co., Ltd. dental supplies, a large amount of dental rubber has always come in the past from America, and no doubt the present and prospective trade restrictions have been instrumental in the formation of this new company. We have also imported a good deal of dental rubber from Germany, and when this was cut off during the war, there was an outcry against the high price charged by British firms for goods of the same character.

The Enfield Edison Cable Works, Limited, capitalized at £200,000, has been formed to take over the business and assets of the Enfield Electric Cable Manufacturing Co., Limited, which, it turns out, was the purchaser of Connolly Brothers' cable works at Blackley, Manchester. The sale of this latter concern by auction was recently referred to in this correspondence. The new company's works are at Brimsdown, near London, and considerable extensions are in progress. The chairman of the new company is Viscount Grimston, son of the Earl of Verulam, and head of the St. Albans Rubber Co., which makes the Grimston tire. Other members of the board are C. J. Ford and E. E. Hunter, the chairman and managing director of the Edison Swan Electric Co., Limited, this company taking up 50,000 shares.

MISCELLANEOUS FOREIGN NOTES.

LONDON RUBBER AND TROPICAL PRODUCTS EXHIBITION AND CONGRESS.

A RUBBER AND TROPICAL PRODUCTS exhibition and congress will be held in London next year. The time set is June 3 to June 17, and the place will be the Royal Agricultural Hall, where previous exhibitions have been held. The manager will be Mr. H. Greville Montgomery; he will be assisted by Miss D. Fulton and Miss Edith A. Browne. The offices are at present at 43 Essex street, Strand, W. C.

NEW FINNISH RUBBER AND LEATHER FACTORY.

A new Finnish firm will be established for the manufacture of rubber and leather goods at Helsingfors, Finland, to be known as the O. Y. Finska Träugölnik A. B., with an initial capital of \$965,000. This concern is closely connected with the Träugölnik of Petrograd. Franz Ulthemann is managing director.

LANCASHIRE FACTORIES BUSY.

Business in rubber fabrics is very brisk in the Lancashire factories, and the garment makers are keeping busy. It is believed that the French Government will remove duties on rain cloth, which will help the French rubber trade at the expense of the English. Cloth for motor hoods is in great demand; it is needed for the imported American cars, many of which have English bodies fitted to them.

MARSEILLES CRUDE RUBBER IMPORTS RESTRICTED.

France will give shipping preference to rubber grown in French possessions or elsewhere by companies organized with French capital and under French law. The quantity of rubber to be imported in the year beginning October, 1918, was fixed by the Allied Rubber Committee at 22,000 tons of which 15,000 are to be landed at Marseilles. The imports at that port before the

war were 800 to 900 tons a year, but in the last two years they have increased to about 8,000 tons yearly.

TIRE EQUIPMENT OF FRENCH MOTOR CARS.

Examples of the tires now used in France are shown in a circular recently received from a prominent automobile dealer of Paris. A touring car has wire wheels, 820 by 120 m. m., equipped with pneumatic tires, the two rear ones being non-skid. A heavy truck, carrying 4,000 kilos net, has solid tires, front wheels 940 by 130 m. m. with single tires; rear wheels, 1,000 by 130 m. m. with twin tires. A light truck, to carry 1,000 to 1,500 kilos net, may have wheels with either pneumatic or solid tires: for the pneumatic, wheels of Michelin steel plate with tires 920 by 120 m. m., single in front and twin in the rear, two being non-skid. For the solid tires, wheels of wood with 900 by 90 m. m. tires, single in front and twin in the rear.

GERMAN BELTING SUBSTITUTES.

German ingenuity during the war was directed, among other things, to finding substitutes for leather and rubber driving belts. Belts made of tissues sewn together or one rolled inside another were found to be very resistant and strong in the edges. The friction was slight, and they could be mended easily. These were made chiefly of spun flax, hemp or paper yarn. Cellulose materials used for medium-sized machinery belts would not stand much tension. Yarn belts were also woven into tube form, then flattened and sewed together, the material being linen or paper; these proved very useful. Substitute rubber was used for belts where crude rubber or balata had been used before; it did not melt when heated by friction, but it could not stand much tension.

ITALIAN SULPHUR.

There has been a shortage of sulphur in Italy. The price, which was 160 lire (\$20.88) a ton a year or so ago, went up to 425 lire gold (\$82.02) when the armistice was signed. The stock in Sicily was nearly used up owing to the shortage in labor and the demands of the Allies; now the sulphur properties are to be worked to full capacity.

At Molagna, where they managed to keep the works in full operation, a plant has been laid down for making sulphuric acid from the vapor that arises from vents and borings. The Montecutini Company, which turned out 388,000 tons of the half million tons of sulphuric sulphur produced by Italy in 1917, has amalgamated with the Romagna Co. They will exploit again the Boratella and Montecutini mines, which were once esteemed the richest in Italy, but have been long closed. The Agoria mines, at Cordevole, which were closed and partly destroyed in order that the Austrians might not get them have started up again.

DUTCH EAST INDIES RESTRICTION.

Holland places restrictions on visitors to her East Indian colonies. They can land only at specified ports in Java, Sumatra, Borneo, Celebes, Tunis, and the smaller islands, and even there must have disembarkation permits. If they think of staying for any length of time they must procure admission certificates or permits to settle.

IMPORTS OF RUBBER GOODS TO VICTORIA, AUSTRALIA, IN THE FIRST three months of 1919 amounted to £174,633 in value, against £112,203 in the same quarter of 1918.

BRITISH DEALERS ARE TROUBLED AT THE PREFERENCE SHOWN BY Brazil and Argentina of late for rubber goods from the United States. Brazilian imports of rubber goods from England in 1918 amounted to 778 tons, as compared with 1,189 tons in 1913, the last full year before the war.

SAMOA HAS BEEN PRODUCING RUBBER TO THE VALUE OF ABOUT \$100,000 a year, but this is likely to fall off for a time owing to plantation difficulties.

Rubber Planting on the West Coast of Borneo.¹

THE FIRST *Hevea* seeds to be planted in Pontianak, West Borneo, were imported from Malacca in 1903 by the Chinese and an Englishman, A. Simons, who later became manager of the Kopoewas Rubber Maatschappij, Soengei Dekan Estate. The Chinese and the well-to-do inlanders were the first to experiment with this new industry, and for want of better ground, they planted on old peat beds. In the Chinese districts of Mador the first rubber planters were formerly Chinese mine-workers, who, when the mines failed, devoted themselves more and more to agriculture. The commerce with Batavia and other parts of Java is of considerable importance, and West Borneo being only 32 hours by steamer from Singapore, is another factor favoring the rapid growth of the rubber industry in Borneo.

A Simon, formerly a mining engineer, planted the first seeds around his home at Bengkalon, in the Kopoewas district and at Smitau in the upper Kopoewas where the oldest rubber trees of that region are found. The climate and ground are well adapted to the cultivation of rubber, and in 1910 many Chinese and inlanders planted their rice fields with *Hevea*.

Hadji Oesoep Saigon, the Nestor of the inland rubber planters, persuaded the Sultan of Pontianak to turn over his grounds around the Kampong to the people for rubber planting, with the result that now there are large plantations in that section where hundreds of coolies and tappers earn their living. Thousands of seeds in small low cases, each containing from 250 to 500 plants, were conveyed to the upper districts in native boats, and the decks of the little Chinese tongkangs were floating *Hevea*-nurseries. In the beginning they planted *Ficus elastica*, and *Manihots* also were seen, but these were soon replaced by the harder *Hevea*.

The Europeans, alarmed by the low rubber prices, did not enlarge their plantations during 1917, and plantations could be obtained for very little money. Seeds were also cheaper, and the inlander, being of the opinion that the present low prices could not prevail, planted every available space with *Hevea*, the cultivation of which is not difficult.

In the fourth year the heaviest underbrush is cut down and therefor the trees are left to grow without further care. The scarcity of coolie labor does not concern the small planter, for he expects to do the work with the assistance of his wife, children, and other relatives.

The importance of the native planters in comparison with the Europeans is clearly shown in the export figures. The European production in 1917 was only one-fourth of that of the native production, and only a little more than one-fifth of the total export. The total export for 1917 was estimated at 2,970,240 pounds. Of this more or less than 560,000 pounds was of European production. The production of inland and Chinese rubber plantations, appraised at 550 pounds per hectare² per year, brings the producing area to 4,349 hectares, more or less. The unproductive area is even greater, being estimated at 8,600 hectares. Planted about 600 trees per bouw³ the total would be 7,250,000 trees.

In ordinary soil, production on land with 50 to 65 per cent of sand is fairly good, while production on the same ground with 70 to 75 per cent sand is very good, and level ground with a standard of 80 to 85 per cent of fine sand, strange to say, also yields a fairly good average; trees on the latter, however, should be tapped very early as the ground dries out quickly. In Pematang soils, where the amount of sand is 85 per cent (highest sand percentage), the absence of plant diseases is noticeable, the growth is quicker, and the bark harder and thinner than on rich and old peat soil. The production is above average, apparently due to the ease with which the water is drained from the land in case of floods, while in dry weather, at a long period of drought, when the top soil is hot and very dry, it is cool and moist under the surface. This condition suggests the feasibility of dry farming.

Various products, such as vegetables, are planted with *Hevea* while the trees are young, even sugar-cane being grown. Coffee is not a profitable venture, as the rubber trees cast considerable shade after a few years, retarding the growth of the coffee plants.

Plant diseases in general are not numerous, the most important being the *Djamoer oepas* (striped canker), and knobbed canker (forming nodules in the cortex of *Hevea*). The latter is most generally known in the Pontianak section.

In Pontianak the average production of one laborer, taping about 300 trees per c., is 1½ to 2 catties⁴ for trees older than 7 years and 1 to 1½ catties for trees younger than 7 years. On Pematang grounds the production from six-year-old trees is 5 grams per day from one tree. On marshy ground near the shore the average is 3 to 4 grams for 5 to 6-year-old trees. As the trees are very close together and the tapping methods crude, this is considered a good average. The European plantations number about eight in that region, and having contract laborers, show better results in general. It has been proved that it is possible for trees older than 10 years and younger than 14 years, planted on good soil and well cultivated, to yield 2,200 pounds of dry rubber per hectare per year, and it has also been proved that 6 or 7-year-old trees will yield an average of 6 to 10 grams per tree per tapping.

The most commonly used methods of tapping are the V-cut and the herring-bone with two cuts. Every Chinese and native planter prepares his own rubber. Wealthier planters have 20 to 40 tappers who do the work entirely on the European scale. Calenders with smooth and ribbed rollers, a work-shed and a smoke house, nearly all of primitive construction, are their only requirements. Alum is used a great deal as an accelerator of coagulation, being cheaper and more easily obtained, the large carboys of acetic acid being beyond the means of most of the native planters. Alum also has the advantage of coagulating without the danger of its becoming moldy.

Mixing inferior rubber with *Hevea* was often done in the beginning. Bush rubber having been in water for some time

("De Indische Mercuur.")

TAPPING RUBBER TREES FROM BOATS.

¹Th. A. de Neve in "De Indische Mercuur," March 7, 1916.
²A cattie = 1.33 pounds. A hectare = 2.4711 acres. A bouw = 1.754 acres.

older plantations, it would without doubt adversely affect the younger ones.

EXTRACTING OIL FROM HEVEA SEEDS.

Planters of *Hevea* have been led to believe that they could make large profits by extracting oil from the seeds, but experiments, the results of which were published in the "Bulletin Economique de l'Indo-Chine," show the expense of collecting the seeds and extracting the oil to be so great that the net returns are not encouraging. The percentage of oil in the seeds was found to be 30 instead of 40 as anticipated, and the number of seeds produced by each tree was much less than the estimates. It seems probable that better results may be expected from improved methods of gathering and treating the seeds, as the oil content is considerable.

WAX-COATED COAGULATING TRAYS.

Wooden trays made waterproof by being coated with a special composition of wax, and intended to take the place of the enamelled dishes used in coagulating rubber latex have been invented by Gordon Skene in Ceylon. The tray is as large as four of the ordinary dishes.

RUBBER ACREAGE IN INDIA.

The following was the acreage of rubber cultivation in India at the end of 1917: South India, 47,631 acres, 37,510 in tapping. Burma, 63,857 acres, 27,172 in tapping. Assam, 3,064 acres *Ficus elastica*.

WET ROT IN HEVEA ROOTS.

Fomes pseudo-ferreus is the cause of "wet rot" in the roots of the Para rubber tree, according to the Department of Agriculture of the Federated Malay States, Bulletin 28. Three species have now been found that can live parasitically on *Hevea*: *fomes lignosus*, the white root fungus; *fomes lamasensis*, the brown root disease, and *fomes pseudo-ferreus*.

INDIA RUBBER IN ITALIAN SOMALILAND.

FROM THE INVESTIGATIONS of botanists and other scientific travelers and from many practical agricultural experiments, it has been demonstrated that in Italian Somaliland many important rubber-yielding plants are to be found growing wild, and also that the surroundings, if properly chosen, are favorable for the culture of *Manihot Glaziovii*. Though experiments in cultivation have met with varying success, a colonial farmer, P. Guelfi-Camajani, asserts in the "Tribuna Coloniale," Rome, that they have taught both scientific men and practical farmers how to surmount the obstacles in their way and strong efforts to establish rubber culture would already have been made had it not been for the war.

Various members of the *Apocinaceae* family flourish in Somaliland; those found so far are: *Landolphia Florida*, *Landolphia petersiana*, *Adenium coitatum* and *Hunteria Africana*. *Landolphia Florida*, in Somali "Mabargo," is found all over Africa; in Somaliland it grows in moist places and gives plenty of latex. The analyses of the plant latices were all made in the Pirelli laboratories, the report stating that the Somali *Landolphia Florida* yielded 18.8 per cent caoutchouc and 79.2 per cent resin, the rubber being of light color and possessing nerve, the resin having a low fusion point. The *Landolphia petersiana* has its home in East Africa. The London Imperial Institute's analysis of that grown in British East Africa gave 82.5 and 80.7 per cent caoutchouc, with 13.4 and 12.6 per cent resin; the quality is close to that of the *Hevea Para*. The *Hunteria Africana* seems to have some rubber qualities, while the analysis of the latex of *Adenium coitatum* by the Pirellis gave 85 per cent resin and 15 per cent of a substance like gutta percha.

Of the *Euphorbiaceae* there are half a dozen varieties, only two of which, however, have a rubber value. *Euphorbia cuneata*, in Somali "Da-ri-nder," gives a latex containing 17.7 per cent caoutchouc and 81.80 per cent resin; the latter is hard, fragile, and neuter. The caoutchouc has little nerve, cannot stand a temperature above 50 degrees C., but, it is believed, can be utilized in the rubber industry. *Euphorbia Tiracalli*, in Somali "Dauno," flourishes in arid places; it could be planted in the many desert portions of the land. It gives an abundant latex which yields 12.2 per cent caoutchouc and 87 per cent resin. This rubber in Senator Pirelli's opinion can be utilized in the rubber industry, and can be substituted for jelutong.

The *Manihot Glaziovii*, imported from Brazil, where it yields the Ceara rubber, flourishes admirably in East Africa. In Somaliland it is the only plant that is cultivated on the rubber plantations. The field is open for Italian enterprise to develop the production of both the cultivated and the wild forms of caoutchouc.

Meanwhile, at the Versailles conference, Italy is pleading to have her Eritrea and Somaliland colonies joined by the concession to her of British Somaliland and the intervening strip of coast. This would cut off Abyssinia effectually from the sea.

RUBBER SOURCES AND RECONSTRUCTION POLICIES.

THE LISTING of GOVERNMENT CONTROL of raw material among the reconstruction policies of European nations again draws attention to the complete dependence of American rubber industry upon importation of crude rubbers. The situation is concisely set forth in the "Commerce Reports" of August 1, 1919, by the following statistics compiled by a representative of an American company.

While it is intimated that the reconstruction policies being formulated abroad will not be without effect on America's supply of crude rubber, it hardly seems credible, in the face of the present great over-production and the anxiety of thousands of plantation shareholders, that any government will find it either necessary or wise to hamper the normal dealings of rubber planters with their best customers in the United States.

The facts and statistics presented are in part as follows:

During 1917 Far Eastern plantations produced about 79.5 per cent of the world's supply of crude rubber; the British colonies turned out approximately 80 per cent of this, or 63 per cent of the total production of the world.

The only place on American soil where conditions have been found favorable to rubber growing is the insignificant total of the Philippine Islands, where 147 tons was produced in Mindanao in 1917, or sufficient to last one of the large American manufacturers about one day. Owing to an insufficient supply of good cheap labor (our Government prohibits the importation of Chinese coolies) and government restriction limiting to 2,500 acres the amount of land which corporations can own, the investment of American capital has been restricted and discouraged.

OWNERSHIP OF RUBBER PLANTATIONS IN THE FAR EAST.

It is notable that 76 per cent of planted acreage of plantation rubber is owned by British capital and 2.8 per cent by American capital, according to best available authorities, as follows:

Plantation Interests.	Average.	Per Cent.
British	1,313,576	75.9
Dutch	260,000	13.0
French and Belgian	109,900	5.0
American	55,000	2.8
German	3,400	.2
All other	63,577	3.1
Total	1,995,553	100.0

The 55,000 acres planted and controlled by American capital comprise the estate of the United States Rubber Plantations, Inc. in Sumatra. American interests have also recently acquired 40,000 acres of undeveloped land in Sumatra. The Goodyear

Sumatra plantations include 20,000 acres. A very limited area is also planted to rubber in Mindanao, Philippines.

A fraction of over 66 per cent of all rubber plantations are situated in British colonies, so that Great Britain exercises both political and financial control over the supply of this important raw material. Of the total acreage under British control 807,491 acres are in the Federated Malay States and Johore, 159,500 acres in the Straits Settlements, 251,500 in Ceylon, 41,820 in South India, 29,880 in British Borneo, 26,390 in British Burmah and 5,000 in the South Sea Islands.

Under the Dutch flag there are 352,455 acres in Sumatra, 238,830 acres in Java and 10,100 acres in Dutch Borneo, giving the Netherlands political control over 49 per cent of the total world acreage in rubber plantations. France controls 10,000 acres in Cochinchina and the share of all other countries amounts to 62,577 acres. An almost unlimited area of desirable land for rubber plantations is as yet available for development in Sumatra and Borneo, but such is not the case with the Malay Peninsula, Ceylon and Java.

SINGAPORE REPLACING LONDON AS THE WORLD'S RUBBER CENTER.

Before the war plantation rubber was shipped direct from Singapore, Colombo, and other ports in the Far East to London, where it was sold at auction. London had always been the world's greatest rubber market. But the submarine menace, together with high ocean freight and war-risk rates and lack of tonnage, placed London at a disadvantage, so that the Singapore market and the Far East has become, temporarily at least, the world's rubber market. The Singapore rubber auctions are growing more and more important and buying of crude rubber is largely centered there. In addition to representatives of all large American manufacturers, all large American and London dealers now have buyers at Singapore. Sales in the Singapore auctions have grown from 552 tons in the year of their origin (1912) to 24,316 tons in 1917. Practically all plantation rubber is now imported into the United States via the Pacific direct from the Far East, in Japanese tonnage.

Although the London market seems without particular influence on conditions here, from a broad point of view, it should not be discounted as a factor in the rubber market; for the majority of rubber plantations are British-owned, and in nearly every case have their central offices in London, and from that city the directors are controlling the sales. It is not unlikely that after shipping, financial, and other conditions resume normal state London may again become a greater factor in the rubber market.

RUBBER LANDS RESTRICTIONS REMOVED.

The rubber lands restriction enactment of 1917, an ordinance of the Government of the Federated Malay States, was intended to discourage American and other alien interests taking up land at a time when British interests were involved in abnormal conditions and at a disadvantage, and provided for discontinuance of land grants of more than 50 acres in extent to aliens. An amendment was passed by the Federated Malay States Legislative Council late in 1917, however, placing British subjects on a par with aliens so far as their position with regard to acquiring rubber lands is concerned.

All British plantation companies, in addition to excess-profits tax, were required to pay export duty of 2½ per cent ad valorem on output of estates when the price of cultivated rubber does not exceed 2s. 6d. per pound, f. o. b. east (which is equivalent to 60 cents gold), and otherwise 5 per cent. The established price is based on standard first latex crepe. Alien producing companies in British territory, including American, were likewise subjected to the payment of export duty.

MINIMUM PRICES AND RESTRICTED PRODUCTION IN THE FAR EAST.

After the American import restrictions were imposed, and with immense stocks accumulating in primary markets, there developed among the far east plantation interests particularly their financial interests in London, considerable agitation for government regulation and protection of producers by establishing minimum prices and restricting output.

Early in August, 1918, Ceylon adopted 125 pounds per acre as maximum production. With prices near the cost of production and the situation acute, an investigating commission was appointed in Singapore by plantation interests, to formulate definite plans and recommendations to submit to the local colonial government and the home British Government, for fixing prices and restricting production. In the meantime temporary measures of relief were provided by the colonial government's suspending export duty and war tax and granting temporary loans to rubber cultivators.

Later the investigating commission appointed by the plantation interests recommended a total restriction of 50 pounds per acre per quarter and the formation of an Imperial trust to buy prime

qualities at \$1 Straits (\$0.56¼ gold) per pound ex warehouse Singapore; or, as an alternative, for the Government to fix the price at \$0.80 Straits (\$0.45 gold), and to appoint a rubber controller to place orders. The Dutch Government was alleged to be favorable to this plan. The commission estimated that the world consumption of plantation rubber during 1919 would be 117,000 tons.

In order to control raw materials the Netherlands Government prohibited the export of rubber from the Dutch East Indies except by permit.

JAPANESE RUBBER PLANTATIONS IN THE MALAY PENINSULA.

The area of Japanese rubber plantations in the Malay Peninsula, located chiefly in the State of Johore, and held by 125 men, is estimated at 93,803 acres, of which 51,166 acres are already planted and yield 344,000 pounds, or about 154 tons monthly.

Rubber manufacture in Japan is making gradual progress. Imports of crude rubber into Japan amounted in 1917 to 3,748 tons, costing \$4,565,113, as compared with 2,961 tons, costing \$3,623,005 in 1916—an increase of 27 per cent. Japan during 1918 is to be importing double the amount of rubber imported during 1917.

THE RUBBER SITUATION IN BRAZIL.

AN INTELLIGENT EXAMINATION of the Brazilian rubber trade appears in "Wileman's Brazilian Review" for April 23, 1919. A few figures serve as a text:

SHIPMENTS OF RUBBER.

	Tons.	Value.
1913.....	36,232	£10,375,000
1917.....	33,998	7,484,000
1918.....	22,662	3,998,000

In 1918 the exportation was one-third less than the year before, while the rubber brought in was only about one-half as much. The quantity is not exact, because 6,000 tons more were produced, but were retained by the Brazilian banks and not exported. The writer thinks it fairer and more scientific to compare the figures for the 4 war years with the 4 years preceding. For those periods the decrease in tons was 35,810, or 18.6 per cent, while that in value was £52,018,000, or 61.1 per cent. "These figures show the tenacity with which the Brazilian rubber industry has in the face of tremendous depreciation and difficulties of every kind, maintained a brave front," and has put off "the complete extinction and transfer to the East" of the wild rubber industry. "So long as hard, fine rubber enjoys a premium over every other kind" that prediction will not come true. Yet hard fine which rose to 12s. 9d. a pound in 1910 in the London market, sank to 1s. 8½d. at the beginning of April, 1919.

In 1900 Brazil's rival in rubber production was Africa; the Eastern plantations producing only 4 tons; the figures being 26,750 tons for Brazil and 27,136 for Africa, the only year save one when Africa was ahead. In 1918 the Eastern plantations produced 200,950 tons, Brazil 30,700, and the rest of the world, chiefly Africa, 9,929 tons.

Production—	Plantation.	Brazil	Rest.	Totals.	Percentage of Increase or Decrease.
1900.....	4	26,750	27,136	53,886	1.7
1901.....	5	26,700	24,545	51,245	4.5
1902.....	8	28,700	23,632	52,332	4.5
1903.....	21	31,100	24,823	55,923	6.8
1904.....	43	30,060	32,077	62,137	11.0
1905.....	145	35,000	27,000	62,000	0.4
1906.....	510	36,000	27,700	63,700	2.8
1907.....	1,000	38,000	29,000	67,000	5.2
1908.....	1,800	39,000	24,600	65,400	2.5
1909.....	3,600	42,000	24,000	69,600	6.4
1910.....	8,700	40,900	21,500	70,500	1.2
1911.....	14,419	37,730	23,000	75,149	6.5
1912.....	28,518	42,410	28,000	98,928	31.6
1913.....	47,618	39,370	21,452	108,440	9.6
1914.....	71,380	37,000	12,000	120,380	11.0
1915.....	107,867	37,220	13,615	158,702	31.8
1916.....	152,650	36,500	12,448	201,598	27.0
1917.....	213,670	39,370	13,258	266,298	31.0
1918.....	200,950	30,700	9,929	241,579	9.0
1919 (estimate).....	230,900	35,000	10,000	275,900	+13.4

Summary—

1909-1913 (before war).....	102,355	302,310	117,952	422,617
Relative production.....	24.2%	47.9%	27.9%	100.0%
1914-1918 (during war).....	745,917	180,790	61,250	987,957
Relative production.....	75.5%	18.2%	6.3%	100.0%

* Inclusive of Brazil, Bolivia and Peru.

The writer hopes that as the percentage of new acreage for the plantations has fallen off greatly during the war, the increased proportion of rubber production will be such that Brazil can contend against it.

The States of Pará and Manaus are practically bankrupt and have applied to the Federal Government for help; it is suggested that that government should assume the administration of both. The Amazon rubber industry has seen its worst, but it has laid the foundations of an agricultural industry that may feed it. The demand for rubber may exceed the supply, and the thing to do is to improve the methods employed and the quality, and even perhaps manufacture *in situ*.

RUBBER EXPORTS FROM PARA.

THE STATISTICS of the Port of Pará Company give the total of rubber exports for 1918 as 29,119 tons (65,226,560 pounds), and the following table summarizes the actual rubber exports for the last four years, together with the regions from which the products came:

From:	1915.	1916.	1917.	1918.
States of Pará, }				
Amazonas and }	30,103,135	27,509,702	26,648,246	18,794,094
Mato Grosso }				
Acre Federal.....	21,651,398	19,142,026	23,142,718	18,086,990
Bolivia, }	12,729,339	15,309,604	29,970,772	27,181,836
Peru, etc. }				
Totals.....	64,483,872	61,961,332	79,761,736	64,062,920

The total amount of rubber received at the port of Pará during 1918 was 54,716,116 pounds, as follows:

State of Para.....	Pounds.
State of Amazonas.....	14,310,828
State of Mato Grosso.....	372,497
Acre Federal.....	1,172,765
Bolivia.....	13,493,806
Peru.....	6,683,620
Unclassified.....	2,334,915
Totals.....	14,247,655
Totals.....	54,716,116

The net weight of rubber exported was 47,643,086 pounds, of which there were shipped to:

	Pounds.	Per Cent.
Liverpool.....	10,622,878	22.2
Havre.....	1,916,539	4.2
New York.....	34,342,832	7.1
South America, etc.....	191,588	.3
Barbados.....	579,249	1.2
Totals.....	47,643,086	100.0

The quantities of rubber thus shipped were:

	Pounds.
Prime.....	17,559,821
Medium.....	1,236,123
Sernamby.....	6,341,284
Cauchó.....	7,776,267
Other grades.....	14,729,591
Totals.....	47,643,086

The quantity of Bolivian rubber actually sent to Pará during the year is registered at 6,672,818 pounds (gross weight), while 2,334,915 pounds came from Peru.

THE RUBBER TREE ASSOCIATION OF AMAZONS.

The *Club da Seringueira*, the rubber-tree club, a section of the Agricultural Association of Amazonas, at Manaus, Brazil, was incorporated April 24, 1916, in accordance with the laws of Brazil, and designated "an institution of public utility" by the Brazilian Government, December 27, 1917. It took over at once the supervision of the *Seringal Miry*, an experimental rubber estate, which had been started in September, 1916. The club also began operations at the *Campo de Experiencias da Sociedade Amazonense de Agricultura*, which had been handed over to the Government three years before when all work was suspended; Dr. Angelino Bevilacqua is director of this and C. J. Carvalhaes, manager of the *Seringal*. The club receives financial aid from the State of Amazonas and publishes a monthly bulletin "*A Seringueira*," which contains not only news of the doings

at the stations it supervises, but also interesting rubber information from all parts of the world.

The president of the Club is José Claudio de Mesquita, with Dr. Osman Pedrosa, Dr. Alpedo A. da Matta, Dr. Antonio Crespo de Castro and Dr. Angelino Bevilacqua as directors; the secretary is Arthur Ferreira, who is on the administrative council with Dr. Emeraldal A. da Silva Coelho, Dr. Alcides Bahia, Dr. Francisco P. de Araujo and Raymundo C. Montiero da Costa.

HEADQUARTERS OF THE CLUB DA SERINGUEIRA.

The office of the club is in the building of the *Associação Commercial* (Business Association), Rua Marechal Deodoro, Manaus.

The Club has selected June 24 as "Rubber Day" and celebrates the occasion by public festivities in the *Seringal Miry*, where experiments in everything that relates to the cultivation and extraction of rubber are carried on and suggested improvements are tried out.

TWO NEW OCEAN CABLES PROPOSED.

An effort is being made by American firms with trade interests in the Orient to have a second Pacific cable laid. The present one from San Francisco through Honolulu, Guam and Yokohama to Shanghai has become wholly inadequate to meet the demands of the increased business during and since the war, and the average time for a message from San Francisco to Yokohama or Shanghai is now about four days. A committee has been appointed by the National Foreign Trade Council to investigate conditions and urge the present Pacific Cable Company to extend its facilities. Reliable estimates place the cost of another cable in the neighborhood of \$8,000,000, and it is believed that such a cable would soon pay for itself with the increasing trade in the Far East.

Large business interests in the United States and Scandinavian countries are also projecting a cable between New York and Sweden, probably ending in Gothenburg. The congested condition of the Atlantic cables, as well as the increased trade with Norway, Finland and Russia, are responsible to a great extent for the project, but a northern route of communication has been needed for some time.

REASONS GIVEN FOR THE REDUCED OUTPUT OF RUBBER FROM Brazil are the low level of rubber prices, the abnormally low prices for cauchó and the epidemic of Spanish influenza which impeded work.

THE "REVISTA DA ASSOCIAÇÃO COMMERCIAL DO AMAZONAS" concurs in the opinion of THE INDIA RUBBER WORLD, quoting as follows: "Numberless risks might result from any modification of the method of extraction—well-smoked 'Pará rubber is the best in the world.'"

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED JULY 8, 1919.

- 1,308,774 Hose supporter. W. E. Cowling, Sioux City, Ia.
 1,308,846 Metal and rubber tire. F. F. Green, Colgate, Oia.
 1,308,870 Saddle or elastic webbing. M. W. Schlöss, assignor to the Treo Co., Inc.—both of New York City.
 1,309,047 Rubber boot or shoe. R. B. Price, New York City, assignor to The Goodyear Metallic Rubber Shoe Co., Naugatuck, Conn.
 1,309,249 Tire inner. J. H. Grube, assignor to Airsafe Inner Tire Co.—both of Los Angeles, Calif.
 1,309,440 Tire tread. H. M. Lambert, assignor to Lambert Tire & Rubber Co.—both of Portland, Ore.
 1,309,460 Cushion tire. H. E. Chute, Tucson, Ariz.

ISSUED JULY 15, 1919.

- 1,309,691 Hose supporter. C. E. Morehouse, Milwaukee, Wis.
 1,309,765 Man's garter. C. L. Meyer, Bellevue Borough, Pa.
 1,309,795 Tire-stem cap. R. A. Campbell, Minneapolis, Minn.
 1,309,912 Garter. H. J. Penn, Madison, N. C.
 1,310,048 Demountable rim for tires. E. K. Baker, assignor to the Universal Rim Co.—both of Chicago, Ill.
 1,310,084 Hose supporter. C. C. Jones, Toronto, Ont.
 1,310,115 Non-puncturable tire. H. H. Culmer, Chicago, Ill.
 1,310,119 Elastic strap fastener. C. D. Harper, Akron, O., assignor to The B. F. Goodrich Co., New York City.
 1,310,121 Inner tube. G. A. Lane, Perrin, Calif.
 1,310,156 Blow-out patch of rubber-covered wire fabric, with vacuum-cured outer surface. L. F. Clark, Fawcett, assignor of $\frac{1}{2}$ to A. L. Stebo, Jr., Philadelphia—both in New Jersey.
 1,310,186 Rubber-covered pads for attaching to automobile pedals. F. C. Grant, Chicago, Ill.
 1,310,212 Bead core for pneumatic tires. H. K. Raymond and I. R. Renner, Akron, O., assignors to The B. F. Goodrich Co., New York City.
 1,310,300 Pneumatic cushion tire. H. H. Schramm, New York City.
 1,310,364 Demountable rim for tires. C. De C. and G. A. Moll, Olathe, Kans.

ISSUED JULY 22, 1919.

- 1,310,438 Inner tube for pneumatic tires, composed of numerous contiguous sheets of rubber with grain running in different directions. F. T. Rolfe, Cleveland, O.
 1,310,513 Resilient tire. E. J. Taylor, Edmonton, Alta.
 1,310,527 Tobacco pouch. V. Guinzburg, assignor to I. B. Kleiner, New York City—both of Cleveland, O.
 1,310,825 Respiratory apparatus. J. M. Ganzer, Poughkeepsie, N. Y.
 1,311,024 Resilient wheel. J. Stuart, St. Kitts, Melbourne, Victoria.
 1,311,126 Split inner tube. J. Stuart, assignor to Kelsey Wheel Co., Inc.—both of Detroit, Mich.

ISSUED JULY 29, 1919.

- 1,311,163 Resilient tire. G. E. Gilmore, Cleveland, and H. M. Hanes, Wellington, assignors by direct and mesne assignments to The Security Tire & Rubber Co., Cleveland—both in Ohio.
 1,311,269 Wheel rim with removable side flange for tires. C. W. Grede, assignor by mesne assignments to The Standard Parts Co.—both of Cleveland, O.
 1,311,309 Two-part interlocking pneumatic tire. B. E. Bliss, Wichita, Kans.
 1,311,444 Corset with elastic inserts. G. Heilner, New York City.
 1,311,545 Composite heel with resilient tread portion. H. R. Abbott, assignor to Brockton Heel Co., Inc.—both of Brockton, Mass.
 1,311,720 Detachable tread for pneumatic tires. L. T. Sintel, Los Angeles, Calif.
 1,311,728 Rubber under-protector. F. A. Thornton, Corsicana, Tex.
 1,311,743 Resilient sandpaper drum, with facing of sponge rubber. M. L. Best, Pasadena, Calif.
 1,311,750 Detachable tread for pneumatic tire. A. A. Brashear, Santa Barbara, Calif.
 1,311,806 Sectional pneumatic tire. H. B. Coats, Veversburg, Ind.
 1,311,857 Laminated rubber and asbestos fabric for tire casings. C. B. Doolin, San Antonio, Tex.

THE DOMINION OF CANADA.

ISSUED JULY 16, 1919.

- 191,512 Garment supporter. R. T. Clarke, Columbus, O., U. S. A.
 191,540 Rubber sole for turn shoes. The United States Machinery Co. of Canada Limited, Maisonneuve, Que., assignee of S. W. Winslow, Jr., Beverly, Mass., U. S. A.
 125,857 Marine life-saving apparatus and observation, having rubberized sleeves and leg portions attached to a metal casing electrically propelled. The Submersible Boat Co., assignee of W. R. Barringer—both of Denver, Colo., U. S. A.

ISSUED JULY 22, 1919.

- 191,732 Fountain pen. The Conklin Pen Manufacturing Co., Toledo, O., U. S. A.

ISSUED JULY 29, 1919.

- 191,766 Fountain pen. G. B. Munn and C. H. Marker, inventors, Warren, N. J., U. S. A.
 191,779 Fountain pen. D. Cameron, Edinburgh, Scotland.
 191,793 Resilient tire. B. Dahl, Minneapolis, Minn.
 191,812 Pneumatic tire having outer shoe of tar-impregnated fabric. L. Harris, Benton, Ill., U. S. A.
 191,869 Fountain pen. J. F. Siegenitz, Thorn, Wis., U. S. A.
 191,915 Demountable rim for tires. The Universal Tire Filler Co., Portland, Ore., assignee of M. G. Tennent, Seattle, Wash.—both in U. S. A.

- 191,924 Inner tube for pneumatic tires. C. R. Rawdon, assignor of $\frac{1}{2}$ interest to both J. H. Heitmann and C. D. Hall—all of St. Louis, Mo., U. S. A.

ISSUED AUGUST 5, 1919.

- 191,974 Indefinite life-preserver coat. S. L. Ross, Lockport, N. Y., U. S. A.

ISSUED AUGUST 12, 1919.

- 192,077 Rubber-covered roller. J. Musket, Manchester, Lancaster, England.
 192,124 Tire relifier and method of manufacture. The Canadian Can-soldied Rubber Co., Limited, Montreal, Que., assignee of W. Kearns, Detroit, Mich., U. S. A.

THE UNITED KINGDOM.

ISSUED JULY 2, 1919.

- 125,795 Device for bathing the eyes. J. J. Pouly, 13 rue de la République, Lyons, and J. M. Daurad, 56 Chemin de Pierre-Benite Oullins, Rhone—both in France.
 125,859 Marine life-saving apparatus and one-man boat for submarine observation, having rubberized sleeves and leg portions attached to a metal casing electrically propelled. W. R. Barringer, Kenmark Hotel, 17th street, Denver, Colo., U. S. A.
 125,870 Friction pad with elastic cord engaged at edge to prevent slipping of shoes at the heel. J. T. Wells, 696 Romford Road, Forest Gate, Essex.
 125,882 Tire tread consisting of metal plates secured to a rubberized leather band, for use on pneumatic or twin tires. T. H. Gytton, 162 Noone street, Clifton Hall, Victoria, Australia.
 125,906 Fountain pen. O. B. Wade, Mayleigh, Petersham Road, Petersham, Surrey.
 125,940 Veil with elastic cord inserted at edge. Bonnie-B. Co., 222 Fourth avenue, New York City, assignee of I. Silverberg, Sea View avenue, Far Rockaway, N. Y.—both in U. S. A.
 125,947 Nut for use with pneumatic-tire valves, etc. H. P. Kraft, 219 Godwin avenue, Ridgewood, N. J., U. S. A. (Not yet accepted).
 125,967 Nasal douche. H. B. Nichols, 145 East 36th street, New York City. (Not yet accepted).
 125,981 Tire valve. H. P. Kraft, 219 Godwin avenue, Ridgewood, N. J., U. S. A. (Not yet accepted).
 125,989 Cushion tire. J. N. McFate, Phoenix, Arizona, U. S. A. (Not yet accepted).

ISSUED JULY 9, 1919.

- 126,116 Pneumatic tire. C. R. Rawdon, 3618 Juniata street; J. H. Heitmann, 4411 Laclede avenue; and C. D. Hall, 5920 Plymouth avenue—all in St. Louis, Mo., U. S. A.
 126,176 Revolving wheel and rubber heel. W. W. Wasdell, 54 Mason street, Carters Green, and H. S. Brierley, 31 Tenscore street—both in West Bromwich.
 126,177 Engine packing having a core of rubber, etc. A. E. White, 88 Chancery Lane, London. (Crane Packing Co., 29 South Clinton street, Chicago, Ill., U. S. A.)
 126,297 Respiratory apparatus. Paul and C. Hall, Pittsburgh, Pa., U. S. A. (Not yet accepted).

ISSUED JULY 16, 1919.

- 126,437 Streamline fairing of ebony, etc. C. H. Gray, India Rubber, Gutta Percha, and Telegraph Works Co., Silvertown, Essex.
 126,491 Packing for stuffing-boxes. A. E. White, 88 Chancery Lane, London. (Crane Packing Co., 29 South Clinton street, Chicago, Ill., U. S. A.)
 126,718 Windshields for airplane landing-wheels. Dunlop Rubber Co., 14 Regent street, Westminster, and F. J. Keegan, Alma street, Coventry.
 126,738 Aviator's garment to maintain normal atmospheric pressure on the body. F. E. Booth, 21 Downfield Road, Clifton, Bristol.
 126,746 Earpiece for acoustic receivers, provided with filling of sponge rubber for deadening sound. H. W. Metcalfe, The Claverings, Harlelow, Canterbury, Kent.
 126,767 Fountain pen. O. Woldenholme, 2 rue Rosetti, Alexandria, Egypt.

ISSUED JULY 23, 1919.

- 126,772 Demountable rim for tires. M. L. Scrimgeour (née Wakelin), 187 Brunshill Place, Edinburgh.
 126,792 Demountable rim for tires. Dunlop Rubber Co., and W. W. Hamill, 14 Regent street, Westminster.
 126,823 Appliance for preventing movements of patient in bed. C. F. Smith, 77 Cannon street, London.
 126,839 Rubber fastening band for pocket-books, etc. W. G. Hall, 36 Camomile street, London.
 126,914 Joint-mastic packing. Schneider & Cie, 42 rue d'Anjou, Paris.
 126,950 Demountable rims for tires. Baker Wheel & Rim Co., 140 South Dearborn street, assignees of E. K. Baker, same address—both of Chicago, Ill., U. S. A. (Not yet accepted).
 126,953 Strip material for wrapping tires, etc. E. H. Angier, Framingham, Mass., U. S. A. (Not yet accepted).
 126,967 Buyarut rubber garment for use at sea. A. V. Sims, 2 Rector street, New York City. (Not yet accepted).
 127,059 Oil hose. J. L. Hancock, Limited, and H. H. Rogers, 266 Goswell Road, London, and R. Cave-Brown-Cave and A. D. Ritchie, Royal Naval Air Station, Kinross, North Ayrshire, Kent.
 127,124 Respirator. Sir W. G. Armstrong, Whitworth & Co., Elswick Road, Newcastle-on-Tyne, and H. S. Rayner, Deepdene, Broadway, Warrington, Lancashire.
 127,148 Puncture-preventing band for interlining pneumatic tires. F. Cressley, Upper Parliament Street, Nottingham.

ISSUED JULY 30, 1919.

- 127,410. Goggles mounted in sponge rubber eye-sockets, adapted for attachment to goggles, etc. E. T. P. Goodyear, Colley Corner, Kentucky, U. S. A.
- 127,476. Eraser formerly of laminated rubber strip, etc. W. W. Beaumont, 222 Strand, Westminster.
- 127,532. Fountain pen. O. R. Waite, Mayleigh, Peterborough Road, Surrey, England.
- 127,562. Fountain pen. J. T. Anderson, Gandstorp, near Otterup, Funen, Denmark. (Not yet accepted.)
- 127,591. Surgical aspirator. H. S. White, Canadian Military Hospital, Orington, Kent. (Not yet accepted.)

THE FRENCH REPUBLIC.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 489,605. (March 30, 1918.) Improvements in electric cables having several conducting strands, and process of manufacture. C. J. Heaver and E. O. Claremont, Paris, France.
- 489,807. (April 30, 1918.) Protective spectacles specially designed for aviation and automobilism. Société Chénat, Soulat & Cie. (July 2, 1918.)
- 490,999. (July 2, 1918.) Improvements in self-filling fountain pens. The Conklin Pen Manufacturing Co.
- 491,101. (July 31, 1918.) Hose coupling. Société Flury & Schwallier.
- 491,102. (July 31, 1918.) Improvements in tires for vehicle wheels. E. Taylor.
- 491,219. (August 30, 1918.) Respiratory mask to protect against harmful and asphyxiating gases. P. J. Peyres.
- 491,239. (August 12, 1918.) Resilient tire. B. F. A. C. Tire & Rubber Corp.
- 491,291. (September 4, 1917.) Removable rubber heel. A. H. J. Person.
- 491,292. (September 19, 1917.) Halter-mask for horses. T. A. Clayton.
- 491,316. (August 21, 1918.) Improved pneumatic tube and process of manufacture. I. B. Jeffries.
- 491,375. (July 9, 1918.) Fountain pen and clip. The Conklin Pen Manufacturing Co.
- 491,403. (August 21, 1918.) Improvement in metallic wheel rims, insuring rapid mounting of pneumatic tires. P. Mongillon.
- 491,404. (August 21, 1918.) Metallic rim for automobile wheels. G. A. Merino.
- 491,443. (August 21, 1918.) Manometer. A. Schrader's Son, Inc.
- 491,474. (August 27, 1918.) Douche bag. G. Whittaker.
- 491,498. (August 28, 1918.) Improvement in fountain pens. T. Cahalan.
- 491,499. (August 28, 1918.) Life-saving suit. S. P. Edwards.
- 491,503. (August 28, 1918.) Resilient tire. J. M. Avery.
- 491,510. (August 29, 1918.) Improvements in resilient tires. S. Grossman.
- 491,602. (September 5, 1918.) Resilient tire. H. C. Babel.
- 491,607. (September 5, 1918.) Hose coupling. Eureka Fire Hose Manufacturing Co.
- 491,635. (September 9, 1918.) Tire valve. C. N. Duval and B. E. Verce.

NEW ZEALAND.

ISSUED JUNE 26, 1919.

- 40,623. Table having rubber surface and clamping bar faced with rubber, for use in removing threads from animal intestine.

TRADE MARKS.

THE UNITED STATES.

- N O. 109,653. Conventionalized representation of automobile headlight glass bearing the words RAINPROOF AUTO-COAT—raincoats, etc. The Miller Cloak Co., Cleveland, O.
- 110,165. Representation of an eagle with spread wings standing on a coil of hose, dividing the word EUREKA—rubber fabric or rubber and fabric hose. Eureka Fire Hose Manufacturing Co., New York City.
- 113,621. The word SNAPPLE—fountain pens. General Manufacturing Co., Sioux City, Ia.
- 115,980. A blue ribbon or band running along the center of belting made of rubber and fabric. The Gutta Percha & Rubber Manufacturing Co., New York City.
- 117,082. The word FIREFOAM—fire-extinguishing compounds. Foamite Firefoam Co., New York City.
- 117,400. Representation of a circle surrounding a child's head and the words TOOTSIE ROLLERS arranged so the capital T starts both words—children's rubber eraser.
- 117,426. The word "DIRECTOR"—golf balls. The Worthington Ball Co., Elvira, O.
- 117,427. The word "MYSTERY"—golf balls. The Worthington Ball Co., Elvira, O.
- 117,532. The word EXALBRESIN—powdered chemical material for accelerating vulcanization of rubber, etc. Rutenbach & Hullock Co., New York City.
- 118,663. The words WING FOOT—rubber or composition heels and soles. The Goodyear Tire & Rubber Co., Akron, O.

THE DOMINION OF CANADA.

- 24,556. The word UNIVERSAL—erasers, pens, rubber bands, etc. American Lead Pencil Co., New York City, U. S. A.
- 24,613. Representation of a circle bearing a rope, having in the upper part the word MINER, in the center the words TRI-COLOR, and in the lower part the letter M—rubber footwear, clothing, heels and soles, rubberized fabrics, belting, hose, tires, insulating material, and rubber cement. The Miner Rubber Co., Limited, Montreal, Que.
- 24,635. A black background with the word RAYSEER placed above the Dominion Symbol and the words MADE IN CANADA below—rubber coats and caps. Canadian Consolidated Rubber Co., Limited, Montreal, Que.
- 24,637. The words DIAMOND GRIT and the representation of a diamond and a heel—rubber heels. Robert E. Miller, Inc., New York City, U. S. A.
- 24,752. The word NAUGARVINE—articles containing rubber. Canadian Consolidated Rubber Co., Limited, Montreal, Que.
- 24,781. The word KERATOL—artificial leather. The Keratol Co., Newark, N. J., U. S. A.

- 24,786. The word INVICIBLE—pneumatic tires. Van der Linde Rubber Co., Limited, Toronto, Ont.
- 24,797. The representation of a circle bearing the semblance of a rope having in the upper part the word MINER, in the center part the word INVINCIBLE, and in the lower part a design resembling the letter M—rubber footwear and clothing, rubberized cloth, belting, hose, insulating material, tires, and rubber cement. The Miner Rubber Co., Limited, Montreal, Que.

THE FRENCH REPUBLIC.

- 26,323. The word DURELUX—imitation leather. The Dureluc Co., 768 Frelinghuysen avenue, Newark, N. J., U. S. A.
- 26,330. The words MOLO—chewing and medicated gum. The Chicle Products Co., Mount Pleasant, Newark, N. J., U. S. A.
- 26,341. Representation of tiger's head holding rectangle in open mouth—chewing gum. The Chicle Products Co., Mount Pleasant, Newark, N. J., U. S. A.
- 26,342. The words "PARAKIT" TRADEMARK corsets, girdles, garters, abdominal bandages, etc. Teco Co., 160 Fifth avenue, New York City, U. S. A.
- 26,288. The words HALL-SOLE TIRE—rubber tires. The Gates Rubber Co., 999 South Broadway, Denver, Colo., U. S. A.

NEW ZEALAND.

- 15,438. The word TEST-TOS—asbestos textiles not included in classes other than No. 50. American Asbestos Co., Norristown, Pa., U. S. A.
- 15,458. The word V-C—articles of clothing in class No. 38. Mishawaka Woollen Manufacturing Co., Hill and Water streets, Mishawaka, Ind., U. S. A.

DESIGNS.

THE UNITED STATES.

- N O. 53,494. Tire. Patented July 8, 1919. Term 14 years. E. O. Fritch, assignor to Hood Rubber Co.—both of Watertown, Mass.
- 53,498. Tire. Patented July 8, 1919. Term 14 years. M. Greenspan, Chicago, Ill.
- 53,511. Tire. Patented July 8, 1919. Term 3½ years. A. L. Weeks, Gadsden, Ala.

- 53,494. 53,498. 53,511. 53,555. 53,553.
- 53,553. Tire. Patented July 15, 1919. Term 14 years. G. S. Anderson, Akron, O.
- 53,555. Tire. Patented July 15, 1919. Term 7 years. C. R. Baker, Akron, O.
- 53,589. Tire. Patented July 15, 1919. Term 7 years. B. W. Hartley, Halleybury, Ont.
- 53,608. Tire. Patented July 15, 1919. Term 3½ years. S. Reele, Houston, Tex.
- 53,625. Rubber heel. Patented July 15, 1919. Term 14 years. C. Wright, assignor to Racine Auto Tire Co.—both of Racine, Wis.

- 53,498. 53,589. 53,608. 53,661.
- 53,635. Horse-shoe pad. Patented July 22, 1919. Term 14 years. W. J. Kent, Brooklyn, N. Y., assignor to Revere Rubber Co., Providence, R. I.
- 53,639. Automobile wheel. Patented July 22, 1919. Term 7 years. W. J. P. Moore, New York City.
- 53,653. Tire. Patented July 29, 1919. Term 3½ years. W. B. Buckley, Washington, D. C.
- 53,661. Tire. Patented July 29, 1919. Term 14 years. J. H. Kohlsch, Kenmore, assignor to The Oldfield Tire Co., Cleveland—both in Ohio.

THE DOMINION OF CANADA.

- 4,605. India rubber rubber. Patented June 6, 1919. Russel Sutherland Smart, Ottawa, Ont.

ROBERTSON M. R.

This new grade of mineral rubber is manufactured by a patented process in which direct heating is eliminated, thus avoiding all possibility of carbonizing the crude materials. The resulting product is suitable for use in manufacturing high-grade rubber product where mineral rubber has not usually been accepted as a desirable ingredient. The usual advantages of mineral rubber are said to be exceeded in the new material.

Review of the Crude Rubber Market.

NEW YORK.

DURING AUGUST the crude rubber market advanced slightly, but steadily. Prices were very firm, with buyers quite eager and sellers holding back. There is plenty of rubber on hand, waiting for better market conditions. Manufacturers appear to be well supplied; usually they lay in their stocks in August, but this year many bought earlier; some are trying to buy now. Trading is still hampered by the delays with the cables to Europe and the East, as well as to Brazil.

While there was some dealing in futures a month ago, it is now difficult to do any business. The fall in sterling exchange was expected to lower the price of crude rubber, but it had, if any, a contrary effect. The Singapore market is much higher than New York, but it is difficult to do business direct, owing to the cable troubles. In Brazil there is little change. The Pará market is quiet, with prices unchanged from the beginning of the month.

The following quotations indicate the price movement of plantation and South American rubber:

PLANTATION HEVEA. August 1, first latex crepe, spot 41½ cents; September, 42½ cents; October-December, 43½ cents, and January-June, 1920, 45½ cents.

August 25, first latex crepe, spot 45 to 45½ cents; October-December, 45½ cents, and January-June, 1920, 47 cents.

August 1, ribbed smoked sheets, spot 40½ cents; September, 41½ cents; October-December, 42½ cents; January-June, 1920, 44½ cents, and January-December, 1920, 45½ cents.

August 25, ribbed smoked sheets, spot 43½ cents; September, 44 cents; October-December, 44½ cents; January-June, 1920, 46 cents.

August 1, No. 1 amber crepe, spot 38½ cents; August-December, 38 cents; January-June, 1920, 40 cents.

August 25, No. 1 amber crepe, 41½ cents; August-December, 41½ and 42 cents; January-June, 1920, 43½ cents.

August 1, clean thin brown crepe, spot 35½ cents; August-December, 36½ cents; January-June, 1920, 37½ cents.

August 25, clean thin brown crepe, spot 38 cents; August-December, 38½ cents; January-June, 1920, 40 cents.

August 1, No. 1 roll brown crepe, spot 30 cents; August-December, 30 cents; January-June, 1920, 31 cents.

August 25, No. 1 roll brown crepe, spot 32 cents; October-December, 32½ cents; January-June, 33 cents.

SOUTH AMERICAN PARÁ AND CAUCHOS. Spot prices were: August 1, upriver fine, 54½ cents; islands fine, 47½ cents; upriver coarse, 32 cents; island coarse, 20½ cents; Cametá coarse, 21½ cents; cacho ball upper, 32 cents. August 25, upriver fine, 54½ cents; islands fine, 47½ cents; upriver coarse, 32 cents; islands coarse, 21½ cents; Cametá coarse, 21½ and 22 cents; cacho ball, 31½ cents.

NEW YORK QUOTATIONS.

* Nominal.

RECLAIMED RUBBER.

The market is characterized by continued dullness. Purchasing is limited to routine orders, with no effort at anticipating future demands. There is slight activity in reclaims for insulation work and a fairly good market for the stock reclaims.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert B. Beers, broker in crude rubber and commercial paper, No. 68 William street, New York City, advises as follows:

"During the first part of August the demand for paper was very light and mostly from out-of-town banks, the best rubber names going at 5 1/2 to 6 per cent, and those not so well known 6 to 6 1/2 per cent, but the latter part of the month rates eased a little to about 5 1/2 to 5 1/4 per cent and 6 to 6 1/2 per cent, respectively."

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [July 10, 1919]:

Notwithstanding advances of declining values in London and New York, the rubber auction opened yesterday to a firm market. There was an unusually large number of buyers in the market, and keen competition was witnessed at intervals throughout the sale.

Ribbed smoked sheet fully maintained last week's value of 67 1/2 cents and 68 1/2 cents was paid for a very really fine lots. Fine pale crepe was in moderate demand and sold up to 67 cents (3 lots sold at 67 1/2 cents) showing no change on the week. Clean brown and dark crepes, with a shade weaker, while Barky crepes advanced two cents. The quantity cataloged was 907 tons, of which 587 tons were sold.

The following is the course of values:

	In Singapore, per Pound.	Sterling Equivalent per Pound in London.
Sheet, fine ribbed smoked	65c @ 67 1/2c	1 1/8 @ 1 1/8 1/4
Sheet, good ribbed smoked	55 @ 64	1 1/8 @ 1 1/8 1/4
Crepe, fine pale	65 @ 67 1/2	1 1/8 @ 1 1/8 1/4
Crepe, good pale	53 @ 63 1/2	1 1/8 @ 1 1/8 1/4
Crepe, fine brown	50 @ 52 1/2	1 1/4 @ 1 1/4 1/2
Crepe, good brown	45 @ 50	1 1/4 @ 1 1/4 1/2
Crepe, dark	40 @ 42	1 1/4 @ 1 1/4 1/2
Crepe, bark	30 @ 46	1 1/2 @ 1 1/2 1/4

¹ Quoted in S. S. Currency—\$1 = \$0.567.

BATAVIA RUBBER MARKET.

HIEMANS, MARSMAN & CO., Batavia, report [May 15-June 15, 1919]: During the month under review the market was very quiet and buyers showed only very little interest in almost all qualities. The quotations received from the foreign markets showed a downward tendency. The markets closed with the following quotations:

	In Batavia Per 52-kilo. ¹	Equivalent U. S. Currency.
Fine pale crepe	1.17	\$0.468
Prime smoked sheet	1.18	.472
Fine pale crepe, basis 75 per cent.	1.06	.424
Off crepe	0.89 @ 1.12	.356 @ .448

¹ Quoted per 52-kilo (1.1 lb.) in Dutch Indian guilders (\$0.40).

FEDERATED MALAY STATES RUBBER EXPORTS.

An official report from Kuala Lumpur states that 7,091 tons of rubber were exported from the Federated Malay States in the month of June, as compared with 7,308 tons in May and 5,161 tons in the corresponding month last year. The total export for six months of the present year was 50,717 tons, against 40,557 tons in 1918 and 39,476 tons in 1917. Appended are the comparative statistics:

	1917.	1918.	1919.
January	3,995	7,588	7,163
February	7,260	6,520	10,806
March	7,088	7,709	10,670
April	5,955	7,428	7,664
May	5,179	5,851	7,408
June	6,009	5,161	7,094
Totals	39,476	40,557	50,717

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official report from Singapore states that 5,059 tons of rubber (of which 948 tons were transshipments), were exported from the Straits Settlements in the month of June, as compared with 15,845 tons in May and 6,515 tons in the corresponding month last year. The total export for six months of the present year was 82,725 tons, against 42,180 tons in 1918, and 39,516 tons in 1917. Appended are the comparative statistics:

	1917.	1918.	1919.
January	3,562	4,300	14,404
February	6,495	2,334	15,661
March	8,299	8,858	20,908
April	6,103	6,584	10,848
May	6,282	13,587	15,845
June	8,775	6,515	5,059
Totals	39,516	42,180	82,725

MARKET FOR COTTON AND OTHER FABRICS.

NEW YORK.

AFTER A SHORT FLURRY at the end of July and beginning of August middling spot cotton fell to 31.50 cents, a price to which it clung steadily until August 25, when it advanced to 32.15 cents, due to rumors of a poor crop. The estimate of the crop, which is below middling in quality, is about 11,640,000 round bales. Considering that crops have been short for four consecutive years there would be a cotton panic were it not for the war conditions hitherto and for the present scarcity of ocean transportation.

EGYPTIAN COTTON is coming in in small quantities, the whole cotton crop is needed in England to enable the mills to return to the output of the years before the war. The Alexandria market shows weakness, prices ranging from 59 to 62 cents for Sakellaris and from 55 to 56 cents for Upper Egyptian, with little business done. A little Egyptian is being doled out to American buyers. The fall in sterling exchange should encourage trading. The market will probably continue unsettled till

the new crop begins to come down in quantities in October and November.

SEA ISLAND COTTON.—This must be left out of consideration this year. The old crop is practically exhausted, while the boll weevil has worked havoc with the new crop, which will amount in all likelihood to less than 20,000 bales this year, so that the tire fabric industry must turn elsewhere for material. The Meade cotton which has been raised as a substitute has not proved popular.

AMERICAN-EGYPTIAN.—The cotton that is free will not make up for the Sea Island shortage. The crop this year is late, and will hardly begin to move before September. The rains have had a bad effect, but the crop will be larger than any the Southwest has previously raised; from 45,000 to 50,000 bales is the estimate. No forward business has been doing.

TIRE FABRICS.—The market is very strong, the product of the mills has been sold, and the factories, though they are working to their limit, will be unable to supply the demand. No new factory equipment has been built lately, while labor troubles have cut the working time from 54 hours to 48 hours a week, thus reducing production. Staple cotton is scarce, and while manufacturers are using peelers as a substitute, some factories prefer to restrict production rather than continue with the inferior material. Little business is being done for next year though great interest is shown in the 1920 possibilities.

OTHER FABRICS.—Belting and hose duck have been quiet until last week; lately the market has been fairly active. There is a strong demand for sheetings, which are sold out to the end of the year. No demand for Osnauburgs. Carriage cloth is very scarce, the mills are sold out practically till the middle of 1920. Yarn prices are high and firm, and advancing rapidly.

*A cantar equals 98 pounds.

(Compiled by Davies, Benachi & Co.)

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.**NEW YORK.**

DURING THE PAST MONTH the demand for chemicals and compounding ingredients has been generally brisk in all items, and present conditions indicate a steady continuance of the demand.

ANILINE OIL.—There has been a distinct advance in price as indicated last month. This may later affect the price of such accelerators as are derived from aniline.

BARYTES.—The demand is good, and the price steady at about \$21.50 per ton.

BENZOL.—There has been a very active consumption, and prices have advanced one cent per gallon.

CARBON TETRACHLORIDE.—Business has continued dull through the month and prices weak.

DRY COLORS.—The market has continued to improve, and at the close, inquiries from the rubber trade indicate the existence of a very good demand.

LITHARGE.—The market on all lead products is very active and consumers' demands are taxing output.

LITHOPONE.—Production is practically sold up, and manufacturers are experiencing difficulty in meeting consumers' requirements. In fact, there is an excess of business being offered.

MAGNESIA.—This material is experiencing a renewal of favor with rubber manufacturers. The more active call will probably result in an increase in the price of the product.

MINERAL RUBBER.—There has developed a pronounced increase in export sales in mineral rubber in addition to large domestic consumption.

SUBLIMED LEAD.—The same conditions rule with this material as in the case of litharge and white lead, producing firm prices.

WHITING.—The market is well maintained at firm prices.

ZINC OXIDE.—The reaction of the automobile tire industry is reflected particularly in the brisk demand for zinc oxide.

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

THE VOLUME OF BUSINESS in scrap rubber during the past month has been very limited. Since the removal of the English embargo on rubber scrap several weeks ago the movement of inner tubes has not gained appreciably.

Market conditions are not noticeably improving, although the rubber scrap dealers are hopeful of marked activity by October. BOOTS AND SHOES. There has been an off and on demand just sufficient to hold prices steady.

TIRES. This grade has not been called for to any great extent. There has been fair buying for picking purposes. Prices have been steady and firm for good stock.

INNER TUBES. The situation continues without interest.
